determining prices, determining special sales prices for certain customers, As well as the degree of autonomy in choosing business partners, canals of distribution etc. The middle level of the subsidiary's autonomy was assessed with 3, and it refers to the human resources management function which comprehends the possibility of an organizational restructure, degree of autonomy in determining tasks and workplace definitions and functions, responsibility for hiring and firing employees as well as determining the income and bonuses for employees. The marketing function that refers to the responsibility for determining the market scope, advertising, content of advertising and the selection of marketing agencies, the possibility of processing standard products as well as the adjustment to local needs also has a pretty high autonomy in most subsidiaries. Finally, the least degree of autonomy is seen in the business function of the Finances, which includes the autonomy of accounting procedures and financial planning, the purchase of additional equipment or the replacement of the existing one, determination of the target rate of return, loan policies and receivables. This leads to the conclusion that the headquarters still has the majority of control of its subsidiaries through the finance function, and that the finances are the best instrument for implementing and maintaining control over subsidiaries.

The research showed that most of the surveyed managers apply a democratic leadership style while much fewer believe their own style to be autocratic. The survey also revealed that the managers of French subsidiaries spend most of their time leading and motivating employees and organizing, they devote a lot of their time on planning and controlling, and the least time on managing human resources.

Table 2: Organizational aspects in subsidiaries

How often do you consult your associates while making decisions?	
Often	Sometimes
73%	27%
Decision making in the subsidiary is:	
Centralized	Decentralized
73%	27%
Is there a rigid hierarchical structure with clear lines of authority in the subsidiary?	
Yes	No
73%	27%

These results are in agreement with the fact that France is a country with an emphasized hierarchic system and centralization in business as well as in other fields. The business positions and its appropriate levels of authority, power, and responsibility are therefore clearly defined with existing functional lines of responsibility.

The research also revealed that collectivistic and "male" cultural values dominate in most French subsidiaries.

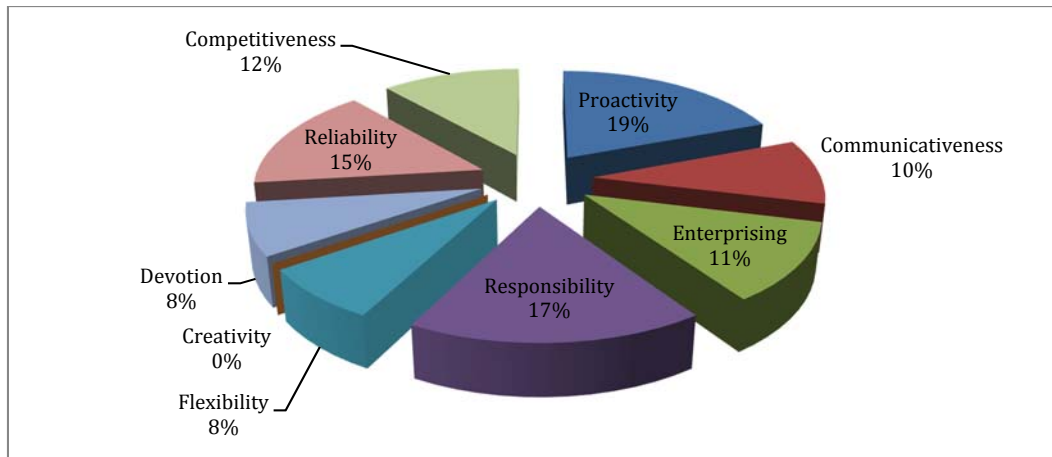
Challenges of the Modern World - Contemporary Economy and Globalization


Chart 1: Main characteristics of employees in French subsidiaries

When asked how important it is that their employees understand French, equal number of managers (35%) answered that it is desirable and unimportant, 18% indicated that it depends on the function of the employee, while 9% thinks it is important. The fact is that nowadays, multinational corporations all over the world use English as their official language. The results of this research reveal that French managers in Croatia, to some extent, still believe that it is important for employees in certain positions to speak, or at least understand French language. This confirms the well-known devotion of the French to their language.

As for the meetings, the managers stated that they mostly hold meetings for 2 reasons: in order to discuss and exchange ideas about ongoing activities and for the purpose of making decisions. The results confirm the idea that the French hold meetings in order to exchange information and events rather than to achieve a consensus or make a decision.

Finally, 63% of managers state that a formal form of communication prevails in the company, while 37% indicates that informal communication is the main form of communication in the subsidiary.

Regarding the degree of cultural distance, the biggest percentage of managers (55%) graded (on a scale 1 to 5) the difference in the business culture of Croatia and France with 3. A certain percentage of managers (27%) thinks that the degree is higher and graded it with 4 or 5, which indicates a high or very high degree of cultural distance, while only 18% of managers thinks that the degree is lower and graded it with 2.

On the other hand, when it comes to the success of the implementation of the organizational culture from the parent organization to the subsidiary, on a scale of 1 (unsuccessful) to 5 (very successful), 45% of managers graded it with 3 and the same number graded it with 4, whereas 10% showed a negative attitude about it and therefore graded it with 1. According to this information it can be concluded that the implementation of the French organizational culture in Croatian subsidiaries is pretty successful.

5   CONCLUSION

The headquarters-subsidiary relationship in multinational corporations is based on different roles and assignments that the subsidiary has towards the headquarters and *vice versa*. The assignments that the headquarters have towards subsidiaries are the control and coordination

of the subsidiary's activities within the corporative network. Also, the headquarters has the important role of knowledge management within the corporation whereas the subsidiaries assignment is adopting and sharing knowledge with the rest of the corporative network. Besides that, subsidiaries have to maintain a certain degree of autonomy within the corporation so they can successfully conduct business activities in the local market.

The headquarters-subsidiary relationship is also influenced by numerous factors that could be the size or geographic distance of the subsidiaries as well as cultural elements of its surroundings. Their influence on the relationship between the subsidiary and the headquarters is mostly visible through changes of the subsidiaries degree of autonomy.

The interrelationship of certain „dimensions" or factors that may affect subsidiaries operations brings different roles that subsidiaries can have and thus different "Types" of subsidiaries within the corporation.

The empirical part researched the levels of autonomy of French subsidiaries in Croatia as well as the differences in business practices between Croatia and France that may affect the headquarters-subsidiary relationship.

Given the dimensions that can affect the subsidiaries operations, it is evident that the theme concerning the role of subsidiaries in multinational corporations is very complex and important subject. That is why more attention should be given to this specific subject, in practice as well as in scientific research, especially in smaller economies. Considering that leadership styles and practices differ from one country to another, and that these styles are transferred from headquarters to the subsidiaries, it would be interesting to compare the headquarters-subsidiary relationships of European or American corporations with the ones from the countries in transition and developing countries in order to detect differences in subsidiary treatment and headquarters-subsidiary relationship between different multinational corporations.

Finally, unlike the traditional headquarters-subsidiary relationships where the control function was the fundamental activity, nowadays there is one other very important element in this relationship – the knowledge transfer (or Management). Considering the new corporate policies that encourage the creation and dissemination of knowledge within the corporation, one can say that in the *contemporary* headquarters-subsidiary *relationship,* the knowledge is the most important link between the entities of a multinational corporation.

SOCIAL ENTREPRENEURSHIP AND CORPORATE SOCIAL RESPONSIBILITY IN SLOVAKIA

Eva Pongraczova

University of Economics in Bratislava, Faculty of National Economy, Department of Social Development and Labor, Slovakia
pongracz@euba.sk

ABSTRACT
Combating poverty and social exclusion is a priority for all Member States of the European Union. The need to strengthen social inclusion, reduce the risk of social exclusion and maintain employment growth has declared the Lisbon Strategy and its follow-up strategy document Europe 2020. These ambitious goals can achieve only by mobilizing all the unused capacity of the economy. The European Research Network - EMES notes that the welfare state is gradually changing to mixed welfare state, where the responsibility is shared between the three sectors of the economy. Solutions to the social problems of society increasingly involve the public institutions, traditional businesses focused on profit and different actors of the third sector. In the area of deteriorating social conditions and employment opportunities third sector organizations have their place. They create mechanisms through which individuals can participate in the activities of civil society. The third sector is developing in areas where the public nor the private sector cannot or for some reason does not want to ensure sufficiently meet the needs of citizens. It is also expected to increase of corporate social responsibility of the traditional business community. Corporate social responsibility is gradually gaining wider acceptance and application in daily practice. Corporate responsibility includes social and environmental considerations into the conduct of the company. The functioning of socially responsible companies approaching the concept of social economy, and their values and goals are very similar. It has developed also a new and innovative business in the area of social economy, which prefers social goals to profit. In developed economies of the European Union, this "hybrid business model" has worked successfully, that why it has merit greater recognition and support in Slovakia.

Keywords: *Corporate Social Responsibility, Social economy, Social entrepreneurship, Social exclusion, Unemployment*

1 INTRODUCTION

The concept of Corporate Social Responsibility and the concept of social entrepreneurship have a lot of characteristics in common; however, significant differencing in their implementation shall be pointed out. Among the initiatives of the social economy we count only those that mandatorily prioritise its social mission or social goal to gaining profits and they work according to principles of commercial business. Socially responsible company is an entity operating in the private sector as a classical profit oriented company integrating on a voluntary basis (beyond the statutory obligations) in its day to day decision making social and environmental aspects and interactions with all other involved parties.

2 CORPORATE SOCIAL RESPONSIBILITY

Corporate Social Responsibility (CSR) is gradually gaining wider acceptance and applicability level in daily practice also in Slovakia. It represents the implementation of social and environmental aspects into business decision-making and acting.

Amongst the first definitions of the social responsibility belongs the definition contained in the book: Social Responsibility of the Businessman in the USA, from 1953. In this book, the social responsibility is specified as a commitment of the entrepreneur to take such decisions or to negotiate in a way desirable in terms of objectives and values of society.

So called Carroblov's four-piece definition of the CSR is based on the principles in the following areas (Doležalová, 2005, pp. 29–74):
1. Economic responsibility.
2. Legal responsibility.
3. Ethical responsibility.
4. Voluntary responsibility.

The interest of the European Union for the concept of a socially responsible company started in the 90`s of the 20th century, especially for seeing it as a tool to achieve sustainable development. The first European definition of the social responsibility is laid in the Green Book (2001), which constitutes an optional integration of social and environmental aspects into day to day business operations and interactions with other involved persons. It means a voluntary, not mandatory nature of corporate social responsibility.

An important milestone in the global development of corporate social responsibility was given also by the origination of the international network named Global Compact, initiated by the United Nations in 2000. It covers NGOs, UN agencies and representatives of companies with a common goal to promote principles (10) of corporate social responsibility in the following areas (Bussard, Marček, Markuš and Bunčák, 2005, p. 14):
  ➢ Human rights:
    1. Companies should foment and respect the protection of fundamental human rights.
    2. Companies should ensure not to participate in any way in its infringement.
  ➢ Working standards:
    3. Companies ought to respect freedom of association and acknowledge the right for the collective bargaining.
    4. Companies should eliminate all forms of forced labour.
    5. Do not allow to abuse the child labour.
    6. Companies should eliminate the discrimination at work.
  ➢ Environment:
    7. Companies should foment the environmental protection.
    8. Companies should support initiatives promoting responsible approach to the environment.
    9. Companies should support the development and dissemination of environment-friendly technologies.
  ➢ Fight against corruption:
    10. Companies should act against corruption in all its forms, including blackmailing and bribery.

Challenges of the Modern World - Contemporary Economy and Globalization

According to socially responsible behaviour the companies shall have in mind the interests of all involved parties. They develop its activities ethically in respect to all market participants (competitors, shareholders, customers and suppliers), working place (employees, management and unions), within the community (local self-governments, state administration, local community) and to environmental protection.

Social responsibility of the companies means voluntary effort of business entities beyond the legal obligations in order to achieve social and environmental goals. Such companies do not seek only the profitability, but include within its interests impacts on the environment and local communities. These objectives are reflected in the so-called triple expressing of the economic results (Bussard, Markuš and Olejárová, 2005) - or triple bottom line according to the Green Book.

Nowadays, the principles of socially responsible enterprising are becoming adopted more and more by the companies in Slovakia. The evidence is given by the interest of companies for the prestigious prize Via Bona Slovakia, awarded annually by the Points Foundation for the best projects in the field of the corporate philanthropy and CSR.

Interested parties can subscribe to different categories:
- The Main Awards: responsible large company for 2012 (more than 250 employees), responsible small or medium company of 2012 (up to 250 employees).
  The main prize for the large company is awarded for the complex and exceptional attitude to responsible enterprising in relation to management of the social responsibility, controlling the impact for the environment, the implementation of ethical principles, taking care of employees, responsible operating on the market and influence of the company on the community.
  Responsible small or medium company should present itself by application of the principles of responsible business practices in at least 2 of the following areas: responsibility to employees, community, environment, market and ethics.

- Area of Corporate Social Responsibility: green company, excellent employer, pro-customer oriented company.
  The Green Company Award can be granted to the business entity having carried out unique project in the area of the environmental protection, being known for the reduction of adverse influences of its operation to environment, elimination of impacts to climate changes, economical and efficient use of energies and materials, protection of biodiversity, reservations, endangered fauna and flora, involving of interested parties and creating of partnerships with the third sector entities.
  The Excellent Employer Award shall promote company fomenting an equal opportunities on the working place, employee training, harmonization of work and family life and creating good working conditions also in relation to remuneration and evaluation of the employees.
  The Pro-Customer company is represented by the exceptional approach to the customers related to care taken of them, communication and claim solving methods, introducing the innovative and responsible products and services and quality in managing its operation.

- The Corporate Philanthropy Area: good community partner and promoter of the volunteering activities.

A Good Community Partner Award is granted to the company applying a strategic approach to donations (partnerships creation, the extent of donations, incentives for support - charitable assistance, investments to the community).

For the Promoter of Volunteering Activities Award can apply the company fomenting its environment not only financially but also by dedicating the time of his employees and supporting the volunteering activities.

With an effect from 3rd December, 2012 the above mentioned initiative has become the part of European program of awards for responsible entrepreneurship. Two nominated companies will have the opportunity to represent our country on a European competition of winners in June, 2013. Evaluation will be carried out for the partnership projects among companies and non-profit organizations in the category: Partnerships of small and medium businesses and Partnerships of large companies.

Given the fact that a socially responsible company supports a local development it often enters into partnerships aimed to solve common problems. Exactly partnerships between sectors are considered to be a driving force and effective source utilization in local development.

3   THE PARTNERSHIP AND THE SOCIAL ENTERPRISES

The cooperation of the third sector and the business entity can have different forms: assignation of 2% from the corporative tax, corporate donations and sponsorship, charity marketing, campaigning, strategic partnerships.

The possibility to assign 1% and later 2% of the corporative tax has existed since 2004 (for individuals already since 2001 – possibility to assign 1% of the tax paid in 2002 for the previous fiscal period) and most companies use this form to help the third sector entities. The total amount paid as a percentage share of the corporate tax paid by the companies is increasing every year.

The corporate donations are realized by providing its own resources for public purposes without any reciprocal service. Often we see the cooperation of non-profit organizations and companies in the form of sponsorship, where the third sector organization provides the company with the opportunity of advertising and promotion. Some companies support also voluntary activities of its employees.

The standard for community investment is an internationally used methodology to measure CSR, i.e. the support of the community by the business entity. Four forms of donation are monitored within this methodology: providing funding, time, gifts in kind and costs incurred during these activities. Comparing inputs and outputs gives the company the exact amount invested to support a local community. This methodology is gradually implemented also by the companies in Slovakia and Czech Republic.

Operation of the Social Economy Enterprises is approaching the concept of the social responsibility and its values and goals are very similar.

The Social Enterprise is considered to be the business entity acting in competitive environment of goods and services, primarily employs physically or socially disadvantaged persons and its main purpose is not the profit maximization but a culture of giving (added

social value) and social incorporation of its employees. A potential profit essentially reinvests into development of its socio-economic objectives (Korimová, 2007).

The Confederation of European social Firms, Employment initiatives and social Cooperatives CEFEC defines the Social Enterprise by the following characteristics:
1. Social Enterprise is established with aim to employ disabled people or those other way disadvantaged in the labour market.
2. It is a business entity using its own market oriented production of goods and services to fulfil its social goals.
3. Most of employees are people with disabilities or other handicaps.
4. Every employee is paid the market wage or salary corresponding to his work.
5. Working conditions are the same for a disadvantaged employees as well as the rest of the staff.
6. All employees have the same rights and obligations.

The entities of the social economy react with innovative solutions to problems of the community. They provide its services especially to disadvantaged people, marginalized groups or to citizen gathered with common social goal. We divide them into social enterprises that meet its social mission:
- By providing services related to reducing or solving the social issues of the community.
- By creating jobs for disadvantaged applicants (so called Social Enterprises of working integration).

There are many initiatives successfully operating in Slovakia, however only Social Enterprises as the tools of active labour market policies are receiving the legal and financial support. Social Enterprises seek to solve long-term unbalance in the Slovak labour market, reflected in major issues, such as significant regional disparities in unemployment (5% - 30%), high rate of unemployment amongst young people with the age of 15 to 24, a high portion of long-term unemployment (unflattering first place within the countries of European Union), high number of job seekers with low education and lack of qualified working force for some specializations.

According to the Employment Services Act with an effect from 1st September, 2008 the Social Enterprise is considered to be the legal or natural entity that (The Act No. 5/2004):
- To the extent of at least 30% of its total headcount employs people being disadvantaged job seekers before accepting the job.
- Help these employees to find a job in the open labour market.
- After deduction of all expenses for its operation, uses at leas 30 % of its income to create new jobs or to improve working conditions.
- Is registered in the register of Social Enterprises.

These entities have the option to utilize a contribution to support and maintain jobs in the Social Enterprise at a maximum extent of 50 % of the total labour costs calculated on the basis of the average wage in the economy of the Slovak Republic for the first to third quarter of the calendar year preceding the calendar year in which the contribution is granted. Should the particular employee fail to get a job in the open market within 12 months, the Social Enterprise has the right to ask to prolong the provision of the contribution for another 12

months to the maximum extent of 40% of the total labour costs calculated as in the previous case.

The category of social entrepreneurship includes also protected workshop or sheltered working place having at least 50% of its employees the people with disabilities. The employer may apply for different contributions to support the employment of those persons: contribution to job creation, contribution to renewal of the technical value of tangible assets, contribution to cover operating costs and contribution to transport of employees with disabilities.

As the indirect support of sheltered workshop and Social Enterprises employing persons with disabilities we can consider awarding the contracts with the purpose to fulfil the obligatory share of employment of persons with disabilities under the law.

An employer who employs at least 20 employees has the obligation to employ people with disabilities in the number of 3.2% of the total headcount, provided the Office of Labour, Social Affairs and Family has such applicant in his evidence. Employing the person with disability with a decrease of earning capacity to the extent of more than 70% is counted as if employing three people.

Failing to meet the share of employment of people with disabilities leads to the obligation of the employer to pay the levy for the failure in the amount of 0.9 times of the total labour costs calculated on the basis of the average wage of the employee in the economy of the Slovak Republic for the first to third quarter of the calendar year preceding the calendar year in which he should fulfil this obligation. The employer does not have to pay this penalty in the case of ordering products or services from protected workshop or protected working place or from employer whose employees – people with disabilities have been involved in manufacturing such products and providing such services.

4   CONSLUSION

Progress in development of Corporate Social Responsibility and social economy in Slovakia is very slow. Companies accepting the CSR principles receive more attention and support as the activities carried out in the area of social economy. It would be desirable to adopt comprehensive legislation related to both concepts regarding the definition of the operating criteria, statistical reporting and financial incentives. There is an increase of social responsibility expected in achieving the inclusive growth not only in the case of entities prioritising the social goal, but the civil sector and the business community as well.

PREDICTING HELMET USE INTENTION AND BEHAVIOR DURING MOTORCYCLE RIDING OF THAI ADOLESCENTS[1]

ABSTRACT

Preventing health risk behaviors of people is the important way to meet the sufficiency health leading to health cost reduction, especially during adolescence phase. Helmet use consistently has been shown to reduce motorcycle crash-related injuries and deaths and universal helmet laws require all motorcyclists to wear helmets whenever they ride. This study, one of seven projects investigating health risk behaviors of Thai adolescents, sought to determine the ability of Ajzen's Theory of Planned Behavior to predict helmet use behavior during motorcycle riding via examination of 7th-9th grade Thai students' attitudes, subjective norms, perceived behavioral controls and helmet use intention. Ajzen's Theory of Planned Behavior postulates the more favorable the attitude and perceived subjective norm, the greater perceived behavioral control, the stronger one's intention will be to perform a given behavior. During a series of 3 data collection phases (elicitation study, pilot study and final data collection-actual study) data were obtained, through use of a research developed Demographic Data Questionaire and a Helmet Use Assessment Questionaire, and analysed by way of descriptive statistics and hierarchical multiple regression. Results revealed only 29.1% of the subjects used helmets during motorcycle riding within the previous month. Regression analysis demonstrated the explanatory power of the Theory of Planned Behavior, in that social norm, perceived behavioral controls, and helmet use intention predicted 6% of variance of their helmet use behavior during motorcycle riding. Interesting, subjective norms explained 22% of variance in their helmet use intention during motorcycle riding within the next 30 days.

Keywords: Adolescents helmet use intention, Helmet use behavior, Theory of Planned Behavior

1   INTRODUCTION

Each year many people die, or are injured or disabled as a result of road traffic crashes, and millions more are injured or disabled. In many low-income and middle-income countries, users of two-wheelers especially motorcycle make up more than 50% of those injured or killed on the road (http://www.nhtsa.gov/FARS; http://www.fhwa.dot.gov/policyinformation/statistics/2010/vm1.cfm). Head injuries are the main cause of death and disability among motorcycle riders and also passengers, and the costs of head injuries are high because they frequently require specialized medical care or long-term rehabilitation (http://www-

nrd.nhtsa.dot.gov/pubs/811208.pdf; Croce, Zarzaur, Magnotti and Fabian, 2009, pp. 390–394). Most of the these are preventable and helmet use consistently has been shown to reduce motorcycle crash-related injuries and deaths and universal helmet laws require all motorcyclists to wear helmets whenever they are riders or passengers. In the United States, economic costs saved in states with a universal helmet law were, on average,$725 per registered motorcycle, nearly four times greater than in states without such a law ($198). Although approximately $ 3 billion in economic costs were saved as a result of helmet use in 2010 (Centers for disease control and prevention, 2012, pp. 425–430).

In Thailand, though motorcycle-related, accidents and deaths are common and account for a substantial proportion of injuries related to motor vehicles, motorcycle riding is still a popular means and used as the main vehicle for all-purpose transportation among youth in Thailand. Preventing health risk behaviors of adolescents such as non-helmet use behavior during motorcycle riding is one of the important ways to meet the sufficiency health and leading to health cost reduction, because helmet use consistently has been shown to reduce motorcycle crash-related injuries and deaths. Though in 1992, the Royal Thai government introduced a law that required all motorcycle riders to wear helmets. Despite the enactment of the law, large numbers of motorcycle riders can be seen throughout the country riding without wearing a helmet. Thus, in order to develop strategies to increase Thai adolescent helmet use, There appears to be a need for health care providers and society to better understand their beliefs regarding helmet use during motorcycle riding.

2   THEORETICAL FRAMEWORK

Ajzen's (1991, pp. 179–211) Theory of Planned Behavior(TPB) is a model for predicting and explaining a given behavior. The TPB was based on Ajzen and Fishbein's previous theory, the theory of resoned action. This theory was developed in 1982 by including perceived behavioral control which influenced by Bandura's theory of self efficacy. According to Ajzen's human intention and behavior, are based on one's attitude toward the behavior, subjective norms, and perceived behavioral control (http://www-unix.oit.ummass.edu/ajzen/tpb.diag.html). Attitude toward a behavior is the degree to which performance of the behavior is positively or negatively valued. It is viewed as the belief that outcomes of one's behavior and evaluation of the ensuring outcomes are the basis for development of either a favorable or unfavorable attitudes toward any given behavior. Subjective norm is the perceived social pressure to engage or not to engage in a behavior. On the other hand, it is seen as the belief that the normative expectations of others, and one's motivation to comply with such expectations. Perceived behavioral control refers to person's perceptions of his ability to perform a given behavior. Thus, the more favorable one's attitude and subjective norm, and the greater one's perceived behavioral control, the stronger is one's intention to perform a given behavior. One's intention to perform behavior, according to the TPB, is assumed to be the antecedent of behavior. The TPB has been found to predict a variety of risk behaviors, such as alcohol consumption (Huchting, Lac and LaBrie, 2008, pp. 538–551), condom use (Fazekas, Senn and Ledgerwood, 2001, pp. 103–117), and breast self exams (Mason and White, 2008, 946–955).

Although a number of studies regarding helmet use during motorcycle riding among various populations have been undertaken, no related studies use of TPB and no studies among Asian populations especially Thai adolescents. Therefore, based upon prior research and lack of studies regarding helmet use during motorcycle riding among Thai adolescents, this research sought to examine the predictability of attitudes, subjective norms, and perceived behavioral

control on helmet use during motorcycle riding of 7th to 9th grade adolescents both as the riders and as the passengers.

3   METHOD

Design: This study is one of seven projects investigating health risk behaviors of Thai adolescents, which consisted of three phases of data collection: phase I: an elicitation study, using focus group interviews, phase II: a pilot study to test the instrument developed as a result of the elicitation study, and phase III: phase of data collection of the actual study, a cross-sectional survey design, using the instrument tested in the pilot study.

Ethical consideration: Prior to data collection, this study was approved by the Ethical Committee on Human Research, Faculty of Medicine, Ramathibodi Hospital, Mahidol University, and the principals of the schools used as data collecting sites.

All potential subjects recruited for the three phases of the study were given consent- assent form, and a written information sheet which addressed about : the purpose of the phase of the study in which a student would be involved; the approximate amout of time involved to participate; the fact that participation was voluntory; confidentiality and anonymity issues; and, the right to withdraw without repercussions. Students desiring to take part in any one of the three phases of the study were asked to return their signed consent and assent forms to their respective classroom teachers within one week. Parents or legal guardians were also asked to sign the consent forms and adolescents were asked to sign the assent forms. Those who did not return the sign assent and consent forms, within one week, were excluded from the study.

Sample and settings: Selection criteria for subjects, in all three phases of the study, consisted of being a 7th – 9th grade Thai student from metropolitan Bangkok, central, northern, northeastern, and southern regional areas of Thailand, enrolled in purposively selected schools under the direction of the Office of the Commission of Basic Education. Schools were used as data collection sites, for both the elicitation study and actual study, were the same ten schools which consisted of six urban schools (one from each of the four regions and plus two from metropolitan Bangkok), and four rural schools (one from each of the four regions). For the pilot study, ten schools within the same five geographical areas used for the elicitation study and the actual study, were purposively selected. To prevent cross-contamination of data between the pilot test and the actual study, the schools used in the pilot test were not the same as in the actual study.

For the first phase: the elicitation study, 100 students (10 per school) were purposively selected to participate in focus group interviews. These students were not involved or enrolled in any other parts of the study. Finally, a total of 102 students (25 seventh graders, 42 eighth graders and 35 ninth graders) willing to participate in this part of study. They included 65 (63.7%) from urban area and 37 (36.3%) from rural area, 58 (56.9%) females and 44 (43.1%) males.

For the second phase: the pilot study, 651 students (64.1% from urban area; 35.9% from rural area) were purposively selected. Of those students, 651 (161 seventh graders, 268 eighth graders, and 222 ninth graders) agreed to be in this phase of the study. They included 346 (53.1%) females and 305(46.9%) males.

Challenges of the Modern World - Contemporary Economy and Globalization

For the third phase: the actual study, 900 students (90 per school), who had not participate in any other phases of the study, were purposively selected. A total of 677 (response rate = 75.2%), seventh grade (n=161; 23.8%), eighth grade (n=268; 39.6%) and ninth grade (n=222; 32.8%). 417 students (61.6%) came from urban area and 234 students (34.6%) came from rural area. They ranged in age from 12 to 16 years of age (mean=13.7 yrs.) and, most of them had a grade point average below 3.0 (n=354; 52.3%) on a 4.0 scale. Most of them were Buddhist (n=639; 94.4%) and female (n=371; 54.8%), came from a family with a monthly income less than 20,000 baht / $666 USD (n=448; 66.2%). Most of their mothers (n=361; 53.3%) and fathers (n=320; 47.3%) had received 6 years or less of formal education.

4   POCEDURE

On the first phase: the elicitation study: The Adolescent Helmet Use Assessment Questionnaire (AHUAQ) was developed from the concepts of the Theory of Planned Behavior, by using data obtained from focus group interviews. Each 60-90 minute focus group was held at ten study-site schools and audio-taped. The focus groups included 9-11 students who responded to open-ended questions which developed by researcher regarding the adolescents' attitudes to helmet use, subjective norms, perceived behavioral control and intention to use helmet during motorcycle riding. Categories and examples of the open-ended questions included: attitudes to helmet use, ("What are the benefits you will have if you use helmet during motorcycle riding?"); subjective norms ("Who are the significant persons effecting your helmet use behavior during motorcycle riding over the next 30 days?"); perceived behavioral control ("What will drive you to use helmet during motorcycle riding over the next 30 days?"); and, intention ("Do you intent to use helmet during motorcycle riding over the next 30 days?").

Content analysis was used to category the data that obtained from the focus group interviews, and also literature review. Then the first draft of the AHUAQ was developed. It consisted of 5-parts (a total of 42 items) that assessed each adolescent's: attitudes toward helmet use (17 items); subjective norms (9 items); perceived behavioral control (14 items); intent to use helmet (1 items); and helmet use behavior (1 items). Findings from the focus group interviews revealed the importance of measuring, via two categories (supportive and prohibitive), the beliefs (subjective norms) of the relevant referent both individuals and groups (i.e. father, mother, parents, cousins, traffic polices, friends, and teachers) that influenced helmet use behavior during motorcycle riding of adolescents.

The draft of the AHUAQ was reviewed by a panel of experts on pediatric nursing to assess the content validity of the instrument. Suggestions were made to modify the language of the instrument in order to make more appropriate to use with adolescents. The instrument was refined and returned to the experts twice more, after they agreed on the final version which remained a 5-part, 42-item questionnaire that was used to assess each adolescent's: attitudes toward helmet use (17items); subjective norms (9 items); perceived behavioral control (14 items); intent to use helmet (1 item); and, helmet use behavior (1 item).

The second phase: the pilot study: The final version of the AHUAQ was pilot tested with 651 subjects (161 seventh graders, 268 eighth graders, and 222 ninth graders) who were not involved in any other parts of the study. The AHUAQ and a demographic data sheet were administered to the students in their respective classrooms. Instructions regarding how to complete the questionaires were provided. No identifying marks were permitted on questionaires. Results of the pilot test of the AHUAQ showed a good internal consistency of

attitudes toward helmet use (α=.86), subjective norms (α=.92); and, perceived behavioral control (α=0.85). Exploratory factor analysis was used to examine the construct validity of the final version of the AHUAQ, and the pilot study suggested the AHUAQ was valid and reliable. Therefore, no changes were made in the questionaires in the final phase of the study.

The final/actual phase of the study: this phase, 677 students from ten selected schools were administered two questionnaires (Demographic Data Questionnaire and AHUAQ) in their respective classrooms. Students were instructed how to; complete the questionnaire; be honest in their responses; place the completed questionnaire in the provided envelopes. The students took about 20-30 minutes to complete all of the questionnaires.

Instruments: The instruments of this study consisted of 1) <u>Demographic Data Questionnaire (DDQ)</u>, and 2) the <u>Adolescent Helmet Use Assessment Questionnaire (AHUAQ)</u>.

<u>Demographic Data Questionnaire (DDQ)</u> contained 10 items to obtain information regarding each subject's such as the regional area of residence, name of school, grade level, age, gender, grade point average, religion, mother's and father's level of education, and monthly family income.

<u>Adolescent Helmet Use Assessment Questionnaire (AHUAQ)</u> consisted of five parts: 1) attitude toward helmet use, 2) subjective norms influencing helmet use /non-helmet use behavior, 3) perceived behavioral control, 4)intention to helmet use, and 5) helmet use behavior.

Attitude toward helmet use: Attitude toward helmet use was measured by 17 parallel items that assessed each subject's beliefs about the likely of helmet use behavior and evaluation of these outcomes. The belief items addressed each respondent's ideas about helmet use (i.e. "Helmet use makes me lose my hair's shape.") Possible responses for the belief items included 1="strongly disagree" to 5="strongly agree". For the parallel outcome evaluation items, statements such as "Lose my hair's shape is _____" required the provision of words, ranging from 1= "very bad" to 5= "very good," to complete the statement. The total attitude score was calculated by multiplying each belief score by its parallel outcome evaluation score, summing the multiplied scores across items and dividing by 17. Possible scores ranged from 1 to 25, with higher scores indicating a more favorable attitude toward helmet use behavior during motorcycle riding.

Subjective norms influencing helmet use /non-helmet use behavior: Supportive and prohibitive prohibitive subjective norms were assessed by way of 9 items. An example of a supportive norm, with respect to a referent person, was: "If I use helmet during motorcycle riding, traffic polices will be _____". An example of a parallel prohibitive norm item was: "If I do not use helmet during motorcycle riding, traffic polices will be _____". Possible responses to both the supportive and prohibitive norm items were 1 = "very unsupportive" to 5 = "very supportive." The total subjective norm score was calculated by multiplying the score for each supportive norm item by the score for its parallel prohibitive norm item, summing the multiplied score across items and dividing by 9. The Possible range of total scores for subjective norms (supportive and prohibitive) was 1 to 25. A high score suggested high perceived social norms in favor of, or against, helmet use behavior.

Perceived Behavioral Control (PBC): Perceived behavioral control was measured by 14 items that examined control belief strength and control belief power that influenced (i.e. facilitated or impeded) helmet use behavior during motorcycle riding. An example of a control belief strength items was: "It is _____ to use helmet during motorcycle riding when I am in hurry." Possible responses to control belief strength items were 1 = "much more difficult" to 5 = "much easier." An example of a parallel control belief power item was: "The likelihood that I will be in hurry within the next 30 days is _____." Possible responses to control belief power items were 1 = "most unlikely" to 5 = "most likely." The total PBC score, which could range from 1 to 25, was calculated by multiplying the score for each control belief strength item by the score of its parallel control belief power item, summing the multiplied scores across items and dividing by 14. High PCB scores reflected a high level of control belief over helmet use behavior.

Intention to use helmet : Intention to use helmet during motorcycle riding was measured with 1 item ("I expect I will use helmet during motorcycle riding in the next 30 days) which had possible responses of 1 = "definitely will not use helmet" to 5 = "definitely will use helmet." A high responses score suggested a high intention to helmet use during motorcycle riding within the next 30 days.

Helmet use behavior: Helmet use behavior was measured by one self-report item that requested, over the last 30 days, the number of helmet use during motorcycle riding.

The internal consistencies of the various parts of the AHUAQ, for the final phase of data gathering (actual study), were found to be similar to those identified in the pilot study. They included: attitude toward use helmet (α=.86), subjective norm (α =.92), and perceived behavioral control(α =.85).

Data analysis: Descriptive statistics were used to analyze the demographic data and item responses to the AHUAQ. Hierarchical multiple regression analysis was conducted to: identify the best predictors (attitude toward use helmet, subjective norm, and perceived behavioral control) of intention to use helmet during motorcycle riding within the next 30 days; and, identify the best predictors (intention, attitude toward use helmet, subjective norm, and perceived behavioral control) of helmet use behavior during motorcycle riding over the past 30 days.

5   RESULTS
Descriptive statistics: Most of subjects had the experience of motorcycle riding include both as riders and as passengers (83.2%). Results also revealed only 29.1% of the subjects used helmets during motorcycle riding within the previous month. Descriptive statistics of the variables (attitudes, subjective norms, perceived behavioral control. Intention, and helmet use behavior) are shown in Table1.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Attitude, subjective norm, perceived behavioral control scores and intention to helmet use within the next 30 days (n=677)

Variables	Range of Scores		M (std. dev.)
Attitudes	1.00	22.00	5.61(2.62)
Subjective norms	1.00	15.00	3.42(2.48)
Perceived Behavioral Control	1.00	13.00	4.30(2.11)
Intention to helmet use within 30 days	1.00	5.00	1.58(0.88)

Hierarchical multiple regression analysis: Attitudes, subjective norms, and perceived behavioral control were entered into the first hierarchical multiple regression model. Interesting, only subjective norms explained 22% of variance in their intention to use helmet during motorcycle riding within the next 30 days(See Table 2).

Table 2: Predictors of helmet use intention within the next 30 days (n=677)

Predictors	b	SE	β	t	P
Attitude	-1.693	.001	-.009	-.242	.809
Subjective norm	9.554	.001	.480	13.527	.000
Perceived Behavioral Control	-1.037	.001	-.006	-.152	.880
Constant	2.471	.159	-	15.568	.000

R= .48 ; R^2=.23 ; R^2_{adj}=.22 ; $F_{df4,676}$=65.97

The second hierarchical multiple regression model attitude, subjective norm, perceived behavioral control, and intention to use helmet during motorcycle riding within the next 30 days, were entered. It demonstrated the explanatory power of the TPB, in that social norms, perceived behavioral controls, and intention to use helmet explained only 6% of the variance of their helmet use behavior during motorcycle riding over the past 30 days(See Table 3).

Table 3: Predictors of helmet use behavior over the last 30 days (n=677)

Predictors	b	SE	β	t	P
Attitudes	-4.071	.000	-.048	-1.129	.259
Subjective norms	1.491	.000	.160	3.631	.000
Perceived Behavioral Control	-7.114	.000	-.084	-2.017	.044
Intention to use helmet	5.931	.020	.127	2.985	.003
Constant	1.011	.095		10.597	.000

R= .25 ; R^2=.06 ; R^2_{adj}=.06 ; $F_{df4,676}$=10.77

6 DISCUSSION AND RECOMMENDATIONS FOR FUTURE RESEARCH

Results of this study revealed that 83.2% of the subjects had motorcycle riders and passengers experiences. Only 29.1% used helmets during motorcycle riding within the previous month, despite the Royal Thai government introduced a law that required all motorcycle riders and passengers to wear helmets since 1992, which is consistent with results reported in the prior research (Germeni, Lionis, Davou and Petridou, 2009, pp. 19–23; Pickett et al., 2005). Understanding reasons for non-helmet use and non-compliance in motorcycle helmet use among adolescent need to explore.

Challenges of the Modern World - Contemporary Economy and Globalization

Results of the study also demonstrated the explanatory power of TPB, in that social norm, perceived behavioral control, and intention to use helmet explained only 6% of variance of their helmet use behavior over the last 30 days. This may be the result of under reporting of helmet use behavior by the adolescents, since helmet use is not considered an acceptable cultural behavior among young Thais. In addition, the fact that intention to use helmet was limited to the next 30 days may have been too short of a time frame to adequately capture the adolescents' full intent to use helmet.

The regression results failed to show an influence of attitudes toward helmet use on both intention to use helmet and helmet use behavior among Thai adolescents. However, it's very interesting, subjective norms explained 22% of variance in their intention to use helmet during motorcycle riding within the next 30 days. The supportive effect of significant persons on intention to use helmet was demonstrated. Although prior research has revealed youth intention to use helmet is predicted by their attitudes, their perceived behavioral control and, to a lesser degree, subjective norm, the effect of significant persons on predicting helmet use behavior was demonstrated in this study(eg,"most of the people who are important to me think that I should not ride without a helmet". Therefore, the effects of significant persons of adolescents such as parents, peer groups, cousins, siblings, teachers, traffic polices, and themselves needs further exploration in order to develop strategies to increase Thai adolescent helmet use behavior.

Since this study examined only variables within the TPB, other variables (i.e. family relationship, and self esteem) that may affect adolescents' intention to use helmet need to be examined. It also is important to recognize the role of subjective norms is supporting helmet use among adolescents. Thus, investigations regarding family interventions that focus on assisting families to foster subjective norms to increase intention to use helmet during motorcycle riding and develop perceived behavioral control are indicated.

Given that familial helmet use should be support or promote to prevent motorcycle accident, parents should be encouraged to become actively involved in monitoring their children's' activities especially helmet use during motorcycle riding. In addition, school-based intervention programs that support peer and teachers involvement in the formation of realistic subjective norms and attitudes need to be encouraged for adolescent helmet use behavior.

7   CONCLUSION
The results shown the important of social influence adolescents' intention to use helmet which has been assessed by social norm / subjective norms of the TPB. Adolescents' elaborative thoughts on subjective norms are perceptions on whether they are expected by their friends/ peer groups, family / cousins and the society to perform the recommended behavior. Thus, strategies to increase Thai adolescent helmet use behavior/ helmet promotion should related to foster subjective norms and develop perceived behavioral control.

8   LIMITATIONS
Like all studies, this research has limitations. The adolescent subjects came from ten select schools in Thailand, thus generalizability of the findings across Thailand is somewhat limited. In addition, since only Thai students were studied, applicability of the findings to other cultural settings is limited. In addition, the results may have been influenced by limitations of the cross-sectional design.

director@jjzmaj.edu.rs

ABSTRACT
The educational system is one of the most important systems in any society. In a long term, well-organized educational system provides highly educated population. The educational structure of the population is a foundation for further growth and development of economy and through system of lifelong learning and permanent training of employees ensures achievement of planned growth goals. For these reasons, the state is vitally interested to create initial conditions for high quality education of the population through allocation of significant amount of budgetary resources. The degree of spending for education of gross domestic product is the indicator of state's interest for implementation of qualitative educational policy. In this regard, the use of the budgetary resources in democratic states is characterized with high level of transparency and simplicity of financial reporting in order to satisfy different needs of information users. The managament of educational institutions through last twenty years there has been recognized a tendency for introduction of elements of desicion making specific for private sector. The introducton of the principles of market thinking in the educational sector requires significant changes in all aspects of educational activities. For these reasons, in changed conditions of functioning of society and state, the educational institutions as budgetary users are faced with rising needs for reforming of accounting and managament. New public managament is reformed concept of budgetary institutions managament, linking budgetary accounting and information support for desicion making process. In this paper, the authors stress the characteristics of New public managament strategy, the role of educational institutions managament in implementation of New public managament strategy and basic features, areas and development of budgetary accounting in educational institutions as significant part of implementation of New public managament, with special regard on the situation in Republic of Serbia.

Keywords: *Budgetary accounting, Decision making, Educational institutions, Financial reporting, Managament, New public management*

1 INTRODUCTION
The degree of public sector development significantly affects the quality of services that public sector provides to citizens, private sector and other interested users of these services. The public sector organized on market principles is designed according to the needs od services users (consumers). All public sector activities, during last two decades, are imposed to strong waves of reform. In these conditions, educational activity has special treatment because of its long-term consequences in development of society and state. The educational structure of population is fundamental for further growth and development of economy and through lifelong learning system provides permanent employees training and achievement of planned growth goals. The costs of educational activities financing and their part in gross

domestic product are among the most important issues for the funcioning of society and state. The system of financing is affected by correct overview of transferred and spent budgetary money of various governmental levels. The accounting provides, through collection, recording and processing of datas, insight in all business transactions of companies and educational institutions.

The evolution of various areas of accounting is the result of specific activities of va-rious sectors of economy. For budgetary users, there is budgetary accounting as a specific form of accounting. In educational institutions, budgetary accounting is an instrument for overviewing the scope of using budgetary resources for financing of educational activities. It is necessary to consider not only the basic principles of budgetary accounting, but also the fundamental directions of public administration reform, in order to improve its quality related to invested budgetary money. In this regard, it is emphasized the impor-tance of New public management for budgatery organizations.

New public management is concept of budgetary institutions management, that links budgetary accounting and information support to decision making process. The educational institutions as budgetary users are characterized with certain specific features related to management, financing and results presentation to their superior institutions. The ma-nagement of educational institutions requires multidisciplinary approach and knowledge of different aspects of educational activities: educational process, normative and regulatory processes, financial and accounting processes, psychological and pedagogical processes, human resources management and managerial approach to all aspects of educational activities. All this causes the specific way of implementation of New public management in educational institutions.

In this paper, the authors present the characteristics of New public management strategy in public sector reforming, the role of management in implementation of principles of New public management in educational institutions, the experiences of implementation of New public management strategy in public sector reforms in the Republic of Serbia and current tendencies in budgetary accounting of educational institutions.

2   THE CHARACTERISTICS OF NEW PUBLIC MANAGAMENT STRATEGY IN PUBLIC SECTOR REFORM

In the field of public administration during last twenty years are defined directions which have improved the quality of comprihensive monitoring of business activities and financial reporting of public sector institutions that are budgetary users. The area of New public management is emphasized as a special form of reforming approach to budgetary institutions management. This concept of public administration management is common name for series of public sector reforms, which are performing in the majority of OECD countries, developing as well as transition countries.

"The main goal of this type of administrative reforms is strategic, tactical and operational formulation of planning, organizing, directing, controlling and coordinating the activities of public administration and public sector in general" (Sevic, 2002, p. 81). The introduction of New public management has a goal to reduce public spending, and its share in gross domestic product. It is based on "cost-benefit analysis, rising role of public managers and reducing hierarchy in public administration" (Sevic, 2002, p. 81). Essentially, reform reduces the number of civil servants (from 28.6% to 20%), and leads to privatization of some parts of

public sector (Separovic-Perko, 2002, p. 41). "According to OECD, the basic characteristics of New public managament are: greater attention on results and rising value of money, reduction of authority and increasing of flexibility, responibility and control, client and service orientation, higher capacity for strategies and policies of development and introduction of competition and other market elements" (Introduction to IPSAS in the public sector in Serbia, 2011, p. 43).

The public management is, since origins, present in the United States with strong stress on efficiency and effectivness, and ex of state administration and public sector-i.e.expressed through results and effects. The concept of New public management is also present in public administration in Australia, New Zealand, the United States and the United Kingdom. As a pioneer in introducing of New public management was Australia, in fact its province New South Wales, allowing all interested researchers insight into advantages and disadvantages of New public management. In case study "The Accrual Basis of Accounting in Public Sector: A Case Study of New South Wales" by Mark Christensen (2003, p. 1) has been pointed out on significant connection between the accrual basis of budgetary accounting and implementation of the principles of New public management. In fact, the reform processes are closely associated with introduction of accrual basis of budgetary accounting. These processes also requires the existence of dominant role of accrual basis of budgetary accounting in implementation of the principles of New public management. On the other hand, especialy fast implementation of reform goals has acheved the Great Britain, during the reign of Margaret Thatcher. Thanks to successful reform of public administration, British model has been promoted as standard model, approved by the IMF and the World Bank.

According to British model, New public management has following features: decentralization of functions through formation of Agency with highly qualified professional managers, increase of public sector flexibility, results measurement, control of activities, responsibility, introduction of human resources management, IT optimization, and development of competence and selection, quality introduction in regulative processes, introduction of principles of responsibility.

In this sense, New public management allows monitoring of public servants activities. The budgetary users are, through applying the principles of New public management, in a position of permanent assessment of efficiency, effectiveness and economic allocation of budgetary money.

The public sector reforms can be seen through four models: market model, participatory model, flexible model, and deregulatory model (Trbovic, Djukanovic and Knezevic, 2010, p. 61). The market model is based on application of the principles of privatization of some parts of public sector and elements of decentralization of public sector management. The participatory model involves changes in budgetary users organization and service quality managament. The flexible model is based on team formation and financing of particular segments of budgetary users activities through projects. The deregulatory model of public sector reform refers is based on reducing of regulation impact and greater freedom of action of public managers and rising initiative in budgetary users activities.

The budgetary accounting is one of fundamental elements in application of New public management and important in reform of public sector. Therefore, it is necessary to be familiar with basic postulates of budgetary accounting and its role in informing of public managers on

operations of budgetary users. Cash basis of budgetary accounting is traditionally accepted among OECD members to cover business operations of public sector for preparation of budget, while accrual basis is used for preparation of financial statements. "The dual approach to the most important instruments of public sector management inherently contains significant risk, because different approach to budgeting and reporting causes difficulties in accounting techniques operations overviewing" (Blondal, 2003, p. 1). The accrual method or accrual based accounting has rising importance in budgetary accounting. It is widely accepted that market thinking lays the foundation of qualitative allocation of budgetary money in developed states and economies and such idea has caused need for accrual basis implementation in accounting records. The states that have adopted accrual based accounting, generaly speaking, previously have implemented public sector reform, especially in government. These reforms were intended to increase managerial responsibility for outputs and environment and reduce the control over input values.

The process of transition to accrual basis of a long-term project. It is necessary, acording to numerous international experiences, eight to ten years to achieve completee implementation of these reforms. The prerequisite for proper implementation of the strategies of New public managament is transformation of budgetary accounting from cash to accrual basis. The association of accounting and managament is obvious in modern economy and budgetary institutions. Therefore, the accrual basis as a tool that provides results based on market priciples, has enough quality for managament of budgetary resources. It has been particularly stressed the necessity to implement the managerial accounting concept in educational institutions and overviewing the relations between managerila accounting and principles of New public managament. Association of accounting and management functions is evident in the modern business environment, both in the economy and the budget organizations.The accrual accounting basis, which provides a basis to establish the results of operations in accordance with market principles, stated as the quality, management of budget funds. Particularly stressed the need for immediate implementation of management accounting concepts in educational institutions, and understanding the links between management accounting and the principles of New Public Management.

In this sense, it is necessary to consider the role of management and especially its role in educational institutions, as well as the possibilities of implementation of New public managament strategy in educational institutions of the Republic of Serbia.

3 THE ROLE OF EDUCATIONAL INSTITUTIONS MANAGAMENT IN IMPLEMENTATION OF NEW PUBLIC MANAGEMENTS STRATEGY

The public managers have originally appeared in United Kingdom in early eighties of the twentieth century as leaders of public management reform. In order to achieve goals of New public managament, public managers have became the executives in education or health service. It has been pointed out the education of managers, widening of all kinds of knowledges they possessed and applied in everyday work. "The public managers in their activities usually use special type of analysis, so called goals management (managament by objectives), cost-benefit analysis, total quality management (TQM), marketing testing and reengineering of administrative organizations " (Trbovic, Djukanovic and Knezevic, 2010, p. 62).

The reporting as an instrument of business performances evaluation is significant for parts as well as for general budgetary organization in educational system. The process of conducting

business and financial activities, or systematic managerial control, is a set of managerial activities focused on effective and efficient use of available budgetary resources in order to achieve objectives of the budgetary users in education. The systematic managerial control is consisted of folowing managerial activities: planning, organization, executive control, communication and motivation. The managerial control is based on decentralization of managament, which means that, through delegation of authority, decision-making is transferred from the top levels of educational system to the lower organization levels or lower levels of managerial structure. According to legislation in the Republic of Serbia (Official Gazette No.72/2009, 52/2011) medium educational management, such as school committees, or bords in higher schools, has considerable authority. These authorities are related to monitoring the legality of educational institutions activities and legal decisions implementation in all aspects of work (educational, financial, normative) of educational institution. In the case of introducing of New public management, medium managers impact will be strengthen, through diversification of decision-making, made on top governments level. This means that lower management has possibility to create and apply any decision with its jurisdiction. Such managerial approach requires creation of adequate performances measurement system, which allows coordinated choices, planning and control types and amounts of systems feutures. Therefore, special role of public managers – educational institutions executives – emerges during implementation of managerial control.

Although public schools and universities are primary users of budgetary resources, it is necessary, through appropriate legislation, to enforce their market orientation. It will allow losing of monopol position, strengthening of competitiveness, increasing of quality, and directing of budgetary resources to those educational segments that are of the greatest interest for state. Following their specific activities an organizational features, for users of budgetary money are applicable two models of organization: functional model and divisional model. Functional model is based on division of complete working process to managament and administration, supply service, teaching process, technical service and professional assistance service. Divisional model requires complete educational service and certain degree of self-managament. New public managament allows educational institutions to create revenue, expenditure, income and profit centers. Market-oriented approach to educational institutions managament focusses on internal sheets of incomes and expenditures, trying to determine internal result of business activities. That result has impact on alternative decision-making of different business segments in educational institutions.

The role of public managers in functional as well as in divisional organization must be on a higher level than is now. Namely, it is necessary to provide flexibility in public managers decision-making of public managers, and to implement principles of New public management, especially those related to managerial skills and professional training. In the case of limited budgetary resources it is important to know how to create other non-budgetary incomes, which requires managerial knowledge, human resources management, accounting, managerial accounting, legal, professional and internal regulative of budgetary organizations. In literature are describe many examples of advantages and disadvantages of implementation of New public managements principless.

4 THE EXPIRIENCES IN APPLYING OF NEW PUBLIC MANAGAMENT'S PRINCIPLESS IN REFORM OF THE CIVIL SERVICE

The application of New public management principless is particularly evident in the countries of Anglo-Saxon tradition, and as leaders in implementation of these principless in public

reform are emphasized British Prime Minister Margaret Thatcher and U.S. President Ronald Reagan. Australia and New Zealand have started to implement New public management on local level and during its application have improved some segments of governement. The modernization of public sector in Great Britain has been carried out through independent agencies, which were market-oriented on the principless of competitivness and without states supervision and control. The broadest reforms were in relations between local and central government and in managament of health and educational institutions. The principless adopted in public sector reform in Great Britain have been distinguished as to be recommended to other to other countries. The reforms in the United States have strenghtened enterpreuniral spirit in public sector, through its professionalization and reorganization. New public management has achivied greatest success in those countries with highly developed institutions, strong sense of market evaluation of all spheres of social and governmental activities and with unsignificant opposition to reforming process.

The problems in application of New public managements principless appear when positive experiences of developed countries are faced with situation in less developed countries. Therefore, it is interesting to examine the expirences of authors with direct involvement in the process of implementation of New public management principless. In a study of Christopher Polit, Professor of Public Management at Erasmus University in Rotterdam, Netherlands, entitled: "The Reforms of Public Management: Relevant Knowledges and International Experiences" (Pollitt, 2003, p. 123) is clearly said: "experiences should excange and not blindely accept foreign reform models as sacrosanct and unmistakebly." In other words, it is necessary to follow self-defined way in reforming public sector. Each state has its own peculiarities and characteristics, either national mentality, tradition or ideas of reforming necessity, so it's illusion to expect that translation from English of some definitions and terms will allow wide acceptance in public sector and among population. Therefore, according to Professor Pollitt (Pollitt, 2003, p. 123), following preconditions are necessary to accept reform model already experienced in other countres: "technology of reform must be relatively simple and understandable, applied methodology must be simple and well understandable, short-term knowledge transfer, voluntary based implementation of reforms, simple relations between main acters in reforming process, significance of common understanding of defined terms and definitions in public sector reform."

The managerial technologies that provide security in the reforming process of public sector are: accrual based accounting, business processing, total quality management, formation of independent organizations and impact of analysis on decision-making. Essentially, reforming necessity must be founded on national consensus that higher level of public sector's services make everyday life easier, rather than be a result influenced by pressure of any national or international organization.

The reforming process in the Republic of Serbia has been implemented for several years, with various success. Conference Report on Public Administration Reform (Conference Report on Public Adminstration, 2009, p. 45) are stressed some objectives of this reform: decentralization, control mechanism strengthening, horizontal coordination of public politics, professionalization and depolitization, modernization and development of e-government, rationalization of emoloyees number and expenditures of public administration. Therefore, the goals are defined and conditions are prepared for implementation of reforms, and according to Report it is necessary to provide additional funds for further financing of the reform.

The main features of reforming process in educational system of Serbia are: transparency, informativeness, advisability, competence and qualification recognition, increasing quality through acquisition of modern equipment and standardization of space in which the educational process in conducted. The steps in financial reform of educational system, according to Ministry of Education of the Republic of Serbia are following: "Field investigation and control of wages, identification and preparation of employees lists, education institutions accreditation and teachers licencing, rationalization of primary and secondary education institutions, strengthening of local government in process of decentralization of educational system, encouraging social dialogue between Ministry of Education and representative workers unions, establishing coordination with other Ministries in the government, establishing cooperation with international institutions" (Journal Economics of Transformation, 2005, p. 6).

Regarding the above, the first steps are taken, such as accreditation of higher educational institutions or transfer of payrolls from schools into Ministry of Finance - Treasury. In other aspects of reform in education, there are visible positive results with defined deadlines for final implementation. Respecting specific local features and intetion to harmonize and enforce E.U. legislation, the Ministry of Education has prepared The Educational Strategy until 2020. The process of managerial reforming in educational system is unstoppable. Sufficient financial resources are fundamental precondition for complete implementation of these reforms, which in one basic governmental tasks in the future. The need for greater part of gross domestic product dedicated to education is imperative and through interconection between New public management and expected educational expenditures can be seen the importance of its implementation in educational institutions in the Republic of Serbia.

5   CONCLUSION

The modern state and society are faced with limited budgetary resources, caused by contemporary economic and financial crisis, and that situation implies the necessity of reforming of public administration. The emergence of public managers and public management has increased the level of budgetary resources managament, leading to further implementation of the principles of public management and theoretical explication of New public management principless, more or less applicable in praxis. All budgetary users are faced with significantly reduced amount of financial resources. This is the main reason for introducing competition in the public services market and increasing preseance of private sector in activities previosly financed exclusively by budgetary resources (education, health service, social welfare, etc.).

New public management is set of comprehensive reforming steps, that touch all segments of society. Its source are developed states with profoundly developed institutions, such as Great Britain, the United States, Australia, New Zealand, the Netherlands. Because of rising budgetary expenses, these countries have seen necessity to relieve budget through partial privatization of public enterprises. The experiences in implementation of New public management are various, but it is obvious that privatized public enterprises are not suffcently effecient and profitable. In existing studies are dominant positive characteristics of reforming and implementation of New public management, among them is increasing quality of given services. Equally significant was introduction of the principles of managerial accounting as fundamental basis for qualitative financial reporting in public sector.

It is widely accepted that education has profound importance in any society. The most important achievements of implementation of New public management are: professionalization of management, training of managers, multidisciplinary approach to management in educational institutions. The implementation of New public management principless in the Republic of Serbia will be completed in the future. As preconditions for its completion are introduction of accrual based accounting in public sector and applying of managerial accounting principless. It is also important to further professional knowledges of public managers – executeves in educational institution. Because of limited budgetary resources for financing education in Serbia, application of economic principless such as effectivness or efficiency and responsibility for results will improve the quality of work in educational system. The final goal of reforming process, through implementation of New public management principless and strategies, is clarified system of result evaluation. Therefore, it is necessary to separate responsibility of different levels of management in educational institutions, from Ministry of Education, through school boards, to school executives.

ABSTRACT
Malawi and Zambia share not only a common border but also many of the same health problems. Both countries have adopted the Millennium Development Goals (MDGs) of the United Nations as targets for development including reducing the maternal mortality ratio; reducing the mortality rate among children under the age of five years; improving hygiene and access to safe water, and improving nutrition. In 2010–2012, the Department of Population Health Science and the School of Education at Virginia Tech, through a Department of State (Bureau of Educational and Cultural Affairs) grant partnered with NGOs in Malawi and Zambia and sponsored twenty eight (n=28) health professionals (Global Health Fellows) from both countries to participate in a four week exchange program. The Fellows spent three weeks at Virginia Tech and one week in Washington, DC. The purpose of this project was twofold: first, to engage professionals at the grassroots level who are actively involved in health care for marginalized populations in Malawi and Zambia, and second, to

develop synergy among community health and media professionals from Malawi, Zambia, and the United States that focused on health strategies to educate women and children in reproductive health, nutrition, hygiene, and sanitation. While in the United States participants learned American public health best practices used to address similar health problems. In addition they spent one week working with a public health professional in an immersion experience. This culminated in 28 different action plans that were implemented when they returned to their country. Action plans included addressing issues associated with women's health, community capacity, reducing the spread of HIV, and health literacy. An American team of public health professionals visited each participant 4 months after implementation of their action plan. Partnering with in country NGOs to select Global Health Fellows, learning American public health best practices, immersion experiences, action plans and follow-up were all successfully planned and implemented. This project represents a successful international partnership that led to important sustainable projects with the potential to impact public health capacity.

Keywords: *Best Practices, Global Health Fellows, International Partnerships, Millennium Development Goals, Public Health Capacity Building*

1   INTRODUCTION

Malawi and Zambia have many things in common. They have a common border, and they once were one country under the Federation of Rhodesia and Nyasaland from 1953 to 1963. The people near their borders share cultural norms and language. During the colonial period under the British rule, the development strategies were very similar, with the exception of the development of industry: in Zambia, the colonial power emphasized mining while in Malawi farming was the mainstay. Both countries have similar challenges regarding development. The majority of their people live in rural areas. Both countries face high levels of poverty with more than sixty percent of the population living on less than $2 per day (World Vision, 2010). In Zambia, one in five children is underweight and 46% of the population is undernourished. In Malawi, 53% of the people live below the poverty threshold, and 75% of secondary school aged children are either working or staying at home to care for their siblings instead of going to school. A chronic food crisis is a major cause of malnutrition and has increased the risk of diseases.

Both countries have adopted the Millennium Development Goals (MDGs) of the United Nations and targets for development. These goals are an embodiment of wider human concerns and issues which are intended to provide "people centered" measures of human progress. These goals are also intended to encourage and challenge national initiatives and strategies geared towards alleviating poverty and improving living standards of the "poorest of the poor" across many nations. At the United Nations forum in New York, heads of state and governments decided to focus on eight goals that touch upon the following: available income and food; education; gender equality; child mortality; maternal health; HIV/AIDS and major diseases; environmental sustainability; and global partnership (UNDP/Malawi, 2009). Both countries are committed to achieving the MDGs but have been constrained by insufficient resources and limited public health capacity. However, with regard to the MDGs relating to health, both Malawi and Zambia have been working on the following priorities:
  a)   Reducing the maternal mortality ratio;
  b)   Reducing the mortality rate among children under the age of five years;
  c)   Improving hygiene and access to safe water; and
  d)   Improving nutrition.

Many communities, particularly in rural areas, do not have easy access to public health information because of the severe shortage of professional staff in the health sectors of both countries as summarized in table 1.

Table 1: Statistics of physicians and nurses (World Health Organization, 2010)

Country	Number of physicians per 10,000 people	Number of nurses per 10,000 people
United Kingdom	23	128
United States	26	94
Malawi	<1	6
Zambia	1	7

According to World Health Organization, the recommended minimum number of health care professionals (physicians, nurses and mid-wives) required to provide key health care services that can meet the MDGs is 23 per population of 10,000. With an average density of seven professionals to 10,000 people, Malawi and Zambia are, therefore, far below the optimum number of health professionals. This human resource constraint has a serious impact on the two countries' capacities to implement effective and efficient strategies for reducing child mortality and improving maternal health in line with the MDGs, through for example, educating women in reproductive health, nutrition, hygiene and sanitation.

Faced with the overwhelming workloads and other constraints such as poor communication and transport infrastructure, limited health kits and inadequate supplies of electricity and safe water the health and social problems in Malawi and Zambia are exacerbated.

The purpose of this project was twofold: first, to engage professionals at the grassroots level who are actively involved in health care for marginalized populations in Malawi and Zambia, and second to develop synergy among community health and media professionals from Malawi , Zambia, and the United States that focused on health strategies to educate women and children in reproductive health, nutrition, hygiene, and sanitation

In February, 2010, funding was received from the United States Department of State (Bureau of Educational and Cultural Affairs) to develop an educational experience for professionals who are actively involved in health care for marginalized populations at the grassroots level such as public health officials, midwives, community leaders, activists, educators, NGO workers, and media specialists to:
1. Evaluate community health policies, practices, and processes focused on reproductive health, nutrition, hygiene and sanitation and identify those practices, policies, and process appropriate for their respective communities;
2. Develop sound, comprehensive community health strategies focused on improving health and wellness of women and children in disadvantaged urban and rural communities;
3. Gain an understanding of community health strategies, policies, practices, and processes that address the health and wellness of women and children in disadvantaged urban and rural communities in Zambia and Malawi.

Challenges of the Modern World - Contemporary Economy and Globalization

The impact of this project was the creation of international networking among professionals participating in the cultural exchange visited. Professionals from Malawi, Zambia, and the US, through this project, developed sustainable networks that facilitated exchange of challenges and best practices in the provision of public health services to the underserved communities.

Accomplishing the objectives of this project required partnering with in country NGOs, recruiting health and media professions in Malawi and Zambia, developing a four week educational experience based in the United States, and evaluating the project. Figure 1 highlights the relationship of the major activities involved in this program.

2   METHODS

2.1   Global Partnerships
The Department of Population Health Sciences and the School of Education at Virginia Tech partnered with the Malawi Health Equity Network in Lilongwe, Malawi and World Vision in Lusaka, Zambia. These NGOs assisted both in the recruitment of health and media professionals from Zambia and Malawi and coordinated experiences for the US teams follow up visits to projects in Zambia and Malawi.

Figure 1: Activites Involved in the Global Exchange

2.2   Recruiting Zambian and Malawian Health Professionals

Through a competitive process, 28 Zambians and Malawians from the health, education, and journalism sectors were selected for US exchanges (seven from each country in year one and year two). They were referred to as Global Health Fellows. The Malawi Health Equity Network and World Vision Zambia were instrumental in identifying in country applicants for

the program and conducting several rounds of interviews to yield a smaller group of candidates. Given that at least a portion of the projects centered on using radio and print media to disseminate information, the messages had the potential to reach millions of people. Participants provided a project report and project sites were evaluated by both the project directors and site visit teams.

2.3   Program Logistics

A program such as this one has many moving parts. The US Exchange involved seminars, discussions, on-site visits, internships, home stays, and cultural experiences. Each participant developed a project designed to increase the health literacy of women and children in urban and rural settings in Zambia and Malawi. After the interviewing and recruitment of health professionals, project directors worked with the United States Embassies in Malawi and Zambia to get immigration approval for participants. For the most part this went smoothly with much Embassy cooperation. Round trip airline flights and hotel accommodations were confirmed. American families who would host the participant for the third week were identified and recruited. The intention was to provide an opportunity for the participant to live with an American family and see how the family functions on a day-to-day basis.

Project directors also needed to critically reviewed the participants' background and interests so that a matching education program and immersion experience could be developed. Developing the educational and immersion experience was done in cooperation with faculty from Virginia Tech and community based health professionals. Draft copies of the program were shared with participants two months before their arrival to procure feedback to update and match their needs and interests with program content.

2.4   Educational Experience

Weeks 1 and 2: Seminars at Virginia Tech

Topics

- Environmental Health
- Epidemiology
- Health Education/Promotion
- Health Communication
- Health Care Systems
- Public Health Programming
- Public Health Program Evaluation
- Grant Writing
- Program Sustainability

Week 3 – Immersion Experience

40 Hour Placement (immersion experience) in

- New River Valley Health District
- Free Clinic of the New River Valley
- Child Health Investment Partnership

- Community Services Boards
- Roanoke County Prevention Council
- Television and Radio Stations

Week 4 – Washington, D.C.

- United States Department of State Conference
- Networking with Respective Embassies

Action Plans

Each participant developed an action plan for a health problem they wanted to address, mostly work related. Action plans were developed in consultation with content specialists from Weeks 1 and 2, the immersion experience preceptor, and faculty from the Department of Population Health Sciences. The format of the action plan consisted of a documentation of the health problem/issue, measurable objectives, intervention, resources needed to implement the intervention, evaluation plan and sustainability plan. Each participant developed a budget to implement their action plan and after the budget review they received $300 to implement the plan after budget review.

Examples of action plans can be seen in Table 2

Table 2: Examples of Action Plans

Action Plan Title	Country	Brief Description	Estimated Impact
Income Generating Activities by HIV Positive Mothers to Improve Nutrition	Zambia	Ten village groups of women and orphans planted gardens where none had existed before to provide for better nutrition and market for money	300 (10 women per village group and 30 orphans per group)
Health Literacy Programs in 40 Churches	Zambia	Volunteers trained in 40 churches who then serve as group facilitators to communicate messages on reproductive health	1,280 (80 volunteers trained; 3 workshops per church and average attendance of 20)
Community-Based Food Supplement Sustainability Program	Malawi	Building a goat house and purchasing goats to provide nourishment for children under 5.	100 children under 5 are receiving daily milk
Contraceptive Clinic	Malawi	Health communication messages focused on contraception	3,000 women
Promoting Behavior Change for Better Nutrition Using Radio	Malawi	Radio messages focused on health behaviors	10,000 Malawians

Challenges of the Modern World - Contemporary Economy and Globalization

Primary School Sanitation Project	Zambia	Training and sensitization on hygiene through skits and discussion including hand washing techniques	1,000 youth
Youth Sensitization on Malaria through Soccer Tournaments	Zambia	Young men are using malaria nets to fish with. To garner their support and understanding of the problem, soccer tournaments were organized which drew them to hear the messages and participate	100 young men and 10,000 spectators
Community Health Scorecard	Malawi	Comprehensive set of needs assessment activities to determine factors related to health status, community engagement, resources and responsiveness. Strategies are then developed to address the findings	500 villagers
Community Bicycle Ambulance	Malawi	Provides transport to health care (15 km away from village) for pregnant women and critically ill children. Access encourages women to deliver their baby in clinics where they can be HIV tested and treated.	3,000 villagers
Improving OVC Households Resilience Through Economic Strengthening in Lusaka	Zambia	Empowering village women who have been impacted by HIV/AIDS to economically strengthen their community through the building of a goat shelter and selling goat milk	5 village women and 25 children

2.5   Follow up Visits

Four months after the Global Health Fellows returned home two teams of American college faculty and medical professionals, most of whom had been involved in the educational program visited each project in Malawi and Zambia. Over a two week period one team visited Malawi and one team visited Zambia. Each team was prepared to both assist the Global Health Fellow with project related issues and evaluate the implementation and impact.

2.6   Project Evaluation

Each project was evaluated based on the evaluation framework in the individual action plan. In addition, the entire program was evaluated by each participant. In all cases the Global Health Fellows were successful in achieving the objectives in their action plans and the projects were felt to be sustainable.

3 PROGRAM EVALUATION

Participants were provided an opportunity to evaluate the overall program. An open ended survey was created and distributed toward the end of Week 4. Results of the evaluation were overwhelmingly positive. Examples of comments from participants concerning what they thought the US would be and what they found from their experience included:

Everything in America is big – large portions of food, sodas, cars

I thought all white people were not good to black people, but see that's not true

People not being friendly, but I found out that people are very friendly

I was surprised with the way people are concerned with life. Life is very fast as compared to Malawi, especially about time

What surprised me? Non-profit fundraising; more Christians than I thought; Virginia Tech is a big university (thought it would be small); thought people would be too reserved to speak but they are cheerful; thought students would be wild (less concerned for each other) but found they were courteous and humorous.

Unsafe, noisy, violent environment as portrayed in Hollywood movies, but we had a safe, violent free setup and no guards.

American people could not have any interest in visitors from Malawi, but many showed interest and wanted to know more of Malawi.

Thought there were no individuals who struggle to get health services, but I noted that there are people who are earning below federal poverty levels and cannot have insurance

My general perception about Americans was that they were arrogant, forceful, unkind as opposed to what we saw. People are a lot more kind and warm hearted.

4 CONCLUSION

The global exchange is a very meaningful way to promote learning about how to deal with health challenges involving social development. The learning was bi-directional.

Malawian/Zambian professionals learned about United States public health best practices. More specifically, they (1) learned how community health efforts work together to protect, promote, and improve the health of the community; (2) observed medical technologies that improve patient/client health; (3) applied networking and skills transfer opportunities to build problem-based community health teams that will continue in country; and (4) observed colleagues' attitudes towards "clients" and noting the impact of culture on the concept of care.

United States professionals who participated in the classroom/community based educational experience and/or supervised the immersion experience: learned how public health professionals work with limited resources in situations of great demand for health services; how others work in environments characterized by limited or lack of communication infrastructure, inadequate health facilities, and poor supply of water and electricity; encourage

networking and skills transfer opportunities; and observe colleagues' attitudes towards "clients" and noting the impact of culture on the concept of care Exposure to different cultural settings helped US participants appreciate cultural diversity and enhance their openness to different colleagues and clients in today's global village in which they practice their community health based professions.

Challenges of the Modern World - Contemporary Economy and Globalization

CONCEPTUAL RELATIONSHIPS BETWEEN TRADE AND TOURISM

Sanda Renko

University of Zagreb, Faculty of Economics and Business, Croatia
srenko@efzg.hr

ABSTRACT

As a very dynamic phenomenon, tourism comprises activities which attract tourists and meet their requirements. Moreover, tourism accelerates other related industries such as trade, the local food production, gastronomy, etc. This paper deals with the relationship between trade and tourism which is nowadays intensified due to an inadequate supply of tourism industry. Today, tourism cannot rely on agriculture and local food production, because there is an inadequate infrastructure to ensure long-term logistics efficiency and to carry out all activities involved in supply of tourism business entities. In such a situation, trade companies provide necessary logistical support for tourism industry. Moreover, wholesalers and retailers start to dictate types of goods, pricing conditions, etc. in tourism industry. In particular, the focus of this paper is on the relationships between Croatian trade and tourism. This relationships was explored from both trade and tourism perspective, and including customers' attitudes as well. Therefore, for the purpose of this paper, a three-phase research study, including a qualitative and a quantitative approach, was used: 1) the qualitative study among trade companies which intended to find out the level of cooperation between trade companies and hotels and restaurants; 2) the qualitative study on the group of hotels and restaurants, with the main goal to assess the quality of trade offerings; 3) quantitative study on the sample of tourists in order to find out the level of tourists' satisfaction with the Croatian hotels' and restaurants' offerings. The findings of the study confirm positive relationships between trade and tourism but study also found some areas for improvement.

Keywords: Croatia, Tourism, Trade

1 INTRODUCTION

Tourism industry has been identified as one of the most important sectors in the economics development. As an evolving sector, it has been defined as the sum of those industrial and commercial activities which produce goods and services, and mainly consumed by foreign visitors or domestic tourists (Hanafiah et al., 2011).

Heterogeneousness is the main characteristic of tourism industry. Many tourism developments are related to investment in other sectors of the economy (Costa and Ferrone, 1995) such as transport, food industry, trade, etc. World Tourism Organization points out its multiplier effect shown through the first round of tourists` expenditures on food, beverages, entertainment, clothing, gift and souvenirs, etc. Development planners point out great opportunity of tourism which, through the creation of backward linkages, can stimulate agriculture and local food production, industry and ancillary services (Torres, 2002). According to Assaker et al. (2011, p. 258), tourism's importance in a country's development has been well documented, and particular attention has been given to the relationship between trade and tourism. Their relationship is evident in many areas, such as: (1) in the increasingly importance of shopping as a travel activity and its significant contribution to the retail trade in tourist markets (Alegre and Cladera, 2012; Hu and Yu, 2007); (2) in the local production of goods and services (Hanafiah et al., 2011); (3) in the opportunities for the employment of local people (Azarya, 2004); (4) in the supply of tourism entities; (5) in providing logistical

support for tourism industry, etc. Trade is an intermediary whose purpose is to distribute products from producers to customers. Last decade we have been witnessing the increase of the range of services offered by trade entities and the extension of trade activities. Processes of concentration and integration transformed trade from a passive intermediary into an active market subject. Small producers often lack contacts and financial resources to carry out direct marketing, and therefore they rely on wholesalers and retailers as intermediaries and their superior efficiency in making goods widely available and accessible to target market (Kotler and Keller, 2006). However, we should bear in mind that trade comprises perform functions that are "visible" to customers and those that are involved in physical distribution and logistics. The fact is that shopping and gastronomy have been recognized as activities tourists often do while travelling (Cai et al., 2001), but they mostly rely on series of activities and companies that move products through on their journey from initial suppliers to tourism entities (hotels, restaurants, souvenirs shops, etc.). Zehner (2009, p. 332) points out tourism as a service-intensive industry that is dependent on the quality of customers' service experiences and their consequent assessments of satisfaction or dissatisfaction. Changing and more demanding tourists' requirements bring challenges among tourism practitioners and trade companies in how to better understand the tourists' shopping behaviour and capture their buying power (Yu and Littrell, 2005).

This paper addresses the relationship between trade and tourism in order to find out in which way they affect each other. In particular, the focus of this paper is on the relationships between Croatian trade and tourism, which was explored from both trade and tourism perspective, and including customers' attitudes as well. In other words, the purpose of the study was to find out whether trade companies provide necessary logistical support for Croatian tourism industry and positively affect tourists' level of satisfaction. As one of the most important industries in the Republic of Croatia (according to the figures from the Central Bureau of Statistics, in 2011 the whole trade share of GDP was 10 per cent, and it accounted for 16 per cent of labour force) trade should have greater importance in tourism offer than it has today. For example, there is no information about the number of stores, types of stores, official working hours, domestic offer in stores, etc., on web sites of tourist community. Croatian Chamber of Economy has been successfully taking the action „buy Croatian" in order to encourage citizens to buy products of Croatian origin, but there are no co-ordinated activities related to tourism industry.

In order to explore the relationships from both trade and tourism perspective, and including customers' attitudes as well, the research was guided by three research questions:
RQ1. What is the level of satisfaction of trade companies, operating on the Croatian market, with the cooperation between them and hotels and restaurants?
RQ2. Do Croatian tourism industry/companies consider high the quality of trade offerings?
RQ3. What is the level of tourists' satisfaction with the Croatian hotels' and restaurants' offerings?

Following this introduction, the paper undertakes a review of the relevant literature regarding trade and tourism. Then it explains a methodology and results of the qualitative study among tourism and trade entities, and the results of the quantitative study on the sample of tourists in three most important tourism areas in Croatia: the county of Primorje-Gorski kotar, the county of Split-Dalmatia and the county of Istria (which together accounted for 67.4 tourist nights in Croatia). The paper then discusses the limitations of the study and future research possibilities. The paper concludes with a summary of the major findings of the study.

2 LITERATURE REVIEW

Although there are many studies that highlighted the importance of tourism and trade, they mostly relate to peculiar components of both sectors. In such a way, trade was explored in the area of retailing, distributive trade, etc., while tourism was explored in the area of special interests of tourism, such as sport tourism, rural tourism, etc. There has been little academic investigation into the area of the relationships of tourism and trade, and positive and/or negative aspects associated with their relationships. Furthermore, poor quality of research has been a continual problem in tourism studies and most of the studies merely focus on tourist flows and receipts.

Blazevic (2007) analyzes tourism as the socio-cultural phenomenon and as the important part of the overall economic system focusing on its relationships with other economic subsystems. Gamage and King (1999) investigate economic effects of tourism spending and find out that the total impact of tourists expenditures are most evident in the wholesale and retail sector.

Comparing the initial and flow-on economic effects of tourism spending by two different types of tourists: migrants resident in Australia and Australians born either in Australia or in a country other than Sri Lanka, Gamage and King (1999) reveal that different expenditure priorities are evident between those groups: non-expatriate tourists were found to spend more on food and beverages with relatively higher flow-on effects, while expatriate expenditures focused on the retail and wholesale sector and on local transport with relatively lower flow-on effects. Babu and Henthorne (2007) investigate the possible impacts of the General Agreement on Trade in Services (GATS) for sustainable development of tourism, especially in the context of the third world.

Timothy and Butler (1995) examine the reasons for the rising number of Canadian tourists spending their holidays in the USA and found out shopping as one of their most enjoyable leisure-time activities. The authors point out that often tourists spend more money on shopping than other forms of entertainment. The same observation was expressed by Eccles and Costa (1996, p. 46) who suggest that the mega-mall concept is being replicated and we may soon witness people visiting a particular area simply for the shopping experience.

Thomas and Thomas (2006) examines how micro businesses within the locality (particularly, traders) responded to the changing attitude of the local authority with regard to tourism. They found out that there was little sense among local traders of how to get involved in shaping how tourism resources would be used, even though the local businesses were central to the delivery of the tourist experience. Renko et al. (2010) point out tourism industry as the possibility for promoting and selling local foodstuffs. Grgona (2002) suggests the necessity of tourism analysis as an activity which represents significant developmental chance for faster economic development of Croatian islands.

The tourism sector is one of the few service sectors showing concrete and quantified trading opportunities for all countries, regardless of level of development (Paton, 2003). Kulendran and Wilson (2000) have explained tourism demand by using variable such as income, tourism price, transportation costs, trade of goods and services. They analysed the direction of causality between different travel and (aggregate) trade categories for Australia and its four main trading partners. Such relationships between international trade and tourism, focusing on the effect that German tourism to Spain has on German imports of Spanish wine, was found

by Fischer and Gil-Alana (2006). Moreover, a positively correlated link between trade and tourism in Malaysia was observed (Hanafiah et al., 2011).

Sutalo et al. (2011) used input-output model and Tourism Satellite Account to assess the total, direct and indirect contribution of tourism demand to the Croatian economy. According to the figures from the Central Bureau of Statistics (www.mint.hr), in 2011 the tourism share of Croatian GDP was 14.4 per cent. Assaker et al. (2011) proposed the model demonstrating the causal relationships between the primary constituents of the tourism destination paradigm – the economy (measured by several variables, and trade volume among them), society, and the natural and infrastructural environments – and demand for tourism at that destination. Meng and Xu (2012) study provide better information and understanding of the factors influencing tourist shopping behaviour, and lead to improved planning, marketing and management of sales, expenditures and opportunities in the tourism and retail industries.

Related to tourism, several studies have shown the advantages of cooperation between entrepreneurs in different industries (Buhalis, 2000; Smeral, 1998). Zehner (2009, p. 342) identifies three forms of cooperation: (1) Horizontal cooperation among companies at the same level of production (for example, among hotels); (2) Vertical cooperation between companies at different production levels (for example, between tour operators and tourist agencies); (3) Diagonal (or lateral) cooperation among companies in different industries (for example, between tourism and agriculture, or between tourism and trade).

3   RESEARCH METHOD

For the purpose of this paper, a research study examining the level of satisfaction of trade companies (operating on the Croatian market) with the cooperation between them and hotels and restaurants, the quality of trade offerings, the level of tourists' satisfaction with the overall services and products offered in the Croatian hotels and restaurants in three phases was conducted. The research comprised three Croatian counties: the county of Primorje-Gorski kotar, the county of Split-Dalmatia and the county of Istria. Using those three Croatian counties for investigation seemed particularly interesting given the fact that according to the number of tourist nights (Statistical Yearbook, 2011) those counties have always been ranked on the first three places (together they accounted for 67.4 tourist nights in Croatia).

Table 1 and Table 2 are given in order to provide the comparison of the situation in tourism and trade in investigated counties. There should be pointed out that the lowest percentage of trade activities of three counties in the total trade in Croatia is the result of the concentration of trade activities in the City of Zagreb (which accounted for 60.4 per cent of total turnover in Croatia). In other words, if we do not consider the county of City of Zagreb in our calculations, investigated counties (the county of Primorje-Gorski kotar, the county of Split-Dalmatia and the county of Istria) will be ranked among the first five counties.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Data on tourism activity in selected counties (2010)
(Statistical Yearbook, 2011, pp. 412, 427)

County	Tourist nights	% of total tourist nights in Croatia	Hotel and restaurant activity (outlets)	% of total hotel and restaurant activity in Croatia
Istria	17.731.881	31,4	1877	10,6
Primorje-Gorski kotar	10.938.291	19,4	2213	12,5
Split-Dalmatia	9.364.032	16,6	2175	12,3

Table 2: Data on distributive trade activity in selected counties
(Statistical Yearbook, 2011, p. 400)

County	Legal entities and tradesmen	% of total legal entities and tradesmen in Croatia	Outlets	% of total outlets in Croatia	Turnover including VAT (000 EUR)	% of total turnover in Croatia
Istria	1.307	4,1	1687	4,2	733.708	2,2
Primorje-Gorski kotar	2.201	6,8	2608	6,4	2.099.527	6,3
Split-Dalmatia	3.203	10,0	4324	10,7	2.238.854	6,7

As mentioned before, the three-phase study included a qualitative and a quantitative approach: 1) the qualitative study among trade companies which intended to find out the level of cooperation between trade companies and hotels and restaurants; 2) the qualitative study on the group of hotels and restaurants, with the main goal to assess the quality of trade offerings; 3) quantitative study on the sample of tourists in order to find out the level of tourists' satisfaction with the Croatian hotels' and restaurants' offerings. A qualitative approach is particularly suited for gaining a better understanding of collective and individual perceptions, and open or semi-structured interviews are suitable means to gain such perceptual data with respect to a given phenomenon of interest (Eisenhardt and Graebner, 2007).

The first phase consisted of in-depth interviews with 11 managers in wholesale and retail companies operating in three investigated counties. The research instrument comprised questions about their targeted markets (customers), the level of satisfaction with the cooperation with their customers, problems that they are usually facing with, areas for improvement, etc. The interview lasted on average about 30 minutes and was transcribed.

The second phase consisted of in-depth interviews with 10 managers from the group of hotels and restaurants in three investigated counties. The group includes mostly small family hotels (seven of interviewed managers were managers from small hotels). The research instrument included questions about their suppliers, the level of satisfaction with the cooperation with their suppliers, the level of satisfaction with the suppliers` offerings, payment conditions, areas for improvement, etc. The interview lasted on average about 30 minutes and was transcribed.

It should be noted that similar to Coltman (2007) pre-survey telephone calls were made at each company to identify whether they would be prepared to participate in the survey or whether they could provide contact details for the most appropriate person in the company. In order to avoid unnecessary vast of time, the research instrument was sent to each company few days before interviewing.

In the third phase, a survey method was used for collecting data from the sample of tourist that were spending their summer holidays in hotels in 12 tourist destinations in three investigated counties. The questionnaire for tourists was prepared in Croatian, English, German and Italian and was distributed to tourists at the reception desk of their hotels. In such a way, 300 completed questionnaires were collected.

The questionnaire consisted of three sections:
Section I of the questionnaire was devoted to seven statements relating to the satisfaction with services, food, prices, etc. in hotels and restaurants in three investigated counties. A five-point Likert format was used to indicate the level of satisfaction of tourists (the scale from 5= completely satisfied to 1= completely unsatisfied).

Section II of the questionnaire consisted of four statements relating their shopping experiences while spending holidays in some of three counties included in this research. Respondents were asked to specify their level of satisfaction with the offered products and services, prices, etc. and they do it using five-point Likert format (the scale from 5= completely satisfied to 1= completely unsatisfied).

Section III of the questionnaire consisted of characteristics of the sample (Table 1): country of origin, gender, age and the level of education.

In accordance with the research methods, the analyses, as well as the results, first refer to the study among trade companies, then to the study among hotels and restaurants, and finally to the study on the sample of tourists. What follows is a short discussion of investigated themes and some interpretations.

4 RESULTS

4.1 The perceptions of trade companies about the relationships with hotels and restaurants as customers

The findings of the interview among trade companies revealed that the majority of investigated trade companies were involved in the supply of small family hotels (small hotels have become more and more popular in Croatia due to their successful market orientation). Four companies focused their business operations to restaurants and large hotels. It is interesting that respondents evaluated their co-operation with restaurants with higher grades than their co-operation with hotels. Moreover, respondents (trade companies) that operate in the county of Primorje-Gorski kotar showed higher level of satisfaction with their relationships with tourist entities than respondents in other counties. In general, trade companies considered orders, demand and pricing conditions as areas for improvement. They pointed out:

"Orders are too small, because hotels and restaurants are relying on direct channels of supply while ordering large quantities of goods".(Trade manager from the group of trading companies).

Trade managers pointed out that very often their customers (hotels and restaurants) use their support in the supply of beverage and small quantities of other non-food products. At the same time, they point out flexibility in supply of such small quantities as the main requirement imposed by restaurants and hotels, which mostly affect the level of their mutual

trust and co-operation. It is interesting that one manager referred to the article published a year ago and the question whether Croatian industries like textile and footwear industry can find interests in tourism industry using trade facilities in order to integrate diversified products designed for the satisfaction of tourists` needs in a better and a higher-quality way.

4.2 The perceptions of hotels and restaurants about the relationships with trade companies as suppliers

The findings of interviews among hotels and restaurants revealed that the majority of investigated hotels and restaurants (eight respondents) ordered directly from producers. It is especially evident in the case of foodstuffs, because nowadays hotels and restaurants are trying to differentiate themselves on the market through the fresh and natural food of a higher biological value.

„*Tourists are looking for something new, and authentic.*" (the owner of a small family hotel in Omiš, small town in the coastal part of Croatia).

World trends are placing an imperative influence on the necessity for a strong and efficient synergy of tourism and food industry in Croatia (Renko et al., 2010). Hotels and restaurants are satisfied with the quality of goods and the quality of the supply of trade companies as their suppliers. However, they considered the range of goods and services offered by trade companies as too narrow with high prices. Moreover, they respect the requirements of their tourists who seek for a natural and fresh food from local producers. Five respondents pointed out that they animated and enhanced tourists to participate in the process of preparing local food. In such a way, they created a valuable „tourist experience".

4.3 The perceptions of tourists about hotels` and restaurants` offerings

The sample mostly consisted of male respondents (59 percent of respondents), with high level of education (47 percent of respondents completed 3 years high school). The analysis of tourists` country of origin showed large diversity in the sample, and three groups of tourists made 1/3 of the sample: tourists from Croatia, from Bosnia and Herzegovina and from Germany. The largest percentage of them (53 percent of respondents) spends 50-100EUR on average for food and beverage, as well as other needs. They usually eat three times a week in their hotels (43 percent of respondents), and the rest of the week the largest percentage of them (35 percent of respondents) often go to local restaurants. Those findings were expected due to the fact that small hotels were mostly included in this study. In such hotels high level of service is offered to tourists and tourists are almost treated as family members. Tourists are satisfied (73 percent of respondents) with the quality and freshness of foodstuffs offered in hotels, and 69 percent of respondents are satisfied with the quality and freshness of foodstuffs offered in local restaurants. More than a half of the sample is satisfied with the retail offer in stores, but the possible explanation lies in the fact that tourists do not come for shopping to Croatia. Croatia has still not been the shopping destination for tourists. In answering the question about their satisfaction with the offer of local retail store, they were thinking about souvenirs and small gifts shopping.

5 LIMITATIONS AND FURTHER RESEARCH

A number of potential limitations of this study need to be acknowledged. Firstly, despite the secondary data analysis which suggested three most important tourist counties, the fact that all counties were not included in the sample might have compromised the representativeness of the sample. Also, limitation of the study lies in relatively small number of trade companies,

hotels and restaurants and tourists included in the study. This was mainly attributable to the limited time and resources available for the study. Therefore, the findings of this research should not be generalized across the entire Croatian tourism and trade industry. The methodology followed and the statistical methods employed in the study were also subject to limitations.

The present paper has certainly acknowledged limitations that need to be taken into account when considering the results of the study and its contributions. More generally, as with any academic work, it is hoped that the present paper will stimulate other researchers to find out what are areas for cooperation between trade and tourism entities role that trade companies securing competitive advantage for Croatian tourism as whole. More extensive research is certainly needed in this important area.

6   CONCLUSIVE REMARKS

Tourism is a growing and dynamic phenomenon that should constantly adapt to changes in tourists´ requirements. Due to its complexness and flexibility, tourism industry should act in the cooperation with some other industries. Economic activities of tourism industry are directly related to the development of industries like hospitality, transport and trade, which serve to meet tourists` requirements and to initiate tourists` consumption. In order to increase tourists` consumption, besides „basic tourist services", some tourist destinations are trying to offer „additional services" (entertainment, recreation, sport, adventures, etc.).

This paper has examined the relationship between trade and tourism and tourists` level of satisfaction as the direct consequence of this relationship. The literature review suggests that there has been little academic investigation into the area of the relationships of tourism and trade. There are studies about the relationship between international tourism and international trade, about shopping and tourism, etc. This paper addresses trade and tourism from a completely different point of view. Namely, the study organized for the purpose of this paper tried to find out the level of satisfaction of trade companies, with the cooperation between them and hotels and restaurants; to discover whether tourism industry consider high the quality of trade offerings, and to investigate the level of tourists' satisfaction with the Croatian hotels' and restaurants' offerings. The findings of the paper point out that both trade and tourism companies are satisfied with their relationships, but that there are still more areas for improvement. Namely, world trends in tourism industry are placing an imperative influence on the „natural", „local", „authentic", etc. Hotels and restaurants order directly from local producers and thus differentiate themselves on the market. Only large hotels and restaurants are mostly relying on the supply of trade companies. We have to point out that hotels and restaurants are part of HoReCa market, and that in Croatia there is still no company, like Italian Marr, which operates only in this sector. Producers directly supply almost 30% of HoReCa market. There is also the group of trading companies like Gastro group (strategic alliance of 36 wholesale entities), Metro (the member of the Metro Group and operates as a wholesale store on the Croatian market), Velpro (the member of the leading vertical marketing system in Croatia and operates as a wholesaler) and Getro (the retail chain stores which entered the Croatian market first as Cash&Carry wholesaler) which supply the rest of 70% of the HoReCa market (Renko et al., 2009).

The most important finding of this study is high level of satisfaction of tourists, which is the result of good relationships between trade and tourism entities. Policy makers should take more proactive actions and extend the area of their cooperation. It is very important to

understand that the tourism-industry development strategy in Croatia has to encompass also those issues that are not directly connected with tourism industry (Meler and Ruzic, 2000, p. 279).

STRATEGY OF INTENSIFICATION OF FOREIGN ECONOMIC ACTIVITIES OF KAZAKHSTAN UNDER WORLD ECONOMY GLOBALIZATION

Rustem Sagindikov
russag@yahoo.com

ABSTRACT
We look at the theoretical prerequisites of developing a strategy to intensify foreign economic activities and on its basis we reveal general features of the new paradigm of the process in question including three basic components: integration, innovation and competition and describe the factors forming it. Besides, the role of frontier cooperation as an important direction of foreign economic activities development is shown.

Keywords: *Competition, Foreign economic activities, Foreign trade, Frontier activities, Innovations, Integration, Paradigm, Strategy*

1 ECONOMIC PREREQUISITES AND THEORETICAL FRAMEWORK FOR THE INTENSIFICATION OF FOREIGN ECONOMIC ACTIVITIES

Forming in the Republic of Kazakhstan the open economy creates favourable conditions for its integration into the global economy and boosts the influence of foreign economic activities of the country and its business structures on sustainable GDP growth which proved to be positive even during the crisis years (1.1-1.2% in 2008-2009), and in locomotive regions it exceeded 3%, for example, in Aktyubinsk region it stood at 3.5%. Meanwhile, the mechanism of regulating the foreign economic activities needs improving, first of all communication marketing, information and legal components should be revised bearing in mind that Kazakhstan is to join the World Trade Organization in the nearest future following Russia. It requires developing a strategy to intensify the foreign economic activities of the country under the globalization of the world markets of products and services and adapting the normative legal basis to the WTO requirements. At the same time it is essential for our country to join the WTO on favourable terms taking into consideration its economic potential, advantageous geographical position for the goods transit from the West to the East, its rich natural resources and rather qualified human resources, and preservation of cultural and historical traditions of the people of Kazakhstan.

Scientifically, the strategy should be proved on the basis of certain theoretical concepts developed by economists in different countries, including in particular the concept of Kondratiev waves that says that the end of the long wave sees a qualitative change in the productive forces and the formation of new technological setup. We should note that within the fifth technological setup the configuration of natural resources, labour and capital is changing and intellectual capital is becoming the leading productive force leaving behind material capital. Such technological transformations boosted by the development of information and communication technologies within the fifth technological setup were opportunely used by developed countries in the second half of the XX century, which resulted in the world economy globalization and forming the World centre and the World periphery. At the initial stages of globalization the World centre included the USA, Canada, the EU countries and Japan. However, the economic progress of certain countries of the World periphery, first of all, China, India, South Korea, Brazil and Singapore led to tectonic changes

and the countries of the World centre started losing their leading role in the world economy still remaining strong enough in the WTO to determine the policy of this global organization.

The essence of globalization and its forms were described by the Nobel Prize recipients J.Yu. Stiglits, P. Krugman and their followers who consider this phenomenon from the point of view of the integration of national markets into a global system, increasing competition in the conditions of boosting innovations and not just as other countries' joining the global market according to the opinion of Karl Marx who wrote in one of his letters to F. Engels, "Now the global market really exists. Globalization has come true after California and Japan entered the world market".

During the globalization and the scientific and technological progress acceleration, as D. Gallyamova fairly notes, "developed countries are increasingly specializing in the production of science-intensive goods requiring bigger investment in human capital as well as capital-intensive "mature" products".
 At the same time these countries protect their know-how with the help of the legislation by banning the sale of innovation technologies for three years, and after this term the technologies as a rule become obsolete and are replaced by the new ones. Meanwhile Kazakhstan, Russia, Ukraine and Belarus have rather high scientific potential, which enables them to partly limit the import of foreign technologies and boost investment in the development of their own research and development together with creating and introducing new relevant clauses in national legislation.

Innovation theory by Joseph Schumpeter is equally important for the development of the strategy to activate the foreign economic activities of Kazakhstan as the competitive ability of a country, its regions and business communities in the conditions of globalized markets considerably depends on the degree of innovation spread in the economy, which allows to increase the economic efficiency and to achieve a positive balance of foreign trade of the Republic of Kazakhstan.

The contents and structure of developing the strategy of intensifying the foreign economic activities should be based on the theory of competition worked out by certain western economists including the founder of the theory M. Porter. His theory is based on three important postulates: marketing of goods and services according to the volume and quality offered by potential competitors; relations with the suppliers of raw materials; studying the needs and requirements of consumers. It is known that those countries and business structures become competitive that have competitive advantage on the foreign market as compared with other countries and business structures. So, the theory of competition is connected with the theory of advantage that has a long history from A. Smith to D. Ricardo and A. Marshall who defined various types of advantages: absolute, comparative, natural, acquired, the latter being especially important for countries and businesses with low competitive ability.

In particular, according to A. Smith those goods should be purchased that are produced by another country at a lower price. His theory got the name of "the theory of absolute advantage". Followers of mercantilism stood up for the principle of the import of money and goods exceeding export. David Ricardo developed the theory of comparative advantage that contains Smith's concept as a particular case and proved that when assessing the profitability of foreign trade we should compare not absolute but comparative effect: according to him the aggregate product volume will reach its maximum when every product is produced in a

country having lower imputed costs. Later Ricardo's theory was developed by A. Marshall and other economists.

The implementation of the above mentioned theories in social practice and forming new conditions for the global economy to function gave us the basis to create a new paradigm of intensifying the foreign economic activities of Kazakhstan.

2 NEW PARADIGM OF INTENSIFYING THE FOREIGN ECONOMIC ACTIVITIES OF KAZAKHSTAN AND FACTORS OF ITS DEVELOPMENT

In our opinion, the new paradigm of intensifying the foreign economic activities should be based on three key components such as integration, innovation and competition which are the main factors of the world economy globalization, and also on the maximum use of the internal economic potential of the country and its constant increase on the basis of innovation using the principle of economic diversification with simultaneous improvement of the normative and legal mechanism of the state regulation of foreign economic activities in accordance with the institutional structure of the global market system and the WTO requirements.

Meanwhile the need for the international economic activities to be regulated by the government is now acknowledged by almost all the WTO members as it results in positive or negative deformation of the structure of the national economy, it changes the structure of supply and demand for factors of production; secondly, in the short term it leads to income redistribution among industries: the growth of income for export-oriented industries and the decrease of income for import-substituting industries with further growth of the income when mastering imported innovation technologies and efficient equipment which results in leveling the income in export and import-substituting industries and general growth of the economy by boosting the foreign economic activities of the country and the business community within state-private partnership.

When creating the new paradigm we have to take into consideration the following factors:
- preserving competitive position of the raw materials sector of the economy of our country on "near abroad" and foreign markets and leadership on the global market concerning such resources as tungsten, nickel, etc;
- boosting the export of goods produced in the processing industry sector;
- developing legislative measures to preserve agro industrial complex in the conditions of joining the WTO and of the free access of agricultural products from developed countries, first of all, the EU, the USA and Canada, to the local markets of Kazakhstan;
- decreasing the import of agricultural and domestic consumer goods by substituting them for locally produced goods of the same name taking into consideration their compliance with international quality standards and lower prices for the local population;
- using the advantages of the Customs Union of Russia, Kazakhstan and Belarus with further creating common economic space as well as the advantages of frontier cooperation of countries and border territories of Russia and Kazakhstan first of all;
- improving the mechanisms of attracting direct foreign investment which is not only the source of additional funding for our business but also an important factor of accelerated modernization of key assets in material production industries and in the service sphere by using western science intensive technologies and more efficient new equipment supported by modern management practices including personnel and financial management. In particular, the efficiency of informational projects decreases

and implementation of new methods of work becomes slower without advanced personnel training in new modernized programmes concerning new production and innovation technologies;

−   increasing the share of the innovation component of the export of goods and services made in Kazakhstan. It requires intensifying the state support of companies entering international markets with innovation products and services like most western countries do it. For that the government of Kazakhstan and regional governmental bodies should develop a valid concept of domestic innovation business support as well as industrial, structural and monetary policy for establishing external economic links relying on a common domestic market and taking into consideration the strategy of interregional leveling by using the business structure of locomotive regions to boost the business in economically depressive regions, as how the experience shows budget injections for leveling the regions turn out to be inefficient, and they are often called 'money dug in the sand' on the post-soviet territory.

Besides, new methods to assess sustainable export and import of goods in different industries of the economy of Kazakhstan should be developed and there is a need to work out measures of state support of foreign economic activities concerning the export of competitive products whose reproduction is becoming profitable taking in consideration world market opportunities and Kazakhstan's expected joining the WTO. A wide use of state–private partnership and administrative resource when forming investment appeal of a region first of all for foreign investors will contribute to the intensification of foreign economic activities. At the same time to increase the competitiveness of 14 regions of the Republic of Kazakhstan we need to provide state support of domestic science which implies a wide attraction of international scientists and commercialization of its innovation project like in the USA and China.

In the sphere of export and import we should use to the maximum communication monitoring of the world prices to be able to inform the governmental bodies and the business community of Kazakhstan about the dynamics of their changes, which will define the strategy of foreign economic activities at macro and micro levels as well as target business structures at gaining niches in different sectors of the global market for example by developing their own pricing policy for various product groups. Besides, in the republic we should increase the liberalization of the import of advanced science intensive technologies and efficient equipment to modernize the key assets in different industries of the economy of Kazakhstan by simplifying the preparation of documents for import and leasing and by decreasing the customs burden for domestic producers and joint ventures connected with high technology import and located on the territory of Kazakhstan.

3   REGIONAL ASPECTS OF THE INTENSIFICATION OF FOREIGN ECONOMIC ACTIVITIES

The external economic policy of the Republic of Kazakhstan is the most apparent in the relations with Russia and its frontier territories. When developing the concept of frontier cooperation we should bear in mind that frontier cooperation is one of the forms of regional international activity. The need to get over the borders and to establish economic links has been determining for the development of frontier regions. The experience of frontier cooperation has been used in the last decades not only between countries but also between internal regions. Now frontier cooperation can be seen as a specific variety of regional international activity, first of all, an economic one.

Challenges of the Modern World - Contemporary Economy and Globalization

We can distinguish three components in frontier cooperation. The first is connected with solving purely local problems such as establishing economic, social, environmental and cultural contacts between the population of border regions. First of all it means trade, joint solution of environmental problems, medical, educational and cultural services, etc. All this defines the essence of frontier cooperation.

The second component is determined by the cooperation of frontier territories in the sphere of joint performing the state functions – transport, border guarding, securing the safety of national economic space, accident preventing and eliminating, etc.

The third component is immediately connected with direct and mediatorial foreign economic activities of border territories. Its volume depends on the economic potential, the economic structure and the development of international transport infrastructure in border territories.

External economic links play an important role in the development of border territories. They contribute to overcoming their peripheral provincial role in domestic economic systems.

The key factors defining structural specific features and dynamics of frontier cooperation are the correlation of contact and barrier functions of the frontier, socio-economic and ethnic-cultural characteristics of border territories, powers of local authorities concerning international contacts, the level of frontier infrastructure including check-points.

The contents and the dynamics of frontier cooperation is determined by the general level of cooperation of neighbouring countries and problems of state's security connected with it. Nevertheless, other things being equal, more favourable frontier cooperation normally arises when the most developed territories are the border areas. The level of socio-economic development of border territories considerably impacts the contents of frontier cooperation, the diversity of its directions and spheres. Thereby it turns into one of the factors of mutually beneficial interregional development of frontier territories. For instance, frontier cooperation of Orenburg region of Russia and Aktyubinsk region of Kazakhstan proved its efficiency, for example concerning the foreign trade turnover of these regions as its growth rate has exceeded the rate of the two countries for the last seven years. And after creating the customs union Russia, Kazakhstan and Belarus should expect an increase in frontier cooperation. Holding interregional forums of the two countries traditionally opened by the presidents of Russia and Kazakhstan also contributes to that.

As an appendix to the report we offer certain statistics characterizing the state of foreign trade activity of the Republic of Kazakhstan showing the key indices for regions as territorial entities of the country's economy management as well as export-import operations of the republic with foreign countries for January – December 2010.

MULTINOMIAL LOGISTIC ANALYSIS OF "SUSU" CONTRIBUTION IN GHANA

ABSTRACT
The study employs cumulative multinomial logistic regression model to analyze "susu" (a micro-saving mechanism for collection of deposits that is common on the West African markets) contribution in Ghana. Evidence from the analysis of 1,630 contributors randomly sampled indicates that between male and female contributors, the former are more likely to contribute higher amounts than the latter. The paper, therefore, avers that "susu" institutions must target their marketing campaigns at income-earning males. Additionally, there is evidence to conclude that the number of years of contribution, the number of years a contributor has been in business, marital status and gender are predictors of 'susu' contribution in Ghana.

Keywords: Cedi, Contribution, Gender, Ghana, Marital Status, Microfinance, "Susu"

1   INTRODUCTION

Financial exclusion among the poor but productive group of the Ghanaian economy has been a debilitating conundrum taxing the intellectual energy of policy makers in Ghana. The rigmarole lending procedures of commercial banks in Ghana, including collateral caveat, have succeeded in pinning most of the poor but productive group of the population to the parameters of mediocrity, rendering stale their entrepreneurial ideas that could otherwise catalyze the developmental agenda of the country. However, proponents of the microfinance concept vociferously argue that it holds the potential to obliterate the financial exclusion headache of policy makers by making finance accessible to the poor but financially excluded at an affordable and convenient cost. Matin et al. (2002) contend that microfinance can be a strategically vital platform that the poor can use to raise their own prospects for an escape from poverty. Indeed, studies have amply demonstrated that microfinance plays three broad roles in development: It helps the very poor households to meet basic needs and protects them against risks; it improves household economic welfare; and it helps to empower women by supporting women's economic participation and so promotes gender equity (Asiama and Osei, 2007).

Microfinance traces its roots to microcredit which was initially administered to the poor as a way of liberating them from the shackles of financial incarceration. After trying the microcredit concept for some time it became palpable that saving services—and not just loans—might help to improve wellbeing of the poor in general and of women in particular (Vonderlack and Schreiner, 2001). Microfinance institutions consist of organizations and

agents that engage in relatively small financial transactions using specialized, character-based methodologies to serve low-income households, small farmers and others who lack access to the banking system. They may be informal, semi-formal (that is, legally registered but not under the central bank regulation), or formal financial intermediaries (Steel, 1998; referenced by Aryeetey, 2008).

The microfinance sector in Ghana comprises various types of institutions and these have been grouped into four (4) categories, namely: formal suppliers such as savings and loans companies, rural and community banks as well as some development and commercial banks; semi-formal suppliers such as credit unions, financial non-governmental Organizations (FNGOs), and cooperatives; informal suppliers such as susu collectors and clubs, rotating and accumulating savings and credit associations (ROSCAs and ASCAs), traders, moneylenders and other individuals; and public sector programmes that have developed financial and nonfinancial services for their clients (Asiama and Osei, 2007). One of the informal microfinance schemes which have been the financial refuge of the poor and the financially excluded in Ghana is the "susu" scheme. Much work has been done on its impact on small and medium scale enterprises (Alabi et al., 2007; Basu et al., 2004; World Bank, 2007). However, one of the murky areas that have not engaged the attention of researchers is the possibility of predicting the daily/weekly contribution. The current study, therefore, seeks to explore this virgin area of the microfinance literature by answering two main research questions:

- Between male and female "susu" contributors whom should "susu" institutions target?
- Are there some socio-economic factors that positively and significantly determine the amount of 'susu' contribution in Ghana?

The rest of the paper is organized into sections. The first section presents the description of the "susu" scheme in Ghana as a source of fund mobilization. This is followed by research methodology section. Presentation of the results and discussion section is next in line. The paper ends with conclusions and policy implications of the findings of the study.

2   THE "SUSU" SCHEME IN GHANA

The Ghana Co-operative "Susu" Collectors Association, (GCSCA) established in 1990, is the apex body superintending the operations of the "susu" scheme in Ghana. The association has identified the objectives of the "susu" scheme as follows: providing mobile savings collection services for individuals and groups in urban and rural areas; providing appropriate financial intermediation for Micro/Small-scale Enterprises (MSEs) and Informal Sector Enterprises (IFEs) who cannot leave their wares; inculcating a savings habit among the rural and urban poor; providing an opportunity for financial intermediation between the formal banking sector and micro/small scale entrepreneurs; and providing individuals with self-employment opportunities as "Susu" collectors (The World Bank Group, 1999).

"Susu" as one of the microfinance schemes in Ghana is thought to have originated from Nigeria and spread to Ghana in the early twentieth century (Asiama and Osei, 2007). It is an informal financial identification for daily or weekly collection of deposits which is prevalent on the West African markets (Alabi et al., 2007). It can be described as a form of banking because it is a system of trading in money which involves regular and periodic collection of fixed amount of deposits that are made available to the owners after a specified period of time or when required or to borrowers within the scheme at a fee. Interest on deposits is almost non-existent (Aryeetey, 2008).   Borrowing under the "susu" scheme does not require

collateral; it relies on a guarantee system to reduce risks associated with 'clean lending' (Alabi et al., 2007). However, borrowing is short periods (Aryeetey, 2008). The essence of the "susu" scheme is to help contributors to protect their daily earnings from competing claims and ensure working capital to restock supplies at the end of the month.

In terms of collection of daily or weekly deposits, the scheme uses two main methods: independent/private (non-salaried) collectors and salaried/commissioned staff. Under the independent (non-salaried) collector's method, the collector undertakes daily door-to-door collection of agreed fixed amount from clients for a cycle, usually one month. In each cycle the collector's reward for rendering this service is a day's deposit of each client. For example, if in each day a client contributes one Ghana cedi then at the end of the contribution cycle the collector will subtract one Ghana cedi from the contributor's total deposit as service fee. In Ghana, it is now common to find that large numbers of individual "susu" collectors have established offices (kiosks) at various points in cities and towns where their clients can actually walk in to make deposits and engage in other transactions (Aryeetey, 2008). The major risk inherent in dealing with private collectors is the possibility of the collectors absconding with contributions. However, evidence suggests that the private collectors have been found to be more aggressive in reaching out to more potential savers since their profit is contingent on the number and per capita daily contribution of their clients. Under the salaried/commissioned staff deposit collection, the collecting agents are full-time employees of the microfinance institution (MFI) who undertake the door-to-door collection for and on behalf of the MFI for basic salary. This is the practice at most banks (CHORD, 2000). To provide customized service, most "susu" collectors begin mobilizing daily deposits around noon each day which provides the clients with an opportunity to transact business and earn some income before saving. This strategy offers convenience for the rural and urban poor women whose income is too low to deposit large amounts of money with the formal banking institutions (The World Bank Group, 1999).

Basu et al. (2004) identify four different types of "susu" institutions that have influenced the operations of MFIs in Ghana. These are **"susu" collectors** who offer a saving vehicle by collecting daily amounts voluntarily saved by their clients, which they return at the end of the month, minus one day's amount as a commission.; **"Susu" associations** which are either (i) rotating (ROSCAs), collecting savings from their members and allocating them to each member in turn, or (ii) accumulating associations, which allow regular contributions to be accumulated, to cover the lump sum costs of such special future events as funerals; "**Susu**" **clubs** which combine the modus operandi of susu collectors and susu associations operated by a single agent in which members commit to save a pre-defined amount over the medium-term (50- to 100-week cycles) and pay commissions on each payment and fees when they are advanced the targeted amount before the end of the cycle; and **"Susu" companies** which are more recent (late 1980s) and registered. In addition to savings collected using traditional "susu" collectors, "susu" companies provide loans after a minimum saving period.

Economically, the "susu" scheme is making immense contributions to the development and sustenance of micro and small enterprises (MSEs) in Ghana. In addition, the scheme is acclaimed to have the capability to swab excess liquidity through its savings mobilization methods. Consequently, the scheme is now being recognized and incorporated into some formal financial institutions as a deposit- loan system using "susu" collectors and operators (Basu et al.,2004). A number of MFIs in Ghana including rural banks and credit unions have incorporated the scheme into their deposit mobilization strategies.

According to the World Bank (1994) "susu" scheme is a major source of finance for most micro and small scale businesses. The scheme cuts across a wide range of socio-economic or occupational groups such as farmers, petty traders, artisans, food processors and salaried workers. For many petty traders, market women, apprentices and artisans, "susu" is alleged to be their trusted and reliable source of starting, sustaining and growing their businesses (Alabi et al., 2007). These groups are generally within the low income bracket and many of them are women (CHORD, 2000).

Evidence abounds that microfinance beneficiaries spend their income on domestic financial obligations. Johnston and Morduch (2008) find that low-income households often apply loans to household needs, including school fees, medical treatment, daily consumption needs, and social and holiday expenses. Female entrepreneurs tend to allocate a greater share of profits for family and child welfare, and that there is a strong relationship between female entrepreneurial activity and children's welfare (Kessey, 2005). Women have a predisposition to use profits to meet family needs rather than to reinvest (Downing, 1990). Evidence abounds that women have spend more of their income on their households; therefore, by helping women increase their incomes, you are improving the welfare of the whole family" (Cheston and Kuhn, 2002).

3 RESEARCH METHODOLOGY

3.1 The Model
The cumulative multinomial logit regression model is utilized to relate the probability of a "susu" contributor contributing any of the five levels of contribution (five Ghana cedi contribution; four Ghana cedi contribution; three Ghana cedi contribution; two Ghana cedi contribution; and one Ghana cedi contribution) to socio-economic factors: number of years of contribution, years in business, gender and marital status. The cumulative multinomial logit model is expressed as follows:

$$Y = y_i \leftrightarrow \alpha_i - 1 < U \leq \alpha_i, i = 1, \ldots, m \qquad [1]$$

Where $-\infty = \alpha_0 < \alpha_1 < \ldots < \alpha_{m = \infty}$. It is assumed that the latent variable U is determined by the explanatory variable vector X in the linear form $U = -\beta'x + \epsilon$ where β is a vector of regression coefficients and ϵ is a random variable with a distribution function F. It follows that

$$Pr\{Y \leq y_i | x\} = F(\alpha_i + \beta'x) \qquad [2]$$

Description of the variables used in the model has been presented in Table 1 below:

Table 1

Description of variables

Variable	Description
Dummy for Contribution (dependent variable)	= 1: One Ghana cedi Contribution
	= 2: Two Ghana cedi Contribution
	= 3: Three Ghana cedi Contribution
	=4: Four Ghana cedi Contribution
	=5: Five Ghana cedi Contribution or higher
Dummy for gender (GENDER)	=1: Female; =0: Male
Dummy for marital status (MSTATUS)	= 1: Married; =0: Otherwise
Years in business (YRSINBUS)	= Continuous variable
Number of years of contribution (CONTYRS)	= Continuous variable

5% significance level is assumed.

The daily or weekly contribution of contributors is the predicted outcome and is measured at five levels: five Ghana cedi contribution; four Ghana cedi contribution; three Ghana cedi contribution; two Ghana cedi contribution; and one Ghana cedi contribution. The hypothesized independent variables are years of contribution (YRSCONT); years in business (YRSINBUS); marital status (MSTATUS); and gender of respondents (GENDER). The variables MSTATUS and GENDER are dummy variables.

3.2 Data and Sampling

Data for the study were collected through a cross-sectional "susu" survey undertaken by the authors using questionnaire as the data collection instrument. A sample size of 1,630, comprising 697 male and 933 female contributors was used in the study. This sample size was arrived at after editing two thousand questionnaires for errors and inconsistencies. Thus, the successful response rate was approximately 82%. The sampling procedure employed was simple random sampling in which "susu" contributors at various market centres in Kumasi and Takoradi were interviewed. The decision to administer the questionnaire at market centres was informed by the literature. According to the World Bank Group (1999), market centers are locations with a large density of enterprises, especially those operated by women. The questionnaire was administered to respondents after they had indicated that they were "susu" contributors. The 'susu' scheme cuts across a wide range of socio-economic or occupational groups such as farmers, petty traders, artisans, food processors (CHORD, 2000). Thus, respondents in the survey were petty traders, artisans, food processors, retailers, and dealers.

4 ESTIMATION RESULTS AND DISCUSSION

The Pseudo R-square statistics reported in appendix A show 17.9%, 18.8% and 6.6% for Cox and Snell, Nagelkerke and McFadden statistics respectively. The model fitting information and the Likelihood Ratio Tests results shown in appendix A collectively rule out the joint hypothesis that "all coefficients of explanatory variables equal zero" and accentuate the robustness of our model.

As shown in Table 2, the number of years of contribution is statistically significant across three models. Evidently, the probability of a "susu" contributor in Ghana contributing one Ghana cedi or two Ghana cedis or three Ghana cedis relative to contributing five Ghana cedis decreases as the number of years of contribution increases by one year. No statistically significant relationship has been found between the number of years of contribution and four

Ghana cedi contribution. It can, therefore, be contended that as the number of years of contribution increases a "susu" contributor in Ghana is likely to contribute five Ghana cedis or higher daily or weekly. This contribution behavior strikes a chord with the concept of logical incrementalism (Quinn, 1980). The benefits of the "susu" scheme may not be known at the commencement of contribution. Thus, to mitigate his or her risk the contributor would attempt to experiment with smaller amounts and would gradually increase the daily contribution as he or she begins to experience the benefits of the scheme. Emblazoned across this logical incrementalist approach is risk consciousness among "susu" contributors in Ghana. Despite their low levels of education it appears that they appreciate the concept of risk in financial management which is commendable. It can be inferred from this finding that "susu" collection institutions in Ghana interested in increasing their turnover should target their marketing campaigns at existing contributors since they are more likely to increase their daily contributions than new contributors.

The number of years a contributor has been in business is statistically significant across two-Ghana-cedi contribution and three-Ghana-cedi contribution groups. The negative odds ratios indicate that the multinomial log-odds for a "susu" contributor to contribute two Ghana cedis or three Ghana cedis would decrease if a contributor were to stay in business for an additional year. In other words, as a "susu" contributor spends more years in business the probability that he or she will contribute five Ghana cedis is high. The number of years in business of the contributor is positively related to one Ghana cedi contribution, implying the log-odds of a "susu" contributor in Ghana preferring to contribute one Ghana cedi to contributing five Ghana cedis would be positive. However, this is statistically insignificant.

Marital status is statistically significant across one-Ghana-cedi and two-Ghana-cedi contribution groups but is statistically insignificant across three Ghana cedi and four Ghana cedi contribution groups. The negative relationship between marital status and one-Ghana-cedi contribution and two-Ghana-cedi contribution suggests to us that married "susu" contributors in Ghana are more likely to prefer contributing five Ghana cedis or higher than their unmarried (single) counterparts. One possible interpretation of this finding is that because married couples have both business and domestic obligations such as providing for the upkeep of their homes and paying children's school fees they contribute more as insurance against these obligations (Alabi et al., 2007). The propensity for low-income households to spend their income on their domestic obligations has been established. Johnston and Morduch (2008) find that low-income households often apply loans to household needs, including school fees, medical treatment, daily consumption needs, and social and holiday expenses. This presupposes that "susu" institutions that desire to increase their daily turnover must target their marketing strategies at married prospects.

Gender is positive and statistically significant across one-Ghana-cedi contribution and two-Ghana-cedi contribution. It is, however, positive but statistically insignificant at three Ghana cedi contribution. Its relationship with four-Ghana-cedi contribution is negative and statistically insignificant. The multinomial logit for female contributors relative to male contributors would be 0.685 and 0.397 unit higher for preferring to contribute one Ghana cedi and two Ghana cedis respectively, given all other predictor variables in the two models are held constant. In other words, female contributors are more likely than their male contributors to contribute one Ghana cedi or two Ghana cedis. One possible interpretation of this finding is the issue of the females meeting family obligations, making them unable to contribute more. This is because female entrepreneurs tend to allocate a greater share of profits for family and

Challenges of the Modern World - Contemporary Economy and Globalization

child welfare, and that there is a strong relationship between female entrepreneurial activity and children's welfare (Kessey, 2005). Women have a predisposition to use profits to meet family needs rather than to reinvest (Downing, 1990). On the other hand, this finding may affirm income inequality between males and females in Ghana and reinforce the need for more poverty reduction interventions to be targeted at women, especially the uneducated or less educated but productive ones. Apart from enhancing the quality of family life in Ghana, empowering such women will also promote economic development.

a. This parameter is set to zero because it is redundant. The referent group is five Ghana cedi contribution.

5   CONCLUSIONS AND RECOMMENDATIONS

The above results lend support to some conclusions about "susu" contribution behavior in Ghana. First, despite the financial and intellectual depravity of most "susu" contributors in Ghana they seem to have some appreciation for risk in financial management. This is evident in their apparent adoption of logical incrementalist approach to contribution, preferring to begin their contribution with smaller amounts before contributing larger amounts as years go by. Obviously, with little capacity-building support, these "susu" contributors who are engaged in micro, small and medium scale enterprises will be able to practice effective financial management in their businesses which will, in turn, promote economic growth in Ghana. Second, male contributors contribute higher amounts of money to the "susu" scheme than their female counterparts. One policy implication for "susu" operators in Ghana is that if they want to increase their profitability they should focus their marketing activities on male prospects. On the part of the Government of Ghana and other international organizations committed to bridging the income gap between males and females it appears that they are far from achieving their targets. The income inequality between males and females still persists in Ghana which calls for more concerted efforts at addressing it. Third, evidence proffered in this paper suggests that the amount of daily or weekly contribution of a "susu" contributor in Ghana is determined by the number of years of contribution, number of years in business, marital status and gender. The policy implication of this conclusion is that "susu" institutions that aspire to scale up their operations should rivet their interventions on these factors.

The authors recommend that more studies should be conducted for more insights into the current findings. The use of different dataset in Ghana will provide fresh perspectives to the findings of this study which will enrich the microfinance literature. The authors also recommend the application of the model to any of the countries in the West Africa sub-region where the "susu" scheme is practiced as this will provide international perspective on the current findings.

ABSTRACT
During the economic development process, it is observed that services sector has gained importance in many importances. In the services sector, transportation is the sector that the most investment is made and the most added values are created. With various carrying types, transportation sector holds considerable share both in domestic and foreign trade with cargo transportation and in tourism and urban transportation with passenger carrying. As for the transportation sector in Turkey, in the early years of the Republic, short range railway and seaway transportation is observed to be made in the Western Anatolia. Upon the establishment of the Republic, much importance was put on railway transportation and the railway systems which would provide east-west and north-south connection were built. In early years of the 1950s, importance was started to be given in highway construction, and considerable improvement was achieved in seaport and airport construction. Overland transportation, after the years of 1950s, has been the most widely used transportation type that exhibited development due to the high cost of the substructure investments in terms of railway transportation. In recent years, Turkey has been experiencing important developments related with railway transportation. Due to playing great role of railway transportation in Turkey's effectiveness in carrying international cargo, being on an important location in the international corridor, increasing the public investments and allowances for the railway transportation, works has been started especially in terms of international cargo transportation. In this study, by examining the general structure of the transportation sector in Turkey, foresight of railway transportation until 2025 has been aimed to be made. In this frame, it is aimed to determine the role of the railway transportation in Turkey's potential economic development.

Keywords: Logistics, Railway Transportation, Transportation

1   INTRODUCTION
Transportation can simply be defined as moving people or goods to fulfill any requirement in a way that would bring benefit in time and space (Barda, 1964, p. 5). Transportation activities

which are the key factor of economic, social and cultural activities are a service activity whose demand is created by other sectors. The most important sectors which create demand can be named as industry, trade, agriculture and tourism. In addition, transportation is sector which plays effective role on productivity of all sectors (Kabasakal and Solak, 2009, p. 27).

Transportation sector is one of the important sectors for arranging product flow, enabling sustainability of this process and being a sector which generating employment. Within economic structure, improvement of transportation opportunities has positive effect on employment structure, investments and production level in macro-economic sense and on activities, sales and distribution process of enterprises in micro economic sense (Nalçakan, 2009, p. 34).

Transportation systems and networks serve in freight which is the subject of world trade. It is seen that transportation networks, systems and transportation ways play effective role in determination of economic and political strategies of nations (Nalçakan, 2009, p. 34). Improvements in transportation created great changes in nations economically, politically and socially. In this process, the first great improvement was enabled in the field of railway transportation systems. By providing dynamism to the process; the breakthrough which began in the field of railway transportation both brought solutions for labor and raw material problem and market requirement of infant industry, and made great contributions by enabling mass production in the fields out of industrial centers.

The main aim of this study which was carried out based on the importance of railway transportation within transportation systems is to analyze the development of railway transportation in Turkey and put forwards expectations in railway transportation until 2025. For this aim, first of all, developments in transportation sector in Turkey were examined generally. Then the current position of railway transportation in transportation sector was aimed to determine by pointing out superior and disadvantageous aspects of railway transportation. In the last section foresight of railway transportation until 2025 was made and the study is concluded with overall assessment and suggestions.

2   TRANSPORTATION SECTOR IN TURKEY

Transportation sector which has become the one that creates the most added values for national economies has an important place for Turkey as well. One of the most important factors which makes transportation sector that has around 14% share within GDP as of 2010 and has 12.2% growth compared to previous year (TOBB, 2012) special for Turkey is its geographical location. When the geography of Turkey is considered together with its environment, it is seen that Turkey is located in a place where political, military, demographic, economic and commercial power balances change continuously, trade and raw material flow is carried out intensely in the sense of global competition (Nalçakan, 2009, p. 37). Turkey which serves as a bridge between Asia, Europe and Africa is like a basis both in freight and passenger transportation and can serve in all types of transportation. Turkey especially has important potential in the sense of shores and harbor with broad hinterland in order to do business with overseas countries through seaway.

However Turkey's bringing this superiority in transportation sector to more developed economic level depends on better evaluating its potential in this sector. In this scope, general characteristics of transportation sector can be summarized as such (Aktan and Dileyici, 2005, p. 18):

- Causing great infrastructure requirements and high fixed cost,
- Providing special benefits in economy by spreading positive externality,
- Increasing mobility of goods and services,
- Multi-dimensional service (being both for transportation of passengers and freight).

Due to increase of international trade, movement of goods among markets has gained importance today, conditions of competition have changed and transformed into rather dynamic structure. At this point, costs of transportation have to be considered in order not to cause malfunction in operation of comparative superiorities with market mechanism (Hummels, 2006, p. 24).

Investments of transportation infrastructure which is the most important factor in providing effectiveness of transportation sector requires enduring costs so high that a single enterprise or organization cannot overcome. For this reason, such kind of investments is generally regarded as those undertaken by the public (Han and Kaya, 2002, p. 248). Studies in literature show that economic effectiveness of railway transportation within all transportation types is much more compared to highway investments (Kabasakal and Solak, 2010, p. 134). This advantage of railways has important effects especially in mobility of goods and services.

However priorities in Turkish transportation policy have changes considerably since the early years of Turkish Republic. Railway transportation undertook the most important role in improvement of infrastructure of public transportation until 1950. However, the dominant role of railway transportation has decreased, leaving its superiority to highway transportation. While 78% of freight was carried out with railways in 1950, this rate dropped down to 5% in 1999 (TÜİK, 2006).

3 DEVELOPMENT OF RAILWAY TRANSPORTATION IN TURKEY AND POLICIES ADOPTED

Beginning of railway transportation in modern sense dates back to the discovery of locomotive in 19th century. The first steam locomotive was invented by Richard Trevithick in England in 1804. Afterwards, especially English, American and French people speed up building railway lines among various cities and region in their own country and other European countries followed these innovations. It is seen that these countries which are powerful in railway transportation are also powerful in economy (Murat and Şahin, 2010, p. 45).

Rail system which is used in intracity, intercity and international passenger and freight transportation has superior aspects compared to other types of transportation. Being an alternative for solution of traffic density, being more advantageous than other transportation systems in the sense of energy consumption, having large capacity in transportation of passengers and freight, having less damage to environment, having fixed price guarantee for long terms and having equipment which is not easily influenced by weather conditions are among these superior aspects. In addition to this, there are also weaknesses of railway transportation. Most important ones are the necessity that nearly all the stations should be large and comfortable, that the construction of roads and facilities, supply of vehicles have

Challenges of the Modern World - Contemporary Economy and Globalization

high cost that cannot be easily overcome by private corporation, that through trip takes long time and that railway transportation does not enable door to door delivery (Koban and Yıldırır Keser, 2011, pp. 223–224).

The history of railway transportation in Turkey goes back to Ottoman Empire. However, planned developments started in turkey with the foundation of Turkish Republic in 1923. 1000 km railway construction was completed and put into practice until 1929 and nearly 200 km. railway construction was completed until 1940. However the following process was not that fast and the total length of railway constructed between 1940 and 1950 was only 300 km (Murat and Şahin, 2010, pp. 75–76).

1950's are regarded as stagnation period in railway transportation. It is thought that this stagnation has two important reasons. First of all; regression caused by II. World War and Turkey's inability in sustaining its advances in coal, iron, steel and machine industry had negative effects in its advances in railway. In fact, it must be remembered that development of railways in inland passenger and goods transportation depends on analysis of industrialization process rather than aims written in development plans (Kaynak, 2002, p. 39). The second reason for stagnation in railways is thought to be the advances in projects about highways within the frame of Marshall Plan. Similarly, due to production and consumption of consumer goods becoming widespread within economic structure of Turkey, it has become compulsory concentrate on highway transportation which enables fast and convenient door to door transportation of such kind of freight (Gerçek, 1999, p. 39).

After 1950, highway transportation gained superiority over railway transportation. Between 1952 and 1962 the budget of T.R General Directorate of Highways began to compose 10% of government budget. After 1960's, as a result of transportation policies based on highways, goals anticipated for railways could not be achieved. Coordination could not be enabled between sub-systems of transportation and investments made on highways sustained its effectiveness. In the beginning of 1970's railway transportation experienced important recession due to establishment of motor vehicle industry, importance given on highway construction, starting ring-road projects and Bosporus Bridge which connects Asia and Europe being put into service (Çetin et al., 2011, p. 137). As a result, only 30 km. new line in average could be constructed per year between 1950 and 1980 (TUSİAD, 2007, p. 117).

With "1983-1993 Main Plan for Transportation" which is the first comprehensive national transportation plan in Turkey it was aimed to decrease highway transportation share from 72% to 36% and increase railway share within freight transportation to 30% but it could not be accomplished.

When the share of transportation types in inland passenger and freight transportation between 1950 and 2010 are observed (Table 1) the recession in railway transportation and importance given to highway transportation can be seen (TCDD, 2011: 9).

Table 1: The Share of Transportation Types in Freight and Passenger Transportation: 1950-2010 (%) (TCDD, Railway Sector Report, 2011)

2009	89,1	5,1	5,8	No Data	97,9	1,6	0,4	No Data
2010	88,9	5,3	5,9	No Data	97,8	1,6	0,7	No Data

Investments in transportation sector being based on highway from 1950 until 2003 brought together structural problems such as inadequacy of railway lines, low standards of infrastructure, inadequacy of railway vehicles in number and quality, scarcity of lines with signal and electric, inadequacy of expert staff and problems experienced in integration and competition with other transportation types (TCDD, 2011, p. 9).

When the current situation in railway transportation is evaluated in Turkey, it is seen that of all 81 cities only 37 of them are connected with railways. 28% of the population does not have railway access. There is no railway connection in some of the most important industrial and commercial cities such as Bursa. There is no railway connection of specific harbors such as Trabzon in The Black Sea, Antalya in the Mediterranean and Tekirdağ in The Aegean Sea. These harbors which cannot make railway connection with their hinterlands are not able to use their potential in transportation of both passengers and freight (Ülgen et al., 2007, p. 138).

With the funds provided for TCDD (Turkish State Railways) between 2003 and 2011 which is the basic executive organ in railway transportation, it was aimed to enable economic and secure railway transportation and increase share of TCDD in transportation of passengers and freight by increasing its competition power against other types of transportation. In this scope, aims were determined in order to put high-speed train lines into operation, enhance current lines and vehicle parks, targets were detected for private sector to carry out railway management and these aims were achieved considerably. In this frame, by the end of 2011 TCDD has 11.112 km. conventional line; 8.770 km. being conventional mainline and 2.342 km. being secondary line and 888 km. high-speed train line; 872 km. being high-speed train line and 16 km. being high-speed line within station, thereby has 12.00 km. railway line in total (TCDD, 2011, pp. 9–14).

Positive results were taken from studies carried out in order to involve private sector into railway sector, which is amongst the aims of TCDD; while the number of wagons belonging to private sector and operated on TCDD lines was 771 in 2003, this number increased up to 2.870 as of 2011. Transportation made by wagon belonging to owners in 2011 reached 5, 6

million tones and its rate within total transportation reached 25% (TCDD, 2011, p. 19). As a result, as a natural result of unplanned practices, there has been serious imbalance between types of transportation, highway transportation became important both in transportation of passenger and freight. This situation not only caused increase in transportation costs but also resulted in traffic density on highways and increases of traffic accidents which results in important loss of life and property.

Within the scope of 9th Five-Year Development Plan for 2007–2013 period, it is seen that railway transportation is given more important within transportation policies. In this frame, practices were initiated in order to consider system holistically in forming an effective transportation infrastructure and improve important harbors as logistic centers by shifting freight transportation toward railways (DPT, 2006, p. 70). Studies upon plan and actualization of logistic centers within TCDD have been carried out since 2007. Logistic centers are specific centers where all the activities about transportation, logistic and freight both in national and international level are conducted by various operators. Transportation focuses on intermodal activities and logistic activities in logistic centers and these centers are generally chosen from regions which are out of metropolitan areas and close to different types of transportation (Gülen, 2011, p. 143).

Within the scope of 9th Five-Year Development Plan, there were also issues discussed such as developing private sector train management on railways and liberalization in making use of managem1ent mentality of private sector; initiation of passenger transportation by high-speed train on a core network Ankara being the center and then through İstanbul-Ankara-Sivas, Ankara-Afyonkarahisar-İzmir, Ankara-Konya corridors and application of public-private sector cooperation in construction and management of lines to be built on these networks (DPT, 2007, p. 71). The legislation about inclusion of third person in State Railway line which terminates the monopoly of TCDD in passenger and freight services was put into force in April, 2005. However it is seen that application mechanisms in this area are not sufficient (Gülen, 2011, p. 113).

The most important project about railways in Turkey which is in progress is the project Marmaray which connects Europe to Asia through a railway tunnel passing under Bosporus. Currently Marmaray is one the main projects of transportation infrastructure throughout the world. With Marmaray it is aimed to relieve traffic flow in the city by transportation of 75.000 passengers per hour with 440 wagons on 76 km. railway line and increase the duration of travel between two sides (Ülgen et al., 2007, p. 138). With the actualization of projects such as Marmaray which is an important step towards adjustment with high-speed trains of European Union, Ankara-İstanbul High-Speed Train, Kars-Tbilisi Projects; it is expected to enable direct, fast and economic railway connection from Europe to Asia, from West to East (TCDD, 2011, p. 21).

There are various transportation networks which are alternatives of each other throughout the world. Considering together with the fact of globalization, it is not possible to think different regions of world independent from each other. This dependency should not be ignored in configuring transportation infrastructure and networks which have private importance in providing benefit of time and space for goods and services. International transportation networks which were built within this frame have great importance in the sense of transportation sector in Turkey. Turkey is on the transition point in international railway networks and included in two main projects of transportation network. The first one is the

Project of Trans Asian Railway – TAR. This is a project which was started in 1960's and connects 28 Asian countries between Singapore and Turkey uninterruptedly with 114.000 km. railway network. The main purpose is to provide effective railway transportation service in freight and passenger transportation between Asia, Pacific and European regions. Another important purpose of the project is to create added value by way of providing harbor connection to shoreless countries (UESCAP, 2009, p. 1). The second one is Trans-European Railway Project- TER in Europe. The project which was started in 1990 aims to improve infrastructure of railway transportation, provide standards about railway transportation among countries, use recent technologies about railway transportation (UNECE, 2006, p. 58). There is a requirement for important railway projects in order to enable functionality to Turkey, which serves as a bridge due to its geographic location and provide sustainability of transportation networks between Europe-Asia. Projects carried out in this scope, as observed in Map. 1, are Marmaray whose construction has started, İstanbul-Basra Railway, North Railway, Hejaz Railway, Southeast Asia Railway, Kars-Tbilisi, Baku Railway, Caucasian-Samsun-Basra Railway corridors (TCDD, 2011, p. 20–21).

4 FUTURE EXPECTATIONS ABOUT RAILWAY TRANSPORTATION IN TURKEY

7 data about sector were used in order to put forward expectations about railway transportation in Turkey. These are "number of stations" on railways, "length of lines", "netton", "freight income", "number of passengers", "passenger income". For data, first of all stationary was analyzed with unit root rest with a structural break. Then, the suitable model was chosen according to absolute and relative error statistics. Finally, compatibility of models with data was analyzed (ex-post analysis) and future estimations of these models were made (ex-ante analysis).

4.1 Unit Root Test with a Structural Break

Perron (1989) proposed a unit root test allowing for a structural break with three alternative models: crash model, changing growth model and the change both in the intercept and the slope. Several studies have found that the conventional unit root tests fail to reject the unit root hypothesis for the series that are actually trend stationary with a structural break. On the other hand, the Perron (1989) test has been generally criticized for treating the time of breaks as exogeneous. Zivot and Andrews further developed the Perron unit root test that considers the breakpoint as endogenous. To test for a unit root against the alternative of trend stationary process with a structural break both in slope and intercept.

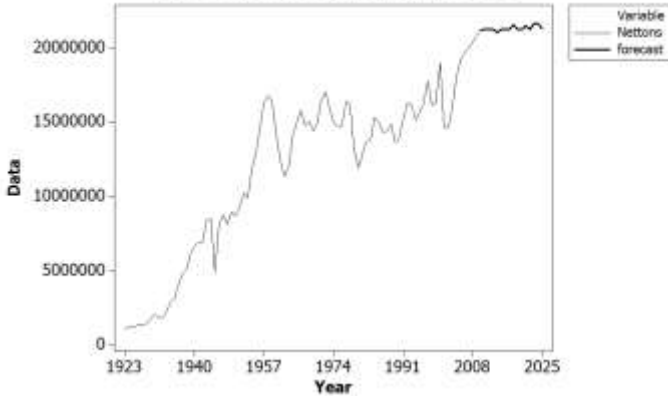
Table 2: The Zivot and Andrews Unit Root Test results

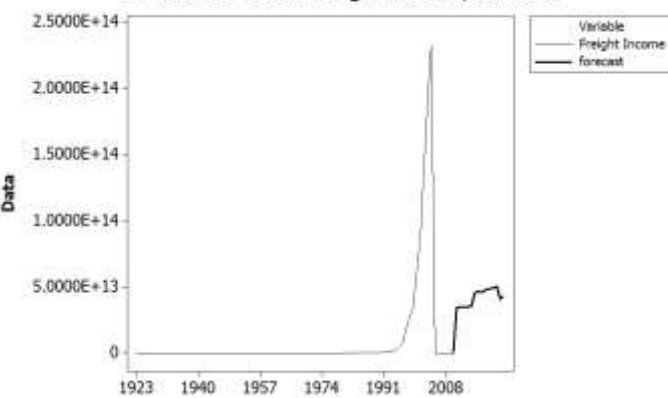
Series	T'_B	Lag	μ	θ	B	Γ	α	SSR
Number of Station	1988	5	14.050 (5.05)	-0.123 (-4.93)	0.085 (6.48)	-0.015 (-5.47)	-0.64 **(-5.1)*****	0.0312
Line Length	1974	4	10.256 (8.58)	0.125 (7.84)	0.036 (5.23)	-0.065 (-3.42)	0.245 **(-6.89)****	0.0135

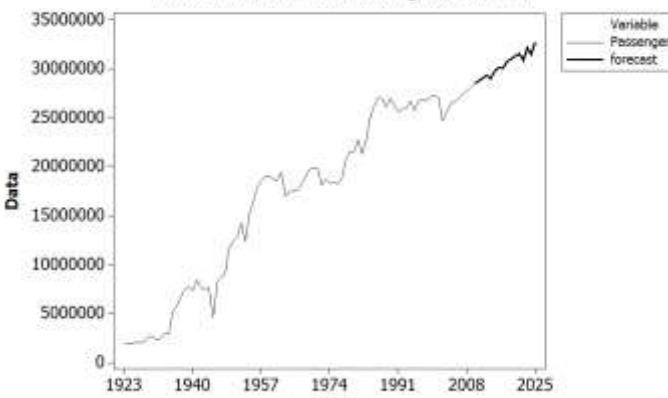
The numbers in parantheses are t-statisics. The t-statistics for α is for testing α = 1. (***) and (**) denote significance at 1% and 2.5% levels respectively, using the critical values from Zivot and Andrews table

As can be seen from Table 1, there is strong evidence against the unit root hypothesis. The ZA results indicate that the breakpoint occurs in 1988 for Number of station series, in 1974 for Overall total series, in 1974 for line length series, in 1932 for passenger wagon series and

in 1974 for freight series. To find out whether the inferences are affected by a different lag length procedure, the Schwarz bayesian criterion, as suggested by Lee and Strazicich (2001) was also used to determine the lag length. The break point was determined by the minimum SBC value. Then, the SBC-based unit root test was conducted by the t-statistic testing the null hypothesis $\alpha=1$. The minimum SBC's indicate same breakpoints in ZA procedure.

Table 3: Appropriate Models for Series






Series	Model	Series	Model
Number of Station	SES	**Passenger**	ARIMA(1,1,0)
Line Length	Linear Trend	**Freight**	AR(1)
Nettons	ARIMA(1,1,0)	**Freight Income**	ARIMA(1,1,0)
Staff	AR(1)		

Results of ex-ante analysis of 7 data observed in order to make prediction for railway transportation of passenger and freight until 2025 in Turkey are given in Table 4.

Table 4: Ex-ante Forecasts

	When the structure of series is observed, it is seen that there is an increase until 1970's. As a result of transportation policies based on highway between 1970 and 2000, railway has lost importance and many terminals and stations became inactive. With the beginning of high-speed train project in 2005 and the importance given to railway, it is expected that effectiveness of terminal, station and train stops which were built by TCDD and operate in the current situation would increase. ARMA (1, 1) model is suitable for the period until 2025.
	Transportation policies based on highway in 1970's decreased construction of railway line importantly. As a result of policies adopted in 2005 and afterwards, and actualization of short and medium term projects and concentrating on railway investments within transportation types; increase trend is expected in main lines. This result was attained by using linear trend model for the period until 2025. The trend of series in 1923-2010 will continue until 2025.

Challenges of the Modern World - Contemporary Economy and Globalization

Time Series Plot of Nettons; forecast

Transportation policies based on highway in 1970's caused important decrease in netton amount. Policies applied within the frame of 8th Five-Year Progress Plan caused increase in netton amount after 2005. This situation is expected as an increase trend until 2025 with the actualization of planned projects. This increase trend in series was found considering ARMA (1, 1, and 0) time series model. This situation would also cause increase in freight income.

Time Series Plot of Freight Income; forecast

As a result of stagnation analysis made for series it was concluded that series was stationary within time. ARMA (1, 1) model was suitable for future foresights of series.

Time Series Plot of Passenger; forecast

Within the scope of expectations until 2025, an important increase is expected in the number of passengers. The main reason of that can be defined as completion of high-speed train projects and actualization of them in short and medium term. At the same time, planning railway investments in intracity transportation would increase number of passengers. An increase in passenger number is also expected according to this. This expectation supports past values of series. As a result of analysis, ARIMA (1, 1, and 0) model was used for future estimation.

As a result of stationary analysis done for series, it was concluded that series was stationary within time. ARMA (1, 1) model was found to be

Challenges of the Modern World - Contemporary Economy and Globalization
Time Series Plot of Passenger Income; forecast 	suitable for future foresights of series.
Time Series Plot of Staff; forecast 	In the graphic, there is a decrease in the number of TCDD staff after 1974 and important increase is expected in staff number until 2025. The series display typical auto correlational structure between 1923 and 2010. It is seen that this structure will continue until 2025. Despite the aim of increasing investments in railway transportation, it is thought that not achieving important increase in staff number would not have negative effect in sector economically. Because it is thought that apart from technological developments, staff of TCDD which is open to competition due to privatization would be more efficient. In fact, although staff number does not increase much, the expectation of increase of passenger and freight income, as mentioned before, supports this thought.

Results of ex-post and ex-ante analysis of these data about railway passenger and freight transportation in Turkey are summarized in Table 5 in five-year periods.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 5: Ex-Post and Ex-ante Forecasts

Series Name	2000	2005	2010	2015	2020	2025
Number of Station	908	718	725	**825**	**850**	**885**

5   RESULT AND SUGGESTIONS

The intensity of highway transportation is high compared to developed countries and EU member states. However, since infrastructure about railway and seaway in Turkey is far behind the developments in highway, highway transportation is in the foreground. It is expected that this situation would continue in short and medium term. However in long term, it is expected that studies of EU in order to decrease intense usage of highway transportation in the process of transition to combined transportation would influence Turkey as well and the intensity of highway transportation would decrease in time.

"Sustainable transportation policies" gain importance that would direct environmental-friendly developments against externalities of highway traffic such as jam, accidents, noise and air pollution. In this sense, improvement of becoming widespread of high-speed trains make railway a preferable alternative against highway and airway especially in middle distance intercity travels.

In this respect, in order to sustain its economic, social development in long-run Turkey should improve its technological skill and direct production and exportation towards manufactured product which have high added value and intense information-technology through physical and human capital investments that would renew technological basis of industry. For an industrial-based growth which has high competitive power and depends on technological development and efficiency increase; first of all development strategy, industrial and technological policies and national innovation systems are required. Direction/arrangement of these processes which require a radical transformation and creation of a suitable environment depend on forming well-functioning corporations and a developed corporation capacity (Eser, 2006, pp. 244–245).

Railway management is traditionally done by public which is in monopoly position and is continuously subsidized by public due to operating losses. Sector's inability of reaching necessary effective operation structure due to absence of competition environment and public funding allocated for the sector becoming no longer sustainable impel states to establish competition in the sector and actualize arrangements that would enable private enterprises take place in the sector (Özcan, 2006, p. 1058).

New railway era emerges with a new development line that passes through three different stages ensuing each other with easterner practices in the world. These stages are respectively

restructuring of railways such that would firstly solve structural problems in a way suitable to transportation market conditions in changing world; "commercialization and making use of flexibility and boldness of private enterprise within this competitiveness" in order to improve competition opportunities with highway transportation which is improving rapidly and about to become monopoly and privatize in order to minimize consumption of public resources (Duman, 2006, p. 1042).

As a result of increase in importance given to costumer demands, competitive element taking primacy, emergence of globalization, change in information technologies and improvement of communication opportunities, increase of environmental awareness; transportation sector shows great alteration structurally.

In the future it is expected that traffic shifts from highway to railway as a result of railway transportation sustaining its improvement and increase of awareness of public opinion for environmental issues. In order to make use of these positive improvements, railways should make amendments in service quality, comfort, reliability and price and take measures in order to increase its competitive powers.

Developing "combined transportation" which is formed with the concept that transportation systems are used together in a way that would complement their superior aspects and making connection between railway and other transportation systems, actualization of logistic centers accordingly would increase the share of railway transportation for future periods.

Challenges of the Modern World - Contemporary Economy and Globalization

SOCIAL SECTOR DEVELOPMENT IN INDIA

Dipak Dayanand Shinde

Department of economics arts & commerce college, India
deep10shinde@gmail.com
deep10shinde@yahoo.co.in

ABSTRACT

Social sector is one of the important sector in the economy because it improves quality of human life as well as help to stimulate the economic development. It is not only improve quality but also make strong, healthy and give power to produce knowledge. Social sector includes such as primary education, public health, housing, drinking water and sanitation etc. Each its own importance and are related with each other. As it is revealed that social sector has not been given due attention during planning area because it has been viewed as less profitable sector, low return as compare to physical infrastructure, which contribute directly to economic growth. The fact is that both these economic and social infrastructure are equally important for achieving balance growth. Economic infrastructure and social infrastructures are inter connected and inter dependent. India has 35 States and UTs and Indian population has 121 corer, therefore it is a huge challenge to develop social sector on ahead of Indian government. However, India has been trying to give more budgetary provision and also give priority to social sector. That is why this study focus on social sector viz primary education, primary health services, housing, drinking water and sanitation. The present paper depends upon collateral (secondary) sources which published by government of India, Private agencies, Books, Journal, Internet etc since 1960 to 2010. In this paper observed that what is present condition of social sector and actual development of social sector such as primary education, primary health services, housing, drinking water and sanitation. Moreover, this paper studied about all states and UTs statistical data which published by government of India. Moreover all of the indicators observed and at the end of concluded and give some suggestion for better development of social sector. Earlier social sector has been viewed as unproductive sector. However, in recent years, it has been recognized that it contributes to economic development directly as well as indirectly. Improvement of quality of education, skill, health, housing condition has closed linked with economic development. Therefore, government has paid more attention to develop this sector. Social sector expenditure was inadequate as compared to the size of the problem. There has been declined trend in the budgetary allocation of both the central and state governments for various sub-sectors of the social sector, especially health and education. There was wide disparities in social sector in terms of economic and social indicators in rural and urban area of India. Social sector development in India has positive trend but it is not reached at expected level.

Keywords: Development, Education, Health care, India, Indicators, Social sector

1 INTRODUCTION

Social sector is one of the important sector in the economy because it improves quality of human life as well as help to stimulate the economic development. It is not only improve quality but also make strong, healthy and give power to produce knowledge. Social sector includes such as primary education, public health, housing, drinking water and sanitation etc. Each its own importance and are related with each other.

Challenges of the Modern World - Contemporary Economy and Globalization

As it is revealed that social sector has not been given due attention during planning area because it has been viewed as less profitable sector, low return as compare to physical infrastructure, which contribute directly to economic growth. The fact is that both these economic and social infrastructure are equally important for achieving balance growth. Economic infrastructure and social infrastructures are inter connected and inter dependent. Human resources and its contribution to growth is necessary at every stage of development. It is therefore, apparent that it is the quality of the people in the terms of their health and education that constitutes the very important sub-sectors of a modern economy popularly termed as the social infrastructure. Economists, such as Marchall, Schultz and Mrydal have emphasized the role of man in the process of development. Development efforts according to them should, therefore, first be to raise in raising the quality of this man in form of his health, education, housing, water etc. Since it is this man who forms the basic engine of growth. However, this sector has captured the attention of the policy makers only recently. This occurred particularly when the policy makers often faced with the inability to attain the goals of development and were confronted with the numerous obstacles and constraints in the path of development. As a result, attention has gradually started shifting from a capital dominated investment policy to the neglected social sector. Education, health, housing, water and sanitation constitute the sub-sectors of the social sector. Thus, the development of these sub-sectors is essential for the overall development of a country.

1.1   Research Methodology

India has 35 States and UTs and Indian population has 121 corer, therefore it is a huge challenge to develop social sector on ahead of Indian government. However, India has been trying to give more budgetary provision and also give priority to social sector. That is why this study focus on social sector viz primary education, primary health services, housing, drinking water and sanitation. The present paper depends upon collateral (secondary) sources which published by government of India, Private agencies, Books, Journals, Internet etc since 1960 to 2010. In this paper observed that what is present condition of social sector and actual development of social sector such as primary education, primary health services, housing, drinking water and sanitation. Moreover, this paper studied about all states and UTs statistical data which published by government of India.

1.2   Trends in India's Social Sector Expenditure

Central government plan and non plan expenditure on social services and rural development has consistently gone up over the years . It has increased from 13.38 percent in 2006-7 to18.47 per cent in 2011-12. Which include education, sports, art and culture, medical and public health, family welfare, water supply and sanitation, housing, urban development, welfare of SCs, STs and OBCs, labour and labour welfare, social security, nutrition, and relief for natural calamities. In recent years government (central and state) expenditure on social services has shown increasing trend. It has reflecting the higher priority given to this sector. Expenditure on social services as a proportion of total expenditure increased from 21.6 per cent in 2006-7 to 24.1 per cent in 2009-10 and further to 25 per cent in 2011-12. As a proportion of the gross domestic product (GDP), its share increased from 5.57 per cent in 2006-7 to 6.76 per cent, 6.91 per cent, and 7.34 per cent in 2008-09, 2009-10, and 2010-11 respectively. India face the global crisis without much adverse impact on the social sector. In 2011-12 it is expected to be 6.74 per cent as per the BE

2   PRIMARY EDUCATION

The government has initiated many schemes for elementary and secondary education. In India Free education for all children between the ages of 6 and 14 years. India has been made a fundamental right under the Right to Education (RTE) Act 2009. While the RTE Act with effect from 1 April 2010 was issued on 16 February 2010. It mandates that every child has a right to elementary education of satisfactory and equitable quality in a formal school which satisfies certain essential norms and standards. The reform processes initiated in 2010-11 continued during the year 2011-12.

2.1   Expenditure on Education

In view to fulfill the objectives of educational programmes/ schemes government has been spending financial resources over time. Because primary education has been considered on priority basis. Hence, there has been increasing trend in making available financial resources to the educational programmes/schemes. The statistical data reveals that the education expenditure was Rs. 58.7 crores during 1961-66, which was increased to Rs. 2976.6 crores during 1980-85 and further increased to Rs. 2316.5 crores in 1990-91 in India and Rs. 11690.5 crores in 2000-01 and Rs. 31420 crores in 2008-09. In relative term, it shows that expenditure on education as percentage to total expenditure increased from 2% to 8% during 1961 to 2008-09 in planning period. While expenditure on education as a proportion of GDP has increased from 2.72 per cent in 2006-7 to 3.11 per cent in 2011-12.

2.2   Progress of Primary Education

In earlier section, it was revealed that various programmes and schemes are being implemented by government. Government has also made financial resources for primary education. Consequently, the position of primary education has improved during planned period, there were 330399 primary schools and 49663 upper primary school in India in 1961 showed 36.54% and 72.62% change respectively over 1951. Similarly, in 1981 there were 494503 primary and 118555 upper primary schools, which showed 17.32% and 23.56% change. Further there has been increased 638738 primary and 206269 upper primary schools in 2001, which was increased by 11.71% and 24.41% over 1991. It was observed that number of primary schools increased by 64.73% during 1961-2009. Thus, keeping in view increasing demand for primary as well as upper primary education, number of schools has been increased significantly during planned period.

2.3   Gross Enrolment Ratio

Enrolment ratio is most important factor at school level because it reveals children attitude toward education. It was observed that gross combined enrolment ratio was 42.6% at primary school, 60.6% for boys, 24.8% for girls in 1950-51, which increased to 62.4%, 82.6% for boys and 41.4% for girls in 1960-61. Further, it was increased 100.1%, 114% for boys and 85.5% for girls. Again, it was increased to 111.24 %, 114.42% for boys, 107.84% for girls in 2006-07. At upper primary level, it showed that 12.7% upper primary school enrolment out of these 20.6% for boys and 4.6% for girls enrolment ratio in 1950-51, which had increased to 62.1% in 1990-91 and 73.63% in 2006-07 of which 77.41% boys and 69.1% girls enrolment. At elementary level (I to VIII) the enrolment ratio increased from 32.1% in 1950- 51 to 67.5% in 1980-81 and 96.7% in 2010-11. As compared to girls, enrolment of boys remained higher as compared to girls, though it has been increased. Moreover, state wise enrolment ratio shows that enrolment ratios were higher in states such as Arunachal Pradesh, Goa, Gujarat, Himachal Pradesh, Madhya Pradesh, Maharashtra, Manipur, Meghalaya, Tamilnadu, Tripura.

Thus, it reveals the fact altogether states governments have given priority to improve the condition of primary education through implementing various programmes/schemes.

2.4   Gross Drop Out Ratio

Children's high dropout rate at schools reveals the fact that it basic literacy and numeric skills to children. In 1960-61, boys dropout rate was 61.7% and girls dropout rate was 70.9% in primary level school and in upper primary level school, boys dropout rate was 18.8% and girls dropout rate was 25.6%. In 1980-81, primary level boys and girls dropout rates were 56.2% and 62.5%. In 2004-05, dropout rate for boys was 31.8% and for girls it was 25.4% at primary schools. It also revealed that dropout rates both for boys and girls have declined over a period of time. The position at upper primary education level, dropout rate was increasing to 68% and 79.4% for boys and girls in 1980-81 respectively. Similarly, in 1990-91, dropout rate was 59.1% for boys and 66.1% for girls which had decreased to 50.3% for boys and 57.9% for girls in 2000-01. It was observed that girls dropout rate was very high than boys during 1960-61 to 2004-05. Thus, overall picture shows that though dropout rate was high however it has declining trend during 1960 to 2005

2.5   Literacy Rate

Literacy rate is considered one of the most important indicators to measure the level of human development. Literacy rate is one of the important characteristics of population. It is essential for social reconstruction, improvement in the quality of life and preparation of manpower of rapid development. A certain level of literacy is, therefore, a basic requirement for people to get out of ignorance and backwardness. Indian census of 2001 defines literate as " a person aged seven and above who can both read and write with understanding in any language.". It was observed that overall literacy rate of India was 18.33% in 1951 and which increased to 28.30% in 1961, 34.47% in 1971, 43.57% in 1981, 52.21% in 1991 and 64.84% in 2001. As per 2011 census India's literacy rate has reached at 76%.

3   HOUSING

Housing is one of the basic requirements for human survival. For a normal citizen owning a house provides significant economic and social security and status in society. For a shelter less person, a house brings about a profound social change in his existence, endowing him with an identity. Housing Scheme was also launched as part of the Community Development Movement in 1957. In 1972-73, the Estimate Committee of the Loksabha in its 37th Report had pointed out that 83% of India's population lives in villages and about 73% of the rural population reside in unsatisfactory *kutcha* structures the problem of rural housing has not receive the close attention of the Government. Following this, certain initiatives were undertaken by Government including the launching of the House sites cum construction Assistance scheme, which began as a central scheme in the 4th plan and was transferred to the state government with effect from 1974 on recommendation of the National Development Council (NDC). Government has been initiating various scheme for rural and urban area. Indira Awas Yojana is one of the most important scheme started by government of India.

3.1   Occupied Households, Residential houses and Deficit in Houses

Housing is the most important parameter to measure the social sector development. In India, there were 65.9 million households, which increased to 84.5 million in 196 and further increased to 100.4 million in 1971, 119.8 million in 1981, 152.0 million in 1991 and 193.6 million in 2001. Urban rural break up shows that there were 53.6 million rural households and 12.3 million urban residential households in 1951. While in 2001, there were 137.7 million

rural households and 55.8 million urban households with respect to shortage of houses it showed that it was 1.5 million in 1951, which increased to 5.6 million in 1961 and 5.0 million in 1991 and further increased to 6.4 million in 2001. Urban rural position showed that the shortage of houses in rural areas was 3.8 million in rural areas and 18 million in urban areas. In 2001, there were 2.6 million of shortage of houses in rural areas and 3.7 million in urban areas. Thus, it showed that India has facing problem of shortage of houses both in rural as well as urban areas.

3.2 Occupied Housing Units by Number of Rooms in India

As per 1981 census, there were 1186.14 lakh units occupying the different rooms in India. Out of the total units, 44.7% were having the houses with one room and 28.9% were having two rooms, 12.2% having three rooms, 6.3% units with four rooms and 5.8% units had five rooms. Moreover, in 1991 occupied units were 1510.32 lakh of which 40.5% units had one room, 13.6% units had two room, 7% units had three room7.2% units had four room, 7% houses had five room. Similarly, total 1919.63 lakh were occupied units in 2001. Of these, the number units in with one room were 38.5%. According to 2001 data there were 30% units as well as 14.3% units having the two and three rooms also 7.5% and 6.6% units were having four and five rooms respectively. Thus, it is fact that majority of houses had one and two rooms, not much suitable for residential purpose.

4 PUBLIC HEALTH SERVICES

4.1 Expenditure and Progress of Health in India

India incurs expenditure on various heads like establishments, which is called as establishment grant, medicines, transport, continuity, and others. The total expenditure made on these heads is but under total recurring expenditure. The expenditure incurred on equipments is put under nonrecurring expenditure. In 1961-66 the Health department of India incurred Rs. 225.9 crores expenditure on health, percentage was 2.6. Moreover in 1974-79, there were 760.8 crores expenditure on health, percentage was 1.9, which has decreased to 1.8% in 1990-91, similarly, during 2000-2001 expenditure was increased to Rs. 4055.3 crores in 2003- 2004, health department expenditure on health was Rs. 4649 crores, in 2008- 09 expenditure on health was Rs.5201 crores. Thus, it showed that five year plan expenditure on public health has increased considerably in India during 1961-2009. Moreover, expenditure on health as a proportion of GDP has increased from 1.25% in 2006-07, which has increased 1.30% in 2011-12. Therefore health expenditure has not yet reached at expected level.

4.2 Progress of Primary Health Centres, Sub Centres, Community Health Centres

India has three tier system available in rural area for rural health i.e. community health centre, primary health centre, health sub centre. Comunity Health Centre for 120000 population and Primary Health Centre for 30,000 population and one sub centre for per 5000 population are providing medial services in plain areas. Also per 80000 population one Community Health Centre and per 20000 population one primary Health Centre and per 3000 population one Health Sub Centre providing medical services in hilly and tribal area.It showed that there were 4793 primary health centres in 1957, which has increased to 5015 in 1970. There were 5293 primary health centres, 33616 sub centres in 1975, which increased to 5484 primary health centres, 47112 sub centres, and 214 community health centres in 1980. There were 9115 primary health centres, 84376 sub centres and 761 community health centres in 1985, which has increased to 18671 primary health centres, 130165 sub centres, and 1920 community health centres in 1990. Further, there has been increased primary health centres

22149, sub centres 136258 and community health centres 2633 in 1997. In 2001, there were 22842 primary health centres, 137311 sub centres and 3043 community health centres working, which has increased to 23673 primary health centre 147069 sub centre and 4535 community health centre functioning in 2010 in rural India. Thus, it shows that primary health centres, sub centres and community health centres were increased during planned period.

4.3   Life Expectancy at Birth and CDR and IMR

In India during pre-independence period the Crude Death Rate (CDR) was 47.2 per 1000 population. Male and Female Expectation of life at birth were 19.42 years and 20.91 years and Infant Mortality Rate was 174 in 1921. Further CDR was reduced to 36.3 in 1931, 31.2 in 1941. Expectation of life at birth for Male increased to 26.91 years and for female, it was increased to 26.56 years in 1931. Moreover, it was increased to 32.09 years for Male and 31.37 years for female in 1941. In 1931 IMR was 174, which reduced to 161 in 1941. During post independence period it showed that, CDR rate was 27.4 in 1951 which reduced to 22.8 in 1961, 19.0 in 1971, 15.0 in 1981, 8.9 in 2001 and 7.2 in 2010. Thus, it shows substantial progress in the reduction of CDR. In case of expectancy of life, it was 32.45 years for Male and 31.66 years for female in 1951, which increased to 50.9 years for male and 50 years for female in 1981 and further increased to 62.06 years for male and 64.2 years for female. In case of IMR, it was 146 in 1951, which reduced to 110 in 1981 and 68 in 2001 and 47 in 2010. Thus, overall analysis shows that there has been improvement with respect to CDR, life expectancy and IMR during planned period. Moreover, in view to provide medical services number of doctors also increased. It was 60.84 thousand in 1951, which increased to 153 thousands in 1971, 395.60 thousand in 1991 and 816.63 thousand in 2010.

5   DRINKING WATER AND SANITATION

5.1   Water Supply and Development

Rural and urban water supply and sanitation facilities are vital elements in the over all programme for development other related elements include infrastructural issues like land and watershed management, soil conservation, a forestation of illiteracy, women's welfare, child nutrition, immunization etc. It is desirable that the thrust and implementation of many of these programmes as possible are converged in order to provide for integrated development. Water, which is essential for life, growth and health, can also be source of spread of disease and cause of ill health, if contaminated or improperly handled and stored. Safe drinking water and improved sanitation play a major role in the overall well-being of the people, with a significant bearing on the infant mortality rate, longevity and productivity. The poor, both in rural and urban areas, bear a disproportionate burden of non-availability of water, as well as poor quality. They often supplement public sources of water with supplies obtained at high prices from other sources. Women bear the physical burden of Water. Women and children are particularly vulnerable to the effects of water contamination. Water Born Diseases 70 to 80 percent of illnesses are related to water contaminated water and poor sanitation. The national objectives of reducing mobility and mortality largely depend on the reduction of diarrhea and jaundice. In fact, no water supply and sanitation programme can be successful if water related illnesses are not reduced. It is a matter of concern the despite the progress made with water supply, the level of water related sickness continues to be right. To quote J. B. Pronk "Community water supply is basic need access to drinking water supply is a human right and it is important to stress this human right because many people don't share it".

5.2   Outlays on Rural and Urban Water Supply Programmes

India's 27.27% outlay was incurred on rural drinking schemes 72.73% on urban schemes. During subsequence periods shows that outlay on rural drinking schemes percentage to the total outlay has increased. It was 33.80% during 4th plan, 63.93% during seventh plan and 70.46% in ninth plan. Thus in order to solve drinking water problems, more attention has been given to rural areas. Thus water born and allied diseases are brought under control by establishing protected water supplies and sanitary methods of excreta disposal.

The Tenth Plan envisages provision of safe drinking water to all rural habitations. Two major programmes are being implemented to achieve this objective. These are the Accelerated Rural Water Supply Programme (ARWSP) and the Pradhan Mantri Gramodaya Yojana-Rural Drinking Water (PMGY-RDW). As reported in the last survey, with an investment of over Rs. 45,000 crores, considerable success has been achieved in meeting the drinking water needs of the rural population. There are more than 3.7 million hand pumps and 1.73 lakh piped water schemes installed in the rural areas. During 2003-04, 95 percent or rural habitations have been fully covered (FC) and 4.6 percent are partially covered (PC) and 0.4 percent are not covered (NC) with drinking water facilities.

India has initiating various drinking water scheme. Moreover, India has also various sources of drinking water such as Public/Private tap, tubewell, well, handpump, bore etc. Out of these sources 38.2% were tap/tubewell/handpump available in 1981,of this 26.5% and 75.1% were rural and urban sources available in India respectively. Moreover, in 1991, rural and urban sources were 55.5% and 81.4% respectively and total sources were 62.3% (tap/tubewell/handpump). Which had increase to total 81.4%(tap/tubewell/handpump) in 2001, of which 77.9% were rural sources and 73.2% were urban sources in India. An investment of about Rs. 72600 crores has been made (under both State and Central Plans) from the beginning of the planned area of development in rural water supply sector. As per available information, this investment has helped to create assets of over 41.55 lakh hand pumps, around 15.77 lakh public stand posts, around 1.60 lakh mini-piped water supply schemes, and 45000 multivolume schemes in the country under the Rural Water Supply Programme. Of these systems, 88.21% hand pumps, 93.49% stand posts, 91.95% mini schemes, and 96.26% multi village schemes were reported functional by the States. During the Tenth Plan , the approved outlay for the programme was Rs. 13245 crores. The programme was well funded during the Tenth Plan (being a part of Bharat Nirman programme) and by the end of March 2007, an amount of Rs. 16,103 corers was released to the States under the scheme. On the physical achievement side, 352992 habitations have been reported covered by the States during Tenth Plan.

6   SANITATION

Sanitation is to be seen as a basic need, as basic as drinking water or food. A sanitary toilet, within or near home, provides privacy and dignity to women. Mahatma Gandhi emphasized the link between sanitation and health as key goal for our society. Sanitation coverage, which ought to be a way of life to safeguard health, is inadequate in our country. In fact, problems like open defecation continue to remain for the majority of the population in rural areas. The practice of open defecation in India is due to a combination of factors the most prominent of them being the traditional behavioral pattern and lack of awareness of the people about the associated health hazards. The Cultural Rural Sanitation Programme (CRSP) was launched in 1986. It was restructured in 1999 after which Total Sanitation Campaign (TSC) was introduced. The TSC envisages a synergized interaction between govt, people, NGOs. Tenth

Plan strategy envisages a shift from allocation based programme to a demand based project mode with greater household involvement, intensive of IEC campaign and emphasis on School Sanitation. Under TSC programme, 578 districts from 30 states have been covered. Provision of proper sanitation system in rural areas would contributes to personal hygiene and overall health. The problem has not yet been receiving the required attention in rural areas, the reason being that most of the villagers like to go to the open areas for defecation. For rural sanitation, low costs sanitation systems should be adopted. It is observed that the soak well system is very commonly used in most of the rural areas. Many agencies have attempted to use vernacular disposal systems such as *ulta mataka*, empty tar drums and other coastal areas, a two-pit latrine system based on United Nations Development Programme (UNDP) design is becoming more and more popular and acceptable because of low cost, less consumption of flushing water, no maintenance, availability of good manure and its acceptability by the people. In addition prefabricated Ferro cement tanks, either of cylindrical of rectangular shapes, are also available which can be used in rural areas with economy as septic tanks.

7   CONCLUSION

1. Earlier social sector has been viewed as unproductive sector. However, in recent years, it has been recognized that it contributes to economic development directly as well as indirectly. Improvement of quality of social sector has closed linked with economic development. Therefore, government has paid more attention to develop this sector. Social sector development in India has positive trend but it is not reached at expected level.

2. Position of education, particularly primary education is not good enough against the backdrop of sharp differences across states and persistence of large male, female and rural-urban disparities. There has been improvement in literacy rate during 1961 - 2011 in India. However, it is not at desirable level. Moreover, female belonging to backward communities are lagging in this regard.

3. Enrolment in primary school has increased during planned period which show the success of education schemes beings implemented by government. However, Enrolment rates of boys and girls in rural areas have not increased at expected level in rural areas. As compared to enrolment rate of boys, enrolment rate of girls remained low.

4. Moreover, India, drop out rate was declining period during 1960 to 2005, however, it was achieved as per expected, drop out of girls was high than boys drop out rate in India.

5. In view to meet increasing demand for primary education in rural and urban areas, number of schools has increased in India However, there has been shortage of primary schools in backward and mountainously area.

6. Shortage of housing in the country is serious problem and has been increasing year to year due to increasing population in rural and urban areas Housing problem has been remained serious issue in rural as well as in urban areas especially for all economically weak and socially backward communities.

7. Government of India has taken various direct initiatives to provide shelter by launching number of schemes like Indira Aawas Yojana, which has been implementing at wider scale in India. In fact, this scheme has made substantial progress in providing houses to BPL families. Yet desirable success has not been achieved.

8. More importantly, houses provided under this scheme are small in size, not much suitable for residential purpose as per family need because financial resources are limited.

9. Under nutrition and malnutrition coupled with high morbidity are serious problem, which affect adversely the quality of health in spite of the fact that health expenditure has

increased during planning period in India .The intensity of this problem has increased due to continuous increasing population, though there has been dealing trend in birth rate.

10. There has been improvement in life expectancy in India. It was caused to improvement and progress of health facilities in rural area and urban areas. In India communicable diseases such as polio, tuberculosis, malaria are under controlled of larger extent. Moreover, treatment for diseases like as heart, diabetics, cancer has been improved. Still there is serious problem with respect to AIDS diseases for which effective medical treatment not developed. Thus, India has achieved success in health sector, yet not attempts to will have to paid on health sector particularly in rural areas with respect to childcare, pregnancy and improvement in health services to be provided to BPL families.

11. It was observed that Primary Health Centres, Sub Centres, Community Health Centres were increased during planning period. In order to achieve objectives set under National Health Mission, health expenditure has to increased. Consequently, there has been improvement in public health facilities. However, these facilities were not adequate to meet increasing demand for medical facilities. Moreover, there has been gap between the actual availability of Medical facilities and their utilization due to lack of awareness among pourers in rural areas.

12. At present, the drinking water supply is made available to 86.74% of the rural population and 85% of urban population of India. However, these facilities were not adequate. In fact, during summer season this problem becomes more serious. Moreover, create additional burden on women in rural areas in getting drinking water far away from village.

13. Moreover, there has irregularity in supplying drinking water through public schemes due to load shading of electricity. In fact, irregularity and uncertainty in electricity supply has affected adversely the proper functioning of government schemes.

14. 70 to 80% of illnesses are related to water contaminating and poor sanitation use of chemical fertilizers, chemicals, poor hygienic environment of water sources, sewage and solid waste in India has made water more polluted, which in turn resulted in water born diseases.

REFLECTION OF POVERTY AND SOCIAL EXCLUSION IN THE CHANGED SOCIOECONOMICS CONDITIONS IN THE SLOVAK REPUBLIC

Silvia Sipikalova

University of Economics in Bratislava, Faculty of National Economy, Department of Social Development and Labour, Slovakia
silvia.sipikalova@euba.sk

ABSTRACT
There is the poverty and the social exclusion problem in the centre of interest of the social policy and research in the EU countries and beyond. New social risks associated with the labor markets unstable development, the family institution conversion and destabilization, the growing migration, as well as with the social state role restriction, led to the poverty and the social exclusion levels deepening in the EU economically developed market countries, too. In the strategic document Europe 2020 one of the targets is oriented to poverty and social exclusion. The aim is decreasing the number of people living in the risk of poverty or social exclusion about 20 000 000. The Slovak Republic is obligated to reduce the number of people living in the risk of poverty or social exclusion by 170 000. According statistical finding EU SILC 2011 the poverty rate increased about 1 percentage point (13 %) compared previous survey. The paper deals with the poverty and the social exclusion phenomenon in the Slovak Republic and measuring approaches to these categories. The statistical finding EU SILC is the harmonic detection main tool in the field of the poverty and the social exclusion in the EU. The author mentions the importance of the national indicators, what reflect the country specificities after the realized analysis of the social indicators of the poverty and the social exclusion. Besides the poverty main income indicators should be received further indicators, what allow to take into account the multidimension of the poverty and the social exclusion problem. In the paper there are suggested the ideas for the poverty and the social exclusion reduction. The solution is in macroeconimic development, in the citizen activation, the education, as well as in the enterprises and individuals social responsibility.

Keywords: EU SILC, Poverty, Poverty rate, Social exclusion, Social inclusion

1 INTRODUCTION

Despite differences in the specific historical experiences, the Member States of the European Union are based on certain common values: freedom, democracy, social justice, respect for human rights and dignity, equality, solidarity and social dialogue. Considering these values, the EU has set the objective to adopt decisive measures to reduce poverty, already at the beginning of the implementation of the document Europe 2020. Nevertheless, the poverty (relative) is present in all Member States and represents very diverse phenomenon having risk factors unequally distributed within the society. However, at the present, it is not only the lack of adequate income in the centre of attention, but mainly processes and mechanisms of social exclusion. In the following sections we will focus on approaches to measure poverty and social exclusion in the Slovak Republic and possible measures to poverty reduction. The paper is a part of the research project VEGA 1/0330/11 Social inequalities and their regional dimension in the Slovak Republic.

2   APPROACHES TO POVERTY MEASUREMENT IN SLOVAKIA

There is no legislative definition of the term poverty in the Slovak society and official statistics did not show the number of poor people until the accession of Slovakia into European Union as it is for instance reported in the European Union by Eurostat. There were more synonyms for the poverty used in Slovakia, such as underprivileged people, socially dependents, low-income households and especially the concept of material need meaning actually the poverty. Therefore, the next section describes the social dependence of citizens and help for people in material need.

The social dependence has been legalized for the first time in our legislation in 1991 by adoption of a Decree on the Social Dependence. This has defined socially dependent citizen as a citizen with an income of less than the sum of amounts required to provide food and other basic personal needs without possibility to increase this income by employment because of his age, health status or other serious reasons. Subsequently, the Act on a Subsistence Minimum has been adopted specifying the subsistence minimum as "socially recognized minimum level of the income of a citizen, which when failed to be reached leads to the status of a material need". Hence, the material need means the status, when the income of a citizen does not reach the level of a subsistence minimum set by a special regulation. This definition was too narrow (financial poverty) to cover all dimensions of poverty.

A new Act No. 125/1998 on the subsistence minimum and on the specification of amounts for the purpose of social benefits was adopted in 1998. This was based on a civil principle emphasizing the responsibility of a citizen for his unfavourable life situation. In terms of current practice in Slovakia it represents socially accepted limit of net cash income that should provide a household with temporarily coverage of its needs on very low level. These include expenditures for routine needs, such as nutrition, basic personal needs, spending on household operation allowing the reproduction of basic needs and minimum social contacts. Thus formulated concept of a subsistence minimum assumes that it is possible to live only temporarily in this conditions and that there is a real possibility to improve the material status of a citizen by his own activity. The subsistence minimum served as the basis for the calculation of social benefits. The Subsistence Minimum Act and subsequently adopted Act No. 195/1998 on Social Assistance as amended specifying the application of the above mentioned act has determined three levels of subsistence minimum and hence also the differentiation of social benefits. The criterion for classification was the fact, whether the unfavourable situation of the citizen was caused by him for objective or subjective reasons.

a.) A citizen being in a material need for objective reasons and having no income from the employment was given the social benefit complementing his income to the value of subsistence minimum.

b.) Another level of a subsistence minimum was a social minimum belonging to citizen in material need for objective reasons and having income from an employment. Such citizen was given the social benefit complementing his income to the level of 120 % of a subsistence minimum.

c.) The lowest level of the subsistence minimum was represented by the existence minimum granted to the citizen in material need for subjective reasons. The social benefit complemented his income to the level of 50% of a subsistence minimum. Existence minimum was to provide for basic living conditions, namely one hot meal per day, necessary clothing and housing.

However, this structure did not consider sufficiently high rate of unemployment on one hand and a low job creation on the other.

The amendment of the Social Assistance Act in 2000 changed the setting of the social benefit for objective reasons. The social assistance benefit was determined firmly in the amount complementing the income to the specified level. Gradual disconnecting of social benefits from the subsistence minimum concept was caused by increasing number of beneficiaries, hence creating pressure on the state budget. There were significant changes carried out in the system of social assistance.

The Act No. 599/2003 on Assistance in Material Need from 2003 replaced the Social Assistance Act of 1998 in the area of financial support for poor. One of the objectives of the Act was to facilitate and introduce the transparency into provisioning of social benefits: the Act removed the differentiation of subjective and objective need; however the amount of benefits in material need was decreased and the entitlement to receive them was redefined and became stricter. The benefit in material need has been set in 6 levels depending on the type of the family and guarantees the citizen in material need basic living conditions (1 hot meal per day, necessary clothing and housing).

Table 1: Benefit in material need in EUR/2012
(Ministry of Labour, Family and Social Affairs of SR)

Household type	Benefit
Single, no child	60,50
Single, 1-4 children	115,10
Couple, no child	105,20
Couple, 1-4 children	157,60
Single, 5+ children	168,20
Cuople, 5+ children	212,30

At the same time, a range of benefits supplementing the material need benefit were introduced (activation allowance, protection allowance, housing allowance, health care allowance). These supplemental benefits are subject to fulfilling certain conditions.

Table 2: Benefit in material need and its allowances for individual in EUR/2012
(Ministry of Labour, Family and Social Affairs of SR)

Year	Life minimum	Benefit in material need	Activation allowance	Protection allowance	Housing allowance	Allowance for health care
2012	194,58	60,50	63,07	63,07	55,80	2

Further, there were introduced subsidies for families for food and school kits to support education for children coming from socially disadvantaged environment. However, in this system there is no clearly defined limit of minimum entitled income proven to cover without doubt clearly defined basic needs of individuals and families. This problem is closely related to definition of a subsistence minimum or the limit of poverty.

Table 3: Comparison of benefit in material need according household type and life minimum (2012)

No. of adults	No. of dependent children	Benefit in material need (BMN)	HCA	HA	AA, PA	Total	Life minimum (LM)	BMN+ allowances / LM (%)
1	0	60,50	2	55,80	63,07	181,37	194,58	93,21
1	1	115,10	4	89,20	63,07	271,37	283,40	95,75
1	2	115,10	6	89,20	63,07	273,37	372,22	73,44
1	3	115,10	8	89,20	63,07	275,37	461,04	59,73
1	4	115,10	10	89,20	63,07	277,37	549,86	50,44
1	5	168,20	12	89,20	63,07	332,47	638,68	52,06
2	0	105,20	4	89,20	126,14	324,54	330,32	98,25
2	1	157,60	6	89,20	126,14	378,94	419,14	90,41
2	2	157,60	8	89,20	126,14	380,94	507,96	74,99
2	3	157,60	10	89,20	126,14	382,94	596,78	64,17
2	4	157,60	12	89,20	126,14	384,94	685,60	56,15
2	5	201,16	14	89,20	126,14	430,5	774,42	55,59

Note: HCA – health care allowance, HA – housing allowance, PA – protection allowance, AA – activation allowance

The result of this reform is that income of most households (especially families with more children) being in the material need situation does not reach legally set subsistence minimum level. The subsistence minimum thus fails to fulfil it's primarily function of securing temporal protection from material need and beneficiaries are withdrawn the basic right – the right to live in dignity. The social policy in this case fails to efficiently solve life situations occurred.

2.1 The Statistical Survey of EU SILC Project

Changed international and political context in Europe has brought also new challenges in the measurement of poverty for Slovakia. Accession of Slovakia to the EU started the usage of common EU indicators within open method of coordination to measure poverty and social exclusion calculated on the basis of common criteria that are part of statistical surveys of EU SILC. The project of EU SILC is tracking especially income poverty, but notices also the aspect of material deprivation and social exclusion in relation to education, health, working conditions, social participation, etc.

The main criterion used in order to examine the income poverty within the EU SILC is the rate of the risk of poverty defined as the share of persons with equivalent disposable income bellow 60% of the median value of equivalent income. The results of surveys of incomes and living conditions in Slovakia showed that there were 13% of the population in the risk of poverty in 2010. At risk are primarily low-income families characterized by the following attributes: social status, number of economically active persons, age and education of the breadwinner, as well as the size of the municipality and the region where families live. In 2010, the limit of the risk of poverty was set to 315.33 EUR per month for individual person, which is more than in previous years of statistical surveys (year 2009 – 305.83 EUR, year

Challenges of the Modern World - Contemporary Economy and Globalization

2008 – 283.55 EUR). The limit of the risk reflects the level of achieved disposable income in particular regions because it is the highest in the region of Prešov, Banská Bystrica and Nitra.

Table 4: At risk of poverty – 60 % median (%, EUSILC)

NUTS 3	EU SILC 2005	EU SILC 2006	EU SILC 2007	EU SILC 2008	EU SILC 2009	EU SILC 2010	EU SILC 2011
Slovak Repubic	13,3	11,6	10,5	10,9	11	12	13
Bratislavsky	7,8	7,3	5,9	6,9	6,5	5,1	7,2
Trnavsky	10,9	8,4	8	6,9	8	6,7	9,5
Trenčiansky	13	10,7	7	9,9	8,6	10,1	9,2
Nitriansky	16	11,8	12,2	12,9	12,9	13,2	14,8
Žilinský	12	11	8,5	10,3	9	9,6	11,0
Banskobystrický	10	13,3	12,6	13,5	13,6	16,9	15,3
Prešovský	21,3	15,7	15,6	13,6	16,3	18,7	20,2
Košický	13	13	11,9	11,2	10,9	12,7	13,5

The seventh year of carrying out the EU SILC project permits, inter alia, also to create a time series for trend evaluation.Comparing to previous years, the share of persons threatened by the risk of poverty tents to grow in Slovakia slightly since 2009 when gradually seeing impacts of global crisis. The limit of the risk of poverty in tracked period reached the lowest values in 2008. The limit of poverty below the national average was reached in the regions of Bratislava, Trnava, Trenčín and Žilina. In other regions, the level of poverty exceeds the national average.

This was reflected also in the development of other poverty indicators. There were no major differences indentified between sexes. Children and young people are under the highest risk of poverty in Slovakia, when the poverty rate in this age category reached the value of 21.2% in 2010 and grew by 2.3 percentage points comparing to 2004. Child poverty is caused by living in jobless households or with parents having insufficient coverage by jobs or poor paid jobs and family income insufficient to avert the risk of poverty. Little motivating environment in which children grow predisposes them very likely to life in poverty as adults.

At the least risk of poverty are persons in pre-retirement age (50–64). Detected rates have grown for all age categories during last three years of statistical surveys except of the oldest age group with noted slight decrease of the risk of poverty.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 5: At risk of poverty by age (%, EUSILC)

		EU SILC 2005	EU SILC 2006	EU SILC 2007	EU SILC 2008	EU SILC 2009	EU SILC 2010	EU SILC 2011
Spolu	**Spolu**	13,3	11,6	10,5	10,9	11,0	12,0	13,00
	Muži	13,2	11,8	9,8	10,1	10,1	11,7	12,8
	Ženy	13,5	11,5	11,1	11,5	11,8	12,2	13,1
0-17	**Spolu**	18,9	17,1	17,2	16,7	16,8	18,8	21,2
18-24	**Spolu**	15,6	12,5	11,6	11,9	13,3	14,7	15,0
25-49	**Spolu**	14,1	11,6	9,8	9,9	9,6	11,4	11,8
50-64	**Spolu**	8,3	7,7	7,0	7,5	7,3	8,7	8,4
65+	**Spolu**	7,1	8,5	8,3	9,9	10,8	7,7	6,3

Another factor increasing the risk of poverty is the economic activity. According to the basic types of the economic activity (workers, unemployed, pensioners and other inactive persons), the unemployed were the most at risk of poverty in 2010, when nearly half of them (42.6 %) lived below the poverty level. Unemployment in Slovakia belongs to the most critical determinants of poverty. Long term unemployed, low educated applicants or applicants with education not corresponding to labour market demands are the most exposed to the risk of poverty within the group of unemployed. The least exposed to the risk of poverty are employed persons. Thus, work is the mean to avoid the poverty, although not always it is the guarantee of adequate income (poor workers). Similarly, inactive persons do have also relatively high risk of poverty.
Chart 1: At risk of poverty by economic status (%, EUSILC 2011)

The type of a household is another important indicator of poverty. Rate of the risk of poverty depending on the type of a household shows the need to pay increased attention to incomplete families. The most threatened by the risk of poverty are households of one parent with at least one child (this was 26.4% of households in 2010). They are twice times more jeopardized by the risk than families with both parents. The cause of the risky situation of this group is especially the absence of the second income in the family. The breadwinner is usually women

Challenges of the Modern World - Contemporary Economy and Globalization

having in most cases lower income than a man. Due to the care of children and household, there is no time left for women to increase its own qualification, hence she has lower assumptions for the qualification growth. In full families the risk of poverty grows with the number of children.

Table 6: At risk of poverty by household type (%, EUSILC)

Type of household	EU SILC 2005	EU SILC 2006	EU SILC 2007	EU SILC 2008	EU SILC 2009	EU SILC 2010	EU SILC 2011
Single	17,3	16,9	17,3	21,7	23	19,1	...
Couple without children	8,1	7,9	6,5	7,5	7,7	8,1	7,9

Couple, 1 dependent child	12,9	8,0	5,9	9,6	10,5	12	13,2
Couple, 2 dependent children	16,7	13,6	12,3	10,0	9,9	11	13,1
Couple, 3+ dependent children	24,2	23,9	25,7	33,3	27,9	29,8	32,6

In relation to the objective - reduction of poverty and social exclusion in EU Member States, there was an aggregated poverty and social exclusion indicator adopted within the strategic document Europe 2020. It is based on three attributes: the poverty risk rate, sever material deprivation and the percentage of people living in households with very low labour intensity. This perspective is considering geographical aspect and forms of exclusion not necessarily related to the income. Geographical aspect is particularly important as the "poorest people" often concentrate in certain regions. We have analysed the poverty risk rate in the previous chapter, so we will focus on remaining two indicators. By a server material deprivation are threatened people not being in the position to afford at least 4 of the following 9 items (EC: The social impact of the ecnomic crisis and ongoing fiscal consolidation. Luxembourg, 2012. pp. 52): 1. pay the rent, mortgage or bills, 2. keep home adequately heated, 3. face unexpected expenses, 4. eat meat, fish and equivalent proteins every second day, 5. one week holiday away from home, 6. own a car, 7. have a washing machine, 8. own a colour TV or 9. a phone. The last aspect of aggregated poverty and social exclusion indicator is the rate of low labour intensity (portion of people in the age of 0-59 living in households with very low labour intensity – it means with adults employing their working potential to the extent of less than 20% in recent years).

At the end of this document we put aggregated poverty and social exclusion indicator considering three above mentioned aspects. Households taken into account in multiple sub-indicators are counted only once.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 2: People at risk of poverty or social exclusion (%, 2011, Eurostat)

In terms of future development and trends in poverty and social exclusion it is important to continue in statistical surveys of the EU SILC project in order to obtain longer time series giving more representative results as it is now. National indicators of poverty and social exclusion defined in the national project approved by the European Commission can help in solving poverty and social exclusion. So called tertiary indicators examine poverty and social exclusion not only at the regional level, but also on the level of district, inter-settlement or community level and they are considering also ethnical aspect and time span of remaining in poverty. Although having defined the national indicators already several years ago, there was no actual data collection performed.

3   CONCLUSION

The issue of poverty and social exclusion persists in the society as an extreme manifestation of social differentiation of society on the basis of material, ethical and cultural differences or differences in lifestyle. It is necessary to come to realize that this is a complex issue requiring cooperation of number of involved subjects (Offices of Labour, Social Affairs and Family, local governments, NGOs, private citizens) and as such cannot be solved only by redistribution and in many cases does have a multi-generational span. Therefore, it is desirable to apply a new approach seeking for social inclusion of the youngest generation of

people coming from marginalized areas, as the poverty and social exclusion is not the failure of the society only but of the individual as well.

The analysis of selected indicators of poverty and social exclusion in Slovakia has shown a complex and yet individual approach to solving questions of social inclusion. The core of the approach is: inclusion into a labour market, availability and quality of housing, accessibility to education, access to health care and adequate income support.

Inclusion into the labour market is considered to be the key aspect of the social inclusion as the prevention against poverty and this also when taking into account the retirement because pension benefits are derived from labour incomes. Moreover, the participation of a citizen in the labour market supports his participation in social life of the society and his personal development. Exclusion from the labour market has different impacts in different types of households. It differently affects the family where the only breadwinner has lost a job and differently in a family with more economically active members with income. Regarding the exclusion on the labour market a high rate of unemployment and high share of long-term unemployed people is characteristic for Slovakia.

The situation of unemployed and their households is to a large extent influenced by the social protection system protecting these citizens from direct impacts of the loss of an income when loosing a job. Unemployment benefit is provided in the amount of 50 % of a daily assessment base for the period of 6 months. Problem generated in our system of social insurance is that a citizen is obtaining the entitlement for this support again only after paying the insurance for another two years. In the actual global crisis it is requested to reconsider the period of the support in the case of the unemployment benefit in relation to reduction of vacancies and increase of spending from the social assistance subsystem. We propose to differentiate the period of support according to the age of the applicant and the time of contributing into the unemployment insurance funds.

Provision of the benefits in the status of material need is subject to the utilization of the unemployment benefit at the first and is understood as the last component of the social rescue network.

Taken legislative amendments have affected the beneficiaries and the public spending as well. Changing the system resulted in decrease of number of the beneficiaries of the material need benefit by more than 420,000 people. We continue to observe regional differences in number the beneficiaries of the benefit in material need, which is mostly influenced by the situation on the labour market – there is a strong correlation between the number of material need beneficiaries and the level of regional unemployment in Slovakia. The largest portion of the beneficiaries is formed by households of individuals (62 %). Allowances implemented to complement the benefit in material need aimed to increase the basic benefit and to implement the effect of activation and motivation to the system in many case failed to meet its purpose. The activation allowance is granted approximately to 67% of citizens in material need, but only in the period of seasonal works or in the case of increasing the qualification, hence not guaranteeing the stability of the income for a citizen. Constant reviewing of the entitlements for the benefits in material need and its allowances makes the system costly in terms of its administration. Nevertheless, we can say that the social assistance system reduces poverty and contributes to its solution. Changing the system resulted in the fact that many families with several children do not reach legally set limit of the subsistence minimum and thus are not

able to satisfy its basic needs. The system of help does not solve an adverse life situation of families in these cases and therefore we propose to reassess again the significance of subsistence minimum as a basic category for ensuring human dignity.

Considering the fact that some people stay in the system of material need for a long time we can conclude that the system itself can form the barrier to possibilities of legal increasing of the income by own activity. It is therefore necessary to look for tools leading to higher involvement of municipal authorities to the area of benefits in material need including budget coverage of increased spending, because municipalities have the best information on the status of beneficiaries, their needs and possible solutions.

Active labour market policy with its focus on education, training, targeted activation of various endangered groups contributes significantly to the fight against poverty and social exclusion. At present, however, we can talk about the paradox: if all capable people are to be socially integrated especially through employment and thus contribute to economic growth, there is a need for more and better jobs, systems and supporting programs and not less as we can see in nowadays changed conditions.

Quality jobs and secure employment is closely related to good and broad education. Slovakia and Member States shall therefore develop combination of suitable measures targeted to coordinate better skills and qualification on one hand and the requirements of companies on the other hand. It is necessary to ensure higher employment rates for graduates and to improve framework conditions for companies in order to create quality jobs.

The issue of the social exclusion of the same importance is the area of housing. Socially excluded people are concentrated in particular areas with several attributes of social exclusion even in its extreme forms with all social and pathological phenomenon and with full load of multiple deprivation of people from these areas. People at risk of social exclusion are often forced to live in low-quality housings, but in many cases costly for them. Due to segregation of these areas there are limited opportunities for investments into the future for inhabitants of these sites. One of the results is especially difficult and even blocked access of children from these areas to full and quality education. This can be result not only of their intentional discrimination, but also consequence of factors, such as low personnel and material equipment of schools in the site of concentrated socially excluded people. But we can not forget that problems with education of these children are not only a matter of lower intellect and limited capabilities but also a matter of cultural differences and the absence of support from their families.

To reduce significantly the poverty and social exclusion, efforts of public administration bodies at all levels shall be supported by social partners, civil society organizations and individuals. One of the ways to fight against the poverty and social exclusion should be the support of expansion of social economy entities giving care to citizens in a need of it and providing employment to citizens who cannot easily find a regular job.

Challenges of the Modern World - Contemporary Economy and Globalization

ROLE OF NON-GOVERNMENTAL ORGANIZATIONS ON RURAL AREAS IN POLAND

Anna Sitek
Nicolaus Copernicus University, Department of Rural Sociology
ania-sitek@wp.pl

ABSTRACT
The idea of the civil society is characterized historically in the past and currently in modern times by on the one hand participation in civil organizations, and on the other hand the extent and form of social self-organization. Therefore, due to the fact that nowadays a more common occurrence is a tendency to express civil society in terms of non-governmental organizations. This article concentrates upon civil society in rural areas of Poland through the prism of NGOs. Therefore the aim of this paper is to describe the process of shaping the civil society in Poland's rural areas.

Keywords: Civil society, Local development, Non-governmental organizations

> *Civil society is the social order towards which all modern democratic societies are gradually working.*
>
> Vaclav Havel

1   INTRODUCTION

There is no doubt that Polish rural society is characterized by significant departures from the basic patterns of civil society. Nowadays all the countries (not only Poland) are facing challenges from the forces of change driven by the globalization. This changing situation causes greater stress upon the a growing significant role of non-governmental organizations, because they are expected to play a key role in terms of development. Furthermore domestic crisis of the European Union (affected by world economic crisis) has a huge impact on civil society. However the crisis is still very much a worrying subject and its effects are keenly felt. This is reflected, inter alia, into the needs of finding a new model of development in rural areas, which can be based on NGOs actions since the current one creates exclusion.

2   ESENTIAL JUSTIFICATION

The term "civil society" is capacious and supporting structure, is only a theoretical construct that is not reflected in reality (only some of its designates could be tested in an empirical way like condition of non-governmental organizations). In other words, civil society is a term ambiguously interpreted and scientifically imprecise. Today *it is one of the most popular ideas of social theory and certainly one of the most popular political slogans (...). The concept of civil society remains primarily a contemporary vision of utopia, a useful but also mysterious catchword* (Herbst, 2005, pp. 9–11). Therefore, because the idea of civil society evolves through time and now the main characteristic of a modern civil society (including the countryside) is on the one hand participation in civil organizations, on the other hand the extent and form of social self-organization, and due to the fact that nowadays a tendency to express civil society more often in terms of outside political activities or activities undertaken outside state institution, in this article civil society is considered as a set of non-governmental organizations.

Further deliberations were used such as sociological/community concepts of civil society, upon which characteristics of the third sector in rural areas in Poland was made. The choice of this tradition is supported by the fact that today there are increasing numbers of NGOs working for environment, community welfare and its inhabitants.

3   RESEARCH INFORMATION

Because in today's world the pursuit of development can take place not only in public institutions but also can be delivered by non-governmental organizations. Therefore this article reflects mostly on the results of research which was oriented on civil society in rural areas in Poland. The research was conducted by the Rural Polish Forum and Nicolaus Copernicus University within the project: "Good Start – support and information centre for non-governmental organization in rural areas" and was based on quantitative methods (surveys) which were performed providing depth to the information gleaned from a large representative sample of survey respondents (together, using CATI, 376 non-governmental organizations took part)[1]. The sample is representative of the non-governmental organizations in rural areas of Poland and so allows for generalization. Qualitative research will be conducted in March 2013 in order to complement the survey work.

The main objectives of the project/research were to develop a methodology for supporting the activity on the rural areas and developing mechanisms to support non-governmental organizations.

Also, it has to be mentioned that this research was financed with funds from Human Capital Programme and was a response to a real problem for the development of civil society in rural areas in Poland, which results from the weakening of the capacity of rural residents in the area of identifying and shaping their own individual lifestyle, needs and develop their own value systems and to influence decisions concerning their local environment by acting in non-governmental organizations.

4   ROLE OF THE NGOs ON RURAL AREAS IN POLAND

In Poland the 3rd sector underwent deep transformation over the past 20 years. NGOs became truly effective in mid 1989, when civil society started to develop at a very fast pace. But the most dynamic moment of its development falls into the year 2000, so almost 10 years after the political system transformation, when according to the National Court Register there were registered 6000 associations and 400 foundations (Przewłocka, 2011, p. 7). Since then, every year across the country have been nearly 4000 new associations and 1000 foundations registered (Herbst, 2010, p. 10).

Currently there are over 100 000 registered organizations in Poland but in this place we have to face with a worrying phenomenon which is noticeable increase in the number of inactive organizations (25% of all NGOs are so called "dead souls", in other sectors there is the concept of 'churn' (e.g. new subscribers to satellite television but older customers drop off)) (Przewłocka, 2011, p. 7). Non-governmental organizations in rural areas that have been tested are relatively young, two thirds of them have been created within the past 10 years – look at diagram no 1. This situation has its justification in the accession to the European Union in May 2004, as the accession has been created artificially. The main goal of many of this

---

[1] More information about research and sample could be fund on following website: www.//ds.org.pl/o-projekcie.

organizations was to apply for funding from various EU programs. Many foundations and associations were established only for the implementation of specific projects.
Chart 1: Age of NGOs on rural areas in Poland (Own analysis)

Reading the report *Basic facts about non-governmental organizations*, we find that in Poland we have a large number of associations involved in sport, tourism or simply single hobbies. We also have organizations involved in arts and culture, education and upbringing (Herbst, 2011, p. 29). This is reflected in the activity profile of the rural organizations. Most of them - 24% - deal with local development, which is a kind of novum, many groups of organizations are connected with social welfare (17,9%), education (13,6%) or sport and tourism (10,7%).

A general overview of non-governmental organizations shows, that the third sector in Poland is not very strong, because almost ¾ of Polish is not involved in the actions taken by civil organizations, and only 1 in 7 declare activity in one area – which is usually education. Moreover, last year, only 1 in 5 Poles partook in a voluntary unpaid work for their local community (CBOS).

The national data also shows that the overall condition of civil society is not the best what is directly connected to low level of civic engagement of Poles, which follows from different kind of historical burdens from the one hand and widely shared believe in the lack of influence of ordinary people on public issues from the other hand (CBOS).

The results of conducted research to date, which are connected with organizations acting on behalf of rural areas, also do not show NGOs in a good light.

Drawing on what we have known from the surveys, it would seem that among those who acting in the organizations are mostly officers (46%) and teachers (31%) – diagram no 2.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 2: The most active members of organizations (Own analysis)

This first category is also working for both NGOs and public institutions. The fact that civil society involves specific members of communities is an example that ordinary people do not believe in the power of this kind organizations. In this way they are biting the hand that tries to feed them.

A similar situation occurs with the number of active members. In reality not many of NGOs participants are acting. In most cases it is up to 50 % (up to 25% - 35% of tested NGOs, 26-50% - 35% NGOs, 51-75% - 12% NGOs and over 75% - 18% of NGOs).

Of course, from a subjective point of view, many good things may be said about condition of Polish rural NGOs, but like was mentioned, the 3rd sector in Poland is not very strong, what we can see in the annual budget of rural non-governmental organizations which is less than 50 000 PLN (about 12 000 euro) – diagram no 3.
Chart 3: Annual budget (in PLN) (Own analysis)

This weakness issue also causes significant influence on the unfavorable situation of these institutions. The disadvantage of this issue means that NGOs are unable to conduct many activities and most of the organizations consisted of less than 2 projects. Furthermore most of the projects had budgets under 10 000 PLN (about 2 500 euro). Significantly regarding the funding, as much as 75% of organizations did not apply for funds and 70% of respondents did

not intend to apply because of too complicated procedures and luck of needs, and it unfortunately is not sufficient. Looking more closely at the issue, we see that the vast majority of organizations assess their financial situation as average (39.6%). However, worthy of note is a fact that about 23% of organizations indicate financial problems.

Moreover, organizations often do not apply for resources from the EU because there is a required contribution, which they do not have. They emphasize the need for policy change, otherwise small non-governmental organizations will have to reduce or suspend their activities. Another, an oft-pointed reason for not applying, is the lack of social trust, which binds to the precedents that took place in the local community (on several occasions it was indicated that the associations were deceived by people who were recruited from the outside to raise funds). Only in the one of southern province – Opolskie Vievodship – does much of the organization does not indicate greater difficulties/barriers. Perceive their situation as good. This is mainly due to the fact that they are related to the German minority, so most of their funding comes from the German government.

Non-governmental organizations also face many other problems. They have to face if they want to exist. Next to the already mentioned financial problems (58.9%), NGOs point out the difficulties of administrative difficulties (33.3%) and lack of interest of the local population (21.1%) – diagram no 4.
Chart 4: Difficulties according to NGOs activities (Own analysis)

We can see, that non-governmental organizations could be the motor of change and be one of the main factors that led to develop civil society in rural areas in Poland. But unfortunately they are not.

This picture emerges from the way of thinking of the members of NGO, which emphasized that there is no one solution for improving the condition of civil society on rural areas, but in overcoming this negative situation, which has arisen, especially helpful could be additional financial support (like as was mentioned by 82%). But to overcome the obstacles accordance to running NGOs also is needed specialist knowledge that may be provided to members in the form of training, especially in the field of fundraising and mobilizing people.

The preliminary analysis give not a uniform picture emerges of NGOs and rural development in Poland. Surveyed organizations are diverse in many ways, such as in the size, by the profile

of action, development prospects, to financial resources. Profile reflects the characteristics of the surveyed organizations of all NGOs operating in the country.

Therefore, results that were obtained show only the problem of civil society development in rural areas in Poland, which results from the weakening of the capacity of rural residents in the area of identifying and shaping their own individual lifestyle, needs and their own value systems and to influence on decision concerning their local environment. Furthermore studies undertake in this project had increased understanding of the importance of sustainable development as well as bottom-up actions. They illustrate mechanisms that allow for more efficient building integrated and informed community primarily and increase the involvement of villages' residents in making pro-development initiatives in the sphere of civic activities. Demonstrably that which was implied was a non-possibility of overcoming the crisis of rural area without full involvement of the local population.

5 CONCLUSION

Civil society has been an important area of study for sociology and another social studies. The research examined civil society variously as a multidimensional phenomenon, an objective and subjective measure. This research provided an integrated and interdisciplinary knowledge. It allowed analysis of environmental problems of a human nature and understanding the role of social factors in the community developing process.

This article has increased understanding of the importance of local development caused by non-governmental organizations because it is common knowledge that NGOs play one of the leading roles primarily and allow for more efficient building of integrated community secondly. And finally, in the long-term goals non-governmental organizations can better adapt their activities to the needs of local communities.

NGOs become a tool of social change. Is helpful and facilitating factor in the development of civil society. A progressive tool to change society for more egalitarian. It is a good beginning, because we cannot change all world but we can start somewhere. Therefore we can say that *civil society has many different faces, Mr. Hyde may be the result even where Dr. Jekyll is the objective* (Edwards, 2009, p. 109).

Challenges of the Modern World - Contemporary Economy and Globalization

QUO VADIS GLOBAL ECONOMY? (TITANIC (THE WORLD ECONOMY) SAILS ALL OVER THE WORLD OCEANS WITHOUT A CAPTAIN)

Dragoljub Stojanov
University of Rijeka, Economic Faculty, Croatia
Vjeverica56@yahoo.com

ABSTRACT
The world economy is in the process of globalization lacking economic theory of globalization. Consequently, we are heading towards a new type of society as a ship without a captain. We think that in the near future world might be confronted with either mega-capitalism or post-capitalism. This projection we deduce from dialectic of globalization. Sure, the process will be followed by the death of the territorial state. Of course, a different future scenario is possible as a way for cyber post-capitalism. Evolutionary transformations of capitalism would give the right of Marx and Keynes and their vision of society expressed in the "Capital" and "Economic Possibilities for our Grandchildren." The first principle of the welfare society to become global citizens, and that means the elimination of market state…Let us not forget even R.Hilferding!

Keywords: Globalization, Dialectic, Mega-capitalism, Theory

"Nothing is impossible in one so inexact sciences such as economics."
P. Samuelson

1 INTRODUCTION

Fukuyama has recently concluded that civilization is at the end of its evolution since it has reached the optimal model and time trends in the extant development of capitalist market-democratic type of society? Did not he to want to know that the structural dimension of the problem of the crisis of contemporary capitalism is the transformation of capitalism from an industrial into financial one? Instead Schumpeter, "creative destruction" and creativity, capitalism developed the "rent-seeking" financial capitalist which Eugene Famma's hypothesis of efficient financial markets transformed into Minski's financial instability. As if we have not learned the lessons of economic history since the "Tulip", "Mississippi" or some other "bubbles", cotton crisis, 1929. crises which all show that logic of Marx and Schumpeter is valid since the early days of the market - capitalist economy? Do we want to accept internal dynamic of capitalism and necessity of its dynamic transformation into a new stage of its development? Or we prefer to keep eyes closed being obsessed with present achievement?

It looks like we do not. For an old-fashioned economist, it would be a bit strange. For young and Nobel economists like Lucas, Prescott and Romero that is a funny issue. According to them, the business cycle is associated with real economic developments - technological changes. And that's it. Credit, money or leverage is of no significance in the development of economic cycles.

Therefore, the old-fashioned economist will not be surprised by three young economists study published in NBER Working Papers No. 17,621 in November, 2011. entitled "WHEN CREDIT BITES BACK: Leverage, Business Cycles, and Crises", in which they, as they claim, for the first time in economic history have found that the cycles goes up and down

hand in hand with credit expansion, which leads to a recession, possibly depression, when it comes to credit contraction and deflationary tendencies (Jorda, Schularick and Taylor, 2011.). These prominent economists seems never read Keynes, not to mention Marx, Fisher and Minsky.

How is this possible? Does nothing have significantly changed from A. Smith to 2012 year? Are we all prisoners of neoclassical economists who used to dominate XIX century economic policy as well as again economic policy of the end of XXI century? The beginnings of XXI century economics prescription of the IMF, World Bank for indebted countries worldwide is great come back of liaises-fair dogma.

In the first part of paper we discuss economic crisis and economic thought of renown economists. In the second part we discuss dialectic of globalization and its possible effect relevant for transition process from territorial into market sate. In the third part we address causality between economic development and development of economic thought. We point out that we do not have an adequate economic theory for globalized world economy which leads us to conclude that mega capitalism might be a next stage in the process of evolution of international world order based on reinvented neoclassical economic paradigm. New world order will be dominated by mega corporations and mega banks and the first principle of mega capitalism might be morbid maximization of profit of leading subjects followed by ever increasing democratic deficit.

2   DISTINGUISHED ECONOMISTS ON ECONOMIC CRISIS

In sufficient aggregate demand is taken by the administrations of many countries, starting with the USA administration, as the main cause of sub-prime financial crisis. Therefore, economic thought of J.M.Keynes has come again at the forefront of the economic knowledge. Following Keynes theory of insufficient demand many distinguished economists such is (Krugman, 2007; Stiglitz, 2007; Vade, 2008; Swartz-Nelson, 2007; Friedman and Swartz-Nelson, 2007; Ben-Barnanke, 2002; Romer, 2002; Pitelis-Argites, 2008; Crotty, 2008) identified present crisis as a crisis caused by insufficient demand. On the other hand, a few distinguished economist such is Taylor (2009) or Rogoff (2008), Minsky in The New Yorker, (February 4th, 2009), and Wikipedia find that aggregate over- absorption usually precedes recession. Our understanding of Marx theory of economic crisis, Stojanov (1985), Keynes theory of business cycle, and empirical data from XIX century (Marx) and from 1929 economic crash suggest that present crisis can hardly be cured by increasing demand. Moreover, increasing demand might provoke world-wide stagflation.

In an attempt to trace determinants of insufficient demand following the ideas of aforementioned economists, we consider that the main causes of insufficient demand might be classified as follows:

Insufficient demand is caused by both low level of personal and investment spending in relation with GDP (Krugman, 2006, 2007; Stiglitz, 2007; Vade, 2008; Bernanke, 2002).

Insufficient demand is primarily caused by wrong macroeconomic management-restrictive monetary policy: Bernanke (2002), Romer (2002), Friedman in Swartz-Nelson (2007), Insufficient demand is caused in two class model either by inadequate consumption of workers or in three-class model by insufficient consumption of financial reenters (Crotty, 2006, 2008; Pitelis-Argities, 2006, 2008; Orhongazi, 2007).

Insufficient spending is a consequence of asymmetric information, moral hazard and inadequate systemic regulation, Stiglitz (2007).

Sound highly surprisingly that no economist has pointed out to the drop of marginal efficiency of capital as a main cause of economic slump. Moreover, there are distinguished economists who even did not believe that an economic crisis is at all possible in XXI century due to the benefits the New Economy brings to field of microeconomics (Krugman, 2006; Summers, 2000). If we take as granted insufficient consumption as the main determinate of crisis, as suggested by aforementioned economists, we may post the following question in order to test proposition of insufficient demand:

1.) How is possible for an economy to be confronted with: balance of payments deficit and inflation if under -consumption in the economy persist and precedes the crisis.
2.) How is it possible that an economy face a sudden drop in assets prices just by changed expectations? Why the expectations are suddenly changed?
3.) How is possible that personal consumption drops down in time of full employment having in mind that according to all economic schools full employment provides the highest level of wages?
4.) Why an economy experiences a drop in investment if not caused by fall in marginal efficiency of capital (MEC)
5.) What factors bring about a fall in MEC: is it insufficient demand or an overheated economy as suggested by Keynes himself?
6.) Why no economist brings credit into analytical procedure which changes the standard textbook approach to Keynes's proposition concerning propensity to spend and consume?

We support an attitude that Credit –debt financed consumption and investment (high leverage) contribute to hyper absorption in an economy before economy face an economic downturn. Insufficient demand, therefore, is a consequence of previously overheated economy and consequent drop of MEC. Once MEC drops to low level, interest rate must follow the suit. As long as MEC is higher than interest rate (i) investments are profitable. Once investment becomes unprofitable, asset prices are endangered and expectations are falling apart. Te factories are getting closed and we get drastic fall in consumption both: investment and personal. Different interpretations of the causes of crisis ask for different economic prescription. If we take insufficient demand as the most important disease, does it mean that the crisis might be fixed out by additional demand? Or the crisis fixing requires more deep systemic changes in time of severe crisis such is present crisis as well as was the Great 1929 crisis. If crisis can hardly be solved by monetary and fiscal easing, politicians must be at work nationally as well as world-wide.

2.1 Could Keynes help us today?

Keynes economic thought was more an evolution than a revolution in development of economic ideas. Still, it was a great and influential economic model shaping world economic development since II Second World war during time of underemployment, and all way around until the beginning of 70s. Keynes medicine can hardly be efficiently applied except in time of depression. An application of Keynes before slump occurs might only prolong the boom for some time, and finally end up in stagflation. This is eventually a reason what economists differ significantly in explaining and applying Keynes under different circumstances for. Additionally, one should be aware that Keynesianism likewise Monetarism or Supply-Side

economics are in its essence suitable economic policies for different stage of a business cycle taken from a national economic perspectives .Under a global world economy the application of Keynes medicine, likewise of any other known school of economic thought becomes highly questionable. Therefore, if current world retreats back into some sort of" soft nationalism" those economic policies might be useful again. And what is the most scare moment from Keynes story for us who live in XXI century is the process of capital depreciation and its duration which was (and might be again) long and time consuming process. "At the outset of the slump there is probably much capital of which the marginal efficiency has become negligible or even negative. But the interval of time, which will have to elapse before the shortage of capital through use, decay and obsolescence causes a sufficiently obvious scarcity to increase the marginal efficiency, may be a somewhat stable function of the average durability of capital in a given epoch. If the characteristics of the epoch shift, the standard time-interval will change."

Under depressed circumstances a state intervention might crowd out private investment both in capital and labor market .In order to be effective state intervention should be undertaken under different social circumstances from those prevailing before the onset of crisis. New profit mathematics needs to be developed, and profit maximizing should stop to be the first principle of a society. That is exactly point quite understood by Keynes, but not welcomed one by him in the same time. However, that is exactly point Phelps is stressing out, and an idea that needs to be elaborated by contemporary economists and politicians. New time ask for new economic solution...That is presumably why Krugman and Stiglitz do not trust into the efficacy of monetary policy at this stage of economic affairs of the USA economy , and C. Romer, A. Swartz, Bernanke likewise Friedman (for the Great depression) do trust only to expansive monetary policy and devaluation of currency as an effective cure. We would say majority of them are seriously mistaken, and probably Phelps is most realistic respecting the time and circumstances we live with. Therefore, we conclude that the world needs a new social fabric to be developed and followed by suitable economic paradigm because two extremely important points are missing from deliberations of majority of distinguished, but confused contemporary economists. These points are internal dynamic of capitalism and dialectic of globalization.

3   DIALECTIC OF GLOBALIZATION

There are many definitions of globalization. All of them are more or less confined to the country's integration into the international division of labor and integration of production factors in international scale. So, Bhagwaty (2004) defines economic globalization as "the integration of national economies into the international economy through trade, foreign direct investment, short-term capital movements, international mobility of workers and aid workers in general, and international technology flows" . Anne Kruger defines globalization as "a phenomenon thanks to which economic agents in any part of the world much are more influenced by events in the world than before "(Wolf, 2004). A lot closer to us is Henderson' definition of globalization. David Henderson, chief economist of OECD defines globalization as "the free movement of goods, services, labor and capital, while creating the single market of inputs and outputs, and full national treatment of foreign investors, as economically speaking, there are no more strangers" (Wolf, 2004).

We hold that, in this and similar definitions of globalization are technical and superficial definitions, which do not reflect the dynamics of the capital. We are most prone to own politeconomic definition that holds that globalization is a process of privatization of the

world's economic resources by large capital, often virtual and hybrid, as evidenced by the exponential expansion of financial derivatives, the last twenty years, whose value has reached 457 trillion Euros in 2007 (Deutsche Borse Group, 2008). And, if privatization is a political process with the economic consequences, often accompanied and favored by policies of international financial institutions, we dialectically come to the conclusion that globalization is the process of transforming territorial (national) market into global corporate state as a new stage in the development of capitalism, which would we call mega capitalism, which makes the observed dialectical stage of capitalist development, which precedes to post capitalist society, as it was seen by Marx (Capital), Keynes (Economic possibilities of our grandchildren) or Hilferding (Financial capital). Practically observed under conditions of contemporary globalization global economic crisis is a process of centralization of capital on a global scale, which this time happens in conditions of imperfect global market structure.

4   THOUGHTS ON THE RELEVANCE OF ECONOMIC POLICIES

In the development of economic thought to date, there has been a fascinating interdependence between economic events, economic ideas and economic policies. One of the most obvious examples of the interaction since the Second World War is the change of focus from unemployment, a Keynesian idea and economic policy, to inflation that is Monetarism, as an idea and policy. An analogous change occurred in the acceptance of Phillip's curve and Ocun's law from the Second World War until 1970 and their replacement by the vertical Phelp's curve together with the notion of rational expectations. With the formation of the IMF and GATT), stage was set for the greatest prosperity that the world economy has ever experienced to date. In the years immediately after 1945 the supply curve of national economies showed a positive Keynesian slope. During the fifties and sixties "it came to be accepted wisdom that businessmen were always in a position to set prices at a margin over costs that would provide them with a rate of return at which they would be happy to invest more. The OEEC in a 1961 report stated: 'The share of labor, apart from cyclical shift, remained remarkably constant in almost all countries around 1950. With high employment, business has been able to maintain a profit margin' (Marris, 1984). During the fifties it became generally accepted that the Phillip's curve, that is a Keynesian type of economic policy was completely compatible for national economies in their attempts to control deflation and also inflation.

It is certainly true that in comparison with XIX century economic liberalism internal economic equilibrium came to have priority over equilibrium of the balance of payments. Foreign trade and currency measures were targeted to achieve affirmative and useful effects from the foreign trade multiplier and accelerator in the interests of economic growth of the national economy. Keynesian economy policy at home was supplemented by choice of a growth strategy based on the theory of the comparative advantages of the 2 x 2 x 2 model. At the beginning, while the argument for protecting new industries was valid, a policy of import-substitution was the dominant strategy for the economic growth of small open economies as well as for large countries. In time the small open economy, which had become a price taker, became more and more geared to an export growth strategy, and had become not only the price taker but also the rule taker. Concentration on the production of an increasing number of tradables ever increasingly made the small and medium countries dependent countries. Unless, of course, the countries concerned had opted for the Prebish or Myrdal models of isolation from the world economy with all the negative consequences of such a decision for growth (as was the case of Latin America). In spite of this, the production of firms of the small open economy more or less completely became part of the

offer curve of national economies. The process of transnationalization of the world economy had begun.

In 1958 the currencies of the EEC countries became convertible with the result that their markets and their economic policies became interdependent. Europe has very quickly become competitor to the USA. From 1960-1965 wages in Europe and Japan, the main US competitors, rose from between 2-6 per cent annually, while wages in the US fell during the same period 0.7 per cent. The new wage relationships caused a balance of payments surplus in America which reached 6.6 billion dollars in 1964 (Mandel, 1972). However, acceptance of the concept of full employment based on the slogan ¨We're all Keynesians today¨ required in the USA, and not only there, an expansive monetary policy. In the meantime the expenses of financing the Vietnam War increased; with the result that inflation soon became enemy number one for the American economy. In 1971, the first time since 1888, America had a balance of trade deficit of 2 billion dollars. The offer curve of the American economy had become a vertical. The world was at that point looking for a new economic policy. When the supply curve had become a vertical Keynesianism became counterproductive. Nevertheless, economists went on trying to cure stagflation by counterproductive Keynesian methods supported by a policy of fluctuating currency rates of exchange. By passing to fluctuating exchange rates in an attempt to save Keynesianism, the effect of the Phillip's curve deepened stagflation the world over. This showed that although the world might have become interdependent, isolationism was still very much alive. In other words priority was still given to the national interests. The supranational concepts, like the process of transnationalization in the world economy, were to gain impetus as soon as the time was ripe. The prosperity of the world economy was certain at some point or another to come to an end. According to C. Dumas "the long expansion of the 1950s and the 1960s consisted to a considerable degree of more of the same ... This relates directly to the inadequacy of present capacity, not only in the implied need to invest in new industries' and write down the capacity in shrinking traditional industries but also in the need to transform by new investments the productive processes of industries with still salable products but outmoded method... Both the incentive to apply advanced labor-saving technology and the actual development of such techniques have to be linked to the large increase in wage cost over the past thirty years" (Dumas, 1985).

The world economy had to enter a phase of structural transformation. This was well presented by Schuker in his «American Reparations to Germany» in which he gave a reminder that the world economy had for 300 and more years experienced what he called-long waves. Long waves went together with the process of the concentration and centralization of capital - that is with the growth of firms and their efficaciousness (Schuker, 1990). The natural result of this was that after 1980 Keynes was replaced by Monetarism. New economic credo becomes the thought: "Governments do not solve the problem, they are the problem. Modern economic policy considers that Welfare State had played out its role of the guardian of economic progress and prosperity. The new economic policy operated under the slogan: "The best industrial strategy consists of tough penalties for business failure, high rewards for success and low interest rates without inflation. Monetarism, renamed at the end of XX century as neoliberalism (neoclassicism), became the "mainstream" economic policy. Even so, Neoliberalism is still a national economic policy; it still has a national identity. While operating with national economic development goals, it has achieved structural transformation of the economy in all countries where it took hold. During that process it led to the centralization of capital and the creation of

Challenges of the Modern World - Contemporary Economy and Globalization

gigantic companies. The redistributive effects of the monetarist type of economic policy in the case of USA can be best seen from the following table.

Table 1: Deconstructing National Income (Bichler and Nitzan, 2012)
These observations, along with the forward-looking outlook of capitalists, suggest that the current crisis may be the result of capitalists becoming not weaker, but stronger and that capitalist power may be approaching its social asymptote – a level too high to sustain, let alone increase.

Monetarism achieved structural transformation of the economy in all countries where it took hold, and in the process led to the centralization of capital and the creation of gigantic companies. In the world economy it created conditions for intercontinental economic integration of companies. According to Denis Lumb competition in traded goods rose significantly, since such goods are exposed to global competition. «Between 1979-1989 in America 1.4 million jobs were lost in industry, yet industrial production increased by about 30 per cent. Integration between the transnational corporations of the USA and Europe attained 200 billion dollars annually. In 1989 alone in Europe the business of European transnational companies was integrated by more than 50 billion dollars. Between 1984-1988 direct European and Japanese investment in the USA increased by 108 billion dollars and 37 billion dollars respectively» (Marris, 1984).

The net profit of the Top 0.01% are earned, at least in part, outside the United States – in what the statisticians call ROW (rest of the world). -: Bichler and Nitzan (2012).The raw data that underlie this chart are fraught with hazards of estimation and interpretation, but the overall long-term trends they portray are probably valid. The thick series at the upper part of the chart plots the proportion of US after-tax profit coming from outside the United States (including both the foreign dividends and reinvested earnings of US-based corporations). According to Bichler and Nitzan (2012), the data show that during the 1940s

and 1950s, ROW profit amounted to less than 10 per cent of the total, but that its growth has been rapid and that its level now hovers around 50 per cent of the total! And here arises an interesting question: indeed, who or what is to prevent US corporations from using their power world-wide? Except maybe foreign competitors coming from Europe, China, Asia and Russia which taken altogether constitute the global "market" state.
Chart 1: Rest of the World: Receipts and Payments of After-Tax Profit (Bichler and Nitzan, 2012)

Graham's contention concerning the production of "goods in common" is vindicated today. It seems that the production of "goods in common" demands the formation of a world economic policy and a world government. In other words, it means replacing national economic policies with a global economic policy.

The basic economic entities of our time are becoming transnational corporations as the entities which reflect globalization process. The basic microeconomic principle of their behavior is the principle of increasing returns and diminishing costs! Transnationalization and globalization of the world economy forms a global market, but the market, whose one of the main characteristics is imperfect competitions with the prevailing oligopolistic market morphology. In an oligopolistic global market large corporations become "price makers" and "" rule makers "also. The market does not determine the behavior of market participants such as is the case under the conditions of full competition. In fact, the "great" form the market and run it, they share it. Transnational corporations spread their production around the world in order to minimize production costs, and the same time they use "world demand curve „as a source of their marginal revenue. So while the existing microeconomic theory helps understanding the operations of transnational corporations, global economy

macroeconomic theory is neither on the horizon. In all this TNCs significantly influence the formation of macroeconomic and development policies of countries all over the world which is becoming addicted to FDI, that is of the capital that TNC have in abundance.

Whether any of the assumptions of virtual neoclassicism is valid in such an emerging global world? If not, then neoclassicism in time of the global economy deserves to go into the memory hole. Again, the global economy does not have a theoretical construct as seen from the angle of the global economy as a whole. What we want to optimize from the point of view of the global economy? Is that the GDP? Whose GDP should be optimized: either that of the global economy, or GDP of less and less sovereign individual countries which are by global privatization deprived of their resources? What about the issue of employment? What about the issue of optimal allocation of resources at the macro (global) level or about the issue of general equilibrium?

Globalization provokes a number of issues related to the process of economic development and its effects on both the host country and the capital exporting country. For example, an American transnational corporation produces a product in China while exporting capital from US. Then, it imports the produced goods from China back to the US. From the point of view of standard balance of payments statistics this transaction is clean and clear. However, from the angle of property rights (especially capital), policy and economic issues seem to be much vaguer on how to treat such a transaction. Does the US import its own goods produced by its own capital and knowledge, or does it import Chinese goods? Foreign direct investment and transnational corporations in the global economy provoke confusion between the "territorial" state and "market" state. The balance of payments issue, at first glance, is perhaps only the beginning of opening the Pandora's Box which will have to be opened and studied by the new economists. Once opened, the Pandora's Box of globalization will have a profound impact on relations between the "territorial" and "market" state as well as on the relations between virtual neoclassicism and real corporatization of the world.

Economic science, which until the age of extant globalization generally reflects national economic interests, presumably has to be transformed into economic science, which reflects the interests of new core subjects of globalization of society; such are transnational mega-corporations and transnational mega- banks

5   CONCLUSION: TOWARDS MEGA-CAPITALISM

The history and experience concerning development of both economic reality and economic theory suggests that the strongest interest groups are the ones that define the economic system, economic policy and economic institutions. If these interest groups today are depicted in a form of corporate power centers, as we believe to be so, then we are free to suggest that we are heading towards "Mega-capitalism"! "Mega-capitalism" seems to be the next stage in the development of capitalism, which will be dominated and led by both mega-corporations and mega-banks. This, in turn, will result with global cybernetic robotization of workers. This process might be supported by neuro-economics, which we would define as cybernetisized neoclassical economics applied under imperfect market conditions. This is because extant economic doctrine is dominated by neoclassical economic theory regardless of the fact that such a theory has definitely become obsolete. Therefore, contemporary economist is lost in the fog of inadequate economic theory. Sure, the process will be followed by the death of the "territorial" state. This process reflects the centralization of capital on a global scale. This

process, however, is evolutionary and repetitive since the beginning of the capitalistic way of production.

Economic science, which until the age of globalization ,generally reflect national economic interests, will be transformed into economic science, which reflects the interests of new core subjects of globalization of society, such as transnational corporations and transnational mega banks. When and if there is a morbid affirmation of the first principles of globalization-profit globally reached, global society will then be ready for its transformation into a post-market and post-capitalist society and economic science will lose its meaning. Evolutionary transformation of capitalism would give the right to Marx (1962) and Keynes (1932) and their visions of a new society as they expressed in the "Capital" and in the "Economic possibilities for our grandchildren". The first principle of the welfare society is to become global citizens, and that means the elimination of the "market" state. Hilferding's (1952) fate of the world has been similar except the fact that the path towards post-capitalism is paved by the "expropriation of expropriators".

If, however, the process becomes retrograde and the "territorial" state overthrows the "market" state, then the thoughts and reflections of the French School of economic war (which is these days advocates the so-called "intellectual protectionism") might become very realistic and attractive. We think that modern technology and cybernetisation of the economy and civilization might not survive this retro course of events without global social, economic and political earthquake a few degrees stronger than that of 1929.

Let us conclude that a Titanic (global economy) sail over the world oceans without captain as far as economic science is devoid of its theory.

CRITICAL SUCCESS FACTORS FOR PRO-INNOVATIVE COOPERATION BETWEEN FIRMS – EMPIRICAL RESEARCH IN POLAND

Agata Sudolska
Nicholas Copernicus University, Poland
aga@econ.uni.torun.pl

ABSTRACT
Nowadays the idea of cooperation is said to be one of the key elements of modern management model that answers the challenges of global economy. This approach follows from the assumption that in today's highly complex and rapidly changing world, cooperation between firms has become an imperative for survival and success. It results from the fact that globalization calls for new ways to compete and demands a different philosophy of doing business. Old rules of strategic thinking probably will not be effective in the future due to the acceleration of technological development, the shortening of product life cycles, increasing difficulties in defining potential clients, markets and competitors. In the contemporary world enterprises act under permanent pressure of economic, technological, political and social changes. In such unstable circumstances the issue that become significant is innovativeness. Increase of the enterprise's ability to create and commercialize innovations today is the base for strengthening their competitiveness. The issues of innovations are essential for firms' development and competitiveness. In times of dynamic spreading of "New Economy" conditions we can observe the change in the process of creating innovations. Market experience shows that quite frequently innovations are stimulated and created by developing close relationships with other enterprises. The paper addresses two tasks. The first part of the paper provides an theoretical overview of the idea of inter-firm pro-inovative cooperation and general conditions fostering its development. The second part of the article presents the research findings which indicate critical success factors for pro-innovative cooperation realized by Polish companies. The article highlights the importance of making pro-innovative relationships work. The major objective of the research findings presented in the paper is to find the answer to the question on what are the most important conditions enabling to accomplish all goals set by the partners for a specific pro-innovative relationship.

Keywords: Critical success factors, Inter-firm relationships, Pro-innovative cooperation

1   INTRODUCTION

The ability to cooperate, and in particular to manage cooperative arrangements, has already become one of the core competencies which companies must possess in order to ensure their survival and future success. Mangers of modern enterprises have to realise that they should compete in a way that enhances rather than undercuts inter-firm cooperation. This approach refers to the phenomenum that is called the great management paradox and which consists in the fact that increasing competition requires increasing cooperation.

Successful managers must be skilful collaborators and should understand when and how to share resources, to combine forces, to do things that benefit another partner – in the interest of superior overall performance of all cooperating parties. The point of the current company shape-up boom is to achieve synergies – the value that comes when the whole adds up to more than the sum of the parts.

Increasing interest in the meaning and importance of inter-firm cooperative relations as elements of the enterprises development strategies result from the fact that these relations on one hand allow firms to gain new advantages and on the other strengthen the ones already existing. Implementing cooperation strategy and building different partnerships on the market enables not only to sustain enterprise's market position but also to develop further. Additionally in times of spreading the "New Economy", which means dynamic increase in knowledge resources, using only one's own potential is definitely not enough. The ability to accumulate knowledge from all possible internal and external sources is of strategic value nowadays. Thus properly constructed strategy of building firms competitiveness and managing knowledge needed to be innovative today is based on the capability to cooperate with other actors of the market place.

2   THE IDEA OF INTER-FIRM PRO-INNOVATIVE COOPERATION

Studding the issue of firms' competitiveness, brings to the mind an important question: why firms differ in their conduct and profitability? It seems that the conduct and profitability of enterprises is highly influenced by strategic relationships in which they are embedded. The ability to create sustainable competitive advantage depends on many factors since the conditions in the environment are constantly changing. The competences and resources creating a competitive advantage today may be ineffective next year, because the situation in technology, market or competition has changed. Due to the fact that creating sustainable competitive advantage of the firm requires having access to many resources and capabilities, it is very difficult to create competitive advantage individually. In such conditions cooperation with others market actors seem to be a good way of improving firm's conduct and ability to compete successfully.

Nowadays, successful managers must be skilful collaborators and should understand when and how to share resources, to combine forces with other companies operating on the market. Cooperation is a new way of creating firm's strategy. According to authors analyzing the matter of inter-firm relationships, today "the essence of strategising is in coping with and taking advantage of relationships with surrounding companies in their entirety. These companies include suppliers, customers and competitors. Co-operation and competition are not simple dichotomy for companies. Instead, strategising involves simultaneous elements of co-operation, conflict, integration and separation in company's relationships" (Ford, Gadde, Hakansson and Snehota, 2006, p. 3).

Based on literature review, we can point out several definitions of cooperation understanding it very widely. Cooperation between enterprises can take place through a variety of different arrangements which include relationships with suppliers, intermediaries or customers, but also relationships with current or potential competitors. All they are formed to facilitate company's ability to achieve some strategic objectives or enhance firm's competitive position on the market (Berg, 1991, pp. 72–73; Graham, 1988, pp. 473–485; Mohr and Sengupta, 2002, p. 284).

In narrower sense cooperation is defined as inter-firm relations having certain characteristics: they are changeable, they have limited range and duration and they set cooperation agreements that make up the base for common work (Adamik, 2008, p. 73).

According to literature sources, the definition of inter-firm relationships highlights their three fundamental features (Czakon, 2007, p. 46):

- the exchange concerning the subject of relationship,
- the commitment that leads to deepening and spreading the existing exchange,
- mutuality including the symmetry of commitment and community of interests.

Above mentioned features suggest that inter-firm relationships are characterised by long-term orientation of cooperators who engage their resources and are willing to adapt their operating processes in order to obtain mutual benefits. In the literature there are many explanations of relationship nature. It seems that one of the best says that inter-organisational relationships are the relatively long-term linkages that occur between organisations which agree to change the way they do business, integrate and jointly control some part of their mutual business system and share mutually in the benefit (Dull, Mohn and Noren, 1995, p. 65).

It is indisputable that inter-firm cooperation brings about several positive effects for involved partners. Taking into account that today companies are becoming less complete and they frequently need new resources and competences, developing close working relationships with other enterprises allows firms to extends their reach without increasing their size. In this sense, strategic partnerships are a potent way to do more with less. One of the fields in which cooperation is becoming more and more important is innovativeness. Today there is considerable agreement among writers and practitioners on the view that innovativeness makes up the base for company' s competitiveness.

In recent decades it has been recognized that innovations are generated mainly in cooperation with other firms, such as suppliers or even competitors. But in order to create any new process or product together, the companies have to develop a close and strong relationship. It is due to the fact that today inter-firm relationships provide essential building blocks to access dispersed capabilities. As such, they have far-reaching implications for filling assets gaps in enterprises and improving their ability to create and commercialize innovations.

In the conditions of strong and still increasing competition only firms that are able to find or create new development directions, new solutions, processes and products can become competitive. This means that competitive company must be also an innovative company. Therefore, it must first create and then develop several relationship with other market actors in order to get access to different resources and to be well informed about contemporary trends and market changes.

As nowadays competitiveness is associated with orientation on innovations, in the field of cooperation so called pro-innovative inter-firm relationships have occurred. The relationships of this type are relatively enduring transactions, flows and linkages that occur between enterprises and are aimed at improving the ability of firms to create innovations. It means that such kind of relationships are orientated on knowledge transfer and learning that is necessary to generate innovations (Sudolska, 2011, p. 79). Partners in such relationships agree to change the way they do business, integrate and jointly control some part of their mutual business system and share mutually in the benefits. Pro-innovative relationships on one hand refer to competence building and on the other hand to competency leveraging that means applying competencies to market opportunities. Both mentioned actions are taken by the enterprises to generate learning resources that enable creation innovations (Mitra, 2000, p. 231).

3   CONDITIONS FOSTERING THE DEVELOPMENT AND SUCCESS OF PRO-INNOVATIVE RELATIONSHIPS

Given the increase of globalization of the world's economy, the importance of creating and maintaining successful inter-firm partnerships is emerging as a critical strategy to be considered by the enterprises.

There are a number of variables that exist in the literature, which are considered as very important to the successful functioning of inter-firm cooperation. In the table 1 the main factors recognized as those that lead to the success of inter-firm relationships are presented.

Table 1: Main variables that are critical for the success of a relationship
(Heffernan, 2004, p. 116)

Researcher	Relationship success variables
Adbor (2002)	Trust, communication
Handfield and Bechtel (2002)	Trust
Hunt, Lambe and Wittman (2002)	Trust, commitment, communication
Simpson and Mayo (1997)	Trust, commitment, satisfaction
Gummesson (1996)	Trust, collaboration, longevity, closeness
Morgan and Hunt (1994)	Trust, commitment, communication
Mohr and Spekman (1994)	Trust, participation, coordination, commitment
Ganesan (1994)	Trust, commitment, satisfaction

As it can be seen there is a considerable agreement among researchers on high level of mutual trust as critical component of development and success in business relationships. Trust is recognized as the fundamental component for successful business relationships due to fact that cooperation between organizations creates mutual dependence.

The research findings argue that healthy, productive and successful cooperative relationships typically are characterized not only by a high degree of trust, but also by high level of commitment and information sharing within a communication system. Another important dimension of successful cooperation is high level of balanced interdependence.

Based on literature, it seems that the path of successful inter-firm relationship oriented on the increase of partners' innovativeness consists of the following steps. The first one is establishing the goals for particular relationship. For further healthy cooperation it is essential to formulate the goals in clear and measurable way.

While analyzing the process of relationship goals establishing, an issue that draws attention is covergance over strategy of cooperating firms and their strategic goals (Volkokari and Helander, 2007, pp. 597–608). When collaborators share common strategic vision and additionally they really understand each other, the base for learning within this relationship is made up in natural way. In such situation both partners show high level of commitment and are willing to share the knowledge they possess. This usually leads to creating specific base of knowledge which is common asset of relationship participants. In result, it strengthens mutual trust of cooperating enterprises and stimulates relationship development.

When cooperation starts developing, there are several signs of this process. Among them we can point out building the communication system for the relationship, specific investments

done for the relationship, resources' sharing and modification or setting outcomes measurement system for the relationship. Such activities undertaken by the cooperators result in gradually increasing and developing mutual trust of relationship parties. A consequence of this process is an increase in satisfaction of cooperating companies. While collaborators see that together they can obtain several benefits they have planned earlier, the level of satisfaction is growing up and partners get the proof of good strategic choice they have made. The ability to obtain particle goals, one by one, increases mutual trust existing in the relationship and that way strengthens the whole relationship.

In the literature there are several approaches to trust. Nevertheless, common to most definitions of trust is a confidence between the partners that the other one is reliable and that the partners will act with a level of integrity while dealing with each other (Morgan and Hunt, 1994, pp. 20–38; Zuker, 1986, pp. 53–112).

Ring and Van de Ven defined trust as "an idividual's confidence in the good will of the others in a given group and belief the others will make efforts consistent with the group's goal" (Ring and Van de Ven, 1994, pp. 90–118). From the perspective of inter-firm cooperation trust means "having sufficient confidence in a partner to commit valuable know-how or other resources to transactions with it despite the fact that, in so doing, there is a risk the partner will take advantage of this commitment (Child, Faulkner and Tallman, 2005, p. 50).

Trust within the relationship develops gradually as the cooperating firms move from one stage of relationship to another. At the beginning of relationship the trust between partners is based on calculations made by them. Then the firms operate together and their activities and outcomes confirm the validity of calculative trust, they begin to develop the knowledge base about each other. Based on literature review, at that stage partners are able to enter the level of mutual trust which now is based on mutual understanding. This category of relationship trust has been also defined as cognitive trust (Lewicki and Bunker, 1996, p. 121).

A further transition of trust build within the relationship should come when "normative trust builds on the depth of knowledge that the parties have acquired of each other and on the mutual confidence they have developed" (Child, Faulkner and Tallman, 2005, p. 57). It is worth noted that repeated interactions between cooperating firms which are perceived as successful enhance their mutual trust. And as the companies of the relationship know more about each other and trust each other, the more likely they are to reduce their emphasis on formal control mechanisms. On the other hand the level of their good will increases. The results that partners have already obtained from the relationship may encourage them to identify with each other's goals and interests. At this stage trust based on personal identification is likely to occur. This is the highest level of relationship trust, which partially emerge from issues relating to goodwill and competency, recognized by each partner at earlier stages of relationship development process. It is important to underlie the nature of goodwill within inter-firm relationship. Goodwill factors refer to partner does more than is formally expected while an unforeseen situation arises.

Concluding, if trust develops over time within the relationship, it serves as a stabilizing influence on partners, helping them to cope with shifts in bargaining power and other types of problems or crises. Trust is seen as the factor that reduces the probability of loss and enables cooperating firms to move forward even though uncertainty in the relationship may remain (Inkpen and Curral, 2004, p. 596).

Another variable perceived as critical to successful cooperation is inter-firm communication. Relationship communication is considered as a dialogue between partners focused on problems solving and decision making, developing new opportunities as well as developing interpersonal relationships. It should be underlined that "the world dialogue connotes an equity and mutuality of exchange of close relationships, whereas persuasion is a common form of communication" (Donaldson and O'Toole, 2002, pp. 150–151).

In the literature on inter-firm cooperation communication is perceived as the foundation process which facilitates relationship development and its ongoing maintance. According to Mohr and Nevin communication in the inter-firm relationship is described as social glue that hold partners together (Mohr and Nevin, 1990, pp. 36–51). Communication is an essential part of a system that particular relation creates, both in the stage of relationship formation and in the stages of its development.

Two most common measures of communication within the inter-firm relationship in the literature have often been associated with mechanistic and behavioral approach. The mechanical aspects of communication include the message content, the channel mode, feedback and frequency. The behavior measures cover communication quality, information sharing and participation (Donaldson and O'Toole, 2002, p.151). Quality of communication is associated with accuracy, adequacy, timeliness, completeness and credibility of shared information. It is important to note that the quality and intensity of information sharing is highly associated with the strength of the relationship. It has long been recognized that the higher the quality of information sharing and the more intense it is, the more likely is that a relationship will be stable and developing (Mohr and Spekman, 1994, pp. 135–152).

Another relevant issue while analysing the critical success factors of inter-firm cooperation is partners' commitment to relationship coordination and development. Commitment has been understood as partners' conviction that the relationship is beneficial for them so they undertake several activities in order to sustain it (Barry and Dion, 2008, p. 119). Therefore, it means that partners' commitment refers to deepening and extending the exchange between cooperating firms (Anderson, Hakansson and Johanson, 1994, pp. 1–15). In other words enterprises engaged in cooperation carry about the stability and efficiency of a relationship.

Partners' commitment to relationship can be of operational, information or investment character. Operational commitment concerns partners' shares in the whole venture undertaken together. The information dimension is related to communication process. In detail it refers to the type, frequency and forms of communication. It also takes into account the way of information usage by the partners. In practice information dimension deals with honest sharing of information that is essential for relationship development. Investment dimension of commitment concerns resource allocation done by cooperators (Czakon, 2007, pp. 82–83).

Here it is important to say that the commitment of cooperating companies first requires mutual trust between them. Such foundation makes cooperators more willing to share their resources, especially those of strategic importance, or information. In this context, we can say that trust is necessary condition for commitment to occur in the relationship. Moreover, mutual trust should make it safer for the collaborators to invest in their relationship particular assets which can not readily be used elsewhere and should reduce the temptation for one

company to take advantage of the other, because of the good will it represents (Child, Faulkner and Tallman, 2005, p. 53).

Concluding, the increase of partners' commitment to the relationship is viewed as the sign of cooperators' determination to accomplish the relationship goals. If partners commitment increases over time, it limits the risk of cooperants' opportunism due to the fact that they have previously allocated particular assets and they steer clear of the loses in the case of relationship breakdown.

All stages of the relationship development, from the very beginning to the end, are influenced by interdependence of enterprises cooperating for successful outcomes. Different approaches, while discussing the issue of interdependence within relationship, especially aimed at creating innovations, point out two facets. The first refers to the complementarity of critical resources engaged in the relationship and the second concerns resource allocation. Both mentioned above are perceived as being important elements of this interdependence.

Resource complementarity reflects the degree to which tangible and intangible assets of relationship partners enable to obtain the needed synergy. Most writers agree that an important issue concerning the resources assigned for cooperation is the way they are bounded. According to resource based view of the firm, creating any strategic inter-firm relationship means looking for the highest possible resource complementarity, then resource modifying and creating such composition that will be optimal to obtain the synergy effects. There is also a considerable agreement among researchers on the importance of any modifications of partners' resources. It is due to the fact that these changed assets are these elements which make up the relationship and create the interdependence bonds between partners (Dubois and Hakansson, 2002, pp. 46–47). Resource allocations refers to the use of different categories of resources (human, capital, know-how etc.) in developing any cooperative relationship. We should remember that cooperating partners often use different resources of each other and thus they allocate them outside of their enterprises. The more intensive it is, the stronger are interdependence bonds between relationship participants.

While discussing the critical variables fostering the development and success of pro-innovative relationship it must be emphasized that there are numerous factors influencing this process and they all connected in many ways. That is why it is very difficult to isolate particular ones and to propose their hierarchy.

4 CRITICAL SUCCESS FACTORS FOR PRO-INNOVATIVE COOPERATION OF POLISH FIRMS – RESEARCH FINDINGS

The empirical part of the paper identifies the main conditions that impact the development of pro-innovative relationships and make these relationships work.

Investigation of critical success factors for pro-innovative cooperation between firms was one of the components of big exploratory survey that has been conducted in 2008 and 2009 at Nicolas Copernicus University in Toruń (Poland). The target population of this survey was 750 companies found in the database of 2000 Polish of enterprises nominated for "Good Company" Prize, chosen on the base of their profitability and innovativeness. 750 questionnaires were sent to targeted firms and a total of 109 responses were returned. So 109 enterprises, having extended experience in cooperation and at the same time attaining successes in the field of innovativeness, make up the research sample.

The survey, among others, helped to determine the desired benefits that Polish enterprises aspire to obtain within pro-innovative relationships they establish. However, the main research problem was to identify the critical factors fostering the development and success of the relationship. The success of particular relationship was understood as accomplishing all goals set by the partners for this relationship.

According to the research findings, the critical factors fostering the process of pro-innovative relationships development are of internal character and they concern specific features of the relationship. The critical success variables chosen for the research project have been indentified through a comprehensive literature review.

Table 2 presents the hierarchy of identified success factors for pro-innovative relationship development.

Table 2: The impact of identified variables fostering the development of pro-innovative relationships in the opinion of enterprises that are successful at cooperation

Variables fostering successful development of pro-innovative relationships	Very strong positive impact (%)	Mean value
High degree of partners' assets complementarity	76,2	4,59
High level of mutual trust	69,1	4,49
Similarity in partners' goals	69,1	4,45
High level of relationship participants' contribution	57,1	4,34
The ability to define the measures for the outcomes of the relationship	54,8	4,34
Effective communication system	54,8	4,24
Relationship is of strategic importance for both partners	47,6	4,21
Partners' experience in the field of inter-firm cooperation	42,9	4,18
High level of relationship coordination	47,6	4,17
Jointly set and clearly defined measures for the goals accomplished within the relationship	42,9	4,15
High level of infrastructure created for the relationship management	47,6	4,10
High degree of relationship participants' independence	28,6	3,90
High degree of partners' investment in the relationship	38,1	3,83
Long term of relationship existence	23,8	3,73
relationship participants' organizational cultures' similarity	28,6	3,59
Symmetry of relationship participants' contribution	26,2	3,43

During the research a five-point scale (5-very strong positive impact and 1-very weak positive impact on relationship development aimed at goal accomplishment) was used to check the respondents opinions.

The conducted analysis allows to say that the factors of crucial significance for successful pro-innovative relationships development are the following: complementarity of partners' assets, high level of mutual trust which is said to be an essential component of successful

Challenges of the Modern World - Contemporary Economy and Globalization

cooperation, similarity in relationship participants' goals, high level of relationship participants' contribution, the ability to define the measures for the outcomes of the relationship, effective communication system, as well as the fact that relationship is of strategic importance for both partners. All aforementioned factors got the mean value above 4,2 reflecting their strong positive impact on successful relationship development.

The importance of assets complementarity refers to the fact that particular assets of relationship participants' are bounded in a specific way. Moreover, some of engaged assets are changed in order to obtain high complementarity needed for participants' common work. While such situation appears, this strong interdependence becomes an element that holds partners together. Additionally, the more valuable are such assets, the stronger bond exists within the relationship.

According presented research findings, the second critical variable is high level of mutual trust between relationship participants. The nature and importance of trust has been discussed in the theoretical part of the paper. Here it must be noted that if there is high complementarity between relationship participants resources, there is also an increase of trust between them. High degree of resources complementarity entails high degree of partners' good will and commitment to relationship development. On the other hand, high level of mutual trust is necessary to share valuable strategic assets, as for example knowledge, and therefore it fosters the process of learning that is so important in case of pro-innovative cooperation.

Also similarity in relationship participants' goals is an import ant variable that bond cooperating firms. As partners strive after similar benefits and share the vision of cooperation results, they take care of relationship sustainability. Such attitudes are reflected in game theory which says that if players have common goals, they consciously create non-conflict situations. Similarity in cooperation objectives results in the increase of partners commitment but also brings about mutual sens of honesty within the relationship. This in turn holds back cooperating firms from opportunism. In consequence such situation influence the level of partners mutual trust.

High level of relationship participants', contribution is next variable pointed out by the respondents as critical for relationship development and success. It was already said that the higher is value of company' s contribution to common undertaking, the more attention it will put to the use of its resources. This means higher degree of coordination and control over the relationship development.

Another significant issue is cooperators' ability to define the measures for the outcomes of the relationship. It refers to already recognized correctness that the process of trust building accomplishes on the base of cooperation outcomes. Consecutive stages of common partners' activities rewarded with desired benefits result in the increase of relationship participants' mutual trust. Here it should be emphasized that ability to define goals as well as the measures for the outcomes refers to the quality and efficiency of communication within the relationship.

Very important fact is that among mentioned factors there are several connections which create a specific configuration determining not only existence of the relationship but also obtaining consecutive stages of its development. In–depth analysis providing insight into interrelations among critical factors of successful development of pro-innovative relationships first gives the managers of cooperating firms the consciousness of the most important issues

and second the knowledge how to manage and coordinate those variables. We also must remember that all above mentioned factors are of dynamic character which means that the state of the elements is changing in time. Knowledge concerning the impact of mentioned factors upon pro-innovative relationships development enables enterprises intentionally create the conditions favourable their successful development understood as achieving defined goals

5 CONCLUSION

In contemporary changing market circumstances the relationships that a firm builds on the market are its assets which play an important role in strategy building. In the literature on strategic management the view that inter-firm relationships are created to contribute to the increase of cooperating companies' effectiveness (operational dimension) and to improve their competitive positions (strategic dimension) becomes commonly used today. Theoretical part of the paper was an attempt to identify the most significant variables having positive impact on the way pro-innovative inter-firm relationship develops.

The empirical research findings presented in the paper have identified and prioritized the factors critical to successful pro-innovative cooperation undertaken by a group of 109 Polish enterprises. Described data show that high degree of partners' assets complementarity, high level of mutual trust and similarity in relationship participants' goals are the most important in terms of relationship success understood as the ability to accomplish all cooperative goals of the partners. It is important to emphasize that understanding the nature of critical success factors can help enterprises investigate and improve the relationships they build in their environment.

The issues considered in the paper highlights the complexity of analyzed problem but also the need for further research on the matter of: trust development stimulation, relation participants' commitment management or minimizing the opportunism of partners.

ABSTRACT
Financial well-being can be defined as the percepiton of degree of security in terms of the financial situation a person faces (Norvilitis, Szablicki and Wilson, 2003). Some studies conducted with university students (Davies and Lea, 1995; referenced by Sullivan, 2003) reveals that the indebtedness of students negatively effects their financial well being. As an important financial instrument, credit cards can be obtained easily even by university students without documenting any current or past financial status. Therefore, the feeling of insecurity as a result of the amount of debt might be triggered by the use of credit cards. The aim of this study is to compare Turkish and French university students in terms of their financial well being. For this purpose, financial well being scale developed by Norvilitis, Szablicki and Wilson (2003) is administered to French and Turkish students. Moreover, questions concerning university students' financial behaviours and attitudes, level of indebtedness, credit card usage were asked. As there are cultural, social and economic differences in between these two societies, it is expected that these will be reflected in the financial behaviour of university students. The results showed that there were significant country differences on life satisfaction. Turkish university students had higher scores on life satisfaction than French students. Also results showed that French students were using credit cards significantly more than Turkish students. Moreover, it was observed that financial well being scores of French students were higher than Turkish students. However, Turkish students revelaed that they were getting more support from their families when faced with financial difficulties in comparison to French students.

Keywords: Credit cards, Financial well being, Indebtedness, University students

1 INTRODUCTION

Payment methods and systems evolved over time. As technological advances change the way the transactions are made, also the ability to purchase different goods and services increases as a result of the growth in credit opportunities provided by financial intermediaries. Credit cards are now used elsewhere in the world and provides an easy way of access to credits needed as compared to taking out loans from depository instutions where individuals are subject to fullfill more requirements and paperwork. This infact encourages individuals to spend more or in other words as Feinberg (1986) states people are conditioned to spend. As some studies (Wickramasinghe and Gurugamage, 2009) reveal, this in turn increases the amount of debt households have. Likewise studies (Sotiropoulos and D' Astous, 2012)

conducted in USA shows that the credit card usage rate among students is on the rise and more importantly large rates of bankruptcy is present among young credit card holders. Therefore, the debt created by credit cards might effect the financial well-being of an individual. Financial well-being can be defined as the percepiton of degree of security in terms of the financial situation a person faces (Norvilitis, Szablicki and Wilson, 2003). Some studies conducted with university students (Davies and Lea, 1995) reveals that the indebtedness of students negatively effects their financial well being. As an important financial instrument, credit cards can be obtained easily even by university students without documenting any current or past financial status. Therefore, the feeling of insecurity as a result of the amount of debt might be triggered by the use of credit cards. The aim of this study is to compare Turkish and French university students in terms of their financial well being. For this purpose, financial well being scale developed by Norvilitis, Szablicki and Wilson (2003) is administered to French and Turkish students. Moreover, questions concerning university students' financial behaviours and attitudes, level of indebtedness and frequency of credit card usage were asked.

In addition, the cultural structures of Turkish and French society are different than each other. Turkey is a country that is experiencing an important transition from a rural society to a more urbanized society in the last decades. Therefore both traditional and indiviualistic values can be found together (Kağıtçıbaşı and Sunar, 1992). Also, close ties and family relations are very important for Turkish people. According to Kağıtçıbaşı (1990, 2007), Turkish families living in urban cities tend to raise children who are emotionally dependent to their parents. Besides, high levels of matterial and emotional interdependency can be observed in rural areas of Turkey. Family control is still an important value in Turkey (Kağıtçıbaşı and Sunar, 1992). As a result of this child raising attitude, Turkish kids are more dependent to their parents and are experiencing a high level of support from their families through out their life. In summary, even individualistic values are dominant among highly educated Turkish individuals, Turkish culture has been characterised by collectivistic values (İmamoğlu and Karakitapoğlu-Aygün, 2004). However, individualistic values are more prevalent in French culture. Individualistic cultures like USA and France are composed of individuals who are more self centered (Hofstede, 1981). According to Meyer (2010), when countries are compared with respect to individidiualistic values they posess, France had a score of 71 and Turkey had 37. Indicating that France has a more individualistic society than Turkey has.

As there are cultural, social and economic differences in between these two societies, it is expected that these will be reflected in the financial behaviour of university students. Therefore, we expected that French university students would have higher scores on financial well being. Also we expected Turkish students would receive more support from their families when they face financial hardship.

2 METHOD

2.1 Participants
In this study 70 (55%) Turkish and 57 (45%) French, in total 127 students were participated. The average age of Turkish students were 20.55 (SD= 2.00) and the average age of French students were 22.56 (SD= 2.25). Turkish students were all from various universities in Ankara (Ankara University, Başkent University) the capital city of Turkey. French students were from UFR (Université de Franche – Comté), DUT, Université de Paris, BTS. When average household income levels of the participants were investigated it is found that Turkish students

Challenges of the Modern World - Contemporary Economy and Globalization

had 2409.29 TL (SD= 2234.86) average household income and were getting on average 380 TL (SD= 494.56) support from their families or receiving scholarship on monthly basis. Respectively French students had 2109.64 Euro (SD= 1009.66) average household income and were getting on average 434.66 Euro (SD= 264.91) support from their families or receiving scholarship on monthly basis. Other demographic characteristics are shown in Table 1. Also participants were asked to evaluate their life satisfaction by using a likert type scale (1= No satisfaction at all, 7= Fully Satisfied). The average level of satisfaction was found to be 4.84 (SD= 1.30) among Turkish students and 4.39 (SD= 1.10) among French students. Likewise the frequency of credit card usage were asked to the participants (1= None, 7= A lot), and the average for Turkish students were 1.93 (SD= 2.42) and 4.60 (SD= 2.09) for French students.

Table 1: Demographic characteristics of Turkish and French students

Variables	Turkey	France
	Frequency	
Gender		
Female	44 (% 63)	30 (% 53)
Male	26 (% 37)	27 (% 47)
Mother's Education		
Illiterate	2 (% 3)	
Primary	15 (%21)	
Secondary	9 (%13)	4 (% 7)
Lycee	27 (%39)	16 (% 28)
University	15 (%22)	29 (% 51)
Post Graduate	1 (%1)	8 (% 14)
No Responce	1 (%1)	
Father's Education		
Illiterate	2 (%3)	
Primary	8 (%11)	1 (% 2)
Secondary	9 (%13)	14 (% 25)
Lycee	27 (% 39)	30 (% 53)
University	21 (% 30)	8 (% 14)
Post Graduate	3 (% 4)	4 (% 7)
Credit Card Usage		
Evet	26 (% 37)	49 (% 86)
Hayır	44 (% 63)	8 (% 14)
Number of Credit Cards		
None	40 (% 57)	
1	20 (% 29)	8 (% 14)
2	10 (% 14)	49 (% 86)
Part-time Job		
Working	9 (% 13)	13 (% 23)
Not Working	61 (% 87)	44 (% 77)

2.2   Measures

Demographic information form
In this form participants were asked to answer questions about their gender, age, father's and mother's education level. Also questions concerning their financial status, their family's average income and their personal average income, their attitudes towards using credit cards (number of credit cards, frequency of usage, amount of expenditure made by using credit

cards and etc.) were asked. Besides, their perception of life satisfaction was measured on a seven point Likert-type scale ranginig from not at all satisfied (1) to very satisfied (7).

Financial well being scale
This scale developed by Norvilitis, Szablicki and Wilson (2003) to measure individual financial confidence and financial well being. The scale has two sub-scales: current financial status (8 items, e.g. i am concerned about repaying my credit card debt, e.g. i think i will not have any credit card debt a year later) and expected future financial status (2 items). According to Norvilitis et al. (2003), single total score from the scale can be obtained. The scale is adapted to Turkish culture by Sunal (2012). In the adaptation study to examine the construct validity, factor analysis were made and consistent with the original scale two sub-scales were obtained. In this scale, some of the items were excluded as these items were thought to be irrelevant to the Fernch culture (e.g. i am concerned about repaying my student loan is excluded). Therefore, a six item scale was administered. Items 2 and 6 are reversly coded. In this study, total score was used. In this study internal consistency coefficient Cronbach's Alpha was 0.79.

2.3   Procedure
The purpose of this study was explained to the participants and then scales were given to them. Participation was voluntary and their answers were kept anaontmously. The application of scales took 10-15 minutes. The scales were administered to Turkish students in classroms and to French students via internet.

3   RESULTS
A one –way multivariate analysis of variance (MANCOVA), using income level as covariant, was conducted to compare financial well being, life satisfaction, credit card usage frequency, and level of support from family received when financial difficulties were faced among Turkish and Fench university students. Significant differences were found between Turkish and French university students on financial attitudes, Wilks'Lambda= .72, F (5, 118)= 9.01, p<.001, eta^2 = .28.

The results showed that there were significant country differences on life satisfaction, F (1, 122)= 3.05, p<.05, eta^2 = .02, credit card usage frequency, F (1, 122)= 38.83, p<.001, eta^2 = .24, support from family during financial difficulties, F (1, 122)= 5.21, p<.05, eta^2 = .04 and financial well being, F (1, 122)= 4.54, p<.05, eta^2 = .03. Turkish university students had higher scores on life satisfaction than French students (Table 2). When groups were compared according to the frequency of credit card usage it was found out that French students were using credit cards significantly more than Turkish students. Moreover, it was observed that financial well being scores of French students were higher than Turkish students. However, Turkish students revelaed that they were getting more support from their families when faced with financial difficulties in comparison to French students.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: Descriptive statistics of finansical attitudes by gender and countrye and F values

Country	Gender	Life Satisfaction		Credit card usage frequency		Support Received from family		Financial well being	
		M	SD	M	SD	M	SD	M	SD
Turkey	Female (n= 44)	4.93	1.17	1.64	2.30	6.07	1.74	13.80	4.63

4   DISCUSSION

The aim of this study is to compare Turkish and French students in terms of their financial attitudes. Findings are consistent with the expectations. Findings showed that French students are financially better off than Turkish counterparts as France is a wealthier country than Turkey when compared in terms of GDP per capita. The nominal GDP per capita in France was 44.007 $ in 2011 and 10.363 $ in Turkey (IMF, 2012). In this study the average household income of Turkish students were 1020 € (2.409 TL) and average household income of French students were 2.109 €. This result is consistent with our expectations though according to the national average nominal income per capitas, we would expect French students' average household income to be four times higher than Turkish ones. Though it was only two times higher in this study. One possible reason is that some of the Turkish participants were from a private university in Ankara therefore their average household income might be higher which possibly do not reflect the Turkish national average income and this might have raised the average. The second possible reason is that families that can afford to send their children to universities might have on average a higher household income level than the national average in Turkey.

Findings also revelaed that, Turkish students are significantly getting more support from their families when faced by financial problems. This is also consistent with our expectations as Turkish culture is more tarditional and children are more dependent to their parents. In individualistic societies emotional and matterial dependence are at the lowest levels (Kağıtçıbaşı, 1990, 2007). Therefore French students might be relying less on their parents when financial difficulties are faced.

Moreover, credit card usage among French students were significantly more than Turkish students according to the results obtained. There might be a couple of possible reasons beyond this fact. First of all France is a wealthier country than Turkey is. Therefore, access to credit cards might be more easier for French students than Turkish students. More importantly, 57% of Turkish participants had no credit cards where as 86% of French students had two credit cards. Therefore, French students use credit cards significantly more than Turkish students cause they posess more credit cards. Likewise in USA –another much

wealthier country than Turkey-, according to SallieMae (2009), students posess on average 4.6 credit cards.

ABSTRACT
Technological development and R&D activities are accepted as one of the factors of basic production in endogenous growth theories. There has been an increasing interest towards R&D on the level of both firm and country. Moreover countries regard FDI as an important element which increase R&D activities. Although there are numerous studies which investigate relationship of both FDI and R&D on macroeconomic variables such as economic growth, employment and export; the number of studies which investigate the relationship between FDI and R&D is quite few. The aim of this study is to analyze relationships between FDI and R&D in the example of EU15 and EU27. For this aim, 1996–2009 period data of mentioned countries were considered and dynamic panel causality testing was done. According to the findings obtained from empirical test made in the study, there is one-way causality relationship among EU15 and EU 27 countries from FDI towards R&D. This finding points out to the existence of complementary relationship between FDI's and R&D for EU.

Keywords: European Union, FDI, Panel Causality, R&D

1 INTRODUCTION

Neoclassical growth theory which was developed under the leadership of Solow (1956) resulted in balanced growth. In the case of balanced growth, output per worker increases as much as technological development. Technological development which is accepted as exogenous in theory is a factor which determines increase in output per worker. However, in the endogenous growth theories which are developed under the leadership of Romer (1986), technological development is determined by intrasystem elements. The theory concluded that a growth rate could be achieved which is above balanced growth rate that was achieved by

Challenges of the Modern World - Contemporary Economy and Globalization

neoclassical theory. Technological development which is based on research and development (R&D) activities was regarded as an important factor in the increase of growth[1].

Technology transfer may have positive effects on economic growth. Foreign direct investment (FDI) may increase economic growth through technology channels such as R&D by contributing to the current technological knowledge. Also, FDI investors may contribute to more efficient usage of resources by getting into competitive environment with domestic firms in domestic market. Domestic firms may carry out R&D activities in order to compete with technology brought by foreign investors. On the other hand, in some cases firms can have the new technology without doing any R&D activities.

Today countries make competition in order to attract FDI investments. Forming an economic integration or accession to an integration is conducted in order to attract FDI. EU which is the most successful example of integration is in an important position for FDI investments. The aim of this study is to analyze relationships between FDI and R&D for EU with panel causality testing. Literature which analyzed FDI and R&D relationship was included in the second section of study. In the third section, econometric method and data set was discussed. In the fourth section, findings obtained as a result of analysis were given. A general evaluation of findings was made in the last section.

2   THEORY AND LITERATURE SUMMARY

Although there are numerous studies which investigate relationship of both FDI and R&D on macroeconomic variables such as economic growth, production, efficiency, export, employment etc.; the number of studies which investigate the relationship between FDI and R&D is quite few. An exact judgment cannot be made about relationship between FDI and R&D according to the results of this restricted number of studies. While some of the studies assert that there is a positive, complementary relationship between these two variables; some studies assert that there is a negative, substitution relationship between these mentioned variables.

According to the studies which assert that there is a positive relationship between FDI and R&D, FDI creates positive externality on domestic firms through technological spillover effect. That is; foreign firms which enter in a country with FDI may have direct or indirect contribution to R&D activities of the host country. For example, foreign firms pay attention to increasing R&D activities of host country in order to adapt economic conditions of host country or to compete with domestic firms. Similarly, existence of foreign firms in the sector can force domestic firms to develop new innovations and increase their technological capacity. Moreover, foreign firms stepping into country can create technological spillover effects on behalf of domestic firms and cause increase in R&D activities of these firms (Sasidharan and Kathuria, 2011, p. 1226).

According to the studies which assert that there is a negative relationship between FDI and R&D, firms may choose to procure technology instead of doing R&D activities as a result of FDI inflow (Lee, 1996, p. 198). That is; domestic firms may decrease their R&D activities by procuring technology from abroad instead of competing with foreign firms. Sometimes firms stepping into foreign country prefer using technology of partner company and decide not to

---

[1] See Romer (1990), Rivera-Batiz and Romer (1991a, 1991b), Grosmann and Helpman (1991), Aghion and Howitt (1992).

make R&D investment (Sasidharan and Kathuria, 2011, p. 1226). Then, FDI and R&D will become competitors instead of complements.

In the following section, specific studies which analyze relationships between FDI and R&D in literature were presented according to the year of analysis. Literature summary which is composed of these explanations is shown in Table 1.

Kumar (1987) analyzed relationship between technology import and R&D expenditures of 1334 firms in manufacturing industry in India for 1967–1977 and 1980–1981 periods with panel OLS method. According to the findings obtained from study, FDI inflows have reducing effect on domestic R&D expenditure.

Bertschek (1995) analyzed on 1270 German firms for 1984–1988 periods that import and FDI have no positive effect on innovative activities of domestic firms. In his analysis, Bertscheck (1995) used Chamberlain's random effects probit approach (1984) and determined that import and FDI have positive effect on both product innovations and process innovations.

Lee (1996) analyzed relationship between technology import (as an indicator of FDI) and R&D in manufacturing industry firms in Korea for the year 1884 with the help of Heckman two-stage estimation procedure (1979). In the first stage of procedure he applies Probit analysis by using all the firms (492 firms) in the sample and determined that firms which import technology have tendency of increasing their R&D activities. In the second stage of analysis, panel OLS was applied on firms which have R&D institutes (92 firms) and it was determined that there is no complementary relationship between FDI and R&D, on the contrary FDI have negative effects on international inventive activities.

Chuang and Lin (1999) analyzed relationship between FDI and R&D with the help of Heckman two stage estimation procedure (1976) by using 8846 firms in Taiwan for the year 1991. Probit model estimation was done in the first stage of econometric analysis and it was determined that FDI has increasing effect on R&D activities. In the second stage panel OLS method was applied for 679 firms which make R&D investment. It was determined that there is negative relationship between FDI and R&D investments.

Branstetter (2000) analyzed changes in R&D activities of Japanese firms which make FDI investments in USA. In the study panel OLS was applied on 208 Japanese and 209 American firms for 1986–1989 period and it was determined that there is a positive but weak relationship between FDI and R&D activities.

Fan and Hu (2007) investigated effects of FDI on domestic R&D activities on 998 firms in China for 1998–2000 period. In the study in which Panel OLS and Fixed Effects Models were used as econometric method, it was concluded that FDI inflows have negative effect on R&D activities. Fan and Hu (2007) stated that firms with more foreign participation allocate less resource for R&D activities.

Kathuria (2008) investigated what kind of changes FDI inflow for domestic firms in India (high and medium technology industries) had on R&D expenditures. In the study in which post 1991 period when corporatization reform was done is divided into two sub-periods; Probit model was used in the first sub-period which is covers the years 1994–1996. According to the findings obtained from estimation of Probit model it was determined that increase in

FDI decreases R&D expenditures. Tobit model was used in the second sub-period which is covers the years 1999–2001; it was concluded that there is no causality relationship between FDI inflow and R&D expenditures.

Like Kathuria (2008; referenced by Sasidharan and Kathuria, 2011) analyzed the relationship between FDI and R&D in India for post-corporatization period with the help of Heckman's two-stage estimation method (1979). In the study in which 1843 firms which go into operation in manufacturing industry sector for 1994–2005 period were analyzed, first of all panel OLS estimation was done without making discrimination among firms. According to the findings obtained from this estimation, it was determined that FDI has no significant effect on R&D. Similar results were obtained when panel OLS analysis was done by grouping firms as high, medium and low technology firms. Finally when firms were divided according to stock ownership (as majority and minority owned foreign firm) and analyzed in this way, it was determined that there is positive relationship between FDI and R&D.

Table 1: Literature Summary about Relationship between FDI and R&D

Author	Period	Country	Method	Applied Findings
Kumar (1987)	1976–1977 1980–1981	India (1334 firms)	Panel OLS	FDI→R&D (-)
Bertschek (1995)	1984–1988	Germany (1270 firms)	Chamberlain's Random Effect Probit Model	FDI→Product innovations (+) FDI→ Process innovations (+)
Lee (1996)	1984	Korea (1. stage 492 firms, 2. stage 92 firms)	Heckman (1979)'s two stage estimation	FDI→R&D (-)
Chuang and Lin (1999)	1991	Taiwan (1. stage 8846 firms, 2. stage 679 firms)	Heckman (1976)'s two stage estimation	FDI→R&D (-)
Branstetter (2000)	1986–1989	Japan (208 firms) and USA (209 firms)	Panel OLS	FDI→R&D (+)
Fan and Hu (2007)	1998–2000	China (998 firms)	Panel OLS and Fixed Effect Model	FDI→R&D (-)
Kathuria (2008)	1994–1996 1999–2001	India (190 firms)	Probit and Tobit model Estimation	• Probit: FDI→R&D (-) • Tobit: FDI↔R&D (0)
Sasidharan and Kathuria (2011)	1994–2005	India (1843 firms)	Heckman (1979)'s two stage estimation	• Full Sample: FDI↔R&D (0) • Technology discrimination: FDI↔R&D (0) • Majority- and minority-owned discrimination: FDI→R&D (+)

Note: Table was formed by authors; (+) reflects positive, (-) negative, (0) meaningless effects in the table, (↔) and (→) symbols respectively point out to the existence of two-way an done-way causality relationships between variables.

3   METHOD AND DATA

In the literature study it was seen that all the studies were based on data at firm level. Publishing of R&D data of countries in database recently and developments in econometric

methods enables testing of relationship between FDI and R&D. Therefore, in this study panel data analyses which pay attention countries different from available literature was included.

In the study relationships between FDI and R&D was analyzed for EU 15 and EU 27 countries. As an indicator of R&D and FDI for mentioned country groups, shares of R&D expenditures and FDI in GDP were used respectively. The data were compiled from the World Bank's Development Indicators online database, available on http://www.worldbank.org. The panel covers annual data for the period 1996–2009. The data set of the study is unbalanced.

For determination of causality relationships between FDI and R&D in EU 15 and EU 27 countries, the method developed by Holtz-Eakin, Newey and Rosen (1988) was used. This method can be explained through a VAR system formulated as follows:

$$Y_{it} = \alpha_{0t} + \sum_{l=1}^{m} \alpha_{jt} Y_{it-l} + \sum_{l=1}^{m} \beta_{jt} X_{it-l} + \emptyset f_{yi} + u_{it} \tag{1}$$

$$X_{it} = \varphi_{0t} + \sum_{l=1}^{m} \varphi_{jt} X_{it-l} + \sum_{l=1}^{m} \mu_{jt} Y_{it-l} + \tau f_{xi} + \varepsilon_{it} \qquad (i = 1, \dots, N; t = 1, \dots, T) \tag{2}$$

Here Y represents R&D; X denotes FDI; i is the number of the cross-section units from 1 to N; t is the time period from 1 to T; f_{yi} and f_{xi} refer to the time-invariant fixed effects unique to cross-section units. This fixed effects of cross-section units were eliminated by taking difference of the equations (1) and (2) so these equations were turned to equations (3) and (4) as follows[2]:

$$\Delta Y_{it} = \sum_{l=1}^{m} \alpha_j \Delta Y_{it-l} + \sum_{l=1}^{m} \beta_j \Delta X_{it-l} + \Delta u_{it} \tag{3}$$

$$\Delta X_{it} = \sum_{l=1}^{m} \varphi_j \Delta X_{it-l} + \sum_{l=1}^{m} \mu_j \Delta Y_{it-l} + \Delta \varepsilon_{it} \qquad i = 1, \dots, N; \ t = 1, \dots, T; \ l = 1,2 \tag{4}$$

Since error terms in equations (3) and (4) can be related with lags of dependent variable; instrumental variables should be used in the estimations. Therefore, the equations (3) and (4) were estimated by using the Generalized Method of Moment (GMM). The direction of causality in GMM estimations were determined by Wald statistics obtained by evanishing independent variables as a group.

On the other hand, it was decided with Sargan test whether instrumental variables used in GMM estimations are valid or not (Liang and Liang, 2009, p. 152).

4   FINDINGS
Causality results were determined by Wald test for independent variables obtained from GMM estimation of equations (3) and (4) for EU 15 and EU 27 are presented in Table 2. On

---

[2] Δ represents difference operator.

Challenges of the Modern World - Contemporary Economy and Globalization

the other hand, the results of GMM estimation of equations (3) and (4) are given in the Appendix.

Table 2: Results for Panel Causality Test

	Equations	Wald Test χ2 Statics	Sargan Test P-Value	Directions of Causality	
EU 15	$$\Delta R\&D_{it} = \sum_{l=1}^{m} \alpha_j \Delta R\&D_{it-l} + \sum_{l=1}^{m} \beta_j \Delta FDI_{it-l} + \Delta u_{it}$$	6.62022[b]	0.32090	FDI ⟹	R&D
	$$\Delta FDI_{it} = \sum_{l=1}^{m} \alpha_j \Delta FDI_{it-l} + \sum_{l=1}^{m} \beta_j \Delta R\&D_{it-l} + \Delta \varepsilon_{it}$$	3.29655	0.29297	FDI ⟹̸	R&D
EU 27	$$\Delta R\&D_{it} = \sum_{l=1}^{m} \alpha_j \Delta R\&D_{it-l} + \sum_{l=1}^{m} \beta_j \Delta FDI_{it-l} + \Delta u_{it}$$	7.81654[b]	0.39797	FDI ⟹	R&D
	$$\Delta FDI_{it} = \sum_{l=1}^{m} \alpha_j \Delta FDI_{it-l} + \sum_{l=1}^{m} \beta_j \Delta R\&D_{it-l} + \Delta \varepsilon_{it}$$	2.70283	0.33244	FDI ⟹̸	R&D

Notes: b is meaningful at %5 significance level. Lags of dependent and independent variables were taken as 2 in the GMM estimations. Instrumental variables used in the GMM estimations are lags of level values of dependent and independent variables from 2 to 5. Δ represents difference operator.

As it is seen in Table 2, Wald statistics is meaningful both for EU 15 and EU 27 in the estimations of the equations where R&D is dependent variable. This result points out one-way causality relationship from FDI to R&D. According to the estimation results presented in the appendix, the FDI coefficients have positive signs which means that FDI have positive effect on R&D. Small values of the coefficients can be interpreted as weak relationship. The coefficients of the estimations made for EU 15 being higher than EU 27 means that relationship is more powerful in the sense of EU 15. Moreover, significance levels of sargan test put forward that instrumental variables used in the GMM estimations are valid.

5   CONCLUDING REMARKS

Endogenous growth theories have been put forward in 1980's. Technological development, R&D, human capital, background information and distribution have reached basic factors of production together with endogenous growth theories. Therefore, technological development and R&D activities becoming an important determinant in competitiveness of firms and growth of national economy resulted in increase of investments towards these in the level of both firm and country.

Increasing importance of R&D activities impelled countries towards different strategies for increasing R&D activities. In this sense, many countries regard FDI as an important factor which increases R&D activities. For example, FDIs may have important contributions to R&D activities in host country through technology transfer and spillover effects. Moreover, foreign firms which get into national economy with FDIs enable usage of resources more efficiently by increasing competitiveness environment in the country. Competitiveness which increases due to foreign firms impel domestic firms to carry out more R&D activities. FDI can also have negative effects apart from positive ones which contribute to national economy and R&D activities. For example, domestic firms may not enter into competition with FDIs and prefer purchasing manufacturing technology and therefore cause national R&D

investments to decrease. Similarly, foreign firms which make investments in the country prefer using technology of partner company and decide not to make R&D activities.

Liberalization of international capital mobility and globalization of financial markets in recent years resulted in increase of interest towards FDIs which are thought to have contribution in R&D activities. Especially developing countries regard FDIs as an important tool both in meeting their technological deficits and increasing R&D activities. Today countries evaluate economic integration as an alternative in attracting more FDI. More clearly, economic integrations result in scale economy with expanding market opportunities and causes increase of FDI inflows of countries both within and out of integration.

This study aims to put forward the kind of relationship between FDI and R&D and EU which is accepted as the most advanced integration. In this sense, it was analyzed through dynamic panel causality test whether FDI and R&D are complement or substitute of each other in EU 15 and EU 27. According to panel causality tests, while there was no relationship from R&D variable towards FDI variable both for EU 15 and EU 27; there was one way and statistically meaningful causality relationship from FDI towards R&D. That the coefficients of related FDI variables have positive signs can be interpreted as that there is a complementary relationship between FDI and R&D in the sense of EU. However, small values of these estimation coefficients points out to weak complementary relationship between FDI and R&D. On the other hand, Coefficients of estimations made for EU 15 being higher than EU 27 means that relationship is more powerful in the sense of EU 15. Recent developments in 2004 and 2007 which include transition economies (apart from Malta and Cyprus) and inclusion of small countries in EU both in the sense of population and economy can be effective in these findings.

As a result findings put forward positive and one-way causality relation from FDI to R&D in EU countries. FDI made in EU countries have positive effects on R&D activities in these countries. This study may have contribution to literature in the sense of future researches for applying different econometric methods on various country groups.

EXPLORING THE EFFECT OF NATIONAL CULTURE ON CORPORATE ENVIRONMENTAL PROACTIVITY

Ilaria Tutore
University of Naples Parthenope, Italy
ilaria.tutore@uniparthenope.it

ABSTRACT
The aim of the paper is to analyze if and in which way the national culture acts as a driver toward the implementation of corporate environmental strategy. An environmental proactive strategy seeks to reduce environmental impact and manage the interface between business and the nature beyond imposed compliance. It is recognized that the introduction of environmental protection can be used to develop successful strategy to reach a competitive advantage. The Organization and the natural environment literature identify several drivers able to push toward ecological engagement. One of the most important is the ethical attitude of organizations. Ethics could vary among different organizations because of different circumstance; in particular ethical values are strictly embedded to culture. The most of literature focused the analysis on the broader issue of Corporate Social Responsibility, analyzing the effect of national culture on Corporate Social Performance. Conversely, only few studies have analyzed the relationship that occurs between the national culture and the environmental proactivity, employing national environmental indicator rather than firms' performance scores. Previous studies, which used Hofstede's framework, have found out that the national culture is able to influence the overall national environmental performances, missing to analyze cultural impact on company's environmental behaviour. Does the national culture influence the company's attitude to implement a proactive environmental strategy? Which cultural dimension is able to represent this pressure? The study is based on a quantitative analysis aimed at statistically measuring how national culture could influence corporate environmental proactivity, measured using the CDP Global 500 report.

Keywords: *Cross-cultural management, Environmental performance, National culture values, Organization and natural environment*

1 INTRODUCTION
The trade-off existing between the goals of achieving an high and sustainable economic growth and to keep an high environmental standard is nothing new.

At organization level, the environmental protection has become an important issue since pollution and natural resources' depletion represent a wide source of costs. Companies may play a significant role in the reduction of man activities' impact on natural environment also promoting a world more ecologically sustainable.

During the last years the Organization and Natural Environment (ONE) stream of research focused the attention on the linkage existing among environmental protection, business management and strategy. According to some researchers (Hass, 1996; Kolk and Mauser, 2002) this attitude can increase by the time, following an ideal path toward sustainability (Hunt and Auster, 1990; Roome, 1992; Hart, 1995; Ghobadian et al., 1998).

The proactive environmental strategy ideally represents the last stage of environmental effort into management practices (Hunt and Aster, 1990). It is defined as the one that seeks to

reduce the environmental impact and to manage the interface between business and the nature beyond imposed compliance (Sharma, 2000; Aragon - Correa and Sharma, 2003).

It is characterised by the presence of four basic elements (Delmas et al., 2011): a environmental reporting; b operational improvements; c organisational changes; d regulatory proactivity. According to some researcher, the introduction of environmental protection at firm level could be used to develop successful strategy to reach a competitive advantage. The reduction of inefficiencies and the rationalization in the use of natural resources are important sources of cost reduction, as the environmental attributes of products and services (Orsato, 2006; Porter and Van der Linde, 1995) are used for marketing differentiation.

Several researches rather have tried to identify, analyse and classify the drivers that may encourage a company to develop and sustain its environmental engagement. Environmental regulations and stakeholder pressure are considered the external drivers, while company's characteristics are the internal ones.

One of the most important factor able to affect company's environmental engagement and the implementation of environmental strategy is the level of ethical attitude.

Infact, in presence of a strong ethical motivations, related with the 'right thing to do' environmental protection become an important matter into organisations.

Ethics is related to values, strictly embedded with both national and organizational culture.
In particular, national culture has been defined as ''…patterns, explicit and implicit, of and for behaviour acquired and transmitted by symbols, constituting the distinctive achievements of human groups'' (Kroeber and Kluckhohn, 1952, p. 13).

The culture shapes the orientation of individuals to take sustainable initiatives and to translate these engagement at firm level.

The most of literature focuses on the effects of the cultural values on the broader issue of Corporate Social Responsibility (Ho et al., 2012; Parboteeah, 2012; Ringov and Zollo, 2007), only few studies have specifically analyzed the relationship that occurs between the national culture and the corporate environmental engagement. In particular, these studies (Park et al., 2007; Husted, 2005), employ national environmental indicators, without focus on this connection at organization level.

In order to cover the gap of existing literature, has been formulated the following research question:
RQ: Does the country's national culture affects the company's environmental proactivity?
The paper is articulated as follows: the first section presents the theoretical background highlighting the main literature on the topic and it develops the hypotheses; section 2 describes the dataset and variables; section 3 presents the result of the analysis. Lastly, in the section 4 are presented the implications of results and the conclusions.

2   LITERATURE REVIEW AND HYPOTHESES
Cross-cultural studies have analyzed the influence that national culture exerts on company's social responsibility from different viewpoints employing as their basis Hofstede's (Husted,

2005; Park et al., 2007; Ringov and Zollo, 2007; Ho et al., 2012) or GLOBE (Ringov and Zollo, 2007; Parboteeah et al., 2012) cultural dimensions.

Despite previous analysis used different models, they assumed that the different sets of values, beliefs, attitude and moral, rooted in the national culture drive individuals on their choices and actions. Therefore, national culture is strictly embedded at the corporate social or environmental behaviours and some cultural dimensions are more likely to support these initiatives than the others.

In order to understand how the national culture affects on the corporate environmental engagement and then their ability to implement a proactive environmental strategies, this paper considers Hofstede's cultural dimensions.

According to Hofstede, culture can be defined as "a collective programming of the mind which distinguishes one group from another" (Hofstede, 1980, p. 25).

From a deep survey to about 60,000 people from over 50 countries, he identified cultural values that distinguish countries from each others, grouping them into four clusters (even if other two dimensions has been added afterwards), called dimensions of national culture (Hofstede, 1980, 2001):
- Power Distance (PD): it refers to the tolerance of unequal distribution of power;
- Individualism/Collectivism (IDV): it expresses the degree of individuals to take care of themselves or to feel a part of a group and take care of its members.
- Masculinity/Femininity (MAS): it is related to individuals' concern of achievement, assertiveness, competition. On the other side, femininity into society is related to the focus of life's quality and interpersonal cooperation;
- Uncertainty Avoidance (UA): it is the extent to which individuals in nations tolerate ambiguity in their lives and are willing to take risks.

Employing these cultural dimensions as their basis, previous research found out that in the presence of high level of Power Distance and Masculinty into society is linked to lower environmental performance (Park, Russel and Lee, 2007) and institutional capacity of a country for environmental sustainability (Husted, 2005). Regarding to Corporate Social Performance, Ringov and Zollo (2007) found out that in a presence of high Power Distance and Masculinity is related with lower CSP performance, while Ho et al. (2012) achieved opposite results.

The degree of Individualism into society has been hypothesized to be negatively related to environmental performance and overall responsibility behavior. Previous scholars were not agree about the effect of Uncertainty Avoidance on firms' environmental performance. According to Ringov and Zollo (2007) and Husted (2005), firms based in country with high level of risk avoidance should show lower environmental or sustainability performance in cause of the small willing to invest into innovative activity, often not related to computable returns.

Empirical results of such studies did not support this assumption. On the contrary, according to Park, Russel and Lee (2007), in presence of an high degree of Uncertainty Avoidance, firms try to find environmental solutions, as individuals feel threatened by uncontrollable risk posed by nature. They should put greater effort to reduce these risks than individuals from

low risk avoidance countries do. Also in this case, any empirical result has been found. Also Ho et al. (2012) showed that countries with higher UA exhibit higher corporate social performance.

Considering the previous researches the following hypotheses have been formulated:
H1: the firms based in higher Power Distance countries show a worsen level of environmental performance
H2: The firms based in Individualistic countries show a worsen level of environmental performance
H3: The firms based in Masculine countries show a worsen level of environmental performance
H4:The firms based in higher Uncertainty Avoidance countries show an higher level of environmental performance

Despite the existing studies did not do this, the paper also considers the fifth Hofstede's cultural dimension, namely the Long Term Orientation, initially called Confucian dynamism. It refers to individual's propensity to save for the future and his ability to change tradition to changing conditions. For this reason is reasonable to think that in a presence of high level of LTO, individuals try to consider environmental engagement as an important matters.
Then the last hypothesis is:

H5: The firms based in a country featured with an high level of Long Term orientation, show an higher level of environmental performance

3   DATA AND MEASURES

3.1   Dependent variable
The analysis is concentrated on the evaluation of national cultural's effect on environmental practivity rather than environmental performance.

Considering the complexity of the definition of environmental proactivity, to find an effective indicator able to measure it is not an easy task.

Christimann (2000) has already revealed that data on firms' environmental practices and the cost reduction due to the implementation of green practices are not avaible from public and global database.

Previous ONE's research used qualitative measures based on mail surveys of a specific samples of companies, environmental indicators provided by institutional agencies; some other used the presence of EMS as a measures of proactivity.

Consistent with the definition provided by Delmas et al. (2011), the measure of environmental disclosure is considered a proxy of environmental proactivity.

For this reason, the paper employs as dependent variable the company's carbon disclosure score (CDS), measured by Carbon discosure project (CDP).

Every year, CDP asks to the Global 500 companies to measure and report what climate change means for their business. During the 2011, 81% (404) of corporations answered to the

CDP questionnaire. A score (from 0 to 100) is applied to most of the company responses to CDP, which are assessed for disclosure and performance.

Low CDS (< 50) indicates limited or restricted ability to measure and disclose risks and opportunities that came from carbon emissions. The companies which gain this score show a compliance attitude towards environmental -or more precisely carbon- problems. It does not indicate poor performance but a low score is assigned to companies that provide insufficient information to evaluate performance and could be considered inactive to climate change. Vice-versa high CDS (>70) indicates a more deep involvement into climate change issue: companies identify into climate change management a tool to reach a strategic advantage.

In this companies "senior management understand the business issues related to climate change and are building climate related risks and opportunities into core business" (CDP, 2011, p. 22).

Moreover, the carbon disclosure project grouped all companies with the highest disclosure score (more than 50) with a performance bands:A, A-, B, C, D and E. All the score and bands simply recognize the evidence in action.

3.2 Explanatory variables
This research focalizes the attention on the role of national culture into shape company's environmental engagement. Considering the most of literature, 5 different cultural dimension developed by Hofstede (1980) are employed:
- Power Distance (PD)
- Individualism (IND)
- Uncertainty Avoidance (UA)
- Masculinity (MAS)
- Long-term Orientation (LTO)

3.3 Control variables
In order to confirm the relationship between national cultural dimension and company's environmental proactivity, control variables which could have a strong impact on company's environmental engagement are introduced.

The selected three variables had been identified by the extant literature as relevant drivers for firms' environmental proactivity. These are: company's revenues as proxies of firm's dimension (Benito and Benito, 2006); company's age (Hass, 1996; Kolk and Mauser, 2002), as usually environmental orientation increases by the time and R&D expenditures. Data have been collected from Businessweek (2011).

3.4 Analysis
To test the hypotheses it is used IBM SPSS Statistic software. The raw sample included 500 companies contacted by CDP report. A screen of the sample has been then developed, in order to evaluate the presence and the availability of the necessary data. The final sample includes only those companies that responded to CDP's questionnaire and that distinctly belong to a specific country.

Challenges of the Modern World - Contemporary Economy and Globalization

Final sample is then composed by 368 companies from 30 different countries[1] and operated in 9 different industries (See Table 1).

Table 1: Industry composition of the final sample

	Frequency	%	Cumulative %
CONSUMER DISCRETIONARY	44	12,0	12,0
ENERGY	38	10,3	22,3
FINANCIAL	84	22,8	45,1
HEALTH CARE	29	7,9	53,0
INDUSTRIAL	37	10,1	63,0
INFORMATION TECHNOLOGY	29	7,9	70,9
MATERIALS	37	10,1	81,0
UTILITIES	18	4,9	85,9
CONSUMER STAPLES	29	7,9	93,8
NOT SPECIFIED	23	6,3	100,0
TOTAL	368	100,0	

The ANOVA reveals no differences among national cultural dimension in different industries (Table 2). Conversely, ANOVA reveals a significant effect of industry on CDS (F=1,699; *p-value*< ,10), Revenues (F=3,266; <, 01); R&D expenditure (F=4,619; *p-value* <,01), and Longevity(F=4,885; *p-value* <, 01),

Note: *. p< 0,1 ; **. p< 0,05; **. ***p< 0,01

Then, the bivariate correlation among variables is calculated (Table 3). As many cross-cultural studies have highlighted, the cultural dimensions are highly correlated each others. The Carbon disclosure score is positively correlated with the level of Uncertainty Avoidance (0,198, *p-value* < 0,01), firm size (0,140; *p-value* < 0,01), company's longevity (0,129; *p-value* < 0,05) and R&D expenditures (0,293; *p-value* < 0,01).

Challenges of the Modern World - Contemporary Economy and Globalization

(9) R&D (MIL $)	2340,81	2569,07									1,00

**. Correlation is significant at 0,01 (2-tails).

*. Correlation is significant at 0,05 (2-tails).

The further step of the analysis consisted of two regression functions (Table 4): the first model considers the impact of control variables on Carbon Disclosure Score, in the second model the cultural dimensions are inserted.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 4: Regression results

Variable	Model 1	Model 2
Hofstede cultural dimensions		
Power Distance		-0,113
		(0,183)
Individualism		-0,16
		(0,154)
Uncertainty Avoidance		0,318*
		(0,161)
Masculinity		-0,01
		(0,110)
Long-term Orientation		-0,02
		(0,121)
Size	1,011E-10	6,727E-11
	(6,894E-11)	(7,072E-11)
Longevity	,043	0,056974708
	(0,40)	(0,042)
R&D	1,485E-09*	1,654E-09*
	(8,931E-10)	(8,927E-10)
Constant	60,168***	59,556***
	(4,090)	(22,301)
Observations	368	368
R-Squared	0,121	0,190
F-Statistics	4,202***	2,553**

Robust standard errors in brackets
***. Significant at 0,01 (2-tails); **. Significant at 0,05 (2-tails) *. Significant at 0,10 (2-tails).

Regression results of model 1 show that the level of R&D is the only variable significantly related to Carbon Performance Score. In model 2, where cultural measures are introduced, the significance of the analysis increases (R-square=0,190). It means that cultural dimensions exert an important effect on the level of environmental proactivity.

In particular, the level of Uncertainty Avoidance has a significant positive impact on Carbon performance Score, finding support for H3. Despite the sign among variables is consistent with the assumptions, hypotheses H1, H2, H4 cannot be confirmed, due the poor significance of the predictors. Long Term Orientation is rather negatively related to CDS, again H5 cannot be confirmed in cause of the poor significance.

4 DISCUSSION AND CONSLUSION
Nowadays, environmental problems are receiving more and more attention at firm level. The snvironmental proactivity is considered an important tool for gain a competitive advantage, helping to reduce costs or increase differentiation.

Both theorist and practitioners highlight that national culture is an important drivers toward this proactivity, as the set of values and beliefs could affect company's ethical – or more specific, environmental- choices and actions.

Starting from this consideration, the paper analyzed the effect of cultural dimension, using the framework provided by Hofstede (1980), on corporate environmental proactivity.

Despite the linkage among variables follow the developed hypothesis, just the H3 had found statistical support.

In particular, it is demonstrated that companies based in a country that have difficult to deals with the fact that future can never be known, try to control it by implementing a more effective environmental practices. People do not feel comfortable in ambiguous situation and try to create beliefs and institutions that try to avoid this uncertainly.

Therefore, the study presents some remarkable implication but also basic limitations.

From a theoretical point of view, it opens the mind to deep analyze the predicted relationship among variables, since different results are presented. From a managerial standpoint, the study of the cross-cultural differences could affect the effectiveness of environmental practices at both intra and inter organization levels.

The lack of environmental indicator to measure corporate environmental proactivity is the main limitation. The lack of synthetic measure of practivity can be the cause of different outcomes within these researches.

Moreover, some important point is still missing. Even if it is demonstrated that national culture exerts a particular role into shaping environmental engagement, studies on this topic only examines the sinlge effect of different cultural dimension on proactivity.

Different results could derive as there exists a combined effect of cultural variables to be explored in depth, that could represent a new and interesting research issue.

ABSTRACT

The public power and the private enterprise, main agents of national economic and social development, when cooperating strategically, promote increased functional efficiency of their activities. In order to highlight the relevance of such partnership, this article aims to analyze the potential of actions jointly developed by private organizations and Brazilian universities. The research problem is lined in the field of health, which hosted actions developed between the Federal University of Rio Grande do Norte (UFRN) and the Hospital Maternity Guiomar Fernandes (HMGF), located in the city of Alexandria, in Rio Grande do Norte. The study emphasizes the shortcomings of this organization, the resolving power of the university in this scenario and performs the analysis of the effects of this cooperation. The methodology used in this research was the case study in HMGF. With emphasis on fundraising and improving the informational management system, funding sources for projects of restructuring and expansion of the hospital were sought, as well as initiatives for developing hospital management softwares for small and medium sized organizations. As a result, the articulation between the university and the hospital provided the elaboration of a project for software development and the production of a project for physical restructuring and technological investment, aiming to expand the supply and quality of the hospital's services. The implementation of information systems, associated with investments in hospital infrastructure, provide increased efficiency in public assistance to the population, bringing both local and regional benefits, besides providing the authorities with relevant data on the development of public policies.

Keywords: Fundraising, Hospital management, Information system, Strategic cooperation

1   INTRODUCTION

The accelerated development of information globalization imposes, the dawn of new and complex technologies, the different ways of seeing the business environment, the relentless pursuit by the competitiveness of market are all factors which fall into an important tool vividly in the current techno revolution: knowledge. In this way, the correct operation of knowledge brings with it the opportunity to incorporate important information to business decisions, allowing them the possibility of achieving greater and better results on the market. It is exactly within this context where the partnership between University and company is inserted. The University, generation and dissemination of knowledge, becomes a powerful ally and licensor of process necessary to reach this knowledge. Companies look at a media holding which does not have access, or don't know how to make use of decisive way. On the other hand, the University has the opportunity, as an institution of teaching, research and extension, it can be inserted into the socio-economic reality of the country, to the same extent that provides the students an early integration with the labour market, managing to form people engaged in the problems the country faces, and better prepare them for the timing of egress.

The problem of public health, while the industry filled with urgent needs and administrative mistakes, falls in search of evidence of the power of the Resolutive problems experienced by private companies operating in this sector. There is evidence that in addition to these, it is necessary to promote joint actions with the participation of health workers, the private sector and civil society.

The Ministry of health in Brazil was established with the law n° 1,920 (Brazil, 1953) and is the Executive Branch entity that has the responsibility to organize and draw up plans and public policies in search of promotion, prevention and health care of the citizens of the country. Despite the campaigns and projects developed by the Ministry and from existing improvements when carried out a comparison with data from previous years, the Brazilian public health still reveals troubling features, requiring immediate actions to change that reality.

In this context, the š of Health System (SUS) in Brazil is the universal service system, namely, aims to cater to all Brazilians, without any kind of distinction of resources among patients without cost to them, where they receive care can be equivalent to your needs. In practice, the conditions of the SUS are quite different: according to the website of the Ministry of health on the internet, the IDSUS (system performance index of health), created by the federal Government, points out that Brazil has IDSUS 2012 equivalent to 5.47– in an average from 0 to 10 – showing that much of the population lives in cities with lower indices of quality of services than the ideal.

It is based on the above so that the present article aims to analyze the potential of general actions developed by Brazilian universities and private organizations in seeking to promote alternative solution to the shortcomings highlighted today in the public health sector.

Based on these questions, the search issue revolves around the following question: how and to what extent the University is able to serve as a partner to assist in solving the problems of strategic and financial nature of a hospital of Rio Grande do Norte? To answer this question, it was for funding sources that can fit to the reality of the institution, serving as support for the achievement of projects that would ensure the immediate needs for this organ.

With increasing significance, the article is divided into chapters and sub-chapters that start with the introductory perspective, followed by theoretical tooling where are presented the themes of the third sector and fundraising for this. It is therefore pointed to the option search methodology, which highlights the ways in which the research was conducted. Soon after, the structuring of the remarks related to the case study-where are the search results, so that, subsequently to be presented the concluding remarks in conclusion, in addition to suggestions for further work. The job is terminated with the bibliographic reference used in the search.

2 THEORICAL REFERENCES

2.1 Fundraising in the third sector

For Olak and Nascimento (2009) the third sector is made up of private institutions with specific purposes of lead changes and whose patrimony is constituted, maintained and expanded from contributions, gifts and grants and that, in any way, it reverts to its members or maintainers.

The main causes of the growth of the third sector, second Olak et al. (2008, p. 32), are summarized as follows: "(a) crisis in the public sector and consequent reduction of resources allocated to social areas; (b) volunteer growth, driven by increased awareness of the people, media support and standardization of this service; (c) growth of urban and rural violence; (d) greater business involvement, trying to Captivate consumers with corporate citizenship policy".

According to Silva et al. (2011), philanthropy, which is at the origin of the third sector, is a very ancient phenomenon and is characterized as a continuing action to donate money or other goods in favor of the institutions or persons. This practice is generally adopted by wealthy individuals, known as philanthropists or philanthropic people.

In this sense the term third sector has been used as opposed to the concept of first and second sector and that basically the third sector is not part of the public sector and has no interest in profit (Niyama and Silva, 2008).

Seen it, Villas Bôas Neto et al. (2003) States that management in the third sector is something that differs from the management of other private companies, because "the management of the third sector, in spite of using traditional management tools, it does through adaptations that there are administrative groups on a daily basis and they begin to be treated in courses and materials for this area-specific management".

Inserted in this context, the fundraising activity won, in recent years, great importance and came to be seen as an action that should be undertaken with increased dose of professionalism, given their significance for the survival of the institutions, since they may not be expecting that only the Government provide the necessary resources so that they can keep, or be at the mercy of donations, what forces and seek other sources investors, making the fundraising activity more efficient and dynamic.

The charities, non-governmental and non-profit organization has for many times their goals are not achieved due to problems faced in fundraising, which precludes the development of projects (Sartori et al., 2003). In this way, the success in fundraising depends on the relationship that is established with the donors, who are persons or institutions which usually

share the mission, values and objectives of the Organization (Szazi, 2005; Pereira, 2006; Tachizawa, 2007).

The stiff competition for resources available, the need to measure and assess the performance of managers, internally as well as to determine the feasibility of projects, fundraising, all these factors compel organizations to improve and innovate ways to capture (Adulis, 2001, 2002a, 2002b). According to Falconer (1999) and Tachizawa (2007), the main sources of financial resources are the cooperative agencies, foreign institutions, the sale of products/services, government bodies, companies, foundations and individual donors.

It is essential that the funded projects add value to the Organization, helping to build its history and contributing to the creation of organizational skills that help in getting new features (Cruz, 2012). Develop fundraising strategies facilitates the adaptation of organizations to changes and requirements of funding sources, to ensure the sustainability of their goals and initiatives. With the expansion and diversification of sources of funding, organizations reduce the vulnerability and subordination typical of when it depends on very few sources of funds (Valarelli, 1999).

3 METHODOLOGY

For the completion of the current work, the methodological option chosen was the case study of the exploratory and descriptive type based on reality and on the characteristics of the object of study.

As research, research the case study can be essentially exploratory, being used as a basis for obtaining preliminary information about the object of interest. May also be analytical, where one seeks to discuss the object under study, build or develop a new theory in order to confront her with something that already exists. To be essentially descriptive, aims to describe some of the case study. An exploratory character work is viable as a pilot study of a large-scale research. The descriptive study when it is necessary for the preparation of an intervention. For Goode and Hatt (Lazzarini, 1995), the technique is "one way to organize the data in terms of a given unit chosen". Yin (2005) States that the case study is an empirical research, a method that covers everything - planning, data collection and technical analysis of the same. Yet about the theme, Yin (2001) States that the case study is a scientific research that investigates a contemporary phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not clearly defined; facing a situation technically only in that there are more variables of interest than data points and, as a result, is based on multiple sources of evidence (...) and benefits from the prior development of theoretical propositions to drive the collection of data analysis.

Accordingly, this study deals with the elaboration of financing plans for obtaining financial resources for a nonprofit organization, deployed from the analysis of their reality.

To this end, the fieldwork lasted from March 2012 to December 2012, during which time he explored the characteristics of Maternity Hospital Guiomar Fernandes (HMGF) from the point of view of knowledge gained at the Academy, general purpose of an extension project approved by the *Universidade Federal do Rio Grande do Norte*. The research had the same coordination of research project, a Professor of industrial engineering at the University.

Thus, in a first step the objective the bibliographical research with regard to funding sources available to establish what and with what focus these could be employed for the purposes necessary for the institution, as well as allow its authors Foundation enough to direct them in the implementation of the current work. Then worked with authors that deal with specific themes, in conjunction with the consultations the scientific articles and research databases, portal of periodic.

Capes. in a later step, aimed at the diagnosis of the situation of the HGMF regarding financial funding to the everyday reality of the hospital, as well as its physical structure, professional framework, shortcomings and needs. For this purpose, were made trips to the city where the institution to achieve a participant observation. As the central data collection techniques utilized to documentary research in financial reports prepared in the file, as well as access to documents on the legal status of the hospital, statistics on the number of calls made, medical equipment; and meetings with the directors, managers and other employees of the hospital.

In a third step, the data coming from the previous step were analyzed in qualitative way, in search of interpretation of these for the moment of the proposition of financing plans. From there he left to develop fundraising projects that meet the interests of the Organization, preparing and submitting three project financing as financing institutions concerned model.

4 CASE STUDY

4.1 History and description of the main initiatives

The Maternity Hospital Guiomar Fernandes (HMGF) is a health establishment of charitable purposes, with certificate of Social assistance Beneficent Entity (CEBAS), founded in May 1, 1956, initially to meet the demand of population of Alexandria, city of Rio Grande do Norte, today with 14 thousand inhabitants. Featured in founded as maternity hospital, HMGF today offers a range of services that the ranks as general hospital.

In the last ten years the hospital developed quickly, passing through a reform of the physical structure and deployment of new equipment and services, funded by the Ministry of health, through the project ReforSUS, which provided duplication of its installed capacity. Developing administratively and technically, with bigger and better resolving power, plus a considerable improvement of the quality of care. Currently, its area of influence is distributed in the municipalities of the 6th Regional health of Rio Grande do Norte, Northeastern semi-arid region, comprising 36 municipalities and some other of the 2nd Regional Health/RN, covering an area with a population of more than 400,000 people, as well as neighboring municipalities in Paraíba, all serviced exclusively through SUS.

Offers services identified by three fundamental classes: outpatient clinic (related to clinical consultations), clinical and surgical inpatient (referring to the patient's hosting), as well as diagnostic support through Imaging tests and laboratories. Outpatient services offered are divided into the following categories: medical clinic, gynecologic, orthopedic, obstetric, angiologic, Pediatrics, cardiology, Gastroenterology, ophthalmology; In addition, speech therapy and physical therapy services.

Among the surgical services are offered: General Surgery, vascular, ophthalmic, orthopedic, obstetric, gynecologic, otorhinolaryngologic dermatological and. There are also image diagnosis support via ultrasound, endoscopy and radiology, electrocardiography, as well as clinical analysis laboratory services and microbiology, still with the inpatient services, urgent

Challenges of the Modern World - Contemporary Economy and Globalization

and emergency. Also in the field of diagnostic electrocardiography, support that integrates the cardiac telemedicine service, in which the exam is done at the health facility and is analyzed and the report issued by a professional in another location, this made possible thanks to the transmission of information across the World Wide Web, which provides flexibility to the institution in the diagnosis of their patients since there is no medical need to be physically present for review of that examination.

There is also the Hospital epidemiology Service (IF) that brings together all the information of the hospital health and compulsory notification services, as well as the national network of Integral attention to health of a worker who is a network of Sentinel "medical services and ambulatory of medium and high complexity responsible for diagnosing the accidents and work-related diseases and by registering them in the information system of reportable diseases (SINAN-NET)" (Ministry of Health, 2009).

The HMGF offers a Material and sterilization (CME) that employs advanced technology to monitor the results achieved through modern validation evidence, besides industrial laundry, electric generator, and waste management program in the Health Service-PGRSS.

Are eighty-seven (87) professionals involved in the dynamic daily, of which twenty (20) are doctors, thirty (30) nursing professionals, ten (10) technical areas of support professionals and twenty-seven (27) General Service staff.

The wealth of the hospital is composed of assets acquired through purchase or donation. Currently has an installed capacity of fifty (50) beds in the national register of Health Establishments (CNES); Surgical Center with three (03) operating rooms, as well as structure and equipment for physical therapy services, speech therapy and occupational therapy.

The maintenance of this structure has a high cost, which is aggravated by the meager income of the hospital. By attending exclusively via SUS, regular income is restricted to the payment of the procedures performed, which is a fixed amount, established by the MS and applied to all health units.

Other features are the parliamentary amendments, approved resources in the annual budget of the Union, or of the State. These revenues, in turn, are for specific purposes, such as purchase of equipment, medicines and equipment, making it possible to target them to payments of fixed costs, such as salaries and maintenance. Another feature of this type of resource is the fickleness, not possible to stipulate certain deadlines for their receipt.

The low volume of resources makes investments in various areas, especially in those that demand the most expressive values. An example of this is the creation of a diagnostic imaging Center, which would correspond to the region of the high West Brazil today without a structure, requiring often going to the capital to carry out examinations. In addition, a technical limit to the expansion of cardiac telemedicine service is the poor quality of internet service in the city, restricting the capacity and range of exams that could benefit.

Another challenge faced by HMGF, and that is also true in other institutions of similar profile is low managerial and operational efficiency, sometimes explained by low supply of instruments that aim to meet the demands of a health unit for small and medium businesses,

being almost non-existent software accessible for this slice of the market. The development of software of this kind demand high investments and time to maturity and implementation.

4.2   Partner HMGF/UFRN

Acting together at the Federal University of Rio Grande do Norte with HMGF was one of the actions planned for the development of strategies on fundraising for the hospital. Through the technical expertise provided by UFRN, extension actions were developed aiming at the improvement of the health unit. The partnership provided to both development, since when approaching a social institution the University gives to its members better reading of the external reality, seeking applications of his theories and improving its techniques, establishing a link between students and the society that allows them greater understanding of what is learned in the Academy. While the hospital receives the contribution of students, teachers and technicians, often in contact with innovative solutions and channelized for various surveys. There is a deficiency in the institutions in General, especially in smaller, pros to develop projects aiming to plead financial entities with the resources or even companies. This grace period deepened when we leave public sector organizations or non-profit. Thus the partnership HMGF/UFRN was established in order to build projects to enable the hospital to request funding, sponsorships and donations to carry out its goals. In addition to projects of this nature, were also developed other seeking to improve the quality of information, developing ongoing evaluation mechanisms, both as an information management system.

4.3   Results

Accurate analysis of existing demands in the hospital revealed structural, managerial problems and staff. From these projects were elaborated demands aimed at raising funds for investment in strategic areas.

A situation observed in HMGF was the absence of an integrated system of hospital management, which would give employees greater accuracy on the information, providing increased operational efficiency, both for greater agility and the ability to better control, reducing waste and freeing up resources. In order to meet this need, devised a system of information technology applied to the management of hospital institutions, small and medium-sized businesses. Through a business plan encompassing market and competitiveness analysis, analysis of the internal environment, product plan, marketing plan and financial plan has structured a product robust and commercially viable for hospitals of this size, since there is a lack of information systems geared to this audience.

This system would consist of ten integrated modules with one another, which would provide information to employees including via remote connection via web platform. The modules would be the following: hospital management, hospital support, hospital billing, particularly Comptroller and covenants, billing the unified health system (SUS), clinical administrative management, clinical management, diagnostic and therapeutic service, supplies, technological support systems.

Fully deploy this system brings, including benefits to public management, as it allows the crossing of various natures information coming from different locations, producing valuable information such as epidemiological distribution, occupancy rate of beds and medical area professionals distribution which allows public health managers more accurate analyses and the development of more efficient strategies.

The concentration of health units able to care of medium and high complexity in the two largest cities in the State of Rio Grande do Norte, Natal and Mossoró, causes a swelling in the hospitals of these cities, being one of the reasons a lot of patients coming from other cities. Within this context the HMGF provides service to a region with a population of more than 400,000 people, since apart from the municipalities of its regional health, people coming from other areas, including the State of Paraiba, seek the HMGF for consultations, surgery and hospitalization. Given this problematic and aimed at the expansion and improvement of these services were prepared two projects in different lines, but equally important in the population. The first was creating a diagnostic sector and orthopedic care of medium complexity, which involves the restructuring and expansion of current facilities and hiring of specialized professionals. This project was developed with the idea of offering the most complete service area population, decreasing the need for these to go along long distances in search of care. This directly impacts on the effectiveness of patient care and public health system efficiency, since from a balanced distribution of the demands there will be reduction of quotas in the major cities, from the queues of waiting for consultations and surgical procedures.

The realization of this project had the following objectives: prevention and treatment of diseases of the brain and cervical order, analyze rich of fractures related to bone changes, perform Cardiology accompaniments, develop gastrointestinal analyses, perform mammography examinations for prevention and treatment, blood analysis, perform diagnostic imaging, surgical interventions and evaluation of Cardiology after-treatment. For both, were provided for a series of civil works and procurement of miscellaneous equipment, as well as hiring and training of professionals to work in the area.

Another project developed seeking the extension of the range of services was the deployment of a wing of the maternal and child health care capable of giving to the population of the region medical services such as examinations, surgeries and treatments geared to the mother and the child. Attention to this area has a high relevance for the region, as the maternal and child health indicators such as infant mortality rate, neonatal mortality, perinatal mortality, maternal mortality rates are among the highest of the Brazilian States influencing directly on regional development.

From the perspective of fundraising, the fruits of the partnership are based detrês HMGF/UFRN projects-being a product development and expansion and restructuring two-hospital managers have greater chance of success when pleading appeal to funding agencies, development banks and Government agencies. Bypassing the line of action of projects, can still be cited eight scientific articles presented in Congress and another six published in journals, as well as two monographs, all of these indicating the success of the partnership.

5 CONCLUSION

The improvement in the health of the Brazilian population did not follow the advancement of economic indexes of the nation in recent years. In a country with very high tax rates, which is invested in public health is not yet the required value, what is proved by those who need the services of Health š system (SUS). Designed to be a universal system and ensure quality care in health care to citizens who so request, the reality of the numbers of the SUS is completely different from objectified in your project. There are doctors, beds, basic physical structure, materials and necessary medical equipment to health problems of the population.

See this, the University-business partnership featured in this survey pointed to a change in the reality experienced by HMGF, reality this fairly close to that experienced by SUS because it is directly dependent on this, while it encourages those who are inside the University a broad vision of the current situation of the society in which they are inserted. While the University hospital Board delivery technical knowledge regarding management strategies, also cares about the other needs of the Organization, pointing out that the major difficulties faced by the hospital fall in the absence of sufficient financial resources to cover what it is necessary to raise the institution to a better level of service to their target population.

Equally difficult is the search for sources of funds - and the return of those who are willing to invest in this issue, which is worrisome given the relevance of the theme in the health problems experienced by society. Thus, in addition to the delivery of a different vision as regards the way in which sees the hospital day after day, the projects for financial - fundraising and other scientific papers are presented as results of the University-company partnership highlighted in the case of the search.

In this way, the partnership can prove HMGF/UFRN effectiveness of benefits of mutualism between the University and the company, to the extent that the initial goal of the extension project which led to the drafting of the article was reached when the students were able to apply the knowledge acquired in the classroom within the perspective of the problems faced by the hospital, while the hospital has benefited from that knowledge to apply to methods, human resource processes and available for carrying out the procedures of daily life at the hospital.

Similarly, the overall objective of the article was fulfilled and his search was problematic, since it is presented as the University-business partnership is important in the search for effectively promoting solutions to today's shortages experienced by the public health sector, and even what stage the Resolutive power of this strategic partnership is able to bring clear benefits to both institutions.

The search does not allow methodological option by itself that the peculiarities provided in case the job object can be extended to other Brazilian States. We then the questioning about the possibility that extension of reality presented to other localities of Brazil, thus encouraging other researchers to further develop this theme, in seeking to promote new solutions - either in University-business partnership, or by other methods - for problems faced by hospitals, with a view on the current situation of significant improvement of public health in Brazil.

Enterprise in Turbulent Environment

AUTOCATALYTIC PROCESSES OF ORGANIZATON TO SURVIVE IN CONTEMPORARY SOCIETY

Marta Ambrozi
Faculty of management Sremski Karlovci, Serbia
ambrozi.marta@gmail.com

ABSTRACT

A few decades ago scientist have already put the finger on a problem that organizations will face with extreme changeable and unpredictable business environment. One of the problem which are contemporary organizations have met is how they anticipate future need of society. They plan their action and organize processes according to this facts. Theories which were applied in management no longer works, they do not completly sustain organization contiunity. Our basic assumption about birth, evolution, survival and function of organization and society has been challenged. According to above mentioned, this paper identifies two problems. First of all organization based their strategic processes on knowledge which is created upon past information and knowledge. They only focus on the need of society neglecting the real problem behind it. On the other hand these anticipations are based on trends, which are not valid in turbulance change. Therefore, these quantum leapes of changes are forcing to apply knowledge from science such as systems theory, chaos theory, quantum physics and some knowledge of genetic engineering. In particularly this paper observes and represents the processes of organization as autocatalytic processes.

Keywords: Autocatalytic processes, Chaos theory, Complex dynamic systems

1   INTRODUCTION

Processes of globalization and new information technologies have changed the world as we knew. Everything is changing: our life, businesses, economy, we are flooded with information, there is a world with no clear borders etc. In short, society has changed and created an unpredictable, uncertain world. These changes of society made impact on today's organizations. Scientists warn of these problems over the past few decades.

In today's increasingly competitive, unpredictable and turbulent business environment organizations can no longer successfully apply theories of management which were effective and efficient before. The contemporary businesses require new approaches in the process of creating their business strategy, which could ensure the survival of the organizations.

So, this paper identifies two problems:
1. The first problem is that organization based their strategic processes on knowledge which is created upon past information and knowledge. They try to anticipate the future need upon past information.
2. On the other hand, they only focus on the need of society. They do not try to discover the real problem behind this need. Besides, the anticipation are based on trends using technical analisys. They worked very well before, but not in business environment with turbulance change. And this is the second problem.

The main charateristic of changes in today's business environment is that they occur in quantum leapes. So existing scientific management approaches and practices are not good enouhg. The impact of these changes requires new approaches in organizations function. They

873

are forcing to apply knowledge from science such as systems theory, chaos theory, quantum physics and some knowledge of genetic engineering.

This paper applies this different knowledge, and observes and represents the processes of organization as autocatalytic processes. It represernt an approach to discovery autocathalitic processes in organization.

2 APPROACH TO DISCOVERY AUTOCATHALITIC PROCESSES IN ORGANIZATION

More than half of century ago Kenneth Boulding invented a scale for systems classification on complexity and behavior. The scale of this classification ranges from 1 to 9. On this scale organizations and human society are at the 8 (eight) level. Systems at this level are able of self-regulations, self-organizations and self-governances. By research of these complex behaviors we can identify number of processes with autocatalytic properties.

Investigating population of organization we identified autocatalytic processes by which evolution of genes, memes and mones are achieved. So at the present level of development of science we can state, that organizations are outcome of co-evolutions of genes, memes and mones.

Organizations are living organisms in which human being is an essential constituent. Human being is a result of **genetic evolution**. One of the vital precondition for functioning an organization is communication between human beings which is necessary to convey ideas and thoughts between them. Communication between human beings is an outcome of **memetic evolution**.

Organizations could survive and develop if they create value for their environment. Value creating is also related to one evolution, and this is the **monetic evolution**.

All these evolutions emerge in every organism and every evolution is an environment to the others. This way they are in an interactive relation, creating a whole entity, an entity which is outcome of co-evolution. So every organization can be considered as a result of genetic, memetic and monetic co-evolution.

Figure 1 illustrates the essence of co-evolution:
- Genes regulate self-reproduction of biological being and biological life using the laws of physics, chemistry and specific principle of biochemical mechanisms.
- Memes regulate self-reproduction of cognitive schemas through mechanisms of thoughts. In other words they regulate cognitive mechanisms of human being.
- Mones regulate self-reproduction of organizations using psychological motivation mechanisms of human being.

Figure 1: Illustration of the essence of co-evolution

This knowledge, which was completely formed in the 21ˢᵗ century, has been the result of the development of science in the last two centuries. There are many scientists who have contributed to this knowledge, but only a few of them have special merits in this matter like Charles Darwin (discovering the basic principles of evolution -diversity, natural selection, inheritance), Richard Dawkins (establishing the selfish gene theory and introducing the term meme) and Douglas Hofstadter, Mérő László, etc. (discovering the mechanisms of natural law of self reproduction and proving with scientific precision the phenomena of mone as replicator).

First of all, it is necessary to explain what kind of roles genes, memes and mones have.
- Gene is basically very simple information. It is a sequence of four types of nucleotide of DNA. It is a peace of information that encodes one feature of an organism. So one biological being is determined by all of its genes.
- Meme is also information which encodes one feature of cognitive schema. Group of memes determines a cognitive schema of the entire organism.
- Mone is also information. But in contrast to gene and meme, it describes one characteristic of organization (enterprise) which is capable to draw investments and in association with other mones it is capable to generate an economic being – an enterprise.

It could be concluded that the essence of all replicators is information and the form of appeearence is just a technical issue.

Enterprise in Turbulent Environment

Organizations, as any organism, in the struggle to survive use replicators. And they use only those autocatalytic processes which they need for their survival. Figure 2 presents the structure of process for survival with all of the factors needed for its performance.

The first part of this process is something which occurs in any organisms: when organisms function they consume resources and in certain time a shortage of these resources emerge. This shortage is a problem to organism, so sensors immediately signal this problem. In respond to this sensory, organism selects processes which are needed for its survival and which are performed only after selection. And at the end, the problem is solved. In the case that these processes are failed organism's existence is in jeopardy.

But in some case organism could not solve its problems only with inner proccesses, that are described so far. It needs help and sevices from the outside world. And these outer procceses are the second part of procces neccesary to survive. It is equally important, so it will be described.

When organism applies existential procceses to resolve its problem a key question arises: who performs these processes? In some cases the indidual can perfom it by itself, but sometimes it needs help from other individuals. And that help can be accomplished in several ways. One possiblity is when several individuals help to solve the emerged problem uniting their knowledge and forces. Naturally, this allience of indivudal depend on the nature of the problem. The other possibilty is decomposition of the process needed for problem solution into several components and allocate them among the individuals who perform the activities.
Figure 2: Cycle of survival through the factors needed for its performance

But there could be a situation when complex approach is needed. In this case some parts of performed procces could be based on the unity of knowledge and force and some parts could be allocated among the perfomer of the activities (Figure 3).

Enterprise in Turbulent Environment

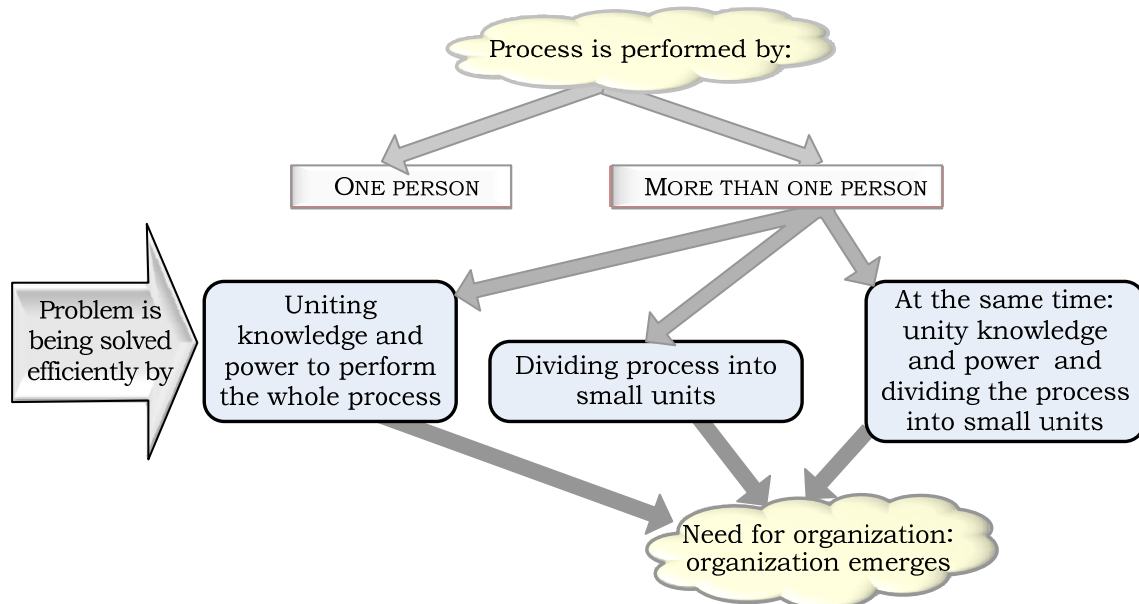
What ever way is chosen for problem solution, it is neccessary to be effective and efficient. Hence, all this leads to the need of forming an organization. From this stems that the **basic function of any organization is problems solution**.


Figure 3: Emerged needs for forming an organization

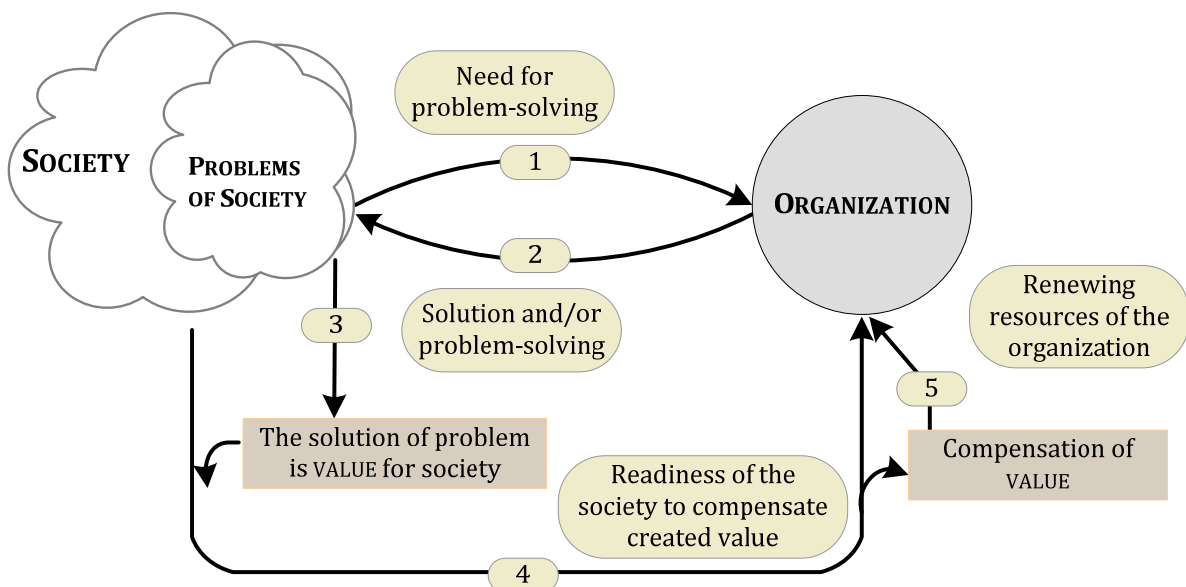
Organizations are like living beings. They solve problems and they need resources for their function. If there is a lack of recourses their existents are endangered. Figure 4 shows the autocatalytic process for survival of organizations.


Figure 4: Autocatalytic process for survival of the organization

Enterprise in Turbulent Environment

After identifying the problems of society (1) arises a need to solve them. These problems are solved or are being solved by organization which is able to do it. When the problems are solved, the society is survived (2) and in that way value is created for society (3). If society reacts wisely and appropriately in long-term, it will be ready to compensate the created values with previously created ones (4). And that enables the organization to renews its consumed resources (5). When this described process is activated and maintained, an autocatalytic process of organization survival arises.

Autocatalytic processes are important in nature, because they are the foundation of life**. They keep organism alive without outside interference.**

As the society develops it becomes more and more complex and consequently its problems are less obvious. And only what are obvious are the "needs of society". Problems related to the needs of society in some cases could be recognized, however in most cases it is not known how these needs arise i.e. how a problem or problems should be solved with these needs.

Today organizations recognize the "needa of the society" instead they identify its problems. Relations of the organization and the society are transformed in the form presented in Figure 5. In the society beside the domain of "problem" there is another domain, which is "the needs of society". In most cases organizations are related to the needs of the society rather than to its problems, which means that relations: 1-2 and 2-1 dominats instead of 1 and 2.

Chances for survival and development of the society largely depend on how the company can detect and identify their needs and how can they formulate these needs. In the relations of society and organizations instead of VALUE, the IMPRESSIONS OF VALUE appears. In the center for future research arise uncertain relations: 1-1 mapping the problems into the needs of society, 2-2 how the fulfillments of the needs contribute to problem-solution and 3-01 how the value coresponds to the impression of value. Beside these relations the main question is what should be applied to discover and identify the real problems of the society.

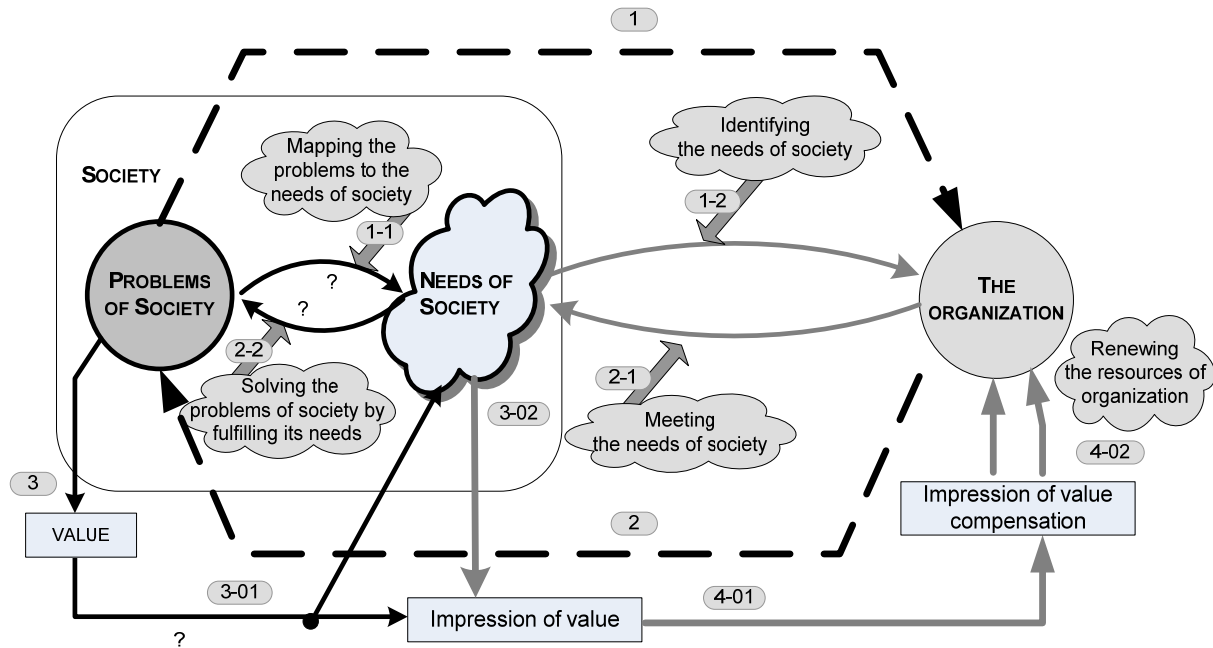
Enterprise in Turbulent Environment


Figure 5: Transformation of autocatalytic process for the survival of organization

The methods and tools applied so far in identifying the needs of society are not appropriate to detec and identify problems of society. Identification of problems means discovering the right diagnosis. And as in medicine, in the pursuit of a diagnosis symptoms should be identified and recorded. But the question is how could the right diagnosis be discovered?

First of all it requires:
- certain knowledge,
- information about the phenomena and
- tools and methods for getting information.

But considering the human societies it requires integrated knowledge about them from every important aspects. To this comprehensive, relevant knowledge we can get through "*integrated systems models*". So, in the first place it is necessary to create "*Systems model of human society*" (SMS) and "*Systems model of concrete organization*" (SMCO). By linking these two models an "*Integrated system model of society and concrete organization*" (ISMSO) is created.

The creation process of system models of society and concrete organizations is carried out through several cycles:
- in the first cycle the **classification structure** is created,
- in the second cycle the **static structure** is identified,
- in the third cycle the **dynamic structure** is identified,
- after that follows the cycles in which the model of behavior of organization and society is created:
  - firstly, functions of survival, development and management are modeled,

o secondly, processes are modeled to the level of activity (here is especially important to discover numerous autocatalytic processes, because they are some of the vital condition for successful function of society and organization),

- after that dominant variables and parameters of structures, behaviors and management are identified,
- and when the modeling process is finished, a computer simulation is performed to test the model.

From the model is expected to reflect to substantial extent the behavior of society and organizations. The model (ISMSO) is a powerful instrument for decision makers in the organization. They can examine and explore the integral behavior of societies and organizations. Not only that the model (ISMSO) can reveal the present problems of the society, but also the problems in future and even well before they emerge. Figure 6 illustrates these system models - SMS, SMCO and ISMSO.
Figure 6: Creating Integrated system models of the society and an organization from the system model of the society and system model of the organization

3 CONSLUSION

The results of the presented approach in this paper is creation of an Integrated system models of the society and an organization.

When an organization is managed as whole organism, the (ISMSO) model is applied:
- in discovering problems of society,
- in discovering the profit potential, which can be achieved bay the solutions of discovered problems,

- in discovering those new functions, which are necessary to solve the identified problems,
- in the process of identifying the performer of function and
- in identifying new, essential competencies which are necessary in organization.

To achieve short-term advantages over the competition, it is enough to start from identifying problems of society and not from its needs. But, it is not enough if they want to compete for the future! Permanently discovering the future and taking advantege of it, is what future successful organization should do.

ABSTRACT
Destination, as a fundamental concept of tourism, is considered to be a product which is extremely difficult to manage, and market because it arises from a number of different products, and many activities of different organizational units and stakeholders that team up to deliver the final product, and create an area of intensive tourist gathering. Sustainable competitive advantage of modern destinations is primarily achieved through the distinctive destination brand. Tourism in Croatia is one of the most important industries with a long tradition and great development opportunities. Therefore, this study aims to test a conceptual model of tourism destination competitiveness, and also the hypothesis according to which which the implementation of destination management elements is a prerequisite for creating a recognizable destination brand of the Kvarner region as one of the most successful Croatian tourist regions.

Keywords: Branding, Destination management, Kvarner region, Tourism

1 INTRODUCTION

Although essential to the travel and tourism system, the destination is widely acknowledged to be one of the most difficult products to manage and market due to the numerous products, organisational parts and stakeholders that are combined to deliver the destination product (Fyall, Garrod and Tosun, 2006). Tourism is, as a very propulsive and dynamic process, associated with new categories and types of arrangements and arranging travel. However it should be adapted to the internal organization of business entities that are engaged in this activity. Specifically, the business entities need to innovate in the field of strategic management and adjust marketing mix according to the demand and desired brand positioning (Mrkaić, 2012). Contemporary destination management is faced with increasing competition and substitutability and branding provides a great tool for creating a sustainable competitive advantage. Kotler and Keller (2007) note that effective branding represents not only an advantage for the company but also for turists who can make easier perceptions about differences between destinations and thus decide on where to travel. Excellent service quality and acommodation are no longer distinctive advantages of a destination. Each destination offers numerous attractions and most countries claim unique culture and heritage. The question arises about the key difference between the two neighboring Adriatic islands or some Mediterranean destinations. Sun, sea and sand are rarely a unique and exclusive solution.

Tourism is one of the most important Croatian industries and Republic of Croatia, as one of the most important tourist destinations in the Mediterranean, has a long tourist tradition and great development opportunities. Kvarner is one of the most developed tourism regions of the country with 173 000 acommodation capacities, representing approximately 20% of total

tourism carrying capacity, and the region generates about one fifth of the total tourist traffic in Croatia. Precisely for this reason, the main goal of this study is to identify and define the factors that constitute a prerequisite for creating a recognizable destination brand in order to identify guidelines for effective destination management, timely recognition of strengths and minimization of weaknesses, so that one can adequately act in the direction of strengthening the brand of the Kvarner region and create sustainable competitive advantage for the region, as well as Croatian tourism in general.

2   LITERATURE REVIEW

Although the roots of branding date back to the late 19th century with the development of branded consumer goods, the concept of branding has only recently become a prominent subject in the scientific and professional marketing literature (Aaker and Joachimsthaler, 2000; Fenichell, 2002). Within the context of tourism destinations, branding started to gain visibility with destination branding as a central topic at Travel and Tourism Research Association's Annual Conference in 1998. Since then, the concept becomes an even more significant subject in the papers of leading authors in the field. If we take into account the fact that the modern consumer is well informed, and that he requires increasing value of paid products and/or services because the consumption of the product not only meets his specifics need, but also communicates his lifestyle, attitudes and needs and associates him with his own kind, it can be concluded that the key competitive advantage of a destination is achieved through the emotion of the client, or tourist.

The answer to the question of how to develop a connection between a specific destination and tourists lies in branding. Namely, a brand differentiates products and represents a promise of value, arouses emotions, forms beliefs, and calls consumer to action, i.e. buying the product (Macrae, Parkinson and Sheerman, 1995; Schiffman and Kanuk, 2000). Choice of holiday destination is thus a significant lifestyle indicator for today's aspirational consumer, so the places where he spends the hard-earned income and limited vacation time have to be emotionally appealing with high value for his peers and observers. The World Tourism Organisation (WTO) talks about this in terms of seeing destinations as tomorrow's fashion items, suggesting that the next century will mark the emergence of tourism destinations as a fashion accessory. The choice of holiday destination will help determine the identity of the traveller and, in an increasingly homogeneous world, set him apart from hordes of other tourists (Lurham, 1998; Morgan, Pritchard and Piggott, 2003). Countries, of course, represent much more than mere fashion accessories. They are often (but not always) sovereign states, they are territories governed by competing interests and political agendas and their marketing has to be viewed in a context of a wider global socio-political system. For these reasons, destination branding is a highly complex and politicised activity and thus, despite its historical pedigree, the notion of branding a country is often greeted by scepticism and occasionally by outright hostility of the destination management organizations (DMO), which should reconcile the interests of private business, as well as strategic, long-term development interests of the public sector, thus ensuring the future of tourism.

According to Morrison and Anderson (http://www.macvb.org/intranet/presentation/DestinationBrandingLOzarks6-10-02.ppt) destination branding is defined as a way of communicating a unique identity through differentiating a destination from its competitors. Moreover, according to Gnoth (2002) branding can lead to the creation of a positive relationship between local resources and products through export of typical products and sharing of cognitive and emotional connections that can increase the

attractiveness for tourists and buyers. There are several important issues related to the problem of destination branding. Ooi (2004) states that destination branding is observed mostly from the perspective of tourists, while little attention has been paid to the study of the concept from the destination managers' point of view. When considering the role of different stakeholders, Marzano and Scott (2009) state that destination branding process depends on a wide range of stakeholders who want their opinion to be implemented into the concept. Although the compliance between stakeholders and brand strategies is a necessary prerequisite to success, coherence of interests between stakeholders does not have to exist. Therefore, the mobilization of stakeholder interests is an important issue when supporting the brand (Hankinson, 2004).

The literature review shows that most of the studies in the field of destination management were focused on destination stakeholders, whereas the main research areas are destination image management (Blain, Levy and Ritchie, 2005; Wang, 2008; D'Angella and Go, 2009), destination branding and the role of stakeholders in destination management (Donnelly and Vaske, 1997; Augustyn and Knowles, 2000). Furthermore, methods and techniques of destination management (Faulkner, 1997; Lenhart, 1998), destination competitiveness (Ritchie and Ritchie, 2002; Gomezelja and Mihalic, 2008), and funding of destination management organizations have also been subjects of research (Masberg, 1999).

In summary, it can be concluded that stakeholders who participate in creating the destination's tourism product were analysed the most. It is interesting to note that tourists visiting the destination were excluded from the survey, leaving space for further research.

3 DESTINATION BRANDING AND CHALLENGES OF DESTINATION MANAGEMENT

Destination branding can be defined as a way to communicate a destination's unique identity by differentiating a destination from its competitors. Similar to the general knowledge and marketing theory on brands, destination brands indicate two important functions: identification and differentiation. In the marketing literature the meaning of identification entails the explanation of the source of the product to consumer. While a product in general terms represents a physical offering that can be easily modified, destination as a product is a large entity that contains a number of tangible and intangible elements. For example, a place includes tangible attributes such as historical sites and beaches, but also the intangible features such as culture, customs and history. Due to the complex nature of the destination to be a brand, the generalization of identity is inevitable. Brand identity is crucial for generalization of desirable characteristics projected by suppliers' point of view, and it explains the expectations of a supplier about how a brand should be perceived on the target markets.

Defining a target market is essential due to the fact that some characteristics of a destination may seem positive to one segment while negative to another (Fan, 2006). Based on the projected identity consumers should develop a relationship with a particular brand through generating value, or favouring and giving credibility to the chosen brand (Aaker, 1996). In general, tourism destinations emphasize points of parity between destinations such as quality accommodation, fine restaurants and well-designed public spaces (Sartori, Mottironi and Corigliano, 2012). When evaluating the brand it is crucial to understand what elements of the brand are superior to those of competitors. In fact, the key to branding is that consumers perceive the difference among brands in the product category because the brand, which is

seen as a distinctive and unique, is hard to be replaced by other brands. Many studies confirm that brand identity and brand image is a crucial ingredient for successful destination branding (Qu, Kim and Hyunjung, 2011; Cai, Feng and Breiter, 2004). Nevertheless, there are concerns about the meaning of these two concepts. One of the key points of differentiation is that the concepts are based on two aspects: the recipient's and the sender's (Florek, Insch and Gnoth, 2006). In short, identity is created by the tourist destinations-the sender, while the image is created through the perception of the recipient, or the potential tourist (Kapferer, 1997). Brand identity reflects the contribution of all brand elements to awareness and image. In order to brand a destination, the destination marketers project a destination brand identity through all the features and activities that differentiate a destination from its competitors. At the same time, the recipient (consumer - tourist) perceives the image of a destination, which is formed and stored in his mind. It is important to note the reciprocal relationship between brand image and identity of the destination. Brand image plays an important role in building brand identity, and at the same time is a reflection of it (Qu, Kim and Hyunjung, 2011). In other words, consumers build a destination image in their minds based on the brand identity projected by the destination marketers who form the destination offerings. Then, destination marketers and marketing experts enhance the brand identity in accordance with the consumers' perception. Therefore, it is clear that the destination image is crucial for creating a positive and recognizable brand identity.

When talking about the challenges of destination branding, Morgan and Pritchard note that the challenges are mostly related to financial problems, political matters and environmental issues. The first challenge facing destinations and their managers is the limited budget, especially when considered in relation to some of the world's producers of consumer goods. For example, a global giant like Apple may spend as much money as the combined total of most of the world's national destination organizations on its annual global advertising budget. Mentioned fact indicates the need for innovative marketing communications that will outsmart the competition rather than outspending it. This is often difficult to achieve, especially taking into account that there is a positive correlation between the promotional budget of the destination and tourist expenditures (Baker and Cameron, 2008). Destination policies and laws, which deal with the complexity of the tourism product, the number of stakeholders and the complexity of their relationships also, represent an obstacle to effective destination branding. The fact that the destination is an amalgam of products, services and experiences that are outside the scope of control of any one organization, and also due to the differing interests of stakeholders which can evoke conflicts, can also disrupt the branding. For example, the question on whether a tourist's opinion of destination image is based on functional values, social values, suitability for all ages or the possibility of experiencing a new culture, arises. In addition, destination managers also have to consider the heterogeneity of travel motives of different target groups, which represents a challenge to find common ground on which the brand image and the destination brand can be built. As a result of an unsuccessful response to the environmental challenges, the image the consumer has of a destination brand can be quite different to the self-image intended in the brand identity (Pike, 2004).

From the foregoing it can be concluded that the new trends impose a shift from the classical concept of destination in terms of its content and capacities towards the concept of a destination as an integral identity and range of experience. Destinations are undergoing a transition (Jurin, 2008):
   1.   from the destination product towards the concept of destination experience, and

2. from destination marketing towards destination management.

Tourists are no longer passive observers of destination events; they expect a myriad of activities, events and a wealthy experience. Experience or adventures are new destination offerings; they represent the destination marketers' reply to the demands of modern tourists, who want to be treated in a distinctive and memorable way. Complexity of the political, economic, social and cultural conditions at the national, regional and local level requires a more precise identification of conditions, resources and organizational structures as well as solutions to fulfil the potential of destination, in order to meet the "on demand" principle of the tourist. Management of tourist destinations is facing a challenge of optimizing the impact of tourism and achieving strategic goals. The task is even more difficult due to the fact that the various destination stakeholders (visitors, local residents, public sector, hospitality companies and others) involved in the development and production of tourism products often, as already noted, have different and even and conflicting interests. In the constellation of such relationships, tourism organizations not only have the task of coordinating the marketers and suppliers destination and encouraging destinations' promotional activities, but they are transformed into destination management organizations with the main purpose of managing the destination. To manage a tourist destination means creating innovative destination management as an identifiable, qualitative development-oriented leadership, which is characterized by the knowledge, clear vision and authority, supported by local governmental authorities, tourism experts and destination marketers, along with the respect of the local population, so that it can, according to the principles of integrity, become a cohesive force for all relevant interests (Laws, 1995). Quality destination management is becoming increasingly important in the global tourism market, as well as in Croatia, where this issue has only recently, despite its importance, received increased interest.

In conclusion, it can be said that the basic element for the success of tourist destinations is the ability to recognize and adapt to change through a range of key factors that interact together. Therefore, this paper presents the concept and the results of an empirical research aimed to define and explore the factors that, in the destination management, create the foundation for recognizable branding and which influence the creation of destination image.

4 METHODOLOGY OF THE EMPIRICAL RESEARCH ABOUT THE IMPACT OF THE DESTINATION MANAGEMENT FACTORS ON THE BRANDING PROCESS OF KVARNER REGION

Empirical research examines which factors within the process of destination management create a recognizable brand of the Kvarner tourist destination, as one of the most prolific and most promising Croatian tourist regions.

The research was conducted using a questionnaire, through dissemination of e-mails and personal interviews with tourist officials and people involved in the development of tourism in the Kvarner area (local and regional governments, tourism organizations, development agencies). Research was conducte in period from February to September 2010. Out of 380 questionnaires sent, 107 were obtained back, and 104 of those were completed and usable for further analysis. The response rate was 27%, and the sample was considered relevant. Questionnaires were mostly returned via e-mail, and a smaller part was personally submitted. Most of the participants were under the age of 40 (70.2%), and the average age of respondents was 38.7 years. The questionnaire was mostly answered by women (68.3%). Most

respondents had a university degree (58%), 23% had high school education, and 19% had a master's degree or a Ph.D.

The sample included 27.9% of managers in tourism associations, 23.1% of the participants were hotel managers, 18.3% were employed in travel agencies, 10.6% of respondents belonged to the local governments, 7.7% of them attended postgraduate studies in the field of tourism, 4.8% of the participants were employees of educational institutions in the field of tourism, 4.8% were civil servants, and there were 2.8% of other respondnts.

The research was conducted through an integrated model of destination competitiveness - commonly used Conceptual Model of Destination Competitiveness, which is a combination of the basic Crouch-Ritchie model from 1999 and the Kim Dwyer model from 2003. The model was taken from the research on destination competitiveness in Slovenia, conducted by Gomezelj and Mihalic in 2008.

The study entailed the assessment of 85 indicators evaluated on the Likert scale of 1 to 5, and the indicators included various segments of destination offerings. They were divided into six groups, i.e. determinants of competitiveness:
1. inherited resources - include indicators that are represented in the survey questions from 1 to 9, for example: climate attractiveness, cultural and artistic heritage, historical sites, etc.
2. created resources - include indicators that are represented through the survey questions 10 to 33, such as offer of sports, adventure and recreational facilities, accommodation, transport infrastructure, etc.
3. supporting resources - include indicators that are presented in the questionnaire from question 34 to 45, for example: telecommunication system, customs and immigration offices, etc.
4. situational conditions - include indicators that are represented in the survey questions 46 to 70, and include factors such as political stability, cooperation between the public and private sector, the development and promotion of new tourism products, etc.
5. destination management - includes indicators that are represented in the survey questions 71–81, such as: co-operation between the public and private sectors in the field of hospitality and tourism education, the growth of foreign investment in tourism development activities, recognizable brand, etc.
6. demand conditions - include indicators that are represented in the survey questions 82-85, encompassing the entire image of the destination, international awards for product destination, destination products and compliance needs of tourists and international awards for our destination.

Inherited, created and supporting resources include various destination features that make the destination attractive to visitors. Destination management implies the factors that increase the attractiveness of resources, enhancing the quality of supporting factors, and it includes the organization's destination management, marketing management, development guidelines, planning, human resource development and environmental management. Demand conditions consist of three main elements of tourism demand: awareness, perceptions and preferences.

Subjects stated indicators rate from 1 to 5, where: 1 - below average, 2 - slightly below the average, 3 - average, 4 - slightly above the average, 5 - well above average.

Correlation analysis tested the relationship between the power of the brand and scores of major competitiveness, represented with inherited and built resources, supporting facilities, situational conditions, destination management and demand conditions. Power brand is defined by two categories - below average (grades 1 and 2), and (above) the average score of brand recognition (grades 3, 4 and 5). The result of such categorization is the distribution of the brand score. Out of the total number of respondents 88% evaluated the brand with grades 2 or 3. Pursuant to dichotomously defined variable of brand, the "point biserial" correlation coefficient was used, during the correlation analysis, as a special case of the Pearson correlation coefficient, when one variable is continuous and the other dichotomous.

Indicators whose scores showed statistically significant association with defined categories accounted for variables in the logistic regression. Given that indicators are ordinal variables, the Kruskal-Wallis test was used to determine the significance of individual indicators. Significance of Kruskal-Wallis test indicates the existence of differences in the distribution of indicator values between the two observed categories. This means that one distribution is shifted to the right, and generally contains higher ratings of indicators than in the second category. All indicators that had significant value were input variables in multivariate analysis, and logistic regression. When groups of indicators were compared, the traditional significance level of 5% was used, whereas when single indicators were compared to the grouped ones the level of significance of 10% was used in order to encompass a greater number of (potentially) important indicators as well as their interactions.

The impact of destination management on creating the brand and the image of the Kvarner tourist destination was estimated using logistic regression. When assessing the impact of destination management and brand image, indicators of the observed competitiveness group were used in choosing independent variables, in order to gain a deeper insight into the impact of destination management on destination brand and image. All initial indicators were analized, not only those that were left after the Cronbach alpha correction, except for the brand in the case when it represented the dependent variable. The dependent variable is dichotomous, i.e. the categories defined with below average and (above) the average evaluations of brand image were observed. The brand, which is an integral part of the destination management group of indicators was defined with the variable "Development of a distinctive destination brand", and was excluded from the definition of the numerical indicators of competitiveness due to elimination during the process of reliability analysis, i.e. during the correction of Cronbach alpha coefficient, which ensured an independent comparison with other indicators without affecting the basic model.

Numerical indicators, i.e. evaluation groups were defined as the arithmetic mean of the corresponding indicators of a specific competitiveness group, and they presented a summarized evaluation of a certain group. Indicators that have proved superfluous in the analysis of reliability, i.e. those that impacted on reducing the Cronbach alpha coefficient were excluded from the calculation.

5 RESULTS OF THE EMPIRICAL RESEARCH
In this paper, the following hypothesis was tested:

H1: Implementation of integrated factors of destination management is a prerequisite for creating a recognizable brand of the Kvarner tourist destination.

Enterprise in Turbulent Environment

Kruskal-Wallis test was used to examine the differences in the distribution of individual indicator scores between the two brand categories that were defined with a below average and above averagescore, and the analysis of differences in the distribution of grades is shown in Table 1.

Table 1: Analysis of differences in the distribution of factor grades between the two categories of brand (authors' research)

Set of indicators: **Destination management**	
Variable	p-value
p51	0,865
p52	**0,007**
p57	**0,006**
p60	0,293
p61	0,312
p62	0,705
p63	**0,059**
p64	**0,016**
p65	0,621
p66	0,314
p67	**0,001**
p68	0,318
p69	0,651
p70	0,507
p71	0,466
p72	0,822
p73	0,865
p74	0,486
p75	**0,001**
p77	**0,001**
p78	0,663
p79	0,181
p80	0,584
p81	**< 0,001**

Statistically significant difference, at a significance level of 10%, in the distribution of grades for certain indicators of destination management between the observed brand categories (below average / (above) average grade) was detected in the following indicators:
1. p52   the private sector recognizes the importance of sustainable development,
2. p57   the entrepreneurial ability of the local tourism sector,
3. p63   a vision of a destination as a reflection of tourists' evaluations,
4. p64   a vision of a destination as a reflection of the local community evaluations,
5. p67   the development and promotion of new tourism products,
6. p75   educational structure adapted to the occupations in tourism,
7. p77   the growth of foreign investment in tourism,
8. p81   reputation of the tourist boards.

These variables, that exhibited a univariate association with the brand, make the initial input for the logistic regression. After including other variables in the model, as described in the

specification, a model is obtained where the probability is modeled BRAND = 1, i.e. that it is evaluated as (above) average when compared to the competition.

This model that presentes the impact of (other) indicators of destination management on to the (above) average rating of the brand shows means that most influencal variable is P81 - reputation of tourist boards. If their reputation score increases by a unit, the odds that the destination brand's score will be (above) the average, relative to its main competitors, increases almost nine times (OR = 8.6). Table 2 shows the results of the logistic regression of destination management factors that influence the destination brand.

Table 2: Results of the logistic regression of destination management factors that influence the destination brand (authors' research)

Variable	Estimate	Standard error	χ^2	Odds ratio			p-value
				Estimate	95% confidence interval (Waldo)		
Constant	-12,473	2,471	25,471				< 0,001
p57	0,865	0,453	3,646	2,375	0,977	5,773	0,056
p67	0,916	0,494	3,433	2,499	0,948	6,582	0,064
p75	0,594	0,341	3,032	1,811	0,928	3,534	0,082
p81	2,148	0,541	15,777	8,567	2,968	24,723	< 0,001
Coefficient of determination R^2	Likelihood ratio						
0,477	< 0,001						

The following indicators have a statistically significant impact on brand recognition: p57 - the entrepreneurial ability of the local tourism sector (OR = 2.4), p67 - the development and promotion of new tourism products (OR = 2.5) and p75 - educational structure is adjusted to occupations in tourism (OR = 1.8); a better evaluation of these indicators increases the odds for an (above) the average score of the brand.

Results of the research indicate the acceptance of the developed hypothesis (H1) according to which which the implementation of destination management elements is a prerequisite for creating a recognizable destination brand of the Kvarner region as one of the most successful Croatian tourist regions.

6 CONCLUSION

Tourism destination management should be perceived as a management system that contains multiple segments (economic, political, environmental, technological, demographic and social). To accomplish this objective, different types of destination management are introduced. Strength of the brand, and previous perceptions of potential visitors, have an increasingly important role in choosing a destination to visit. It can be said that the sales of a tourism product have attained a new dimension in which the focus is on the customer or visitor and his perception, thus the choice of a destination is pre-destined.

Brand management is an integral part of destination management because every business decision made by the destination managers as well as their success or failure will be reflected on the overall destination brand. Good or bad decisions affect the image of the destination, through the perception of the community, or the visitors. If the destination managers do not accept the role of brand managers and manage the brand, the brand will probably continue to

develop in an unwanted direction. Therefore, the management of destination has to indeed take care about the destination image in the public and manage the process of branding, in order to communicate the wanted image and consequentially influence public awareness and create a strong brand.

The model of destination management indicators shows that the reputation of tourist boards has the most significant impact on the above average rating of the brand. If their reputation score increases by a unit, the odds that the destination brand's score will be (above) the average, relative to its main competitors, increases almost nine times.

Entrepreneurial ability of the local tourism sector, the development and promotion of new tourism products and the adapted educational structure have a statistically significant and positive impact on brand recognition and are the local tourism sector, adapted occupations in tourism, i.e. their evaluation increases the chances for an above average score of the brand, which indicates the acceptance of the corresponding hypothesis (H1) according to which the existence of destination management factors that influence the brand recognition of the Kvarner tourist destination.

ABSTRACT
The purpose of this paper is to analyze value relevance of accounting information for Croatian banks. Most of researches conducted in the area of value relevance are focused on nonfinancial companies and therefore it is interesting to analyze are accounting information published in bank's financial statements value relevant. The usefulness of accounting information in the process of decision making is also examined through value relevance analysis and information about usefulness and quality of bank's financial statements are interesting not only to investors on the capital markets but also to bank supervisors. A value relevance analysis was conducted by using F-O valuation framework. According to F-O model market value of a company can be expressed as a function of accounting information, i.e. earnings and book value. In this research authors analyzed the value relevance of banks whose shares were listed on the Croatian capital market at the end of 2011. In 2011 Croatian banking sector consisted out of 32 banks but only 12 banks were traded on Zagreb Stock Exchange. Therefore research was limited only on a sample of 12 banks, meaning that sample included 37.5% of banks that operated in the Republic of Croatia at the end of year 2011. Research results indicate that book value was positively and significantly related to share prices while earnings were not related to share prices. More precisely, regression coefficient on book value amounted 0.617 (sig. 0.0001) and regression coefficient on earnings was 0.359 (sig. 0.586). Generally observed, it can be concluded that accounting information published in financial statements of banks are value relevant, i.e. related to share prices since regression model was significant as a whole (sig. 0.0001). Total explanatory power of accounting information measured through coefficient of determination amounted 97.3%.

Keywords: Accounting information, Banks, Value relevance

1 INTRODUCTION

Value relevance studies present a line of research which analyses the usefulness of accounting information in the process of decision making. Namely, accounting information is considered value relevant if it is associated with share prices. If this relationship does not exist it can be concluded that accounting information are not value relevant or that financial statements do not meet one of its primary goals. In the literature the concept of value relevance is defined in different ways. According to Beaver (2002) accounting information is value relevant if it is associated to market value of equity (with shares or returns). Similarly, in Barth et al. (2001) it is stated that "*value relevance studies examine association between accounting information and market variables*". Value relevance studies represent the most productive area in accounting research in the last 30 years and they are conducted in most of developed

countries. Anandarajan et al. (2011) consider that this growth in international importance of value relevance studies is motivated by two key factors. As a first factor authors specify the increased globalization of financial markets which resulted in a movement towards international standardization of accounting practices. As second factor, they state that the significant increase in international investments has necessitated the need for more reliable and informative financial statements on a global basis. In recent years in the area of value relevance research focus is on comparing the value relevance of accounting information among different countries and on determining the factors that cause the observed differences.

This research is, unlike most of the other papers in this area, focused on the analyses of value relevance of financial institutions, more precisely, banks. In fact, in most of the value relevance studies, authors excluded financial institutions from the sample because of the specificities of their operations and, to our best knowledge, until today there is no value relevance studywhich analyzed the value relevance of Croatian banking system. Banks play extremely important role in financing corporations and the overall economy and therefore the analyses of usefulness and quality of bank's accounting information certainly has significance. It should be noted that value relevance analyses for the financial institutions, or more precisely for banks, is relevant not only to investors but also to bank supervisors whose interest is to tighten market discipline by reinforcement disclosure and transparency requirements.

Paper is divided in four sections. The introductory part is followed by literature review from the value relevance area. Third part of the paper shows results of empirical research conductedon a sample of Croatian banks. Last part of the paper brings concluding remarks.

2   LITERATURE REVIEW

A large number of value relevance studies that were conducted in the last 20 years have its origin in different corporate governance systems. Authors consider that differences in corporate governance systems cause differences in value relevance among different countries. As examples of studies where differences in value relevance are explained by different institutional and legal frames studies performed by Ali and Hwang (2000), Ball, Kothari and Robin (2000), Black and White (2003) can be pointed out. Ali and Hwangcompared value relevance of accounting information for 16 countries in the period from 1986 to 1995 in order to determine differences in the value relevance between countries that belong to continental or to Anglo-Saxon model of corporate governance. Research results have shown that value relevance of accounting information is lower in countries that belong to continental corporate governance system and which are characterized by a strong bank orientation in raising external capital.

Influence of differences in corporate governance systems on the quality of accounting earnings was analyzed by Ball, Kothari and Robin (2000). Authors conducted research on four countries that belong to Anglo-Saxon corporate governance model (Australia, Canada, USA and United Kingdom) and on three countries that belong to continental corporate governance model (France, Germany, Japan). Finally, the sample consisted of more than 40.000 observations in the period 1985–1995. Authors analyzed two important characteristics of accounting earnings (conservatism and timeliness) and research results have shown that timeliness is higher in countries that belong to Anglo-Saxon corporate governance model.

Black and White (2003) compared value relevance of book value and earnings in Germany, Japan and USA. Research results show that value relevance of book value is higher than value relevance of earnings in Germany while the results are less robust for Japanese companies.

More precisely, for Japanese sample book value is more value relevant than earnings only in the case of companies that reported negative earnings. Results also show that value relevance of earnings is higher than value relevance of book value for the sample of USA companies. Second stream of research is based on comparing value relevance of accounting information prepared according to different accounting standards. As examples of such studies papers of Arce and Mora (2002) and King and Langli (1998) can be pointed out. Arce and Mora performed a research on a sample of corporations from 8 European countries. Research results have shown that it can not be concluded that accounting information are more value relevant in market orientated systems than in bank orientated systems although it is noted that book value and earnings have different roles in valuation of a company. King and Langli conducted comparative value relevance analyses on the capital markets of Germany, Norway and United Kingdom. Results have shown that accounting information are value relevant in all three observed markets. Also results have shown that accounting information are the least related to share prices in Germany (R^2 amounts 40%), the best relation with share prices was evidenced for UK capital market (R^2 amounts 70%) and explanatory power of the accounting variables in Norway was 60%.

As third line of value relevance studies cross time value relevance studies can be pointed out because of their significance in the value relevance literature. Study performed by Devalle et al. (2010) can be pointed out. Authors analyzed whether the value relevance of accounting information has increased after implementing International Financial Accounting Standards as mandatory for preparation of consolidated financial statements. Research results have shown that influence of earnings on share prices has increased after IFRS implementation in case of Germany, France and United Kingdom while impact of book value was decreased in all the analyzed countries except United Kingdom.

As separate line of value relevance research studies dealing with value relevance of banks can be pointed out. Example of such studies are papers written by Agostino, Drago and Silipo (2011) and Anandarajan, Francis, Hasan and John (2011). Agostino et al. (2011) measured value relevance in the European banking industry before and after the adoption of IFRS. The aim of the paper was to determine whether the mandatory application of IFRS increased the value relevance of accounting information to the prices of bank shares in the European Union. Research results have shown that IFRS introduction enhanced the information content of both earnings and book value for more transparent banks. Also, authors came to result that less transparent entities did not experience significant increase in the value relevance of book value.

Anandarajan et al. (2011) focused only on financial firms in 38 countries during 1993–2004. Sample included 813 banking institutions and research results have shown that, on the macro-level, value relevance was affected by "Transparency" or disclosure requirements of a country's standards boards. More precisely, authors came to conclusion that the value relevance was more significant in countries were greater disclosure of financial information was required. Also, one of the conclusions was that value relevance is influenced by who sets the standards, meaning that value relevanceis greater when there is a local environment which is more focused on the private sector and the legal environment is opeded and friendly to shareholders. According to this research, at the bank level, the organizational form and risk had the most impact on the value relevance of banks.

3 VALUE RELEVANCE OF BANKS: EVIDENCE FROM CROATIA

3.1 Sample and research model

The purpose of this paper is to analyze the value relevance of accounting information for Croatian banks whose shares are listed on the Zagreb Stock Exchange. At the end of 2011 Croatian banking sector consisted out of 32 banks but on the Zagreb Stock Exchange data on share prices were available only for 12 banks. Therefore research was limited on a sample of 12 banks meaning that sample included 37.5% of banks that operated in the Republic of Croatia at the end of 2011. Descriptive statistics for the banks included in the sample is shown in table 1. Table 1 provides information about number of banks included in the sample, mean and standard deviations of market value per share, earnings per share and book value per share.

Table 1: Descriptive statistics

	Mean	Std. Deviation	N
P	370,0233	525,04774	12
EPS	20,7100	50,58683	12
BVPS	582,8625	823,16531	12

Table 2 provides information on correlations between variables included in the regression model. In multiple regression models, where regression coefficients reflect partial influence of one influencing variable on the dependent variable when other influencing variables are constant, assumption that regression variables are independent should be fulfilled. In a situation when this assumption is not fulfilled there is a problem of colinearity among two, or the problem of multicollinearity among more regression variables. In practice perfect multicollinearity is very rare, but strong or very strong multicollinearity is not that rare (Gujurati, 1992). According to expectations, in the observed regression model earnings and book value are positively and statistically significantly correlated among each other, andthey are also significantly related to share prices.

Table 2: Correlation ^{a} among variables in the sample

Variable	P	EPS	BVPS
P	1,000	0,606	0,989
EPS	-	1,000	0,590
BVPS	-	-	1,000

^{a} *All correlation coefficients are significant at 1% level.*

Since colinearity among regression variables was noted in order to test multicollinearity problem variance inflation factors (VIFs) were analyzed. In order to test the multicollinearity problem, statistical package SPSS, which was used in this research, applies variance inflation factors, so called VIFs. If VIFs are less than 5 it can be concluded that multicollinearity is not a significant problem, but however some authors consider that VIFs can be up to 10 and that multicollinearity is still not considered as a significant problem. Although there is a correlation among independent variables in the observed regression model the multicollinearity problem is not significant (Table 4). More precisely, since none of the VIFs is higher than 5 (VIFs equal 1.534), it can be concluded that in the observed regression model multicollinearity is not a significant problem.

In this research authors analyzed the value relevance of accounting information of Croatian banks, i.e., the relation between accounting information and share prices for banks whose shares were listed on the Zagreb Stock Exchange at the end of 2011. This research contributes to the existing valuerelevance literature since to our best knowledge there is no similar research on the value relevance of Croatian banks. The aim of this research was to test the following hypothesis:

H: Accounting information prepared and published by Croatian banks are value relevant.

Operative approach in testing value relevance of accounting information has basis in Feltham-Ohlson valuation framework (furthermore F-O model). According to F-O model the market value of the firm can be expressed as linear function of its book value and discounted expected abnormal earnings (Feltham, Ohlson, 1995; Ohlson 1991). So, in this study, authors express value relevance of accounting information as a function of earnings and book value as follows:

$$P_{i,t} = a_0 + a_1 E_{i,t} + a_2 BV_{i,t} + e_{i,t} \qquad (1)$$

Where:
$P_{i,t}$ – stock price at the end of year t
$E_{i,t}$ – earnings per share during year t
$BV_{i,t}$ – book value per share at the end of year t
$e_{i,t}$ – other value relevant information in year t.

3.2   Empirical findings on the value relevance of banks in Croatia

As previously mentioned value relevance analysis for the Croatian banking sector was conducted on a sample of 12 banks whose shares were listed on Zagreb Stock Exchange in 2011. In performing value relevance analysis, consistent with previous research in this area (Black and White, 2003, Ali and Hwang, 2000), we examined value relevance by drawing conclusions from the explanatory power of models statistics (R square) and by drawing conclusions from the significance of the model as a whole and also from the significance of regression coefficients of the variables included in the research. A conducted value relevance analysis indicates that accounting information of Croatian banks are value relevant, i.e. related to share prices. Namely, as it is shown in table 3 developed and tested regression model is significant as a whole (sig. 0,0001) and based on the model's significance it can be concluded that bank's accounting information are value relevant.

Enterprise in Turbulent Environment

Table 3: Model's significance

ANOVA[b]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2965557,885	2	1482778,942	199,571	,0001[a]
	Residual	66868,543	9	7429,838		
	Total	3032426,428	11			

a. Predictors: (Constant), BVPS, EPS

b. Dependent Variable: P

Further analysis of regression coefficient has revealed that book value is positively and significantly related to share prices while earnings are not. More precisely, regression coefficient on book value equals 0.617 (sig. 0.0001) which indicates a high degree of association and it can be concluded that book value is highly significant in explaining changes in market value. Regression coefficient on earnings equals 0.359 (sig. 0.586) and it can be concluded that earnings, when observed individually are not significantly related to share prices in the Croatian banking sector.

Table 4: Parameter estimates and odds ratios for the model

Model		UnstandardizedCoefficients		Standardized Coefficients			CollinearityStatistics	
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	Constant	2,669	30,949		,086	,933		
	EPS	,359	,636	,035	,565	,586	,652	1,534
	BVPS	,617	,039	,968	15,793	,0001	,652	1,534

In the context of value relevance analysis special attention is on analyzingthe determination coefficients because these coefficients represent the explanatory power of the model and measure the value relevance of accounting information.

Table 5: Explanatory power of developed model

Model	R	R Square	Adjusted R Square	Stid. Error of theEstimate	Durbin-Watson
1	,989	,978	,973	86,19651	1,868

For the observed model R square equals 97.8% and the adjusted R square amounts 97.3% which indicates very high explanatory power of the model. So, according to the research results explanatory power of the model equals 97.3% meaning that accounting information explain 97.3% of share prices of Croatian banks. As it can be seen value relevance is quite high but however when interpreting this research results one should have in mind relatively small sample of banks included in this research since different sample might result in differentvalue relevance of bank accounting information.

4 CONCLUSION

Accounting information published in financial reports are the primary source of publicly available information about company's performance and thereby transparent financial reporting is an essential prerequisite for efficient functioning of capital markets. The accounting information usefulness approach is emphasized both in theory and practice of financial accounting and value relevance studies represent stream of research in which relation between accounting information and share prices is analyzed. The literature of value relevance is increasingly getting attention in the international contex (Ali and Hwang, 2000) but it is important to emphasize that most of the researches are limited to manufacturing and non-financial firms. Actually, financial institutions were in most of the cases excluded from the sample because of the specificities related to their business operations and process of financial reporting.

In this paper authors use F-O valuation framework in order to test the value relevance of Croatian banks. According to F-O model market value of a company can be expressed as a function of accounting information, i.e. earnings and book value. Sample included 12 banks whose shares were listed on Zagreb Stock Exchange in 2011. Results of research conducted within this paper confirmed the research hypothesis and have shown that accounting information of Croatian banks are value relevant, i.e. related to share prices. More precisely, regression model was significant as a whole and the total explanatory power for the tested model amounted 97.3%. Furthermore, research results indicate that book value was positively and significantly related to share prices while earnings were not related to share prices. Regression coefficient on book value amounted 0.617 (sig. 0.0001) and regression coefficient on earnings was 0.359 (sig. 0.586).

In the end it should be noted that although accounting information of Croatian banks are found to be value relevant, when interpreting research results one should have in mind relatively small number of banks included in the sample. Small number of banks in the sample is one of the limitations of conducted research but itis result of quite small liquidity of banks shares on the Croatian capital market. However, to our best knowledge this is first attempt of determining the value relevance of accounting information for Croatian banks and it is important to emphasise need for further investigation in this area in order to get more robust information on value relavance of banks but also to get better insight in factors that affect bank's accounting information quality, transparency and in the end factors that affect value relavance of banks.

ABSTRACT
The success of company strategic management greatly depends about the integration level of human resource function in the process of business strategic planning. This means that managers and professionals from the human resource department should be integrated into the process and team for strategic planning. In the strategic process planning human resource managers should:
  a) be involved in strategic plan construction in all the question of human resources and in the implementation of strategic choices in the company;
  b) know stategic goals of the company;
  c) know which kind of skills, behaviours and attitudes of employees are needed as the support to the strategic plan of the company;
  d) develop programs which will ensure that employees realy have needed skills, behaviour and attitudes as a support for company strategic realization.
Regarding that basic questions of business strategy are where, how and wherewith compete, the good answer on this questions suppose that human resources are key strategic and competing factor. Because of that top management of the companies beyond team for strategic planning should engage not only the formal team for strategic planning, but also human resource management function with its management and professionals. This paper research the tipes of connections of strategic and human resource management in company praxis of Serbia on the sample of 212 companies. It answer on the question about the connection tipe between human resource management and strategic planning, is this connection on the administrative, one-way, two-way or integrated level. By means of questionnaire research method applied to managers on all management levels (top, middle and lower) are obtained interesting results in the area of integration of the human resource management and the business strategic planning on the case of Serbia.

1 INTRODUCTION
The choice of strategy consists of answers related to the competition, i.e. the way in which a company is going to compete in order to accomplish its mission and goals. Strategic decisions consist of answers to questions where, how and with what to compete. Strategic management is an approach to reacting to competition, and it deals with a range of decisions such as: how

to frighten the competition, how to weaken the competition, how to react and influence laws not yet passed, how to treat different and specific interest groups, how to reduce production costs, how to increase income, which technology to use and how many and which type of people to hire. All of this represents competitive challenges which must be considered. Strategic human resource management is a model of planned distribution of human resource which should enable a company to achieve its goals (Noe et al., 2006, p. 43). All systems in a company are managed by people, thus strategic human resource management requires engaging right (skilful) employees in the right place at the right time and developing a motivational system which would harmonize the behavior of employees with the company's strategic goals (Bogdanović, 2010, slide 20). The success of strategic management greatly depends on the degree of involvement of a company's human resource management (HRM) function, so HRM has a key role in defining and implementing the business strategy, but also business strategy has an impact on the HRM strategies and programs (Bahtijarević-Šiber, 1999, p. 122). By means of HRM can be achieved concurrent and strategic advantage, because no other resource, except human resource has this power (ability) to create new products and services (Bogdanović and Zelenika, 2011, p. 364). Implementing strategy includes eight (8) important activities: building a capable organization, steering ample resources into strategy-critical activities and operating units, establishing strategy-supportive policies, instituting best practices and programs for continuous improvement, creating internal support systems to enable better execution, employing appropriate motivational practices and compensation incentives, creating a strategy supportive corporate culture and exerting the internal leadership needed to drive implementation forward (Thompson and Strickland, 1998, p. 334) what can not be effectively achieved without tight cooperation between sound strategy and HRM. A very common problem in strategy realization is the lack of adequate labor force, because every part of the process of managing a company involves issues related to people. Therefore, a certain level of connection between human resource management and strategic planning is needed in order to achieve harmony between strategy and realization. The higher the level of that harmony is, the closer the company is to achieving business excellence. An American research on 115 strategic business units which belong to 500 companies from a Fortune magazine's list has shown that there is a certain level of connection between human resource management and the strategic planning process in between 49% and 69% of companies (Martell and Caroll, 1995; referenced by Noe et al., 2006, p. 45). The concept of Human Resource Management was created under the auspices of the British social services at the beginning of the twentieth century, who cared for the workers welfare (Živković, 2012, p. 161). HR managers are becoming more and more involved in formulating and implementing strategy in their organizations, because it has become understood that the key elements of organizational success are: mission and strategy, organizational structure and HRM, which requires their close connection. HRM thus becomes the main protagonist in strategic plans development, and organizational and human resource plans and strategies are inextricably linked (Ivanchevic, 1994, p. 7). The levels of this connection can be different, thus it is important to understand the connection. Literature regarding strategic human resource management (Noe et al., 2006, pp. 45–47; Golden and Ramanujam, 1985, pp. 429–451) makes a difference among four basic forms of the connection:

a) *Administrative connection* (the lowest level of integration). The attention of the HRM function is directed at daily activities. Human resource management has neither time nor an opportunity to deal strategically with the issues of human potential. A company's strategic planning function exists without any input from the human resource department. The HRM department is completely separate from any part of the strategic management process, from strategy formulation as well as from its

implementation. The HRM department deals with administrative issues that have nothing to do with the company's key (strategic) business needs.

b) *One-way connection*. The function of strategic business planning is developing a strategic plan after which the HRM function is informed about it. Human resource issues are not considered when formulating a strategic plan. Strategic plans that a company cannot implement successfully are often a consequence of this level of integration.

c) *Two-way connection*. Human resource issues are considered when formulating a strategy in three steps. Firstly, the strategic planning team informs the HRM function about different strategies the company is considering. Secondly, after that, HRM analyzes the influence of different strategies on human resource. Finally (thirdly), after a strategic decision, the strategic team delivers a strategic plan to the HR management which is to develop programs for its implementation. The strategic planning function and the HRM function are interdependent here, though HRM is not directly involved in strategy formulation but only in its implementation.

d) *Integrated connection*. This connection is based on a constant rather than sequential interaction. A HR manager is a member of the senior managers team (the strategic team). The HRM function is involved in both strategy formulation and its implementation. The HR management provides strategic planners with data regarding the company's human resource abilities, where the abilities mentioned are a result of the company's HRM system. In accordance with the human resource abilities, the best strategy is chosen and human resource practice is organized in a way to motivate employees' performance.

This paper researches the problem of connection (integration) between strategic planning and the HRM function on a sample of companies of the Republic of Serbia. The goal of the research is to establish the level of the connection, whether it is at the level of an administrative, one-way, two-way or integrated connection. Furthermore, it researches whether there are statistically significant differences in answers among different manager levels (top, middle, lower) as well as between HR managers and other sector managers.

2 THE METHOD

Using a questionnaire related to the integration between strategic business planning and the human resource management function (adapted according to Golden and Ramanujam, 1985 – see the annex), the management in 212 companies in the Republic of Serbia was surveyed anonymously (in the period from 8th to 10th month of 2012).

Answers to questions in the main part of the questionnaire were offered in two categories (yes, no), and the examinee was to circle what, in his/her opinion, referred to the statement in question. In addition, the questionnaire consisted of open questions regarding the level of management (top, middle, lower) and the jurisdiction sector. One manager was surveyed in each of the 212 companies. Completed questionnaires were returned to the researchers.

The sample structure included 75 top managers, 79 middle managers and 38 lower managers, in total 212 surveyed managers in 212 companies in the Republic of Serbia. Out of the given sample (N=212), 17 managers were employed directly as HR managers while the other 195 were employed as managers in other company sectors.

3   RESULTS AND A SHORT DISCUSSION OF RESEARCH RESULTS

The first step established the levels of connection between the HRM function and strategic planning (plan and execution), while the second established differences in answers regarding the management level (top, middle, lower) and the sector role (the manager of the HRM sector and other managers).

Table 1: Administrative connection between the HRM function and strategic planning (SPSS ouput)

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)
V1	Group 1	0	207	.98	.50	.000[a]
	Group 2	1	5	.02		
	Total		212	1.00		
V2	Group 1	0	207	.98	.50	.000[a]
	Group 2	1	5	.02		
	Total		212	1.00		
V3	Group 1	0	191	.90	.50	.000[a]
	Group 2	1	21	.10		
	Total		212	1.00		
V4	Group 1	0	153	.72	.50	.000[a]
	Group 2	1	59	.28		
	Total		212	1.00		

a. Based on Z Approximation.

It is clear from the given table 1, considering the answers (1=yes, 0=no), that the majority of examinees' (managers') answers lead to the conclusion there is not only an administrative connection between the HRM function and strategic planning in their company. A statistically significant difference was established between answers yes and no (p=0.000) for all four variables measuring the given connection (v1= HRM activities in the company are mostly of administrative nature; v2= HRM activities have nothing to do with the key business needs of the company; v3= strategic planning exists without any input from the HRM department; v4= our HRM department deals mainly with daily operational activities), thus a conclusion can be reached regarding the direction of the non-existence of an exclusive administrative connection between the HRM function and strategic planning in companies of the Republic of Serbia.

Table 2: One-way connection between the HRM function and strategic planning
(SPSS ouput)

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)

	Total		212	1.00		
V6	Group 1	0	175	.83	.50	.000[a]
	Group 2	1	37	.17		
	Total		212	1.00		

a. Based on Z Approximation.

In the area of the one-way connection, table 2 presents tested variables (v5= notification concerning the strategic business plan, the HRM sector receives only the final information; v6= the HRM sector receives the finished strategic business plan, but is not involved in its creation). It is visible from the table that the majority of answers to given questions are no=0, with statistically significant differences between answers yes and no, which implies that companies' managers perceive that the connection between strategic planning and HRM is above the one-way connection.

Table 3: Two-way connection between the HRM function and strategic planning
(SPSS ouput)

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)

	Total		212	1.00		

a. Based on Z Approximation.

Similar results were received in the area of the two-way connection between HRM and strategic planning, i.e. variables: v7= regularly inform the HRM sector regarding different business strategies the company is considering; v8= human resource managers consider the influence of different business strategies on human resource and present their results to the strategic planning team; v9= after the decision on the business strategy, the plan is delivered to a HR manager who develops programs for its implementation; v10= business planning

functions in the company are interdependent (one influences the other and vice versa). Most of the examinees in companies stated that the connection between HRM and strategic planning is at this two-way level of connection.

Moreover, the goal was to determine whether the connection between the HRM sector and strategic planning is at the highest level, i.e. at the level of the integrated connection which the following table presents.

*Table 4: Two-way connection between the HRM function and strategic planning
(SPSS ouput)*

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)
V11	Group 1	1	189	.89	.50	.000[a]
	Group 2	0	23	.11		
	Total		212	1.00

	Group 2	0	15	.07		
	Total		212	1.00		
V14	Group 1	1	211	1.00	.50	.000[a]
	Group 2	0	1	.00		
	Total		212	1.00		

a. Based on Z Approximation.

Similar results to those in previous connection researches were received when researching the integrated connection where most examinees believe the highest level of connection between HRM and strategic planning is present in their companies (variables v11= a HR manager is a member of the senior (top) management team; v12= the process of formulating strategy and the process of its implementation in our company cannot happen without intensive involvement of the HRM sector; v13= a human resource manager provides strategic planners with the key data regarding human resource abilities, which helps choose the best possible business strategy; v14= the practice of HR in the company is organized in a way to motivate the success of individual employees as well as the function of work teams.

The only exception is variable v12= the process of formulating strategy and the process of its implementation in our company cannot happen without intensive involvement of the HRM sector (35% of answers were opposite the general tendency of the highest level of connection between the strategic plan and execution), which, at least in this area, opens the question of whether the given answers in this research were really meant by the management or whether they were largely moulded by social desirability.

Two control questions, v15= before a strategic business choice, strategic planners consider all business questions related to human resource and v16= employees in a company are the key

means for maintaining competitive advantage, confirmed the conclusion mentioned above, as can be seen in table 5.

Table 5: Strategic significance of human resource in companies of the Republic of Serbia (SPSS ouput)

		Category	N	Observed Prop.	Test Prop.	Asymp. Sig. (2-tailed)	Exact Sig. (2-tailed)
V15	Group 1	1	153	.72	.50	.000[a]	.000
	Group 2	0	59	.28			
	Total		212	1.00			
V16	Group 1	1	211	1.00	.50	.000[a]	.000
	Group 2	0	1	.00			
	Total		212	1.00			

a. Based on Z Approximation.

Question v15 referred to the direct productive and operational connection between a company's work teams and its strategic choice, therefore the direct connection between the plan and execution (28% of companies stated that this is not characteristic of their companies, which is a relatively small percentage when it is known that companies in the Republic of Serbia are not at the world's level of competitiveness).

The given results could lead to a non-critical conclusion that there is an exceptional connection (the integrated connection) in the companies of the Republic of Serbia between strategic business planning and human resource management, even better than it is the case in 500 companies from the Fortune magazine's list, which states that there is a certain level of connection between human resource management and strategic planning process in between 49% and 69% of companies (Martell and Caroll, 1995; referenced by Noe et al., 2006, p. 45).

Of course, results acquired in this manner should not be taken for granted, and the survey method used to question the management of concerned companies could be non-critically declared completely true as such if it were judged impeccable (without mistakes in measuring, i.e. if managers' answers could be treated as completely true and in accordance with the organizational reality). In testing praxis are known the terms of response bias, socially desirable responding, response distortion, overreporting which can be the problem also in psychological praxis (Richman et al., 1999; referenced by Fastić-Pajk, 2005, p. 6).

Namely, the management itself often provides socially desirable answers and distorted answers in accordance with its own specific motivation, especially in situations when given answers would not be in its favor or when it cannot control given answers. Results of a survey can often be 'thrown in the garbage' as examinees in certain researches do not provide true answers, namely in the research and cultural territory of the Balkans 'everyone lies' because it is the famous defense mechanism (Gotal; referenced by Brajša, 2012, p. 12) and a means to an end, even to survival. Naturally, a much better methodology would be for researchers' trustees to see the real situation in researched companies and provide true reports regarding given issues (measurement subjects), but such an approach requires a long and expensive research and not a single questioning of the management using a simple questionnaire.

Afterwards, examinees' answers were inspected taking into consideration the management level (1=top, 2=middle, 3=lower management), i.e. whether there was a difference in given answers considering the management level variable. For that purpose, the questionnaire dealing with the integration between strategic business planning and the HRM function was reduced to one variable (composite) as a linear combination of 14 variables and the testing of significance with post-hoc tests according to Scheffe was conducted (tables 6 and 7).

Table 6: Comparison of answers of all three management levels for the variables of integration between strategic business planning and the HRM function (SPSS ouput)

Management	N	Subset	
		1	2
1	95	7.6632	
3	38	7.7632	7.7632
2	79		8.1392
Sig.		.866	.133

It is visible that there is no statistically significant difference in answers among all three management levels seen globally as p=0.133.

Table 7: Post-hoc tests (multiple comparisons) of statistically significant differences between certain management levels (SPSS ouput)

(I) Manage-ment	(J) Manage-ment	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
1	2	-.4761*	.15606	.011	-.8608	-.0913
	3	-.1000	.19673	.879	-.5850	.3850
2	1	.4761*	.15606	.011	.0913	.8608
	3	.3761	.20234	.180	-.1228	.8749
3	1	.1000	.19673	.879	-.3850	.5850
	2	-.3761	.20234	.180	-.8749	.1228

1 - top management (N=95 managers in sample)
2 - middle management (N=79 managers in sample)
3 - lower management (N=38 managers in sample)

It is visible that between top management and middle management there is a statistically significant difference in answers at the level of p<0.05 (p=0.011), whereas between top management and lower management that difference is not statistically significant (p=0.879) and it is also not significant between middle management and lower management (p=0.180). The interesting finding mentioned is presented graphically in chart 1.

Enterprise in Turbulent Environment

Estimated Marginal Means of AL14
1= top management; 2= middle management; 3= lower management

*Chart 1: Statistical differences in answers from different management levels
(top, middle, lower) (SPSS ouput)*

Why the mentioned difference appeared is not totally clear, though a possible explanation is that middle management often serves as the 'buffer zone' between top and lower management and that precisely due to its double role it can have a different perception of organizational reality (Templar, 2011, p. XIII), as well as of the connection between strategic business planning and the HRM function of a company.

In this research, the appearance of a difference in the perception of human resource managers and other managers may also be interesting, thus the difference mentioned was examined by a one-way variance analysis precisely between these two categories considering the dependent variable of the connection between strategic planning and the HRM function.

Table 8: Statistical significance in answers from human resource managers and other managers (SPSS output)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	.370	1	.370	.339	.561
Within Groups	229,385	210	1,092		
Total	229,755	211			

It is clear from the given table that there was not a statistically significant difference between the survey statements from human resource managers and their colleagues, managers of other sector provenance. The main reason for it is that actually all managers are human resource

managers as they are all to manage personnel in order to be successful (Buble, 2006, p. 358), and another reason is that human resource management is not yet such a differentiated discipline in the Republic of Serbia (which requires specific knowledge, special education and specialization) to have so much influence on the thoughts and perception of the managers mentioned in comparison with managers of general or some other provenance.

4   CONCLUSION

This paper researched the problem of connection (integration) between strategic planning and the HRM function on a sample of companies of the Republic of Serbia. The goal of the research was to establish the level of the connection, whether it was at the level of an administrative, one-way, two-way or integrated connection. Furthermore, it researched whether there were statistically significant differences in answers among different manager levels (top, middle, lower) as well as between HR managers and other sector managers.

It was established that the connection between strategic planning and the HRM function was at the highest (integrated) level, even though the results given should not be taken for granted as the survey method was adapted to the manager sample, which can provide distorted results due to the specific motivation of the manager personnel as well as the cultural milieu of the place the survey was conducted at (companies of the Republic of Serbia). Furthermore, it can be concluded from the findings that the strategic management process in companies of the Republic of Serbia is impeccable and that it is extremely well connected with execution (human resource management and especially human resource), which is difficult to believe considering the unrelatedness of the previously mentioned with the competitiveness level of companies of the Republic of Serbia.

There was inconsistency between answers from middle and top management (statistically significant difference), which can possibly be explained by the specificity of middle managers' position, the so called 'buffer zone' and which can influence this difference in perception, whereas the answers from top and low as well as those from middle and low were consistent (not statistically significant difference). HR managers' answers were consistent with the answers from other sector managers (not statistically significant difference), which can possibly be explained by the fact that there is no essential difference between HR managers and other sector managers in companies of the Republic of Serbia.

The given findings imply further research regarding the connection between strategic management and human resource management, especially in the direction of changed methodology, as the survey method (which has been expanding in recent years) does not seem to be able to provide reliable and scientifically valid and objective results any more.

ANNEX 1: QUESTIONNAIRE REGARDING THE INTEGRATION BETWEEN STRATEGIC BUSINESS PLANNING AND THE HRM FUNCTION OF A COMPANY

1. HRM activities in our company are mostly of administrative nature. YES NO
2. The activities of the HRM department in our company do not have much to do with the company's key business needs. YES NO
3. Strategic business planning in our company exists without any input from the human resource department. YES NO
4. The human resource department in our company mostly deals with daily, operational activities. YES NO
5. Regarding the strategic business plan, the human resource department receives only the final information about the adopted plan. YES NO
6. The human resource department is not involved in the creation of the strategic plan, it receives the finished strategic business plan in order to execute it. YES NO
7. The strategic planning team regularly informs the HRM department regarding different business strategies the company is considering. YES NO
8. HR managers analyze the influence of different business strategies on human resource and present the results of these analyses to the strategic business planning team. YES NO
9. After a decision on the business strategy, the plan is delivered to a HR manager who develops programs for its implementation. YES NO
10. In our company, the function of strategic business planning and HR are interdependent (one influences the other and vice versa). YES NO
11. A HR manager is a member of the senior (top) management team (company administration). YES NO
12. The process of formulating strategy and the process of its implementation in our company cannot happen without intensive involvement of the HRM department. YES NO
13. A human resource manager provides strategic planners with the key data regarding human resource abilities, which helps choose the best possible business strategy. YES NO
14. The practice of HR in our company is organized in a way to stimulate the efficiency of individual employees as well as the function of work teams. YES NO
15. Before a strategic business choice, strategic planners consider all business (especially including production and operational) questions related to human resource. YES NO
16. The employees of our company consider themselves the strategic (key) means of sustainable competitive advantage. YES NO

Which management category in the company do you belong to?

a) Mainly executive (the highest management level – administration, mostly interacting with those occupying the lower or equal position in the hierarchy).
Please name the jurisdiction sector _____

b) Double role I (both an executive and a follower – middle management level)
Please name the jurisdiction sector _____

c) Double role II (more or equally a follower as an executive – lower management level)
Please name the jurisdiction sector _____

MAKING DECISION IN COMPANY DISMISSAL PROCESS

ABSTRACT
Although all companies tend to develop and grow, the reality is also business contraction with necessity of firing company employees. This especially occurs during the global crisis and decreased demand for company goods and services that reduces company reproduction process. Therefore is employee reduction often the only solution for cost reduction and company survival. To minimize social costs, employee dismissal process should be managed fairly with all relevant criteria taken into account. Management of the company should rate actual workers performance, development potential or social criteria all objectively to get strong arguments for first selection and for making the final choice. Not all rated criteria are equally important in a specific moment so Analytic Hierarch Process is used to select and rank the employees that are taken into account for firing based on the importance of each criteria which is defined by company management. Human individuals cannot always be measured or valued by pure numbers, yet final result of this method precisely shows which candidates should be in focus for dismissal based on different information about each employee (actual performance, development potential or social criteria).

Keywords: AHP method, Dismissal criteria, Employees dismissal, Ranking, Saaty's scale

1 INTRODUCTION

In its lifetime company goes through different stages or phases. All business entities tend to grow, develop or decrease through these phases in general. Growth represents increase of material and human resources of the company (business enhancement, employment increase, revenue and profit increase or capacity increase), while development represents qualitative changes like new technologies, higher product/services quality, new markets, better quality structure of employees or higher business efficiency (Dvorski and Kovšca, 2011, pp. 378–379).

Reduction in business activities is connected with different strategies for resolving the problem surplus of employees by means of different options for regulating this problem (Buble, 2006, pp. 373–374). Although there are different strategies for resolving the employees surplus (e.g. job sharing, shortening the working time, non-paying days off, diminishing or "freezing" the salary, stimulating free abandonment of the company, earlier retirement, demotion, transfer to another working place, natural drain, discharge/layoff) because dismissals causes big economic, social and general social "shaking" (Bahtijarević-Šiber, 1999, pp. 235–237) that often can not be avoided. Besides exceptional situations where employee has to be fired under certain circumstances (serious contract violation for example), neither growth nor development have the aim or intention of dismissing company employees. This type of employee discharge is known as final disciplinary step (Mathis and Jackson, 2012, p. 221) and does not represent topic of this paper. Business contraction as a long term

or permanent negative change in business (Dvorski and Kovšca, 2011, p. 389) on the other hand, often results in reducing the number of company employees despite the fact that company owners do not want or tend to fire someone. Dismissal process can be treated as non-voluntary separation and should satisfy the criterion of justice, in order to diminish the negative consequences like court accusation or violence toward company (Noe et al., 2006, p. 355). Therefore the whole employee dismissal process should strive to the maximum level of justice. It is a great managerial mistake when trying to convince employers that something is just and correct, when it is not, because in this situation respect and trust may be lost (Templar, 2011, p. 73), with negative impact on working and organizational climate and culture. The important managerial tool in dismissal decision process can be objective method for calculating the rank of employers which should be unwillingly separated from the company according to defined criterions. Discharge of company employees is phenomenon particularly often in times of crisis and official figures have shown that unemployment rate across the eurozone hit a new all-time high of 11,8% in November 2012 (Eurozone unemployment reaches new high, 2013). Current situation with unemployment problem worldwide confirm relevance of this topic.

2 WHOM TO RELEASE?

The dismissal process should also be the part of human resource management politics, so in this process we should differentiate two types of dismissal causes (Marušić, 2006, p. 309):

a) dismissal due to the disciplinary causes (e.g. the employees who do not respect the rules of the company or even worse, who do not react to manager requests, i.e. they destroy working discipline and/or working atmosphere);

b) dismissal due to technological surplus (which imply some employers rights).

This paper deals with the second dismissal causes, because the first group of employees is usually on the top of the manager dismissal list. To answer on the question in unwanted situation where dismissal of the employees is "an unfortunate must", because of technological surplus reasons, certain assumptions have to be realized. This primarily refers to the permanent monitoring of the company employees and their performance. This process consists of observing employees in an ethical and legally permitted way by measuring their performance, conducting interviews, or in other words rating them in general. It is not easy to release someone, especially after long-term successful business relationship or in small rounding where people are usually bond. One thing that is critical for successful managing of labor relations is fairness, but in addition to fairness, a decision to dismiss an employee must also be lawful (Amos et al., 2008, p. 356).

Decision making tool that simplifies any problem similar to this one (certain number of different alternatives where each alternative can be described with more criteria of different level or intensity) is given in Analytic Hierarchy Process – AHP Method. The method was developed by American mathematician Thomas L. Saaty, and the core of the whole process is to make a structure where is possible to determine the importance of the elements – dismissal criteria in this example. Once the main structure is completed, the AHP is surprisingly easy to apply (Saaty and Vargas, 2012, p. 2). In this specific case, management decides which criterion has higher priority over another.

Enterprise in Turbulent Environment

2.1 Defining criteria

Process of observing employees and rating their performance varies among different companies. Measured categories and measuring techniques both depend on many different factors.

Internal factors:
- type of business
- company size
- organization,
- Management goals etc.

External factors:
- country / region development level
- ethical environment
- competition
- Legal environment etc.

Each company management defines categories that are considered as relevant. The authors present list of relevant criteria based on their own working experience and management knowledge. Criteria determination represents the first step of dismissal process.

Observed and measured criteria:
1. Efficiency (Labeled as **Eff.**)
2. Quality of work (**Q**)
3. Ability to react and adapt to unknown situations (**Unk.**)
4. Team work (**TW**)
5. Loyalty (**L**)
6. Absences (**A**)
7. Improvement potential (**Imp.**)

2.2 Employee shortlist – alternatives and evaluation

Employees that are considered as potential for contract termination are already rated in each category only if company permanently takes care of their evaluation. Evaluation of employee's performance example is shown in Table 1.

Table 1: Example: Shortlist and evaluation of each criterion

Employee	Eff.	Q	Unk.	TW	L	A	Imp.
X Y	0,40	0,60	0,40	0,60	0,20	0,80	0,40
X A	0,40	0,60	0,40	0,60	0,20	0,60	0,40
X B	0,60	0,60	0,40	0,60	0,40	0,60	0,60
X C	0,40	0,80	0,20	0,60	0,80	0,60	0,80
X D	0,60	0,40	0,40	0,80	0,40	0,80	0,20

Enterprise in Turbulent Environment

Evaluation of every employee based on rating all criteria is described as follows:
Chosen range for evaluation: each criterion rating with 5 levels of evaluation

Eff.:
0,20: satisfying
0,40: average
0,60: efficient
0,80: very efficient
1,00: remarkable

Q:
0,20: low quality
0,40: average
0,60: quality
0,80: high quality
1,00: remarkable

Unk:
0,20: not so good
0,40: average
0,60: good
0,80: very good
1,00: remarkable

TW:
0,20: poorly functioning
0,40: average
0,60: good
0,80: very good
1,00: pure team player

L:
0,20: not very loyal
0,40: average
0,60: loyal
0,80: very loyal
1,00: extremely loyal

A:
0,20: often absent
0,40: average
0,60: rarely
0,80: in some situations
1,00: almost never

Imp.:
0,20: low potential
0,40: average
0,60: has potential
0,80: a lot of potential
1,00: constant improvement shown

Described evaluation in mentioned example gives overall results as shown below ($\sum$):
Employee X Y: 3,4
Employee X A: 3,2
Employee X B: 3,8
Employee X C: 4,2
Employee X D: 3,6

Since managers find different criteria as relevant or more important, the next step is to determine list of priorities with purpose to adjust evaluated criteria to manager's preferences. Therefore overall results gathered above have unsatisfying relevance - since evaluation or rates to be more precise are not weighted yet by manager's priority list. Thus the procedure goes to the next step of criteria significance determination.

2.3   Significance of each dismissal criterion

Management of the company uses objectively gathered rates for each employee, yet to get needed (and final) results must determine relevance of each measured and evaluated criterion. The authors present AHP so this is realized using Saaty's scale (Table 2).

Table 2: Saaty's Scale – definition and explanation of creteria domination (3, 5, 7 etc.) or subordination (reciprocal value: 1/3, 1/5, 1/7 etc.) intensity (Saaty, 2006, p. 3)

Intensity of Importance	Definition	Explanation
1	Equal importance	Two activities contribute equally to the objective
3	Moderate importance	Experience and judgment slightly favor one activity over another
5	Strong importance	Experience and judgment strongly favor one activity over another
7	Very strong importance	One activity is favored very strongly over another, its dominance is demonstrated in practice
9	Extreme importance	The evidence favoring one activity over another is of the highest possible order of affirmation
2 – Weak, 4 – Moderate plus, 6 – Strong plus, 8 – Very, very strong (Intermediate values) Intensities 1.1, 1.2, 1.3 etc. can be used for elements that are very close in importance.		

Example of management preferences and weighting of measured criteria is shown in Table 3.

Table 3: Distribution of weighting criteria importance (pair wise comparison)

	Eff.	Q	Unk.	TW	L	A	Imp.
Eff.	1	1/3	5	4	3	4	5
Q	3	1	6	5	4	5	6
Unk.	1/5	1/6	1	1/3	1/3	1/2	1/2
TW	1/4	1/5	3	1	1/2	2	2
L	1/3	1/4	3	2	1	2	3
A	1/4	1/5	2	½	1/2	1	1/2
Imp.	1/5	1/6	2	½	1/3	2	1

Values above show Saaty's scale usage to compare all criteria to get relevance list, or in other words to get importance of each observed and rated criterion. Fractions are further calculated (1/5 = 0,20 for example) and each value from table above goes in ratio with column sum (Table 4. and Table 5).

Enterprise in Turbulent Environment

Table 4: Intermediate step to get normalized matrix

1	0,33	5	4	3	4	5
3	1	6	5	4	5	6
0,20	0,17	1	0,33	0,33	0,50	0,50
0,25	0,20	3	1	0,50	2	2
0,33	0,25	3	2	1	2	3
0,25	0,20	2	0,50	0,50	1	0,50
0,20	0,17	2	0,50	0,33	2	1
∑= 5,23	∑= 2,32	∑= 22	∑= 13,33	∑= 9,66	∑= 16,5	∑= 18

As described above, every element is further divided with its column sum.

Table 5: Calculated criteria importance

0,1912	0,1422	0,2273	0,3001	0,3106	0,2424	0,2778	**24%**
0,5736	0,4310	0,2727	0,3751	0,4141	0,0303	0,3333	**39%**
0,0382	0,0732	0,0455	0,0248	0,0342	0,0303	0,0278	**4%**
0,0478	0,0862	0,1364	0,0750	0,0518	0,1212	0,1111	**9%**
0,0631	0,1078	0,1364	0,1500	0,1035	0,1212	0,1667	**12%**
0,0478	0,0862	0,0909	0,0375	0,0518	0,0606	0,0278	**5,5%**
0,0382	0,0732	0,0909	0,0375	0,0342	0,1212	0,0556	**6,5%**

The last column in Table 5. calculates row average, which represents each criterion relevance. Labels (**Eff., Q, Unk. TW, L, A, Imp.**) are excluded from Table 4. and Table 5. due to calculation table simplification. Hypothetical management from this example find working quality and efficiency as two most relevant criteria.

3 EMPLOYEES RANKING AND FINAL CHOICE

Evaluation results from Table 1 are further being multiplied by the criterion weight to get final score. For example, assigned score in Team Work category (0,20; 0,40; 0,60; 0,80 or 1,00) is being multiplied by 9%. The rest of calculation is shown in Table 6. This specific case shows that employee XA achieved worst results in regard to the management requirements. The authors present a simple example that can be easily implemented in any organization. This method will be of special benefit in organization with larger number of employees where many of whom show similar performance.

Table 6: Obtained results and final ranking

Employee	Eff.	Q	Unk.	TW	L	A	Imp.	TOTAL
X Y	0,096	0,234	0,016	0,054	0,024	0,044	0,026	**0,494**
X A	0,096	0,234	0,016	0,054	0,024	0,033	0,026	**0,483**
X B	0,144	0,234	0,016	0,054	0,048	0,033	0,039	**0,568**
X C	0,096	0,312	0,008	0,054	0,096	0,033	0,052	**0,651**
X D	0,144	0,156	0,016	0,072	0,048	0,044	0,013	**0,493**

Making final decision in dismissal process does not necessarily have to be strictly related to the result of AHP method. Although AHP method can be very important managerial tool for making decision regarding employee dismissal, it should not be the only tool/method for dismissal decision. Since dismissal of employees have serious business, economic, but also emotional-psychological and social consequences, in this process beyond management (as owners representatives) professional team from the HRM department and Union representatives can be also involved. Situation where decision or agreement is achieved by the consensus between management, professional team from the HRM department and Union representatives represents good solution.

So by means of the AHP method with the assistance of professional (e.g. criterions of employers potential development and "soft" people characteristics which can not be measured only with figures) and social Union support (who should include different social criterions-e.g. difficult family situation), maximum level of the justice principle in dismissal process can be achieved. When dismissal process is done correctly (by means of AHP method as a main managerial tool in dismissal process) and after discussion plus consensus with professionals from the HRM department and Union representatives, and after detailed and kind explanation to employees who should be separated from the company, the negative dismissal effects can be prevented in a two way sense. Firstly in sense of the company wellbeing in terms of angry employees who have to leave the company against their will (e.g. court accusation, aggression toward management), and in terms of deteriorated working and organizational climate for the employees who are staying in the company. Secondly in sense of the psychological strengthening of dismissed employees, who in the case of just and socially kind dismissal procedure can confront their difficult situation much more easily.

4   CONCLUSION

Dismissal is an organizational procedure for diminishing the employee number. The paper resolves the problem of objectively righteous dismissal of employees in case of technological surplus by means of AHP method. Using AHP method management can objectively choose those employees for dismissal who have shown the worst performance according to the nominated criteria (e.g. efficiency, quality of work, ability to react and adapt to unknown situation, team work, loyalty, absences, improvement potential etc). AHP method represents very good basic tool/method which can facilitate this kind of decision, namely dismissal decisions are never an easy ones.

Since dismissal have serious business, economic, but also emotional-psychological and social consequences, in this process beyond management (as owners representatives) some other things may be included: professional team from the HRM department and Union representatives. Well balanced dismissal solution can be achieved in situation where final decision is result of the consensus between management, professional team from the HRM department and Union representatives.

Namely when dismissal has been done correctly (by means of AHP method as a main managerial tool in dismissal process) and after discussion and consensus with professionals from the HRM department and Union representatives, further after detailed and kind explanation to the employees who should leave the company, all or most negative dismissal effects can be prevented in a two way sense. Firstly in sense of company wellbeing in terms of calming down angry employees who should leave the company although they do not want to (e.g. court accusation, aggression toward management), and in terms of diminishing the

consequences of deteriorated working and organizational climate for the employees who are staying in the company. Secondly in sense of the psychological strengthening of dismissed employees, who in the case of righteous, just and kind dismissal procedure can confront their own unwanted and difficult situation much more easily and with less stress.

ABSTRACT

Reform of public administration is a process that intertwines political, legal, sociological, economical, informational and other activities that demand everyone involved to use all available means and to implement a variety of activities. The management of information systems in decision making process represents one of the most important challenges. The better information management is an opportunity for innovation introduction in business, it shortens the decision making process and cuts costs. Business surroundings nowadays are faced with a vast quantity of data to be gathered, stored, processed and used in the decision making process and with the limitations in doing so. There is a variety of information systems such as: Decision Support Systems (DSS), Management Information Systems (MIS), Expert System (ES), Transaction Process Systems (TPS), Group Decision Support Systems (GDSS), Executive Support Systems (ESS) and others. Each one has a different role in the hierarchy and decision making process. This paper determines a frame for further research of the usage of Decision Support Systems (DSS) as a support in public administration decision making.

Keywords: Decision support systems, Executive support systems, Expert System, Group decision support systems, Information system, Management information systems, Public administration, Transaction process systems

1 INTRODUCTION

Continuous changes in political, social and industrial aspects pose demands for constant development in working efficiency of public administration which, as a government service, has to monitor the process of these changes.

Changes proposed by the public administrations e-service require changes in legal regulations, implementation of new IT technologies, mastering various resistances both inside and outside of public service organizations as well as the establishment of a new operation model at all levels. Changes in public administration require a change of people's attitudes (both employees and customers), a change in working processes and a change of choice of technology used. The government of each country and the administration in organizations need to change their business processes in order to comply with changes in the public administration. Changes introduced within the public administration have various side effects on all spheres of life. Before introducing these changes, the government must be ready to negotiate with interested parties (users) and be opened to changes and challenges that these

changes imply. Deciding on these changes has to reflect long term solution design. In order to achieve this goal, the changes should be made thoroughly, systematically and implemented methodically. They can only be executed when a critical mass of different factors along with adequate software and other IT support is achieved. Introduction of an information system as a support to a decision-making process in public administration should result in:

- Customer satisfaction with introduced changes,
- Shorter period of various problem solving and decision-making processes,
- Efficient and continuous monitoring of introduced side effects.

Introducing information system as a support to decision-making processes in public administration leads to new challenges because it changes the way IT infrastructure has been used in the past in different departments of public administration. The goal of implementing the changes in public administration is to equalize different processes in variety of public services, determine formal and vocational decision-making levels and to standardize operation procedures to full extent in order to achieve a form in which the user solves his pending request in one step.

Implementation of information system as a support to decision-making process in public administration requires from many services that connect users with the public administration to change their structure and a way of working to be able to follow the changes in legislation and the work of public administration.

Changes will also have to be made in various NGOs that supervise the work of public administration in order to control and efficiently monitor this work.

To improve decision-making process, advanced features of DSS (Decision Support Systems) should be used as they are specific type of information systems focused entirely on data and model integration.

The power of Decision Support Systems lies in their interaction with databases. Results obtained with DSS can be as simple as a table review or as complex as a full system with its own database and mathematical modeling software, statistical analysis, linear programming or various other specialized modeling techniques.

Implementing a decision-making support system would particularly come to the fore in semi-structured and unstructured decision-making on middle and senior decision-making levels.

2   VOLITION AND DECISION SUPPORT SYSTEMS

Definition of decision-making process should be formed considering intertwining relationship between an organization and its environment through optimized use of resources necessary for production or other services, providing work tasks, administrative directives for guiding all employees towards the same objective, inclusion of coordination of human and material resources under objectively defined achievements, establishing effective working environment for the people who work in formally structured groups and through undertaking activities in order to coordinate the work of a group which is not able to achieve the goals of the organization (Baca, 2006).

Decision-making process differs three phases in which certain activities are conducted:

- problem identification, finding various possible solutions and decision making.

Problem identification stage establishes a connection with the system and its environment considering negative and positive influencing factors in relation to appointed objective.

Once the analysis is complete, it is necessary to consider all variants that allow the change of the current situation.

There are two groups of possible solution variants that can be differed in phase two. One group consists of solutions used so far, along with the different variants that depend on the level of influencing factors that are involved in them. The second group consists of variants of new solutions. After creating both groups of different solutions, selection of varieties should be made along with the final decision.

Decision Support Systems can efficiently support the activities carried out in decision-making process as long as certain conditions are met: the objectives must be well defined, the area referred by the objective has to be limited and it is necessary to possess a database. Decision Support Systems are particularly efficient in structured and semi-structured decision-making. In semi-structured and unstructured decision-making process, DSS help decision-maker simulate various solutions dependent on associated factors.

Computerization of public administration along with gaining access to its databases (only those not protected by law) would provide Decision Support System users with broad database. Ever changing environment of public administration, with its constant structural and legislative variations, represents an obstacle for DSS.

Decision support systems could provide better and faster decision-making, particularly in relation to public administration, offering mainly semi-structured and structured decisions dependent mostly on changes in legislation.

2.1 Decision support systems, DSS

Decision support systems are specific type of information systems focused entirely on data integration and behavioral model development in order to improve and accelerate the decision-making process. Strength of these systems is that they are an interactive computer – a database. They can be used for tasks as simple as a table review or as complex as full system integration with its own database and mathematical modeling software, statistical analysis, linear programming or various other specialized modeling techniques. Managing decision support systems represents one of the most elaborate challenges.

With better information management, the opportunity for introducing innovations in business comes, shortening a decision making process and reducing operating costs. Business environments are facing a large amount of limitations and data that is necessary to collect, arrange and use during decision-making process. Public administration is the largest collector of various data used in its work. The possibility of using the data gathered by the public administration and of gaining the access to its databases (those that are not considered public secret) would facilitate the decision making process in different segments of society as well as in public administration itself. Today's business world recognizes different types of decision support systems. These systems are particularly designed and developed to support decision-making at different levels and in different stages of decision making process.
Simon [11] distinguishes two types of decision making:

Enterprise in Turbulent Environment

- Programmed decisions that are repeated during a period in time and that depend on pre-entered parameters and
- Non-programmed decisions that are unique and usually less structured in IT decision making.

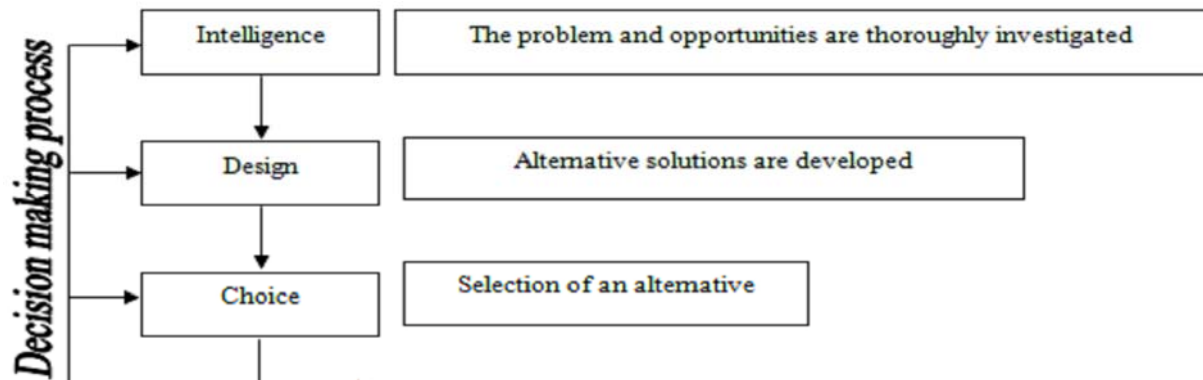
Simon's model of decision making consists of three steps (Figure 1).


Figure 1: Decision making steps according to Simons model (Simon, 1997)

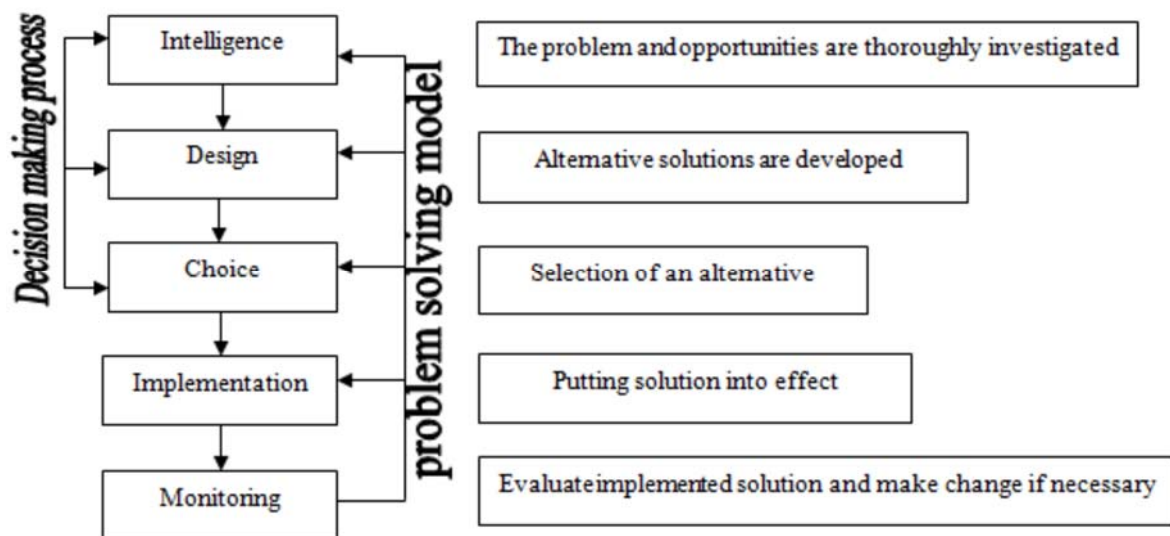
Unlike the Simons model, Huber (1980) has further refined the decision-making process model, adding two more steps, implementation and monitoring, and thus completed Simon's model (Figure 2).


Figure 2: Decision making steps according to Huber's model (Huber, 1980)

Decision support model (DSS) by Raymond [10], consists of four parts:
- **The database** formed based on intrinsic and extrinsic data stored in a database.
- **Program (software)** for generating both scheduled and unscheduled reports. Scheduled reports all have the same structure and are generated by process languages such as Cobol or PL / I. Unscheduled reports are generated in response to user queries created with the fourth-generation programming languages.

Enterprise in Turbulent Environment

- **Mathematical model** produces information as a result of either a simulation in which one or more organizational physical system components are included or as a result of its own operational processes. Mathematical models can be written in any procedural programming language. Specific languages make this task easier and are more effective.
- **Group decision making** involves multiple decision-makers working in a decision making group. Group members communicate with each other directly or through a group leader.

Report generating program (software) along with the mathematical model is considered to be an essential part of decision-making system.

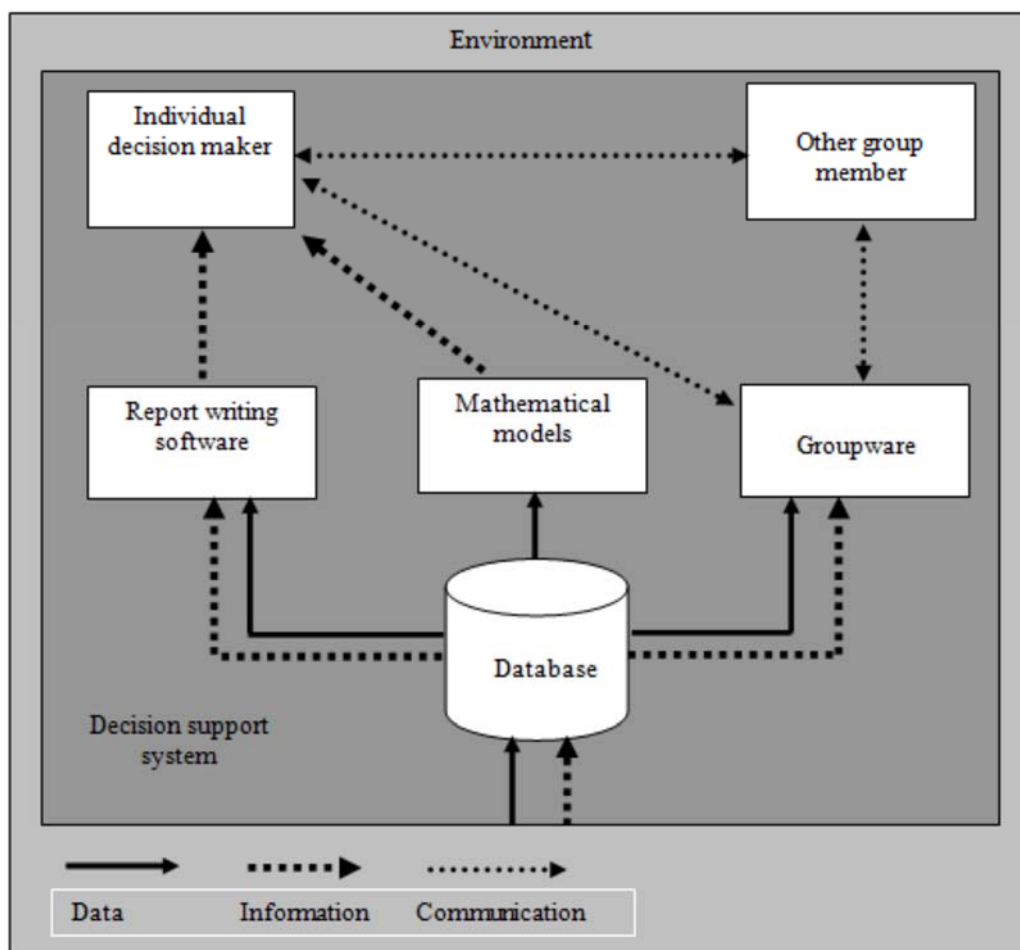
DSS concept was expanded to support a two or more decision maker team. This way, the idea of special group-oriented programs (software) for group decision making is realized.


Figure 3: Decision support model according to Raymond (Raymond McLeod, Jr., 1998)

Decision support systems come in a form of scheduled or unscheduled reports that have resulted from a mathematical simulation of entered data. Scheduled reports are routine and repetitive so each organization develops specific forms of their representation. Unscheduled reports are generated according to new information provided within user quarries that may have an impact on the result of a mathematical simulation.

If provided information is structured and repetitive, the usage of decision support systems enables us to reach programmed decision.

Non-programmed decisions are regularly individual decisions related to unstructured and semi-structured problems that use mathematically immeasurable data.

Managers at different levels of the organizational hierarchy need different types of information that can help them make decisions about increasing organizational efficiency. On the lower decision making levels the information should be clear, precise, measurable and related to the organization.

Higher decision making levels require future orientated information that are harder to obtain or to compress, are not fully defined, mostly come from outside of the organization and mainly are not measurable. Only a part of the externally collected information can be measureable, especially referring to sociological factors (availability of labor force), competition, market requirements, price of goods and services, etc.

Different types of data and information are suitable for different decision-making levels and require differently defined information system. Different information systems, if integrated on various levels, can meet the IT needs of current and of a higher decision-making level.

3   ANALISYS OF A DECISION SYSTEM SUPPORT USAGE STUDY

To gain insight in actual usage of DSS among the users, a study has been made in period from September, the first to October, the 25th 2012.

The study was conducted over 26 decision makers and 24 database operators. Examinees were employed in public administration, private organization and some other institutions. The survey was conducted anonymously with the help of a closed type questionnaire with 30 questions. For evaluation purposes, Likert scale of descriptive scores was used, where different levels of consent regarding the claim in question are represented by 5 different categories. The research was conducted through both online surveys and paper questionnaires filled out by 124 participants, out of which only 50 of them or 40% answered all the questions.

76% of examinees declared that the organizations have sufficient technical requirements for implementation of DSS, 20% declared otherwise, while 4% of them remained undecided.

40% of examinees declared that there are sufficient human resources for the implementation of DSS, 44% believe otherwise, while 16% of them remained undecided.

84% of examinees consider information system to be a guide towards efficient decision-making, 4% disagreed, 12% were indecisive.

68% of examinees believe that the information system helps in researching new business organization ways, while 32% could not make the assessment.

28% of examinees regard lack of funds to be an obstacle to the introduction of information system, while 52% remained undecided.

Enterprise in Turbulent Environment

80% of examinees think integrating their own database with other databases would sufficiently improve decision making quality, while 20% were indecisive.

24% of examinees think that their position could be jeopardize by other people using their database, while 36% believes otherwise.

68% of examinees are convinced that their presently used databases provide sufficient information, while 20% were indecisive.

84% of examinees find introducing DSS and the usage of information systems important in decision-making process, while 12% remained undecided.

20% of examinees feel that they spend too much time searching for information, while 68% feel otherwise.

68% of examinees believe that specific queries should be created for data acquisition in decision-making process, while 24% remained undecided.

66% of examinees favor the usage of their own information centers in decision-making process, while 36% remained undecided.

84% of examinees consider usage of their own database in the decision making process most helpful.

60% of examinees believe that usage of DSS contributes to operating costs reduction, while 40% were indecisive.

60% of examinees find that computerization of public administration contributes to the usage of DSS, while 4% remained indecisive.

72% of examinees think that using available public administration databases helps in the decision making process, while 28% remained indecisive.

36% of examinees see the possibility of graphical data processing provided by DSS as an aid in decision-making process, while 20% remained indecisive.

96% of examinees consider the confidentiality and protection of information indispensable while using DSS.

The differences between different types of DSS were not taken into account in this study. Most available software packages can perform data analysis, modeling, visualization and are versatile enough to adapt to every decision making level. Since advances in technology are significant and present in a variety of organizations, a tendency exist to use more easily accessible information (owned information system and databases) and highly structured data in decision making processes. Contribution of DSS and other information systems for decision making support, based on the answers of examinees, is reflected in decision making process and reduced decision making time. DSS is more frequently used in private organizations (according to 76% of examinees) and at higher decision making levels, which is

evident by the structure of the examinees. All examinees stated that they use some information system as a help in decision making process.

These results should be considered as initial information of a pilot project, while the questions used in the poll need to be supplemented with a group of additional questions to obtain more precise answers on a larger sample group.

This questionnaire does not show if organizations and institutions use integrated DSS or some other ad-hoc tools have been developed that use spreadsheets and databases to create most common reports and analyses.

4   CONCLUSION

Reform of public administration in Republic of Croatia is a process that intertwines political, legal, sociological, economical, informational and other activities that demand everyone involved to use all available means and to implement a variety of activities.

The main political-sociological and economic aspects of the reforms and computerization of public administration in the Republic of Croatia is its inclusion in the EU. Croatia wants to keep running effective social and economic development of the country. To do that it needs to simplify administrative processes and barriers, reduce the number of employees in the public administration and enable the use of modern tools to improve the quality of decision making.

Computerization of public administration is a complex process exposed to many influences from inside of the administration as well as from the external environment. Information is the most important intangible resource in the decision-making process.

The quality and reliability of information directly affects the quality of decision making. Decision-making in public administration has an impact on society as a whole.

Social information systems (including that of a state) have a common goal to enable the participation of as many social subjects in decision-making.

People who make decisions have to be well informed to be able to make quality decisions. The use of modern information technologies and decision support systems helps the quality and speeds up a decision-making process. Input information obtained from databases using structural connections in DSS determine the influence level of factors involved in the process. Simulating changes in the greatness and in influence of individual factors, different variants of the solution in relation to the target can be obtained.

Management information systems and their use in decision-making process is one of the most important challenges in public administration. Better information management provides an opportunity in reducing bureaucracy as well as the cost of administration. Public administration operates in complex environmental conditions that include frequent changes of legal framework and the evaluation of public policies as well as internal constraints related to data management. How to cope with the increasing amount of data to be collected, stored, used and modified in accordance with changes in the legal framework?

For management of changes, this work elaborates the possibility of using ontological approach that can improve the consistency and timeliness of inputting changes in the largest data bases. For quality decision-making, the use of the DSS has been proposed.

Conducted research shows that all examinees use some information systems in their decision-making process. The majority of examinees is familiar with the benefits provided by these systems although they use them only partially still favoring the usage of their own databases.

This research should be continued by supplementing questionnaires with a new set of questions that would show how much are these systems used in problem detecting and solution obtaining purposes and how much just for making repetitive decisions in accordance with the changes occurred in the environment.

FINANCIAL INSTABILITY OF ENTERPRISE AS THE MAIN OBSTACLE HAMPERING DEVELOPMENT IN TURBULENT ENVIRONMENT

Konstantin Chernavsky
University of Latvia, Latvia,
kon.cern@inbox.lv

ABSTRACT
This research is related to simulating the leading indicator of financial instability of an enterprise – with a view of issuing an early warning as to about possible forthcoming changes in the enterprise's activities. This index has been acknowledged as the leading one with respect to the enterprise, since is it can reflect the future financial capacity, based on the initial data already available. The financial stability concept implies diagnostics of an enterprise's activities on a long-term horizon. The first group of financial stability indices operates with discreet findings; the second group of financial stability indices is capable of reflecting continuous random variables. The diagnostics process consists of two stages – the analysis of the past activity of enterprise and the simulation of its future activities. At the second stage, experts encounter the fundamental problem of forecast inaccuracy and unpredictability of results for years ahead. The goal of this research is to supplement the enterprise financial stability concept and to simplify the tasks of simulating the future activity - by working out and using the leading indicator. The object of research is the activity of three conspicuous Latvian enterprises operating in three well-known sectors of economy. The subject of research is financial stability of enterprise, characterized by harmonic functioning of the activity and the process. The main problem to be solved to attain the goal is the validation of the future financial instability index as a leading indicator and the proof of its efficiency. In process of research, monographic method, comparative analysis method, and method of induction as well as some other mathematical and econometric approaches were used. The results obtained are of practical nature, since they allow one to simplify the procedure of enterprise finance stabilization under a turbulent environment by using the possibility of obtaining important information describing future shocks.

Keywords: Activity, Financial stability, Leading indicator, Process

1 INTRODUCTION

The concept of financial stability implies diagnosis of enterprise activity in the long term. The basis of the concept is division of analysis tools into two groups. The first group of financial sustainability indices operates with discrete results, while the second group consisting of financial stability factors is capable of reflecting continuous quantities.

The diagnostics process consists of two stages: analysis of the past and simulation of the future activities of the company. At the second stage, experts normally face a fundamental problem of inaccuracy and unpredictability of forecasting results for many years to come. This problem can be solved by simulating alternative scenarios that could change depending on future changes in the internal and the external environment of the company. The need to adjust the scenarios should be determined by the value of an integrated indicator, which can alert the managerial staff of the company in advance as to potential threats of upsetting stability condition.

Enterprise in Turbulent Environment

The purpose of this study is to complement the concept of financial stability of a company and to simplify the tasks of simulating the future activities through the development and use of the leading indicator.

The target of research is the activity of some well-known Latvian enterprises operating in three different sectors of economy. The scope of research is financial stability of the company characterized by the harmonious functioning of the activity and the process. To hit the target, the main thing is to test the future financial instability index as the leading indicator and to prove its efficiency. This task is solved by using official data received from some well-known enterprises. The research period has lasted 10 years – from 2001 to 2010.

In the course of research, the following techniques were used: monographic method, method of comparative analysis, method of induction and other mathematical and econometric techniques.

The findings are useful since they allow one to simplify the process of stabilizing the company finance in turbulent environment through the possibility of the timely receipt of important information concerning future perturbations.

2 TURBULENT ENVIRONMENT AND ITS INFLUENCE ON ENTERPRISE FINANCE

The modern stage of development of economy is associated with a lot of factors. After the global economic recession swept the world in 2008, a certain solution was continuously sought for under the grave situation that had occurred. All of the approaches and methodologies suggested within the last five years are subdivided into two groups – political and economical ones.

Advocates of the approach of the first group consider necessary some continuous changes of external environment to bring about economic and social alignment, i.e., convergence. This approach seeks to find an optimal balance of all elements of the system by virtue of the State's efforts to ensure prosperity in the long run. However, it happens frequently that such declared goals are not achieved. This may be due to the system elements' inability to maintain balance for a long period of time. Even as a result of manipulations with external environment, a short-term balance only is achieved; continuous changes of all factors of the system take place in the course of economic development, which leads to the necessity of reviewing "the optimal vector". As a result of permanent correction of those factors under a continuously changing turbulent environment, experts eventually cease to understand each other. The essence of this problematic situation is external environment's inability to control the system. Therefore, the existence of this approach is impossible if isolated from the concepts of the second approach.

The second approach focuses on analysis of the system from the inside - through study of the principles of functioning of the system structures and the interaction between its elements, thus giving one an opportunity to receive information on economic potential and the extent of its use.

The economic potential is formed through the interaction of such subjects of economic system as enterprises, lending institutions, insurance and financial companies and households. In this article, the first subject of the system – an enterprise - is regarded as the key subject. This

choice is accounted for by the degree of freedom of using the financial potential of the subject in question. Since the activity of lending institutions, financial and insurance companies is strictly regulated by State and international legal and legislative acts, the company was offered a greater flexibility of its finances. As regards households, they can not enjoy such a high freedom since they possess a far inferior financial potential.

Thus, the internal element of economic system operating under turbulent environment, which possesses the highest manoeuvrability, is a company. Therefore, optimization of activity of this particular subject is capable of raising the economic potential of the State.

According to the theory of financial stability developed by V. Kovalev (2002), I. Blank (2004, 2005), R. Kaplan and R. Norton (2007), L. Gilyarovskaya (2006) and E. Altman (1993, 2002) the current potential of a company is determined through calculation of its financial potential. This is accomplished by the current activity financial ratios determination method based on using the company's financial data reporting. However, such an analysis reflecting discrete past performance is inadequate for the development of the enterprise under a turbulent environment.

For the company development in the long term, the author examines the concept of financial stability as harmonious interaction of activities and processes within a specific system's framework. A set of methods of this approach allows the enterprise to successfully build and use its financial capacity for a long period of time, through the transition from financial sustainability to financial stability.

3   FINANCIAL POTENTIAL OF ENTERPRISE FROM THE PERSPECTIVE OF TIME

In order to obtain objective knowledge about the company's activities, the managerial staff use various data generated by various divisions and departments of the company. As a rule, in order to determine a current state of performance, all the tasks are reduced to evaluation and comparison of the past and the current potential of activities. Practice shows that experts' opinions differ because different methodologies involve an analysis of various, and often multifaceted components of financial capacity. When a calculus tool is focusing on efficiency, while another one – on productivity and the third one is focusing on variability, no homogeneous result can be obtained. As regards interpretation of such a distorted result, conclusions and recommendations are distorted even to a greater extent, as a rule. Ultimately, the company management not only fails to receive necessary information in support of decision making, but is being mislead since there is no more way to check exactly which specific component of financial potential was analyzed by expert.

Within the framework of the research performed by the author, a financial model of enterprise should be presented as a system of interaction of activities and processes. The model in question enables one to make parallel investigations of the activities run by the company under the influence of many different processes. At this point, one can identify the stability of the activity itself, not excluding the essence of the impact rendered by processes. If the activity is stable, there is no point of subjecting it to the impact from processes. But, if the activity is unstable, it is necessary to identify the extent of the impact rendered by processes, which would enable one to find and determine compensatory mechanisms capable of stabilizing the activity (Olve, Roy and Wetter, 1999; Scott, 2000; Teslinov, 2011; Van Horrne and Vachowicz, Jr., 2001).

Stabilization of activity is reflected in the financial potential of enterprise over time. Therefore, a model is required that could trace the financial potential of enterprise in the long run. Such a model cannot be developed on a one-sided concept of financial position or financial sustainability; as a must, the model should include the trends of changing the key parameters of activity with respect to future periods.

Thus, the financial potential of enterprise should be assessed from the perspective of time, – in the short and long term, respectively. As regards the financial stability approach the methodology of which enables one to analyze continuous performance results, the theory of financial sustainability analyzes only moment quantities of financial condition at the given moment. Consequently, the methodology of ratio analysis of financial sustainability determines discrete variables from the perspective of time, whereas the methodology of financial stability enables one to identify trends based on the analysis of continuous variables.

Table 1: Financial potential analysis methodology time-orientated comparison

Financial potential from the perspective of time	Short-term prospects	Long-tern prospects	Pattern of result	Recommended approach
Assessment of past activities	Very efficient	Efficient	Continuous	Stability
Assessment of current activities	Efficient	Inefficient	Discrete	Sustainability
Assessment of future activities	Inefficient	Very efficient	Continuous	Stability

Discreteness and continuity of findings obtained by these approaches is a core principle of the analysis where identifying and forecast of continuous data come to the fore. Discrete data in this task enables one to set some known standards for the basic criteria of stability of activities, the control of which enables one not only to state an accomplished fact but to perform a discrete valuation of a model scenario of the activity development in future, where usage of data in advance is a compulsory requirement.

4 ANALYSIS OF DISCRETE DATA IN ASSESSING FINANCIAL SUSTAINABILITY

Financial sustainability of an enterprise is a definite set of criteria the values of which lie within some definite preset ranges. From the standpoint of research performed by V. Kovalev (2002) and L. Gilyarovskaya (2006) financial sustainability of any profit-making company is its solvency, i.e., the availability of a mortgage debenture with respect to the company's assets. The investigation performed by Kaplan and R. Norton (2007) has expanded this object domain to system presentation. The authors have come to the conclusion that provided this principle is observed within the framework of the preset system, it would seem inexpedient to consider each criterion individually or to try to unite all possible sustainability criteria into a single set.

Taking into account the statement mentioned above, a single individual value of a criterion can not fully describe an activity, while any attempts to unify all of the known sustainability criteria of the enterprise into a single set lead to heterogeneity of results with respect to the samples that also often contradict to each other.

Enterprise in Turbulent Environment

While interpreting these results reflecting a definite period of time, experts face with the problem of discreteness of extracted values. Since financial sustainability criteria are based on such a form of financial reporting as accounting balance sheet and the annexes enclosed thereto, one must reckon with the fact that the economic sense of the received result is discrete, i.e. it reflects the situation as of the current moment - the end of the financial year.

The problem solution in terms of division of the study timeframe is to present the financial potential of companies in two time prospects – short-term and long-term ones. The use of criteria in this case, from the perspective of time, is pre-conditioned by two different approaches and toolsets.

Within the framework of the author's study, financial sustainability of the company is assessed according to a respective rating developed. The main components of sustainability are liquidity and solvency. By graphically combining the two components, "sustainability quadrants" are formed, whereon the obtained values, characterizing the standard-meeting level with respect to received indices, are marked. Thus, rating A, B or C is formed with respect to each component, depending on the indicator scale received.

Financial sustainability is formed by 9 main coefficients generalized in the Table below:

Table 2: Financial potential discrete data analysis instruments

No	Name	Designation	Indicator most affected	Parameters used when calculating indicator	Recommended value
1	Current assets of company's own	*Wcap*	Solvency	*CL, CA (Inv, AR, C)*	*Wcap>CL*
2	Current liquidity ratio	*Kcl*	Liquidity	*Inv, AR, C, CL*	*≥2*
3	Liquidity turnover ratio	*Kfl*	Liquidity	*AR, C, CL*	*≥1*
4	Absolute liquidity ratio	*Kal*	Liquidity	*C, CL*	*0,5 – 1,0*
5	Current assets coverage ratio	*Kwc*	Solvency	*Wcap, CA, (Inv, AR, C)*	*≥0,1*
6	Working capital share in stock cover	*Ws*	Solvency	*Inv, Wcap, (Inv, AR, C)*	*≥0,5*
7	Stock cover ratio	*Wjsc*	Solvency	*Wcap, JSC (Inv, AR, C, BL, CR)*	*No recommendations*
8	Current assets to equity ratio	*Me*	Solvency	*E, Wcap (Inv, AR, C)*	*No recommendations*
9	Maneuver capability of company's own circulating assets	*Mwc*	Solvency	*C, Wcap (Inv, AR, C)*	*0,0 – 1,0*

where: *CL –current liabilities*;
    CA – cash reserves (current assets): CA = Inv + AR + C;
    Inv – stock;
    AR –accounts receivable;
    C- cash resources,
    JSC – logically substantiated stock cover sources;
    JSC = Wcap + BL + CR.

BL – bank stock loans,
CR – accounts payable for raw materials,
E – shareholders' equity.

Financial sustainability substantiated by the discreteness of essence of results, shows the state of the company under investigation in the short term. The values in question are useful for financial analysts both analyzing the past and the current activities and assessing the sustainability of future development scenarios. However, one should bear in mind the fact that these values characterize the time-related control points of future scenarios rather than tendencies which are continuous in essence.

5   ANALYSIS OF CONTINUOUS DATA IN ASSESSING FINANCIAL STABILITY

Continuous data obtained in process of analyzing trends, are quite fit for assessing financial potential in the long run. Such data is capable of reflecting the potential-changing dynamics both with respect to a period of the last activities and when simulating the future activities. The main purpose of the analysis of continuous data within the framework of the author's study is to identify and formalize financial stability criteria.

The methodology of research of continuous data and analyzing the company's finance in the long run is revealed in the works by R. Higgins, T. Copeland, T. Coller, J. Moorin, A. Dolgoff, and I. Ivashkovskaya (Fonseka and Tian, 2011; Copeland, Koller and Murrin, 2008; Copeland and Dolgoff, 2006; Ivashkovskaya, 2012). Within the framework of a system-based presentation, from the perspective of the long run, the development of integrated indicators is coming to replace the system of financial ratios.

The enterprise growth theory proposed by R. Higgins (Fonseka and Tian, 2011) in the 80-ies of the 20th century, originally anticipated calculation of planned sales growth in a subsequent period based on current data. At present, the sustainable growth pace also requires formation of a balance between all many-sided objectives of a company. The parameters of this equation include, for example, the planned capitalization of profits and the level of dividends, the planned level of turnover and capital coefficient of assets, the planned leverage of company-owned and borrowed funds, and some other purposes. These goals are difficult to be agreed among themselves, since, according to Pareto principle, achieving one of the goals, to a certain extent, prevents one from achieving another. Ultimately, the goals may be balanced in such a way that the result is absolutely stable and equal to zero. It is exactly in this situation that financial sustainability is achieved. But as soon as the growth rate becomes positive as a result of interaction of the parameters, this suggests possible development of activities in future by way of using the current financial potential.

If the available potential is sufficiently used, a number of changes concerning criteria supporting the increase of business value take place in the company. In the opinion of T. Copeland, T. Koller and J. Murrin (2008) who had generalized the theory of cost estimate of a company for the first time, the discounted cost index of a free cash flow is an integrated indicator of company's activities. This index includes all the business activities - from the smallest incoming payments to the largest outgoing ones; the included business activity is corrected with due consideration for depreciation deductions and changes in current assets. Therefore, within a number of years a general wave of positive and negative financial flows is formed. This value, depending on the purposes of analysis, may be given, i.e. discounted,

with respect to weighted average capital cost at any given time. At this point, discreteness of the value and continuity of trends come into contact.

In the studies performed by I. Ivashkovskaya (2012), a number of cost dynamics-tracking models have been developed, that demonstrate this figure as the most objective and successful indicator of activities. Consequently, the financial stability of the enterprise implies the use of the existing financial potential in the long term in order to create value. The author considering growth rapidity indicators as predictor of possibilities, and considering value as a result of realizing them, forms "sustainability quadrants", whereon the obtained values, showing the standard-meeting level with respect to received indices, are marked. Thus, rating A, B, or C is formed with respect to each component - depending on the indicator scale received. The main indicators of growth rapidity change and creation of value are generalized in the Table as follows:

Table 3: Financial potential continious data analysis instruments

No.	Name	Designation	Indicator most affected	Parameters used when calculating indicator	Recommended value
1	Sustainable growth ratio	SGR	Growth rapidity changes	Pr, P_n, S, E, D, A	$SGR > 0$
2	Sustainable growth ratio under changing conditions	SGR_g	Growth rapidity changes	$E, div, S/A, D/E, P_n/S, b, S_0$	$SGRg > 0$
3	Future cash flow	FV_t	Cost	$P_n, Dept, A, NI, ROIC, g$	$FV_t > 0$
4	Current cash flow	PV_t	Cost	$FV_t, d, P_n, A, NI, ROIC, g$	$PV_t > 0$
5	Total present value integrated	PV	Value	$C_0, N, PV_t, FV_t, d, P_n, Dept, A, NI, ROIC, g$	$PV > 0$
6	Weighted average capital cost	$WACC$	Value	$w_S, R_c, w_D, d_D, t_s, R_f, R_m, \beta$	$WACC < g$
7	Further present value at the end of forecast period	PV_{term_N+1}	Value	$FV_{term\_N+1}, N, FV_{N+1}, WACC, g, P_n, Dept, A, NI, ROIC, w_S, R_c, w_D, d_D, t_s, R_f, R_m, \beta$	$ROIC>WACC$ $ROIC>g$
8	Enterprise value	$PV_{project}$	Value	$PV, N, PV_{term\_N+1}, FV_t, FV_{N+1}, WACC, g, P_n, Dept, A, NI, ROIC, w_S, R_c, w_D, d_D, t_s, R_f, R_m, \beta$	$ROIC>WACC$ $ROIC>g$
9	Further value in an indefinite term	$PV_{term|g=const}$	Value	$NOPLAT, ROI_g, g, WACC, w_S, R_c, w_D, d_D, t_s, R_f, R_m, \beta$	$PV_{term|g=const} > PV_{term\_N+1}$

wherein:

P_r – *increase in retained profit;*
P_n – *net profit;*
S –*target sales volume;*
E –*ownership capital as of the beginning of the current period;*
D –*borrowed capital as of the beginning of the current period;*
A – *Company's assets;*
S_0 – *sales volume within the current period;*

Dept – depreciation;
NI –investment rate;
T_{DO} – period of time preceding the pay-back period;
N – prediction period;
NOPLAT –net operating profit after deduction of adjusted taxes;
ROI_g – incremental profitability of new investment capital;
w_S – ownership capital share within the general capital structure;
R_c –earning power (profitability) expected by shareholders;;
w_D – gearing (borrowed capital share within the general capital structure);
d_D –lending interest rate;
t_s –profit tax rate;
R_f –risk-free rate;
R_m – expected return of the market;
β –systematic risk ratio;
ROIC –Return on Invested Capital;
g – expected growth rate for an indefinite term.

The financial stability determined by the continuity of the essence of results shows the state of the investigated company in the long term. The values in question are useful for financial experts both when analyzing the past activities, where they prove their efficiency, and in process of assessing alternative development scenarios in future.

6   SIMULATION OF LEADING INDICATOR OF FINANCIAL INSTABILITY

In process of simulation and assessment of alternative scenarios of development under a turbulent environment, one must bear in mind that stability-creating mechanisms are efficient provided the corresponding pre-requisites exist. In this connection, the main obstacle to the company development under a turbulent environment is financial instability of the company's financial potential.

In other words, working out a future development scenario implies formalization of those instability processes that are most likely to occur. Moreover, the possibility of occurrence of those formalized processes unbalancing the activities should be identified prior to the advent of those processes. To make an early warning of the managerial staff, the task in question shall be solved by way of simulation and proof of the leading indicator efficiency.

Within the framework of the author's study, the indicator in question is expressed as financial instability index and reflects the future unbalance between different integers of the company. In process of simulation of the indicator, the principles of advance, polarity, irreducibility, commensurability, and adequacy have been applied (Chernavsky, 2011, 2012; Kopitov, Faingloz and Chernavsky, 2012).

The index is based on current activities, is an integrated indicator of disruption of stability and growth in the future period; after some transformations, it is expressed by the following formula:

$$FFI = w_1 \frac{A_0}{S_0} + w_2 \frac{D}{A_0} + w_3 \frac{Exp}{S_0} + w_4 \frac{CL}{CA}, \tag{1}$$

Enterprise in Turbulent Environment

wherein:

FFI (Future Financial Instability) – future financial instability index;

A_0/S_0 – current ratio of capital intensity;

D/A_0 – scheduled combined insolvency ratio;

Exp/S_0 – scheduled loss ratio;

CL/CA – scheduled coefficient of net capital intensity;

w – weight or percentage of overall index parameters.

Recommended values: *FFI < 0,8; A_0/S_0 < 1; D/A_0 < 1; Exp/S_0 < 1; CL/CA <1.*

By assessing unbalance between the objectives and the destruction extent of the current financial potential, the indicator in question can show the planned degree of financial instability for the subsequent period. The indicator saturation principle is unidirectional one; it is preset within the limits of 20% according to Pareto law as well; consequently, approximation to a preset limit means launching the most powerful destructive forces destroying financial potential. Thus, the most essential function of the indicator is to notify about an imminent possibility of the advent of the above-mentioned phenomenon. Since predicting the advent of a definite phenomenon reflects the essence of the trends typical to those phenomena, the indicator in question is a reflection of development trends characterizing the company's financial potential.
Chart 1: FFI Indicator and present value dynamics comparison

Since value is an integral reflection of activities, this diagram shows the dynamics of discounted value of a well-known Latvian pharmaceutical company, as well as the dynamics of the leading indicator of financial instability (http://www.lursoft.lv). Despite the obtained financial sustainability index «AA», the graph shows that the company underwent a strong decline in value during the period from 2004 to 2006; however, within the period from 2004 to 2006 the company was able to pull out its free cash flows to the former and even a higher level. In the first above-mentioned case, a leading indicator of financial instability came out in a critical area in early 2004, which attested to the forthcoming problems already at that time. In the second case, i.e. during the recession period of 2005 – 2006 when the value was negative, the indicator came out of the critical area. This fact also testified that financial stability criteria had been defined correctly, and the financial potential available to the company had been used in full already a year before the upswing.

By considering the parameters of the indicator as summarized in the Table 4, one can come to the conclusion that some erroneous steps directly causing loss in value had been taken in the past; moreover, a conclusion can be made concerning the actions that were compensatory mechanisms in the solution of this problem.

Table 4: Sensitivity analysis on FFI index parameters

Parameters of FFI indicator	Early 2004	Early 2005	Early 2006	Early 2007
CL/CA	**1,073991076**	-0,237371014	0,654742972	0,189598617
A_0/S_0	0,84280475	**1,131708556**	**1,143288293**	**1,02325683**
D/A_0	0,784922927	0,268207797	0,455452641	0,19989205
Exp/S_0	**1,097760494**	**1,021562697**	**1,051896073**	**1,022917329**
FFI	**0,9499**	0,5460	**0,8263**	0,6089

On analyzing the equation (formula 1) parameters with respect to key periods characterized by the highest variability, one can draw a conclusion on the main problem that had been solved by the company successfully. The loss of free cash flow at the company was caused by a parameter which was the most sensitive one for the company – the planned net capital intensity. The problem is connected with a mistake in working capital management and non-observation of the rule of financing of long-term investments. In early 2004, the company has created a situation where long-term investments were financed by short-term loans, which lead to a sharp loss of free cash flow.

However, on having managed to solve that problem by early 2005, the company faced the challenge of total capital intensity, which attested to the fact that the assets acquired were too large with respect to the planned sales. Throughout the whole period of investigation, no problems with the leverage of equity and borrowed funds were observed; however, the planned sales volume was short to cover the current expenses, although the company had been working profitably.

The efficiency of the leading indicator has been tested in process of analyzing the activities of 18 well-known Latvian companies from 3 different sectors of economy; developing a multi-factor regression model implies that all the four parameters are meaningful. In the course of checking observation of the model adequacy principles, it was found that correlation between dependent and independent variables is missing; furthermore, no autocorrelation, multicollinearity, and heteroscedasticity of remnants were stated. In this connection, the model adequacy was acknowledged, and it is possible to use the model in problems of financial diagnostic of the company.

In the process of ensuring financial stability, the indicator was recognized as a leading one, as it may show future continuous efficient value-cost when using current data of financial statements.

7 CONCLUSION
The accomplished study complemented the concept of financial stability of the company and simplified the task of simulation the future activities through the development and use of the leading indicator of financial instability.

Enterprise in Turbulent Environment

The use of the indicator in question enables the managerial staff of the company to receive early warnings as to about violations and unbalance in the company's activities some time in advance - prior to their occurrence. The necessity of using the indicator is motivated by a possibility of identifying some implicit threats to financial potential through the analysis of four main parameters of equation. The effect rendered by each individual parameter implies a definite degree of destruction of the financial potential stability. The findings received through the analysis of empirical material prove that the financial instability indicator is capable of detecting threats of instability even under the circumstances where the financial potential is acknowledged admissible in terms of sustainability and stability. This is primarily due to the essence of leading values. This example clearly shows that the company has violated the principle of financing long-term investments as early as in 2004, and has subsequently corrected this problem by early 2006. Accordingly, data on the value of business is showing a sharp decline in 2005 and the subsequent stabilization by the end of 2007. It should be noted that the situation in terms of stability and growth rate changes of the company was good enough during the whole period of the study.

This result is not a contradiction but rather a supplement to the concepts of financial sustainability and financial stability, as in this study using a systems approach the assessment was conducted from the perspective of two-level separation of financial potential. The assessment of financial potential was presented from the perspective of activity and processes and from the perspective of time – both in the long and the short term.

Compliance with this principle is the main recommendation to simplify the procedure of stabilization of the company's finance in a turbulent environment, through the possibility of a timely receipt of important information about future perturbations, which should be used in the simulation of financial potential in the long run.

PERCEPTION OF THE IMPORTANCE OF THE STRATEGIC PLANNING FOR THE EMPLOYEES MOTIVATION

Maja Darabos
Faculty of Economics and Business, University of Zagreb, Croatia
mdarabos@efzg.hr

ABSTRACT
Strategic planning is a very important business activity. It is an organization's process of defining its strategy, or direction, and making decisions on allocating its resources to pursue this strategy. In order to determine the direction of the organization, it is necessary to understand its current position and the possible avenues through which it can pursue a particular course of action. For an organization's vision and mission to be effective, they must become assimilated into the organization's culture. They should also be assessed internally and externally. The internal assessment should focus on how members inside the organization interpret their mission statement. The external assessment — which includes all of the businesses stakeholders — is valuable since it offers a different perspective. These discrepancies between these two assessments can provide insight into their effectiveness. It seemed very interesting to explore the involvement of employees in the process of strategic planning in retail chains in Croatia and the impact of the level of involvement to their motivation. The aim was to investigate the extent to which employees at different hierarchical levels are involved in the strategic planning process. The results showed that the top management is mostly involved, as expected, that has a negative influence on employee motivation. It is also shown that the impact on employee motivation in retail chains is positive only if management realizes the importance of participation of employees at all levels in the process of defining and creating strategic planning.

Keywords: Croatia, Employees, Motivation, Retail chains, Strategic planning

1 INTRODUCTION

Strategic planning concerns the firm's objectives and acts as a vehicle through which top management can plan for the future. It also includes the identification of mission and goals, the implementation process towards the achievement of identified goals and objectives and finally, finding solutions or correction actions in strategy evaluation and control process (Hitt, et al., 2000; Pearce and Robinson, 2000).

The largest part of definitions includes strategic formulation which identifies the mission and goals, how the implementation takes place and evaluation at the end of the stage of strategic planning process. The definition of strategic planning used in this thesis comprises a process where a firm establishes its objectives, formulates actions designed to achieve objectives, implements the actions and assesses the progress and results. As this definition implies, strategic planning process focuses on the setting of firm objectives and development and implementation of plans designed to achieve them.

In order to determine the direction of the organization, it is necessary to understand its current position and the possible avenues through which it can pursue a particular course of action. For an organization's vision and mission to be effective, they must become assimilated into the organization's culture. They should also be assessed internally and externally. The internal assessment should focus on how members inside the organization interpret their mission

statement. The external assessment — which includes all of the businesses stakeholders — is valuable since it offers a different perspective. These discrepancies between these two assessments can provide insight into their effectiveness. It seemed very interesting to explore the involvement of employees in the process of strategic planning in retail chains in Croatia and the impact of the level of involvement to their motivation. The aim was to investigate the extent to which employees at different hierarchical levels are involved in the strategic planning process. First, the strategic planning will be defined through all process, then the benefits of successful planning will be explained, after that the results and discussion will be given and finally the conclusion.

2 DEFINING STRATEGIC PLANNING PROCESS

Strategic planning process increases the way a firm manages the internal resources, scanning the external environment, position themselves in an industry. This is because small and medium firms are easily affected by the changes of the industry (Covin and Slevin, 1989; Storey, 1994; O'Regan and Ghoabadian, 2006). Strategic planning process in the study is divided into three elements namely efforts in strategic planning, degree of involvement in strategic planning and formality. Strategic planning process include efforts made by managers and a number of essential dimensions for rational decision making including goals, environmental positioning and matching firm's capabilities with opportunities (Kramarczuk, 1987; Stanwick and Pleshko, 1995). The efforts in strategic planning process are shown in Figure 1. The efforts consist of strategy formulation stage; implementation stage, evaluation and control stage are identified in firms' execution of strategic planning.

Figure 1: Efforts in strategic planning process

The strategic planning process addresses a long-term goal and requires the involvement of top management in policy making, reviewing the objectives, goals, allocation of resources, identifying alternative strategies, scanning for environment and evaluation to the whole

process. Degree of involvement suggests how strongly a person is interested in the firm. Thus, for any given firm, a person can conceivably be strongly attracted, indifferent, or strongly repelled in terms of the range of involvement (Wooldridge and Floyd, 1990). Many authors have highlighted the important role of top management involvement in the strategic planning process (Foo and Grinyer, 1995; Elbanna, 2003; Wooldrigde and Floyd, 1990; Fiegener, 2005; Ketokivi and Castaner, 2004). Although not all research has supported the positive impact of top management involvement in strategic planning (Dyson and Foster, 1982), strong theoretical support suggests that broad involvement by top management in the strategic planning process enhances the organizational outcomes. For instance, Westphal and Frederickson (2001) found that top management has a significant impact on strategic planning. Moreover, some researchers support that top management involvement in strategic planning even though many strong theoretical suggest that broad base involvement by top management in the strategic planning enhances the firm performance (Hrebiniak and Joyce, 1984; Higgins, 1981; Van de Ven, 1980). Similarly, Freeman (1989) reports that top management involvement in strategic planning clearly influence effective planning consequences. Besides, the involvement also enhances psychological planning consequences such as morale, commitment to the firm, commitment to planning and motivation.

According to Pugh et al. (1968), formalization is the degree to which the norms of the organization are explicitly defined. He further distinguished between "formalization", referring to whether these norms are written down in manuals and other documents. Formality in strategic planning requires an explicit process (Armstrong, 1982; Mintzberg and Lampel, 1999). The reason of having strategic planning written in detail is to ensure strategic planning process receives commitment from those who are affected by it and to allow an explicit evaluation and clearly specify objectives is part of the formal strategic planning (Armstrong, 1982).

3   BASICS OF EFFECTIVE STRATEGIC PLANNING

The benefits of a successful planning process are too important to leave unfulfilled and the benefits include: goals and objectives; decision aid which entails a guide for making really tough decisions in difficult situations, such as which programs to cut, where to invest energy, where to invest capital, or how to adjust to a rapidly changing environment; change management that represents a framework for managing organizational change and building creativity; management board (a springboard for recharging and reforming the board); and finally an inspiration that acts as a tool for generating organization motivation und excitement.

There are three organizational qualities required for excellent strategic planning: the objectivity to accurately assess the organization's strengths and weaknesses, the ability and creativity to envision the future, and the discipline to work through the plan with enough detail to provide a road map for staff and board members.

Many organizations do not invest enough thought into the preplanning process. Good data should drive the planning process, and it may take a bit of time to gather it. Creativity and intuition are also needed, but a solid base of information is needed. Also, the participants in the planning process are critical. This involves key staff and their diversity in skills. Moreover, an off-site meeting space is excellent for changing the mindset of participants. Timing is everything, so rimes of crisis or times during which key staff members are too busy has to be avoided.

When the proper groundwork has been laid, the planning process can be straightforward. The need for efficient use of time and the need for adequate discussion and resolution have to be balanced. A review of the mission and vision statements is necessary as a starting point. Maintaining a valid mission and vision for the organization are the reason for planning in the first place. Avoid compromise for the sake of compromise; it often leads to mediocrity, not excellence. The discussion of strengths, weaknesses, opportunities, and threats should cover internal as well as external factors. Every strategic plan has goals and objectives, and the good ones have measurable and specific objectives. The plan must be tied to timeframes. Otherwise, the more difficult items will be put off until it's time to do another strategic plan.

What concerns the evaluation of the process, frequent reviews will mark progress, so the areas of concern have to be identified, as well as necessary changes to the plan. A strategic plan is like a budget in that which constantly needs tweaking as organizational environment changes. Management board and staff members should be thinking strategically all the time, because the plan represents a framework for their thinking.

4 THE IMPORTANCE OF THE STRATEGIC PLANNING FOR THE EMPLOYEES MOTIVATION

There are many different ways to define motivation, but in the narrowest sense motivation can be explained as the process of encouraging people to achieve both, the companies and personal goals. These goals are intertwined and often the realization each goal individually, indirectly means the realization of other (Bogdanovic, 2003). Motivation, aims to: improve productivity, efficiency and creativity at work, improve the quality of working life in the organization, strengthen the competitiveness and success of the company etc. (Bahtijarevic-Siber, 1999).

Motivational strategies can be classified into material and pecuniary motivation strategies (Buble, 2010). Material motivation strategies can also be divided into direct (wage system) and indirect pecuniary motivations (benefits). Pecuniary compensations with a role to motivate employees are of an increasing importance same as the awareness on the need to introduce them. At the same time companies are taking care of the continuous carrier development of their employees. They generally have a greater effect with highly educated employees.

When talking about the importance of motivation for firm performance, we talk about skills and competencies of employees, but not only that, motivation has its direct and indirect impacts, and thus significantly affects the performance of tasks, improving employees work performance, productivity and efficiency.

Just as the system of motivation is based on different forms of rewarding and stimulating successful employees for their outstanding work, they must be a worked out system of penalize employees who do not do their work conscientiously and responsibly. A penalizing system, as long as an employee gets an explanation on why he or she is being punished, can sometimes have a positive effect on the worker.

Corporate vision can be one of the motivators in a company. Corporate vision is the main motivator and instigator of the entire company and it is very important that is integrated into the company's business. People, who should carry on the vision of the company to its employees, are company managers. The best example is a charismatic leader who in practice

often begins this process by clearly articulating a vision that promises success, and then sets high expectations and expresses the belief that people can accomplish them.

5   RESULTS AND DISCUSSION

The research was conducted among employees of two retail chains by using a questionnaire, in order to determine the difference of motivating employees in domestic and foreign firms and also to investigate the extent to which employees at different hierarchical levels are involved in creating the vision, mission, goals and strategies of the company in which they currently operate. Sample consisted of 50 employees.

The familiarity of employees in the existence of the vision of sample in the first company is 84%, while in the second case, it is only 37%. Likewise, the question of whether employees are considered as an important part of the vision of the firm, the first sample shows 78% affirmative answers, while in the latter firm only 20% gave an affirmative answer. When asked whether the vision of the company motivates them, employees of the first company responded positively with 62%, and employees of the second responded with 36%. The questionnaire has shown that employees in the first chain are mostly motivated by money rewards and bonuses (66%) slightly less through praise by superiors and gift packs, and at least through the vision (7%). The situation is similar in the other retail chain; greatest motivators are money and financial incentives (87%), supervisors praise from 11% and 2% of the gift packs. Also, the survey results show that as much as 81% of employees in the first retail chain to be sufficiently motivated to work, while in the second chain for the same question only 59% of employees answered confirmatively.

Previous research has shown that workers of the first company have a much greater incentive to work, which is closely linked to their information on the vision and mission of the company, which is being implemented across all branches and levels of management. In this way, workers are informed on company's vision and are thus considered an important part of it, which in psychological terms becomes an immaterial motivator to work. While the other company is seen with insufficient employees awareness of the vision, mission and objectives of the company and do not have nearly no opinion about that. There could be found a group of disinterested workers, which may be a consequence of that, which can eventually affect the financial results.

From all results shown, it can be concluded that the impact of vision on the motivation of employees in the companies is positive, but only if the management of the company recognizes this as a good way to motivate with an intangible method, and if it is used periodically toward all employees in order to create mutual concern in completing of work tasks. Vision can have a very powerful impact on employees in a positive way if through vision they feel as a very important link in achieving profit and a qualitative and quantitative progress of the company.

Enterprise in Turbulent Environment
Chart 1: Current position of respondents in the sample

Chart 1 show the current position of the respondents in the enterprise in which they operate. It has shown that 2.9% of respondents perform a top management position, while 14.3% of respondents are in positions of middle management, and the highest percentage, 82.9%, are lower level management.

The majority of respondents feel that they have enough knowledge of the vision, mission, goals and strategy (51.4%) and that it takes certain knowledge in order to create the appropriate mission and vision (85.7%). Their companies have clearly defined and documented visions, missions, goals and strategies (80.8%), and in creation of strategy most participates are top managers (92.9%), while 3.6% of them responded that it is also done by middle managers, and lower level management which can be seen from chart 2.
Chart 2: Participants in the process of creating a vision, mission and goals of the companies from sample

Furthermore, the results show that respondents did not participate in the process of creating a vision, mission, goals and strategy (89.3%) and they view this process as partially an important part (53.6%). According to the respondents the top management has partially devoted enough time developing a vision and mission (46.2%) and has partially tried hard enough to bring them to other employees (51.9%). This vision and mission are partially challenging and motivating (57.7%), they are clear to every employee (42.3%), and related to the system of values (48%). According to most respondents success of the company depends on the vision and mission (48%) and on the observance on the company vision and mission (68%).

6   CONCLUSION

A strategic plan is like a budget and it constantly needs tweaking as your organizational environment changes. Frequent reviews will mark progress, identify areas of concern, and highlight necessary changes to the plan. Management board and staff members should be thinking strategically all the time; the plan is a framework for their thinking. There are two distinct dynamics in the planning process, including the content of the plan itself and the emotional climate. Both must be managed to obtain ongoing success.

The aim of this paper was to investigate the extent to which employees at different hierarchical levels are involved in the strategic planning process and what influence that has on employee motivation. The results showed that the top management is mostly involved, as expected, and that has a negative influence on employee motivation. It is also shown that the impact on employee motivation in retail chains is positive only if management realizes the importance of participation of employees at all levels in the process of defining and creating strategic planning.

Every employee, regardless of which position he works in a company, should participate in the process of defining and creating a mission and vision. This will contribute to a greater employee motivation and increase their desire to work and remain in the company as they will be under the impression that his opinion is valued and affirmed.

STRATEGIC ANALYSIS OF CROATIAN COSMETICS INDUSTRY

Maja Darabos
Faculty of Economics and Business, University of Zagreb, Croatia
mdarabos@efzg.hr

ABSTRACT
Firms have to develop their strategies based on market and competition analysis. Key premise of shaping firm strategy is industry analysis. Michael Porters' five competitive forces model of industry analysis provides an insight into the effect that forces like supplier power, buyer power, threat of substitution, barriers to entry, and internal rivalry have on competitive intensity and profitability of cosmetic industry in Croatia. The profit potential of the industry is defined by the interaction of all competitive forces. Porter's five competitive forces model highlights how each of the five forces is not equally important, but it should be noted that it can help the firm to better understand the environment in which it operates, as well as its advantages and disadvantages, that enables the firm to affect its long-term profitability. Based on the strategic analysis it can be concluded that the key factor of success in Croatia, but also in Europe, including the global cosmetics industry, lies precisely in the power of having strong recognizable and established brands, which also affects the loyalty of customers. This fact is confirmed by the results of an empirical study that showed that the most important factor that contributed to the success at the cosmetic market is existence of strong and recognizable brand. The analysis showed that the cosmetic market in Croatia is attended by the numerous competitors, but with the presence of a few dominant industrial participants, which shows how competitors are not nearly equal in size and power. The research results showed that the profit potential of cosmetic industry in Croatia, as well as its prospects for the next five years, is not showing so great profit. Although there is the expected growth in the following years, which will certainly be moderate and slow.

Keywords: Cosmetic industry, Industry analysis, Industry profitability, Strategy

1 INTRODUCTION

Nowadays firms do business in a very insecure environment, and they are everyday faced with sudden, unexpected and unpredicted changes in the environment. Markets are becoming more demanding, complex, and new industries and industrial branches are constantly appearing. Competitiveness is becoming a key issue: how to be better than other firms. That question is exactly the foundation of not just success, but also survival at the market. Firms must be flexible, innovative and must improve their management on a daily basis, lead by a business strategy so they can achieve better position than their competitors, because that is what differentiates successful firms from unsuccesfull ones. The goal of this research is to determine which elements are crucial for long term survival of firms in the cosmetics industry, to analyze and grade the competitive ability of the Croatian cosmetical industry, as to determine certain structural changes. The goal of this research is also to carry out a strategic analysis of the Croatian cosmetics industry using Porters' model of five competitive forces, and to analyze strategic groups and firms.

Analysis of an industry provides us a structural analysis and a display of an individual industry, it's participants and basic characteristics (Fleisher and Bensoussane, 2003). The main purpose is the attractiveness ratings of individual industries, respectively the foresight of the average level of long term profitability of a firm in industry, which is measured by the rate

Enterprise in Turbulent Environment

of return on invest capital (ROI). The basics of industrial analysis are based on the assumption how profitability of an industry is not random, nor is it totally dependant of special influences inside the same industry, but it is at least one part under industrial structure. The four key elements of industrial structure that affects profitability, but also competitiveness of an industry are: incoming and outcoming barriers, information, difference in implementation and industry concentration (Goett, 1999). Request for strategic analysis comes from the statement that a manager cannot effect the outside environment in a short term period but can adapt and in the light of change, perceive the set vision, mission, goals and strategies, and also determine the movement direction in the future period. Therefore analysis ensures conceptual framework for elaboration of strategic options, which will be based on ration approach, intuition and experience (Buble et. al., 2005).

The basic settings of the S-C-P paradigm include the search for position inside the industry, whether it's regarding an existing, respectively the one in which the firm competes or it's regarding potential industries (Porter, 1980). That would enable a better postion compared to competitive forces, as well as achievement of an above average profit. Structural approach observes long term profitability as a basic characteristic of competitiveness of a firm. The essence of this approach is that a firm achieves its competitive advantage depending on the condition which is offered from the external, outside environment of the company, and that the plain industrial structure determines the performance of the company (Spanos and Lionkas, 2001).

The idea how the success of a company is actually a question of its inner capability, and not the position in industry, is based on the resource based view, which was very popular in the 80's and 90's (Rumelt, 1984). The better the resources , the larger the chance of chosing the enhanced strategy due to the fact that long term profitability, which all companies tend to achieve, comes from having superior resources which enable significantly lower cost or a sustainable differentiation advantage (Wernerfelt, 1984). Competitive advantage must eradiate from a possession of unique resources, skills, knowledge and technology that competitive firms cannot have at all, or cannot easily endorse or imitate. Non material resources are considered a very important source of competitive advantage because of its intangibility which makes them hard to transfer to other groups or contexts (Szulansky, 1996).

According to the resource principle strategy in order to achieve competitive advantage, companies need to have unique resources according to four criteria: creation of added value, rarity, impossibility to imitate, and capability to use (Barney, 1991). After analizing internal and external factors it is necessary to estimate the capability of a compay through comparing its key success factor with its key competitiveness indicators. The most influential of structural analysis was developed and elaborated by Michael E. Porter who states that the being of forming strategy comes from the capability of a firm to carry itself along with competition, and that the threat of competition in industry is not just from direct competitors but also from all economic elements of the industry (Goett, 1999).

In his model Porter (1980) identified five crucial factors that affect the level of concentration and profitability of an individual industry. Industrial business environment, its components, its real and possible interrelations that effect long term profitability of a company is defined through the firms' position in industry by: **1. Strenght of industrial rivalry**- rivalry appears when some of the competitors are not satisfied with their position (or feels endangered or has notices a possibility of improvement of his market position. The level of rivalry among

existing companies depends on these factors: exit barriers, number and size of competitors, fixed costs, growth rate of industry, differentiation of products, recognizable brands, tranfer costs, diversity of competitors and strategic importance which interact with one another. Industrial rivalry will be intensive when there are a large number of competitors that are equally strong and large and when there is slow industrial growth rate, or when there is a decline in demand for products. **2. Suppliers bargaing power**- it is necessary to define it through relations with commodity suppliers, material equipment suppliers, but also with the supplier from the financial sector (firstly the banking sector) which supplies companies with capital. Bargaining power of the supplier goes toward lowering profitability of an industry, and increasing profitability of themselves through increasing the price of their own products or lowering the quality of their products while keeping the same price (Porter, 1987). Every company has to improve its strategic position by finding those suppliers and buyers which have less bargaining power (Tipurić, 1996). **3. Bargaining power of buyers**- buyers compete within the industry through requests for lower prices, getting a higher quality product at the same price, through request for receiving extra services or in fact throught turning competitors toward a mutual battle which as a consequence has lowering profitability of the same industry (Porter, 2004). Bargaining power of buyers defines the position of a monitored industry in distribution channels. **4. Threat of substitute products** - Significant success in the battle against substitutes and in the favor of own products, can be yielded only by mutual activity of the whole industry, of all of its participants. **5. Threat of new entrants**- potential industry entrants refer to companies that could be interested in entry with the same or similar asortiman as the company within the industry.The size of the advantage that existing firms have over newcomers is measured by the size of barriers to entry, and that determines the measure in which an industry can enjoy long term profits outside the competitive level. Barriers to entry present the force that deters new companies from entry into a certain industry that seems attractive; it protects competitors, and in way shrinks dangers from fragmentation of the same industry.

2   CHARACTERISTICS OF THE COSMETICS INDUSTRY IN CROATIA

The cosmetics industry is one of the most competitive markets on which the world biggest companies are fighting for domination. Until the 1990's people in general considered that cosmetical products are intended toward the adult female population, however today's reality and the picture of the market are totally different (Kumar et. al., 2006). Companies that manufacture cosmetical products are mostly directed toward younger females, but also males, so in other word a widespread population of consumers, with which this market gains much more importance. It was high productivity, competitivenes and constant growth in the last couple of decades that created the strength of this industry and ensured foundation for a solid future. But of course, there are some weaknesses which can be seen through the fact that the cosmetical industry, even though very secure and attractive, is not totally resistant to the widely present recession and on the fall of the purchasing power of the customers which find the sometimes very high prices of cosmetical products ''too big to swallow''. Cosmetics companies and producers find a big chance in focusing on specific market niches and certain chosen clients so they can effectively follow the battle with big industrial leaders that already take a large part of the market and are too strong to compete due to their tradition, product quality and safety.

Nevertheless, even though the constant growth in the last few decades, there still exists a threat of stagnation and saturation of the market where numerous industrial leaders present a great threat to the profits and future of smaller competetitors. The number of cosmetical

companies is growing day after day and with that as well their rivalry on the market, while the strength of industrial rivalry is very important for the industry profitability. A mutual competition of companies is present to achieve a better technological and market position. With the companies of the local industry, it is important to include the companies that cover the import segment (international competitors and importers) which are also rivals in the battle for market share. According to the degree of industrial concentration the cosmetics industry represents consolidate industry in which there is a domination of larger companies, even though there are also a large number of small and medium companies, but they do not have the power of forming industrial events. The main characteristic of this industrial structure is expressed by the interdependence of the companies, which is manifested in a way that actions of one firm affect the profitability and market share of other firms.

The world most famous producers can be found on the Croatian market, and even though Croatia for them presents a very small market, they are all fighting for prestige and profit. Large companies dictate the trends; invest large funds into research and development and also in the promotion of their products. It is very hard to deal with this competition. New values are constantly entroduced; production is getting more efficient with an increased environmental protection and safety of the consumers themselves. Products of the highest quality of the world biggest companies are available to Croatian consumers and the product quality they carry. There is a need for a lot of effort, knowledge and funds in advancement and development of new products and technology due to various inovations and progress to be followed and the Croatian products the parry with import competition.

The main characteristic of the cosmetics production in Croatia is the exceptional dependance on the import of commodities, along with the already mentioned presence of the largest European and global producers. It is a fact that import of cosmetical products is growing even though the domestically produced products are of good quality; it is actually the rise in consumption that is generated by imports. The quality of products of larger and smaller producers is on a very high level which testifies its establishement on the local and neighboring markets where certain products have become somewhat of a brand. The operations are complicated due to the liberalization of markets, and with the recent accession of Croatia to the European Union, the liberalization process will further strengthen. There is a risk of increased competition, and thus greater market competition.

The cosmetics industry market marks the phenomenon that is called the experience economy, a phenomenon by which means consumers are no longer so interested to try the product, as much as they are in trying a new experience, which helps to create a memory of a particular moment or activity. The general economic crisis has left its trace on the cosmetics industry, but according to research made by Mintel the so called "Lipstic index"[1] proved to be a pretty good measure of the recession. This study, has predicted that some categories of the cosmetics industry will even see an increase in sales due to the recession. Of course, this increase in sales cannot be assumed for the whole cosmetics industry, but only for certain segments. The reason for that probably lies in human psychology that is not an element with a negligible impact on the purchasing habits and decisions of every consumer, there is even a deep emotional link.

---

[1] "Lipstic index" of the research indicates the use of cosmetic products during the recession. Type of economic indicators coined by Leonard Lauder, chairman of the Estee Lauder. The greater is the crisis in the country, women buy more lipstick.

Enterprise in Turbulent Environment

For the production of perfumes and cosmetics in Croatia in 2010, 52 companies were registered, with total revenue of 229 million, and 323 people employed. The largest Croatian companies that produce toale-cosmetical products are Saponia, Neva, and Biokozmetika Annyer. The manufacturing of cosmetics is also done by a successful series of small, often family-oriented companies primarily in the natural cosmetics area (olive oil, essential oils, plant extracts, bee products), which is also a trend in the field of cosmetics. The demand for products on the Croatian market, has been growing, year after year, therefore a continuing increase in imports is not surprising. The support of this shows the data by which the total exports of toale-cosmetical products in Croatia in 2010 amounted 5 727 tonnes, in 2011 5 792 t, and meanwhile the import was significally larger, around 27 552 tonnes in 2010 and 25 237 t in 2011.
Chart 1: Import – export relation

The consumption of cosmetics in Croatia in addition to increased domestic production and increasing imports is still very modest, compared with the developed countries of Europe. Almost the entire world's major companies that produce cosmetics are represented in our market: Henkel, P & G, Unilever, Beiersdorf, L'Oreal, Beecham, Colgate, Benckiser, Revlon and many others. The most imported products are skin care and makeup products, shampoos, hair care products and perfumes (only the import of perfmus in 2009. reached the value of $ 25 million). The problem is that Croatia does not produce perfumes and cosmetics, and therefore these products are only imported. Domestic producers compete significantly with imported products only with toothpastes (Saponia, Neva), which occupy about 35% of the market. The promotion of Croatian products has had an important role and so has the Croatian Chamber of Commerce with their projects like "Croatian Quality" and "Originialy Croatian".

For small businesses the Golden Kuna prize for innovation has been very stimulating and so the 2005. prize was awarded to Milla, a Zagreb based company specialized in producing natural cosmetics and organic detergents. The Croatian level of knowledge stands alongside to the European and Croatian legislation is in full compliance with European regulations. With this an important role is given to the Croatian Society of Cosmetic Chemists (HDKK) established in 1992. by the initiative of professionals and scientists in the fields of research, development and production of cosmetics. HDKK has around a hundred members, mostly experts in the filed of comestics, dermatologists and pharmacists, and its main activity is to promote science and cosmetics as well as promotion of education and extension of knowledge related to the production and operation of cosmetic products.

Enterprise in Turbulent Environment

3 RESULTS OF STRATEGIC ANALYSIS OF THE CROATIAN COSMETICS INDUSTRY

Given the subject of research and the breadth of topics, the methodological approach was based on desk research and the collection and processing of relevant secondary data (books, magazines, studies, Internet, annual reports of companies, data CCE's). In order to meet performance goals, and thus the quality of processing threads have been conducted along with additional primary research, such as the questionnaire (quantitative research), and in-depth interviews with manager from the industry (qualitative research). Based on the strategic analysis we can conclude that the key success factor in Croatia, but also in Europe, including the global cosmetics industry, lies precisely in the power of owning recognizable, strong and established brands, which also affects the very loyal customers. Confirmed by the results of an empirical study in which a majority of respondents that were familiar with the Croatian cosmetics industry, recognized that having a strong and recognizable brand is a factor that largely contributed to the success of the cosmetics market. The next success factor of the Croatian cosmetics industry is an effective development of new products that enable companies to increase the sales, and thus higher profits. Consumers are looking for new sensations, new specialized products, and are therefore investing in market research, which is subsequently processed in detail, the best investment in innovation, and thus the development of new products. Investments prior to the occurrence of a product or an entire line, often are much more profitable than investments in in pure promotion of a product that already exists in the market.
Chart 2: Key success factors on the Croatian cosmetics market

Cost-effectiveness, as well as partnerships with wholesalers also contributes to the success on the Croatian cosmetics market. However, it should be noted that a key deciding factor of success may change over time, and it is a particularly interesting condition referring to the mature phase of the life cycle with stagnant industrial growth, which the Croatian cosmetics industrie also faces. It is exactly cost effectiveness that will in times of stagnation become a key factor that will determine the ability of a company to survive and prosper.

3.1 The strenght of industrial rivalry

The analysis has shown that there are several companies at cosmetics market in Croatia, but with the presence of a few dominant industrial participants, that shows how all the competitors are nearly equal in size and power. Respondents have stated this as the most important competitive force, the force that contributes most to reducing the attractiveness of

the industry itself, and thus lowering profitability. Competitive moves of one firm have significant effects on other firms in the industry. Methods of promotion, commercial activities, discounts and specialization of products are often conditioned just by competing with each other, and only those companies that follow the trends can count on maintaining their market position. Sometimes it's surprising how fast certain products are being copied by rivals. Foreign companies, whose share sales are growing, most certainly have an important role on the Croatian cosmetics market. Therefore, the results showed that intensity of rivalry in cosmetics industry in Croatia is high.

3.2 Threat of new entrants

According to the respondents of this research the cosmetics industry in Croatia and its prospects over the next five years was graded mediocre, without great profit. But it is still satisfactory compared to other activities in Croatia, and thus represents a potential magnet for new competitors. However, the total number of firms in the industry is high, and the leading position in the industry is held by a few dominant companies, and is therefore very difficult for a newcomer to enter the industry. According to the estimates made by the cosmetics industry participants, the entry of new competitors would be accompanied by high costs and high investment in marketing in order to win loyalty of consumers. A confirmation of high customer loyalty is evident in the relatively stable market share of present company, which implies the need for high investment in marketing by the new competitor to win the customers. Companies that are already renowned in the industry and are known by users, automatically receive a greater deal of confidence. The effects of publicity are generally cumulative, and therefore must promote more newcomers than existing industrial enterprises in order to try to achieve the same sale, and to create a general awareness of their existence in the market. Respondents stated that the easiest option of entering the market is through importing finished products, which is now also present. Brand recognition is of crucial importance together with the compliance of quality and the price, plays the biggest role in selecting a particular cosmetic manufacturer. Govermental policy and regulation do not harden the entry of new competitors, in other words the government does not have a big role in the protection of existing companies, although there are various governmental regulations and requirements in order to fit a particular cosmetical product according to standards, so it would be safe for humans and their health. Because of that the product distribution of a new competitor could be a major problem because of the strong relationship with his distributors. In other words, for companies in cosmetics industry threat of new entrants is low.

3.3 Threat of substitute products

While some claim that for cosmetical products there exists a large number of substitutes, others argue that substitutes do not exist. So according to one side, subsitutes do not exist because each product is in some way original, with an exception of copies of branded perfumes or similar products that are trying to copy. As possible substitutes to so called skin care category products, could be certain supplements with similar effects cosmetics, skin however they just for themselves are not sufficient, so there is virtually no replacement. On the other hand, other respondents claim that substitutes consist of all the strong competition, private label products and consumer products. Private label products as a substitute for a product of a well-known brand, but not a cosmetical product as such, they are another version. The results showed that there are virtually no substitutes, which means that replacement products are not available on the market. Products that meet the needs of this industry cannot be easily satisfied by other products; however there is an important role of complementary products.

3.4 Bargaining power of buyers

By analysis of the questionnaire on the negotiating power of buyers the following figure was obtained. Companies in the industry distribute most of their products to a smaller number of customers; most of the manufacturers distribute their products through wholesalers and retailers who make a link between the producer and the final consumer of cosmetical products. Customers are very powerful, and they create a negative pressure on the business of cosmetical companies that seek to fully adjust to the needs of their consumers. From the customers point of view the loss of one manufacturer is not a big loss, and therefore companies in this industrys must follow market trends, especially among its customers. Customers are becoming more and ''pickie'' and will not choose a particular cosmetic product if it does not suit their lifestyle, they demand more specialised products, but also the simpler natural ones. The launching of brands in more categories and their increasing presence in the consumption of Croatian citizens has lead to the formation of some price sensitive consumers. This increases the bargaining power of buyers who are driven by price, and thus forces the manufacturers of certain branded products at a to lower prices on special ocasions , which has a long-term negative effect since it is still the price that plays a key role. Since it is unrealistic to expect that consumer spending power will increase to a greater extent, it is clear that each share won in favor of the trademark, is also a long-term loss for the branded products. However, branding is very intense on the cosmetics market and it is very hard to find a customer and distract him from his brand. If the buyer believes that the benefits of his brand are superior to the rest, he will be willing to sacrifice the possible savings that he might gain when chosing a cheaper product. When we view wholesaler as the main purchasers of industrial products, the following applies: a high degree of concentration of buyers, buyers are well informed about the demand for the products, buyers can significantly influence the purchasing decisions of end customers, powerful customers using their position seek and succeed to get better terms from the manufacturer. In other words, buyers have high bargaining power.

3.5 Bargaining power of suppliers

In the cosmetics industries both key and smaller suppliers have important role. Key suppliers are the ones that are relevant to the core business of the company, and with them the company develops long-term partnership, on the basis of the contract. There is a large impact on the quality of inputs on the final quality of cosmetic products, and is therefore necessary to require a certain certificate on their quality. The highest bargaining power suppliers have in the case when an enterprise does not depend on one supplier or a small number of suppliers. Bargaining power of suppliers is gained by their size, but also by the importance of the company's business. The number of suppliers of the cosmetics industry is limited and most competitors use the same, it is almost impossible and unprofitable to store inputs for longer period, which in fact increases the bargaining power of suppliers. Suppliers in the industry have a dominant position when negotiating the price, so when changing the suppliers companies incur additional costs that are related to the testing of inputs, modification of the manufacturing process, etc. The fact that products of different suppliers really fluctuate in price, but also in quality, and it is impossible to use cheaper raw material without affecting the quality of the final product, this characterizes as a force with high bargaining power. But also, the respondents stated that the cosmetical companies are important customers to their suppliers and that they can not easily raise their prices or threaten by lowering the quality of their products. Therefore, we can conclude that the bargaining power of suppliers was graded with a mean.

4   CONCLUSION

Based on the strategic analysis it can be concluded that the key factor to success in Croatia, but also in Europe, including the global cosmetics industry, lies precisely in the power of owning recognizable, strong and established brands, which also affects the very loyal customers. This is confirmed by the results of an empirical study in which a majority of respondents familiar with the Croatian and cosmetic industries having a strong and recognizable brand recognized as a factor that largely contributed to the success of the cosmetic market. The attractiveness of the Croatian cosmetic industry can be considered mediocre, while the intensity of the rivalry and the bargaining power of customers contribute the most to the profitability of the industry, it has not been seriously jeopardized by other forces like: the threat of substitute products, the entry of new firms into the industry, as well as the bargaining power of suppliers. According to the estimates by the respondents' intensity of rivalry among existing competitors it is established as dominant force that affects the profitability of the cosmetics industry in Croatia. The analysis has shown that there are several companies present in the market, but with a few dominant industrial participants, which shows how competitors are not nearly equal in size and power.

According to the estimates made by the cosmetics industry participants, entry of new competitors would be accompanied by high costs and high investments in marketing in order to win loyalty of consumers. Therefore, the threat of new entrants into the industry was rated low because it is quite difficult for entrants to come alive in the minds of consumers. Companies in the industry distribute most of their products to a small number of customers through wholesalers and retailers who make a link between the producer and the consumer of cosmetical products. Customers are very powerful, and perform a negative pressure on the business of cosmetical companies that seek to fully adjust to the needs of their consumers. However, the profit potential of the cosmetic industry in Croatia, as well as its prospects for the next five years were rated as mediocre, without greater profits. Although growth is expected in the years to come, it will most surely be moderate and slow, and the recent Croatian accession to the European Union will not bring great and positive changes.

ABSTRACT
The main objective of the study is to identify the factors that influence the need for driver's training among the small and medium logistics firms. In addition the study aimed to determine the relationship between the selected factors namely economic return to the firm, personal career development of driver, reputation of firm that influence the drivers' training. Respondents consisted of representatives from the logistics firms especially the person in charge of the training and development or the human resource department managers in the firms. A survey method was utilised where 256 small and medium logistics firms were selected using a stratified random sampling method from a list of small and medium logistics companies. Questionnaires were distributed to all the selected small and medium logistics firms to gather the information. A total of 110 sets of questionnaires had been returned giving a response rate of 43%. The result of the present study indicate economic return to the firm and personal career development of driver were found to have positive significant relationship with drivers training. Implications for the findings of the current study and directions for future research are discussed.

Keywords: Commercial vehicle drivers, Small and medium logistics firms, Training

1   INTRODUCTION
The logistics industry in Malaysia has grown by 10.3 percent to RM129.93 billion against an estimated RM117.8 billion in 2011 due to the rapid growth bacause of the advance demand of services and competrition among companies. The impact of growth in this logistics industry has subsequently given significant growth in transportation especially for road transport. These changes are reflected by the increase in number of logistics firms which has created job opportunities for commercial vehicle drivers (CVD) in the shipments of raw materials, spare

parts from endors, and the finished goods to consumers. However, with the increase in CVD in Malaysia, road accidents has subsequently on the rise too. Road accidents became one of the top ten major factors of death in Malaysia, and accidents involving CVD are increasing with the statistics of accidents involving lorry drivers for the year 2008 was 44,683 cases and has risen to 65,944 cases for the year 2009 (Royal Malaysian Police Force Record, 2010).

Many factors have been put forward as the main cause of road accidents such as the road, traffic lights, driver's factor, vehicle condition, speeding, road lighting and others. One major factor that is of importance here is the driver's competency in handling the vehicle.

Competency is usually associated with highly professional performances. Competency is defined as a behavior or a set of behaviors that reveal mastery at work and can be applied in the determination of work standards, formulation of strategies in describing individuals and teams, formation of authority and responsibility, and the extension of desicion making (Hsieh and Chihuikao, 2003). Developing drivers' competency is an immense task and responsibility. A competent driver is one that reveals a mastery of work. One way to improve driver's competency is through training. The government of Malaysia has spent a huge amount of investments for training in Malaysia in the hope of enhancing the competency of drivers in the country. There is no denying that training plays a pivotal role to boost the competency of CVD in the logistics industry.

A CVD's training will further develops one's skill and also improves his performance. However, the number of small and medium logistics firms that participated in providing training to CVD are very much lacking. The ignorance of the logistics firms to provide training can be considered as a barrier to the improvement of CVD's skills to achieve competence level (Johnson, 2002). Most small and medium logistics firms attested they have insufficient levy given by the government to send their CVD for skills upgrading. Thus, the purpose this study was to investigate the relationship between factors that influence the need for drivers training. Specifically, the study objectives are to (i) identify the factors that influence the need for CVDs training among small and medium logistics firms, and (ii) determine the relationship between the factors of economic return to the firm, personal career development of driver, reputation of firm that influence CVDs' training.

2   LITERATURE REVIEW
Driving is a complex task that involves the performance of a range of visual, physical, cognitive and perceptual functions in a dynamic traffic situation. CVDs have big responsibility and they are the person representing the firms thus, making sure CVDs are competent should be the responsibility of the hiring firms.

Training has been accepted as a viable human resource practice to get workplace transformation (Pidd, 2004). Training is regarded as an investment. Every investment bears a return on investrment (ROI) value. Training affects attitudes of employees, and according to Brinkerhoff (2006) if they show positive behavior change on job, expense on training becomes an investment. A review of training and development literature shows that many small and medium logistics firms in Malaysia still do not consider training as an important function of the firms that could contribute to the firm's success. Instead, many firms consider training and development as cost incurred which little attention was paid. The lack of emphasis among small and medium logistics firms on training has consequences on the skills and competency of these CVDs.

Driver's training means improving driving skills and knowledge (Christie, 2001). The increased rates of accidents were found to be due to the lack of skills, thus, training and education appears to be a counter measure to such problem (Evans, 1991). Research has demonstrated that there were marked improvements in accident risks when drivers engaged in training (Anderson, Ford and Peck, 1980). The driver's training is also aimed at increasing the vehicle control and handling skills of the drivers (Christie, 2001). With training, drivers will have good handling skills, thus improving their performance.

A number of researchers have identified that some of the small and medium logistics firms are ignorance towards the importance of drivers' training (Storey, 2004; Panagiotakopoulos, 2011).

The current research focused on the relationship of the three important dimensions, namely; economic returns of the company, personal career development of the driver, reputation of the company and driver's training. The framework for the study is shown in figure 1.
Figure 1: The theoretical framework of the study

3 METHODOLOGY

The population for this study comprised of small and medium logistics firms in Selangor. The total number of these firms is 552. From this number, a total of 256 small and medium logistics firms were randomly selected to participate in this study. Stratified random sampling method was utilised from small and medium logistics firms. Once the firms were identified, a set of questionnaires were distributed. This study measured whether the variables of economic return, personal career development and reputation of the firm do have any influence on small and medium logistics firms' ability to provide training to CVDs. The individuals chosen as repondents in this study comprise of representatives of the logistics firms especially the person in charge of the training and development in the firms or the human resource department managers.

Since this is a quantitative study, questionnaire survey was developed for the purpose of collecting data. Prior to the development of final questionnaire, discussions with focus groups which comprise of experts in training in logistics industry was conducted. Four multi-item constructs were considered in this study, referred to as economic return of the firm, personal careed development of driver, reputation of firm and drivers training.

3.1 Measures and variables

Items included in the survey questionnaire were selected after a review of literature and focus group interview were done. There were altoghether 28 items that were used to represent the

three dimensions of the independent variables and 8 items represented the driver's training. Factor analysis was conducted on all the 28 items where 6 items had to be deleted resulting in 22 items that were finally used for reliability analysis.

The questionnaire has been divided into three sections; section A was designed to measure firm's profile. Section B measured the information pertaining to commercial vehicle drivers' training as a dependent variable and section C was designed to measure the independent variables; namely economic return of the company, personal career development of driver, reputation of the company. All the questions items were measured on the seven point Likert scale ranging from very strongly disagree (1) to very strongly agree (7) for sections B and C. The data were screened using SPSS and descriptive statistics were run to obtain the sample profile.

4   RESULTS AND DISCUSSION

The respondents for the current study made up of representatives of the logistics firms especially the person in charge of the training and development in the firms or the human resource department managers. A total of 256 sets of questionnaires were distributed to all the respondents identified. From this, a total of 110 sets of questionnaires were returned giving a 43% response rate.

The types of business organizations of the samples comprises 42.7% (n=47) corporation, 30% (n=33) partnership, 24.5% (n=27) sole proprietor, 2.7% (n=3) others. In terms of types of ownership, the sample was representative of larger number of Local Company (Non-Bumiputera) respondent with sample comprises 50.9% (n=56) respondent, 36.4% (n=40) Local Company (Bumiputera) respondent. The least represented group (n=2) is the foreign/multi-national. 10.9% (n=12) represent others respondents.

4.1   Demographic profile of firms

In terms of the number of firms that have commercial vehicle drivers; there are 60.6% (n=66) firms that has between 5-19 drivers. Around 21.8% (n=24) has a strength of 20-50 drivers and 17.4% (n=19) firms has drivers less than 5.

On the other hand, figure 2 shows the number of firms that engage drivers as sub-contractors. Approximately 24 (48%) of the firms have less than 5 drivers as sub-contractors, 22 (44%) have between 5-19 drivers as sub-contractor and 4 (8%) have around 20-50 drivers as sub-contractor.
Figure 2: Number of drivers as sub-contractors

Enterprise in Turbulent Environment

The total number of firms that have 5 – 10 rigid trucks was 40% (n=40), 30% (n=30) have less than 5 rigid trucks, 23% (n=11-20) firms has between 11-20 rigid trucks, 6% (n=6) represent firms that has 21-30 rigid truck and only 1 firm (0.9%) has 31-40 rigid trucks.

Figure 3 depicts number of employees in the firm (all employees including commercial vehicle drivers). There are 87 firms (79.1%) that has between 20-50 employees, followed by 21 firms (19.1%) with 5-19 employees and one firm (0.9%) has less than 5 employees.

Fgure 4 depicts the training that the firms offer to CVD. The majority of the respondents 59.1% (n=65) do not offer any training to commercial vehicles drivers. Whereas only 40.9% (n=45) offer training to commercial vehicles drivers.
Figure 3: Total Number of employees
Figure 4: Firms that offer training to commercial vehicles drivers

Figure 5 depicts that 22 (47.8%) firms offer training only once a year to their commercial vehicles drivers. 17 (37%) firms offer training 2-4 times in a year and only 7 (15.2%) firms provided 5-7 times of training in a year to their commercial vehicle drivers.
Figure 5: Frequency of training in a year

Reliability analysis was conducted to test the level of internal consistency for the measurements of all the constructs in the study. The Cronbach alpha obtained for all the constructs is depicted in Table 1. The reliability score range from 0.50 to 0.60 is considered sufficient for the early stage of the study [11]. Nine items were used to measure the perception on economic return (α =.98), for perception on personal career development, a total of five items were used (α = .97), and eight items were used to to measure perceptions of firm's reputation (α =.97). All the measures were found to be acceptable and reliable for the test.

Table 1: Reliability Coefficient

No.	Dimension	No of items	Cronbach alpha
1	Perception on economic return	9	.98
2	Perception on personal career development	5	.97
3	Perception on reputation of firm	8	.97

Perception on economic return, perception on personal career development and perception on reputation of the firm which were treated as independent variables were posited to influence driver's training. The dependent variable driver's training was regressed on all the variables of perception on economic return, perception on personal career development and perception on reputation of the firm. Table 2 displays the result of the regression analysis. The model was significant with R^2 = 0.621 and F value = 87.683. This means that 45% of the variance in the dependent variable (driver's training) was explained by the variance in the independent variable. As the table shows, both economic return (β = 0.425, $p<0.05$) and career development (β =0.451, $p<0.05$) significantly predicted driver's training [$F_{2,107}$ = 87.683, $p<0.05$].

These results provided evidence that perception on economic return and perception on career development have positive and significant effect on the dependent variable driver's training. However, it was found that variable reputation of company did not have any significant relationship with the drivers training. Thus, this study also provided evidence that reputation of company has no positive or significant effect on the dependent variable driver's training. From the table 2, it can be determined that the most important factor that influence outcome variable namely drivers training is perception on economic return (β = 0.52) followed by perception on career development (β = 0.29).

Table 2: A Summary of Regression Analysis

Dimension	β	Std. Error	sig

4   CONCLUSION

The aim of this study was to investigate the relationship between factors of perception on economic return, perception on career development and reputation of company that influence the need for drivers training in Malaysia. Overall, the majority of the respondents in this study

perceived that economic return and personal career development of CVDs do influence drivers' training. This implies that firms will send drivers for training when they perceived the economic return to the firms and also if they perceived that career development of the drivers will be enhanced. The study also revealed that small and medium logistics firms are very concerned in providing training to the CVD because training is always seen not as an investment, but more on a cost to the small and medium sized firms.

The issues of providing training are increasingly becoming important not only to small and medium logistics firms but also among the large logistics firms. This is because understanding the various factors affecting training would ensure that these firms will have competitive advantage from the competing firms. A comprehensive empirical approach is needed to explore the relationship between these factors and driver's training.

ABSTRACT
The Pharmaceutical Industry is one of the most promising markets in the world. It is highly competitive, complex and requires huge investments in research, development, production, marketing and sale of pharmaceutical products. One of the main strategies of the pharmaceutical industry is the promotion of its products for the medical fraternity through drugs sales representative, essential for the acceptance and prescription of your brand. This study identifies the essential drug promoter skills to competitiveness and the success of these organizations. Data were collected through semi-structured individual interviews and resulting forty six competences mentioned as most important by own sales representatives. The research points to the need for new methods of empowerment, essential to the competitiveness of sales representatives, considering that these competences contribute for industry establishes its strategies.

Keywords: *Competences, Competitiveness, Pharmaceutical industry*

1   INTRODUCTION

The research, development and production of drugs are fundamental to maintain health. With time the pharmaceutical industries have evolved over their role as manufacturer of medicines to innovator, provider of information, employer and a significant player in the world economy (Das, 2011). Porter (2004) points out that, besides the global environment that businesses are located, they should worry about their competitors, suppliers, customers, substitutes and potential entrants that influence competition in your industry generating profits.

There is an observable growth of investments in pharmaceutical laboratories in Brazil, aligned to population purchasing power, increasing the job opportunities for this category. Supporters

of pharmaceutical promotions claim that marketing expenditures give innovative pharmaceutical manufacturers a fair chance to recover high R&D expenditures (Kremer et al., 2008). The pharmaceutical market is a specialized field that requires knowledge in drugs and sales skills by the sellers that sells the product to a customer (doctor) who has more scientific knowledge. It is known, the importance of competency management in this scenario, aligning human resources managements with business strategy incorporating the concept of competence.

In this market, consumers do not always choose the product because is the doctor who prescribes the medication and decides be more appropriate to the patient. To Rubin (2003) marketing may serve as a communication channel to educate physicians and expose consumers to information that may improve their health outcomes and medical options. This is reason to take promotional and commercial actions with the physicians and competent distributors (drugstores and wholesalers) in order to reach their planned objectives. Such spending benefits both patients and physicians in a variety of ways. The pharmaceutical representatives are valued highly by physicians as a reliable source of information. Kobayashi and Leite (2010) assert that these professionals must be increasingly qualified and updated, so the investments could revert to keep the competitiveness of the organization.

The question refers to the importance of core competencies of the pharmaceutical representatives as competitiveness in the city of Natal, RN, Brazil, outlined the following specific objectives: to identify individual skills, classification of competencies (knowledge, skills and attitudes) and characterization of the pharmaceutical representatives activities.

2   COMPETENCES AND STRATEGY

Organizational competencies stem from the specificity of each company to identify its resources and turn them into competitive advantage. It is noteworthy that the process to transform resources into organizational competencies happens in the competitive scenario and moves the dynamic of the organizational.

This way, the strategy emerges linked to the company's competences, while its separation into personal competences goes through hierarchic levels and work teams. The effectiveness of the organization results of the ability to articulate their strategic guidance and expertise of the company, group and individual skills. Therefore, establishing the strategic direction, aligning the organizational competences and separating into individual competences reflect the organizational culture and the management model (Moura and Bitencourt, 2006).

Mintzberg et al. (2008) pointed out that both organizations and strategies exist independently. However, one influences the other, since strategies are constructed from a previously organizational framework, and be evaluated by the strategic management at some moment. This can be conditioned, either by need to change as well as for the survival of the organization. Therefore, the strong and weak points and the opportunities and menaces must be considered as a start point to build a new management strategy. The strategic management plays an important role in the characterization of the diverse and complex organizational processes, contributing to create a kind of management focused on the efficiency and the search for better results (Queiroz et al., 2011).

The word competence associated to human resource management originally appeared in a paper published by David C. McClelland in 1973: "Testing for competence rather than

intelligence" (Daólio, 2004; Dutra, 2004). The concept of competence is though as a set of knowledge, abilities and attitudes justifying a high professional performance (Fleury and Fleury, 2004). To Le Boterf (2003), by embracing knowledge, skills and attitudes, competence is something that requires a continuous motion, a constant mobilization of diverse knowledge for application to a specific situation. Hence, it can be said that to be competent, the professional needs knowledge, abilities and attitudes which are specific to practice his activities. In other words, the professional must have attitudes and abilities enabling him to mobilize his knowledge, at a precise time, to reach a particular goal, in order to solve a specific problem.

For this study, we consider competence as a set of knowledge, abilities and attitudes providing the professional and a better performance of his functional attributes, with efficiency in developing the activities and success. Organizations situated in competitive environments need to define its strategy and the necessary competences in a continuous learning.

2.1 Individual competences

To Zarifian (2001), individual competences are those regarding to each professionals of the organization. These are skills that the individual possesses by his educational background, family creation and his biography. Business competences refer to the comprehension that a person must have about the "business" of the organization and the organizational goals, as well as a comprehension of the social and political environment surrounding the organization. In this sense, a good professional must incorporate competences, or improve those already present, according with his experience in the environment.

A switchover between organization and persons is perceivable, both sides have effective participation in the process of professional growth. A professional unable to move his knowledge, information and abilities to solve an immediately solvable conflict, becomes unproductive for reaching the organizational goals (Le Boterf, 2003). Therefore, competence refers to the professional capacity to associate all his personal qualities in order to get a better performance in his acting area.

2.2 Management competence

From the decade of 1990, Prahalad and Hamel (2004) developed the concept of essential competences in organizations. Such competences are a set of abilities and technologies resulting from contributing a fundamental difference for the competitiveness of the company. The identification and skills development are imperative for the organization to define its action strategies in a complex and ever changing world. The companies are able to detect just a limited number of basic competences giving them strategic and sustainable advantage in the market. Competence management gains importance and is perceived as a management model derived from the Resource-Based Theory of Management.

Bitencourt (2005) points out that competence can be summarized and associated to the development of concepts, abilities and attitudes. Besides, they constantly rise questioning and trigger a process of individual learning. The competences are transferred and consolidated by the relationship (interaction).

2.3 Identifying competence

Fleury and Fleury (2004) and Dutra (2004) highlight the importance of Competence-based

management. Two models: the *American Society for Training and Development* (ASTD) and *Competency-Based Management* were the first ones to stand out identifying the competences.

The research in Skills Management involves different approaches, including the views of managers, employees and customers. The methods and techniques adopted to identify competences have the following features: observation of high performance employees behavior in order to delineate their qualities; application of semi-structured focused interviews; brainstorming; brain-writing; surveys; and modeling by specialists.

2.4 Medical advertisement strategy

Medical advertisement is defined by the World Health Organization (WHO) as all informational and persuasive activities by manufacturers and distributors to influence the prescription, supply, sale or use of drugs (Norris et al., 2007).

The industries concentrate its investments and efforts to develop drugs to treat chronic diseases that require ongoing prescriptions for longer periods (Rey, 2010). On the other hand, Palacios (2008) brings out that the use of sophisticated marketing and advertisement techniques, and the relationships established between physicians and pharmaceutical representatives are potentially harmful for the users and therefore it makes evident the importance of regulating medical advertising.

One of the main links between the pharmaceutical industry and the physicians is its sales force, the pharmaceutical representatives or medicine advertisers, who are employed and earn their salaries working to attend the interests of their employers (Brody, 2005). In this sense, some difficulties rise from different beliefs and interest values existing among doctors, patients and third parties, including the media and the pharmaceutical industry (Neolan, 2012).

The Brazilian resolution establishes a difference: for over-the-counter medicines, advertisements can be addressed to the consumer, but for prescription drugs (either with or without retention of the prescription), the advertisement must be addressed just to professionals entitled to prescribe them, though communication channels restricted to them. There are two different segments for pharmaceutical marketing: the market of over-the-counter medicines (OTC) and the markets for strictly prescription medicines, acquisition is done through medical prescription. There are one resolution regulating the activities of pharmaceutical representatives, determining that these professionals "must be limited to scientific information and characteristics of the medicines registered by the National Health Surveillance Agency".

The ethical matter about physicians and pharmaceutical representatives relationship have been widely discussed in the literature, evidencing a debate about conflicts between medicine users (patients) and the pharmaceutical industry, which, through the pharmaceutical marketing plans a series of promotion and advertisement techniques directed to the doctors. The use of freebies, free samples, invitations to events, lunches and gifts are the central point of this debate (Fugh, 2007; Gagnon, 2008; Palácios, 2008; Wazana, 2000).

3 METHODOLOGY

The study was performed based on qualitative search (semi-structured interview) with the intention to release the expression of ideas, thoughts and opinions from the own

pharmaceutical representatives. From the point of the objectives, this research is characterized as descriptive, as it intends to describe the features of a given phenomenon and to establish the relationship among variables. Sampling is non-probabilistic and the selection is made by typicality (Vergara, 2000), developing medical advertisement activities in the Natal market.

This work adopted a model praised by Dutra (2004) and Fleury (2004): competences can be surveyed based on their components of knowledge, abilities and attitudes. The universe of the research was the group of pharmaceutical representatives, city of Natal, RN, Brazil. Information about functional competences was collected from 35 pharmaceutical representatives from a whole universe of 250[1], representing 18.8% of the professionals at Natal. These professionals develop their work though health professionals visits, mostly physicians of different specialties. They promote and advertise pharmaceutical products manufactured by several pharmaceutical companies.

3.1 Interviews
As a first procedure for collecting data on individual competences, a semi-structured individual interview was applied to thirty five pharmaceutical representatives. For the semi-structured interview, a script was used containing: a heading indicating the date of the educational institution; identification of the post-graduate program; the name of the searcher and the title of the work related to the research; definitions of organizational and individual competence; and the question to be answered: "based on the typical activities of the pharmaceutical representatives and the competences that you consider important for the pharmaceutical representatives".

The thirty five pharmaceutical representatives were interviewed individually, in different moments and places according to their convenience. Firstly, a brief explanation was made about the reasons, what was the research about and what was it for. It was emphasized that the data provided were strictly intended for academic research.

4   RESULTS AND DISCUSSION

4.1   Competences identified in the interviews
Forty six competences were identified in the interviews in the requirements: knowledge, abilities and attitude according to Table 1.

Among Knowledge requirements, four competences were considered relevant, cited frequency higher than 60% by the interviewed professionals. At the knowledge requirements standing out as the most relevant:
- sales techniques,
- planning techniques,
- advertisement techniques and
- negotiation techniques.

These competences are related to the application of the daily activities knowledge of the pharmaceutical representatives, such as supplying information in an efficient and effective way to the highest number of health workers. For this, they prepare activities and promote products through advertising techniques, promotional material, freebies and gifts, in order to gain the medical prescription, a fundamental point to increase the sales and consequently reach the planned goals of the company. The pharmaceutical companies frequently work out

these competences in their trainings, providing this technical knowledge to their professionals in order to transform these individual competences into useful company competences. Other two competences identified were foreign language and product composition, which interviewed professionals believe essential knowledge in order to inform, negotiate and convince the doctors to prescribe.

Among the requirements of abilities, the competences stand out with more than 60%:

- good human relationship,
- communication skills.

The results point toward a concern of the professionals about how to communicate and relate with the clients. It is evident the importance attached by pharmaceutical representatives to personal relationship skills and communication skills related to their daily activities. Based on these data, know how to deal customers is very important for the performance; as well as communicate in a clear concise and transparent way. Among these requirements, it worth to consider the importance perceived to the following competences: work under pressure taken as relevant in spite of receiving lower scores (less than 60%). The ability to work under pressure is one of the new realities of the modern world, and it is very evident in the pharmaceutical market. The strong competition and high investments on research and development, beyond establish goals to be attained by their collaborators, as way to get higher profitability.

None attitude requirement reached 60% in its score, but empathy, professional ethics and initiative got 54% and integrity reached 51%, hence being the most cited competences, evidencing the preoccupation about professional behavior and the doctors, colleagues and patients relationship. The ethics issue got much attention as a result of discussions, raised by researchers and experts, about the limits and acceptable conduct of pharmaceutical representatives trying to convince the physicians about a medical prescription. Another competence to stress is empathy, which is also considered a quite relevant competence, as professionals relate empathy with a better performance of their functions.

Table 1: Knowledge, abilities and attitudes detected in the interview session, considering significant proportion (own resource)

KNOWLEDGE	IMPORTANCE (%)
Sales techniques	77%
Planning techniques	71%
Advertisement techniques	66%
Negotiation techniques	60%
Foreign language	54%
Products composition	54%
Informatics and internet	49%
Good manners	43%
Human relationships, Professional norms, Memory techniques, Notions on human health, Politeness, Good Portuguese.	Less than 40 % (each)
ABILITIES	IMPORTANCE (%)
Good human relationships	77%
Communication skills	69%
Work under pressure	54%
Good memory	51%
Ideas synthesizing capability	51%
Decision-making capability	49%
Vehicle driving	46%
Informs writing, Continuous learning capability, Innovation capability, Creative capability, Sense of organization, Team work, Integral dedication, Concentration, Logical reasoning.	Less than 40% (each)
ATTITUDES	IMPORTANCE (%)
Empathy	54%
Professional ethics	54%
Initiative	54%
Integrity	51%
Motivation	49%
Flexibility, Good personal appearance, Team spirit, Professional position, Enthusiasm, Discipline, Responsibility, Commitment, Dedication, Good Sense, Patience.	Less than 40 % (each)

5 FINAL CONSIDERATIONS

The present work detected the essential competences to pharmaceutical representatives acting in Natal, by own perspective. As a whole, 46 competences were identified. These competences were classified into knowledge, abilities and attitudes. Knowledge on sales techniques, negotiation techniques and planning techniques are competences related with knowing how to do, daily activities of medical advertisers to plan their work, to know how to negotiate, to be able to identify the needs of their clients and demonstrate the advantages and benefits of the promoted products. As evidenced by Fleury and Fleury (2004), knowledge competences are those related with a potential to do, and competences identified among the

requirements of attitude are those showing a capability to do and denote personal habits.

Pharmaceutical representatives are professionals that transfer information about diseases and medicines, and in this case it is fundamental to have the ability to create and keep good relationships, and communicate in a clear and objective way. These relationships between physicians and pharmaceutical representatives are built through respect and ethical behavior, based on empathy and integrity (Palacios, 2008). It is necessary the ability to create and keep good relationships, abilities to communicate in a clear and objective way, and work under pressure, in response to the high competitiveness of this market. Some attitudes are essential: empathy, professional ethics and integrity, which are competences related to conduct and behavior, in the daily activities visiting and promoting pharmaceutical products to health professionals. It was observed that these professionals, in daily activities, carry out complex activities demanding these competences in order to reach objectives and the goals imposed by the pharmaceutical industry.

This work highlights the importance of knowledge, abilities and attitudes for the pharmaceutical representatives in order to attain results for the pharmaceutical industry. In this sense, it is necessary increase the investments to develop new manuals for teaching and training pharmaceutical representatives in order to turn them more capable and aligned new realities of this market. This will make pharmaceutical representatives force more conscious about the necessary essential competences. The survey still pointed out that the competences of sales techniques, good human relationships, to know how to communicate or communication skills and work under pressure as relevant.

The competence considered the most relevant by survey was sales techniques. This result indicates that knowledge on sales techniques is essential for the good performance of this profession, as evidenced in previous studies (Brody, 2005; Medawar, 2002; Wazana, 2000; Maguire, 1999; Norris, 2007). This competence is related to sales activities include: knowledge about the client's needs, about benefits and advantages of the product and to be capable of keeping commercial relationships with the doctors.

Planning and negotiation techniques are competences related to knowing how to do and knowledge. Planning and negotiation are related to the daily work of the pharmaceutical representatives. Before the visits, they need to structure a plan called "pre-visits", daily and weekly schedules and the client profile. The negotiation technique, on the other hand is necessary to go around questions and to convince doctors to prescribe their brand.

These results show that, besides knowing how to do, the pharmaceutical representatives must have the skills to do. In order to be able to transfer knowledge, the professionals need to read study and retain knowledge in a constant and continuous way, and therefore, good memory is relevant.

ABSTRACT
Corporate scandals throughout the world have brought attention to company boards whose primary role is to give the so called „tone from the top". In most cases it has been determined that corporate scandals have occurred due to the lack of proper corporate governance structures, improper structure of corporate boards as well as corporate board practices. This paper will present current trends with regards to company boards, their structure and practices. The authors will point out the bad company board practices in several corporate scandals as well as emphasize good practices and improvements that should have been made in those cases.

Keywords: *Boards structure, Corporate governance, Corporate scandals*

1   INTRODUCTION

Economic crisis is still present all over the globe. Euro zone crisis, a high level of indebtedness of countries, high unemployment rates and illiquidity problems have influenced to a great extent every day company operations. We have all witnessed deep structural reforms in the economic systems of many countries which created some new reality and rules for companies. Each and every company, across the world, no matter in which sector it operates, is affected by these changes.

Today, companies struggle with changed economic systems and „rules of the games", and they have constantly numerous questions on their „plates": how to increase productivity, how to be more efficient, how to cut costs, how to raise reputation etc. Realizing the consequences of the global economic crisis, companies are even more assured that a part of its origins stems from a variety of corporate governance weaknesses and failures. Moreover, the crisis has showed that companies not having the proper corporate governance structures suffered the most - individuals were truly disappointed with actions and behavior of high level management in many companies, whose decisions contributed greatly to the failure of their respective businesses and creation of a domino effect in the whole world, while investors started pooling out their investments firstly from the companies with a low level of corporate governance practices. For those investors the low level of corporate governance was connected with the high level of risk.

The crisis and subsequent consequences have highlighted the areas of particular concern regarding corporate governance. Failures of risk management systems in several cases were closely related to the encouragement and rewards for the high level of risk taking (Kirpatrick, 2009). Since risk guidance and review are key responsibilities of the Board, this leads us to a conclusion that in most cases the Boards were ineffective, they haven't challenged the senior management and they probably did not have the right competencies, composition etc. For those reasons, this paper will focus on corporate Board structure and composition. In the first part of the paper we will present several corporate scandals which have happened due to the improper structure of corporate Boards as to point out to the failures of corporate governance practices. Results of the research regarding corporate Board structure will be showed in the second part of the paper as to point out the existing practices around the world. In conclusion we will create remarks regarding current trends and emphasize good corporate governance practice related to Board structures.

2   WHY BOARD STRUCTURE IS IMPORTANT?

Best corporate governance practices imply that Boards should have:
- the appropriate number of executive, non-executive and independent directors;
- the right mixture of skilled, knowledgeable and experienced individuals;
- the right procedures and rules as to allow each of the Board members to make informed and liable decisions.

The right balance between executive, non-executive and independent directors is necessary as to preclude the possibility for individuals or small groups to dominate the decision-making process (IFC, 2008). Non-executive directors contribute greatly to the Board with their external insights, additional expertise, experience and knowledge. On the other hand, an independent director is a person who does not have any business, family or other ties with the company, the owner of the company, members of the Board or executives, who could influence his/her objective and independent decision-making. Independent directors can make a substantial contribution to important decisions of the company, especially in evaluating executive performance, setting executive and director remuneration, reviewing financial statements, and in resolving corporate conflicts.

Several researchers have showed that boards with greater number of independent directors have better performance (Jensen and Meckling, 1976; Shleifer and Vishny, 1997). The main reason why independent directors are needed on Boards is related to the managers' behavior which is individualistic, opportunistic and self-serving. Also, it is expected that independent directors do not put personal interests and activities in front of their professional duties (Eisenhardt, 1989; Fama, 1980; Fama and Jensen, 1983; Jensen and Meckling, 1976). This theory also supports the view that those independent members (who are in the same time non-executive directors) can better supervise the work of executive members in the Board (Ramdani and Witteloostuijn, 2010). Many empirical studies have proven that Boards are more efficient, more insightful and that they undertake a better monitoring of the senior management when greater number of women and non-executives sit on them (Higgs, 2003; Hagendorff and Keasey, 2008; Mateo et al, 2009; Bear et al., 2010). Moreover, researchers have shown that foreign investors as non-executive directors also have positive impact on firm performance. This conclusion is related to the fact that foreign investors lead towards improvement of corporate governance practices and foreign directors also send positive information signaling to the capital market (Black et al., 2006). To support this argument,

Oxelheim and Randoy (2003) showed that firms in Norway and Sweden that have foreign investors in their Board achieved better performance.

All the above mentioned facts imply that independent and non-executive directors add value to the company performance. Despite that fact, roots of several corporate governance scandals and failures of companies happened due to the inadequate Board composition and structure. Here we will describe Lehman Brothers case study, considered by many as a trigger of the crisis, and one of the most recent ones related to Olympus.

2.1   Lehman Brothers case study

Lehman Brothers Holdings Inc. (LB) was a global financial services firm. Before declaring bankruptcy in 2008, it was the fourth largest investment bank in the US. Founded in 1850, Lehman was also the oldest investment bank in the US. In early 1980s, after a serious internal power-struggle coupled with a downturn in the markets, than CEO Lewis L. Glucksman was forced to sell the firm to American Express. A decade later, in 1993, American Express began to divest itself of its banking and brokerage operations and in 1994 it spun off LB in an initial public offering. Richard S. Fuld was appointed as CEO-Chairman of LB and he led the firm until its very end.

Lehman performed quite well under Fuld. Since going public in 1994, the firm had increased net revenues over 600% from $2.73 billion to $19.2 billion and had increased number of employees over 230% from 8,500 to almost 28,600.

At the 2008 ALB China Law Awards, LB was crowned Debt Market Deal of the Year and Equity Market Deal of the Year. By 2008, Fuld had been with the company for 30 years. In fact, he was the longest-tenured CEO on Wall Street.

Yet, the same year, on September 15, LB announced it would file for Chapter 11 bankruptcy protection. It became the largest US bankruptcy based on assets ($639 billions). A legitimate question is how this could have happened?

Board Composition - An effective board is one that is competent, active and independent. The LB Board had 10 members. Only one of them, Fuld, was an executive director. At the same time Fuld was both CEO and Chairman of the Board. Although, at first sight, this might imply that the LB's board was independent and better equipped to monitor the executives, it proved not to be the case. In addition, the fact that none of the other executives was in the Board accentuated the existing unbalanced power of Fuld at the executive level. Indeed, in 2007 Fuld earned almost three times more than the four most senior executives beneath him did on average (Nestor Advisors, 2009).

Age - While age is often cited as a good thing for board members since it presumably means more experience, an ageing board might present significant risks. Specifically, older directors might be less tuned to an ever-changing business environment and a bit out of touch with an aggressively growing financial sector and its myriad of exotic financial engineering products. It is logical to expect that old directors have lower sensitivity to their professional reputation and future employability. In LB, an average age of non-executive directors was 69.4. In fact, LB had five directors aged above 72. For comparison purposes, the average age of non-executive directors in the 25 largest European banks is 60 (Nestor Advisors, 2009).

Tenure - Companies should maintain their vitality, flexibility and ability to adapt to new challenges by changing the composition of their board of directors from time to time. An optimal term of directors is not strictly defined and might differ from company to company. Directors should have a term long enough to be able to take a longer-term perspective (crucial for their strategic role) and to be able to see the results of their efforts. On the other hand, directors tend to lose some of their (independent) edge if they remain on a board for too long. The Board of LB was an entrenched board. The average tenure of non-executive directors in the LB board was 9.4 years. In contrast, an average tenure of non-executive director in the 25 largest European banks is 5.6 years (Nestor Advisors, 2009). Such a long tenure contributes to a lack of independence which, coupled with a lack of an adequate expertise, allowed Fuld to be almost the sole decision-maker who was not effectively questioned by anyone.

Financial industry expertise - The Board should be comprised of members who together have the knowledge, capability and professional expertise necessary for successfully managing, directing and overseeing the company. Best practice recommends certain competencies for all boards, irrespective of the company. These are: industry experience, business judgment, and special skills such as financial acumen and legal knowledge. For LB, financial sector expertise was crucial. However, only 10% of the LB Board had this expertise (Nestor Advisors, 2009). Board diversity might be a good thing. However, if we know that one of LB directors was a theatrical producer and the other a retired rear admiral of US Navy we can legitimately question capability of these directors to effectively oversee one of the most complex balance sheets in the US financial industry.

Risk oversight - Henry Kaufman, formerly of Salmon Brothers, chaired the risk and finance committee. However, he was already over 80. The other member of this committee did not have a robust enough financial sector expertise. The committee met only twice throughout 2007. Does it mean that LB did not have a risk management function? Probably not. LB, at least on paper, had very sophisticated risk management systems and the teams of experts to manage it. Still, the function was not properly addressed at the board level. The board should ensure that systems that are established enable the company to assess and control risks. The fate of LB shows that its board failed to successfully perform this task.

Incentives - Were Fuld and the other executives inadequately incentivized? It is a fair estimate to say that Fuld had more of his net-wealth to lose than many of his peers. By making the wrong decisions and taking the wrong risks he ruined himself as much as he ruined the company and its shareholders. Thus, the LB case proved that an adequate alignment of the CEO's interest with the shareholders' interests cannot substitute for the board's oversight.

2.2   Olympus case study

Olympus is a major Japanese manufacturer of optical equipment founded in 1919 by Takeshi Yamashita and under the name Takachiho Seisakusho. It initially specialized in microscope and thermometer businesses. In 1950s Olympus introduced its first camera. Olympus is listed on the Tokyo Stock Exchange.

In September 2011 Olympus promoted the first ever non-Japanese chairman as a CEO. Mr. Michael Woodford had worked for Olympus for 30 years. Before that Woodford was chief operating officer, while he previously worked as executive managing director of Olympus Medical Systems Europa.

Only two weeks after the promotion into CEO, Woodford was fired. Woodford alleged that his removal was related to several prior acquisitions he had been seeking answers to, particularly the US$2.2 billion deal in 2008 to acquire British medical equipment maker Gyrus Group. The major question in this case was related to the US$687 million paid to a middle-man as a fee – a sum equal to 31% of the purchase price. Further investigations showed that in several acquisitions between 2003 and 2009 similar practices were undertaken. This revelation led to the Olympus confession that their accounting practice were not appropriate and that US$1.5 billion of losses were hidden in books. Just a couple of months after the scandal, the capitalization of Olympus fell by 75%. What went wrong in this case?

Board Composition - Olympus Board within the period of controversial acquisitions was comprised of three non-executive directors, while all other members were executives. The Board was comprised of 13 members and until 2011, a non-Japanese was never appointed as CEO. In that way, Olympus non-executives could always be outvoted. This practice leads towards "one fold" thinking, a lack of useful insights and discussions. There is also the fact that when individuals hold both managerial and Board positions, a conflict of interests can appear. Furthermore, there was an established practice where former CEO was becoming President of the Board, while former President of the Board remained as a member of the Board and an executive director of Olympus. This is against the best corporate governance practice since actions of the new CEO can be postponed, rejected or similarly blocked just due to the influence and the presence of his predecessor.

Age - As already mentioned an ageing board might present a risk to the company since despite their professional experience they might have a lower sensitivity to their professional reputation and future employability. In Olympus all of the Board members were above 50 while the average age of Board members was 65.

Tenure - Even though the data on individual tenure of Board members is not known, the fact is that five Board members, executives, served for Olympus between 30 and 50 years. This implies strong connections and bonds with the company. It is also obvious that these individuals lost the outside and independent perspective.

Financial industry expertise – With regards to the knowledge and professional expertise of the Board only one member of the Board had financial expertise and this was a CFO of Olympus. Two of the non-executive directors had the expertise in trade as former ministers, while the third member had the industry expertise.

3   BOARD STRUCTURE TODAY
The diversity of the Boards regarding gender, background, professional experience and competencies, leads to a broader debate which prevents Boards from a narrow, group thinking. Therefore, the next logical question is - what is the trend regarding Board structure? In 2007 the average size of the Board in Europe was 13 members, but it varied significantly in different countries - from 8 members in UK to 19 members in Germany (Heindrick and Struggles, 2007).

Enterprise in Turbulent Environment

1999 European average		13.5
2001 European average		12.5
2003 European average		12.5
2005 European average		12.5
2007 European average		12.8
UK		8.3
Netherlands		8.6
Switzerland		9.8
Sweden		10.8
Belgium		12.9
Portugal		14.1
France		14.3
Spain		14.7
Italy		15.5
Germany		19.1
Figure 1: Numbers of directors per Board

Furthermore, in their research Heindrick and Struggles have showed that the average rate of independent directors in Boards is 54% and that it represents a significant improvement when compared with 37% in 1999. On the other hand, Grant (2007) has shown that practices regarding independent directors differ significantly between US, on one hand, and Europe and Asia, on the other hand. As shown in Table 2, percentage of independent directors on companies' boards in US is almost three times higher than in Europe and almost four times higher than in Asia. This implies that Board structures with regards to the level of independent directors are more in line with good corporate governance practices in US than in Europe and Asia.
Figure 2: Board Composition by category of director

Table 1: Board Independence

S&P 500 (United States)	92%
FTSE 350 (United Kingdom)	36%
Asia	23%

The greatest level of divergence, in companies across Europe, exists in the Board composition (Heindrick and Struggles, 2009). This study showed that (i) one in four European Boards include no foreign directors despite the fact that majority of the companies have a strong international presence, (ii) that a proportion of women on Boards in the EU on average 12%, (iii) that 19% of non-executive chairmen are the former company CEOs, (iv) that the average remuneration of directors has gone up by 164% in the last ten years and (v) that a proportion of the fixed remuneration in the overall directors' remuneration is on average 83% (Heindrick and Struggles, 2009). Heidrick and Struggles (2009) have also analyzed functional diversity in European boardrooms and found that 48% of European boards have no director with a sales and marketing profile.

All the above mentioned shows practices regarding Board structure three to five years ago, but what is the situation regarding Boards structure and practices today? Around 40% of US and non-US Board members state that there is significant lack of skills and expertise or that they are insufficiently represented on their Boards (Heidrick and Struggles, 2012). Even though they agree on the abovementioned, US Board members stated that technology expertise is the most common underrepresented skill on Boards, while non-US board members named HR/talent management as the most important existing gap on Boards (Heidrick and Struggles, 2012). Heidrick and Struggles (2012) have also recognized the following trends:
-   53% of US directors and 63% of non-US directors say their boards do not provide effective training for new members;
-   50% of US directors and 46% of non-US directors report their boards do not track decisions over time to determine their effectiveness;
-   38% of US directors and 52% of non-US directors say their boards do not have an effective means to address poorly performing directors;
-   30% of both US and non-US directors said that the time allocated to discuss strategy in board meetings is not sufficient.

OECD (2011) study regarding Boards in South America has shown that Boards size is ranging between 5 and 11 members, that minimum and maximum size of the Board is regulated by law, and that in most countries there is a fixed number of independent directors. If we look at the best practices regarding the Board structure and its competencies and compare them with the results of these empirical studies, we will be able to conclude that these results are quite discouraging.

4   CONCLUSION
A global economic crisis has pointed out a several weaknesses in corporate governance practices which have contributed greatly to the failure of companies and subsequent domino effect throughout the globe. Excessive risk taking and Board structure were recognized as the primary and the most prominent ones. Furthermore, Boards packed with directors who lack necessary expertise to assess risks properly in an extremely complex and ever changing environment, connections between board members and management or controlling shareholders which led to weak scrutiny and absence of constructive challenge, formal

compliance with rules and a systematic disregard of their spirit, perverse incentives in many executive compensation contracts that reward excessive risk and do not punish failure.

Despite the fact that many researchers have proven the positive correlation between Board structure and company performance we can still observe in a majority of companies a low level of independent directors, a lack of certain skills and expertise of Board members, a low level of women on Boards, a lack of training for new Board members, a lack of mechanism for tracking decisions implementation over time, a lack of means to address poorly performing directors, not sufficient time allocated for consideration and discussion regarding company strategy and a lack of knowledge regarding risks. The lack of supervision by Boards has enabled the senior management to be short-term oriented and take the excessive amount of risks neglecting the long-term perspective of their actions. This lack of supervision and excessive risk taking has its roots in the inadequate structure of Boards. The crisis has indicated that Boards need to understand in a better way the risks associated with actions undertaken, they have to possess knowledge on how to monitor the risk management and include managing of the risk in the process of implementation of the company strategy. Therefore, one of the crucial measures should be related to the clear definition of Board responsibility related to risk management, their knowledge and understanding of risk associated functions. Furthermore, the change of the structure of Boards is crucial since independent directors can make a substantial contribution to important decisions of the company, especially in evaluating executive performance, setting executive and director remuneration, reviewing financial statements, and in resolving corporate conflicts. As mentioned already these are crucial areas which, due to poor supervision, led to the financial crisis. Very importantly, independent directors give investors additional confidence that the Board's deliberations will be free of obvious biases.

THE IMPACT OF MERGERS AND ACQUISITIONS ON CORPORATE PERFORMANCE (THE CASE OF RUSSIAN ALUMINUM INDUSTRY)

Anna A. Dokukina
Plekhanov Russian University of Economics, Russia
Dokukina.AA@rea.ru

ABSTRACT
The paper focuses on the merger in the aluminum industry in Russia between OJSC "Russian Aluminum" (RUSAL), OJSC "Siberian-Urals Aluminum" (SUAL) and Glencore International Plc. Besides the practical issue connected with the optimization of the united resources, the overall effect of the merger has raised ambiguous concerns among both theoreticians and practitioners. Therefore, further research is needed to analyze the multifaceted impact of the merger on the corporate performance. The present research considers the theoretical pattern of the M&A influence on the corporate performance through the prism of management and financial factors including economic ratios and market multipliers. The practical implications of the development of these factors in the pre- and post-merger periods are considered. Additionally, the impact of the merger on the corporate performance is assessed through the market multipliers approach which allows evaluating and trailing the dynamics of the companies' fair value over 2006-2011. Finally, the paper provides an overview of the stock prices performance of the companies operating within the aluminum industry to demonstrate the general impact of the merger.

Keywords: Aluminum industry, Business integration, Corporate performance, Impact of M&A

1 INTRODUCTION

The Russian market of mergers and acquisitions has strengthened over the recent decade. The grounds for such a surge in the number of deals vary from liberalization of Russian regulations ending with the political shifts. However, the most considerable reason lies in the balanced economic development which propelled the companies to seek for the global expansion through consolidation and innovative decisions.

The result of these activities has been the ongoing creation of large companies becoming major players in the industry on the national and global levels. Even though the success of M&A transaction is obvious at first glance, the analysts should consider different issues concerning the deal effectiveness. Moreover, accumulating the experience of each deal can contribute to invigorate the M&A activity within Russian legal and economic contexts.

One of the most significant consolidations on the Russian market was the merger of Russian aluminum giants, i.e. RUSAL and SUAL, and Swiss company Glencore which was supposed to create an international diversified metallurgy corporation. In light of the recent announcement, the analysts predicted the success of the deal and, in turn, the world aluminum market shake-up (Bank of Moscow, 2011). So, it can be assumed that this deal represents particular value in terms of its useful experience for M&A process development.

This paper covers main findings of the research devoted to causes and effects of the particular deal and its reflection on the conceptual integration development.

2 RUSSIAN ALUMINUM MARKET AND INTEGRATION STRATEGY DEVELOPMENT: RESEARCH SCOPE AND OBJECTIVES

The importance of appropriate research is defined by the multifaceted impact of merger on corporate performance. The main question is connected with the influence of RUSAL, SUAL and aluminum assets of Glencore International Plc. merger on the corporate performance of the United Company RUSAL over 2007–2011. To achieve this purpose, the main goals are described as follows:

- to establish the theoretical framework of the influence of M&A activity on the corporate performance;
- to compare the pre- (2006) and post-merger (2007–2011) financial indicators of the corporate performance of the considered companies;
- to trail the trend in the fair value of the considered companies, evaluated through market multipliers approach;
- to assess the impact of the merger of the considered companies on the stock price performance of the companies-rivals within the aluminum industry.

Moreover, there is the attempt to lay down a general pattern of integration strategy realization.

2.1 Research contents and methodology

The initial research issue concerns the definition of corporate performance in terms of M&A deals. Then, to reinforce the results, the research includes an overview of the aluminum industry identifying the pre- and post-merger company position.

Methodologically, the research is based on the literature review, economic and financial analysis of the companies in question, and comparison of the pre- and post-merger company's performance on three levels. First, the financial ratios of the OJSC RUSAL and UC RUSAL are evaluated. Second, the fair value of the company based on market multiplies is assessed. Besides, the market multipliers performance is trailed within the company perspective and aluminum industry. Finally, there is the estimation of the impact of merger on the stock performance of the companies-rivals of OJSC RUSAL and UC RUSAL within aluminum industry. As the last stage of the overall analysis, the discussion of the main findings of the deal impact on corporate performance along with limitations is provided.

2.2 Approaches to the evaluation of merger impact on corporate performance

Integration strategy based on M&A processes is a question of great importance to modern business units (Dunaway, 2008; Gaughan, 2010). Making a decision about such deals, companies conduct multiple-factor forecasting of organizational and financial results of joint entrepreneurship activity. Obviously, there should be the assessment potential (Coskun, 2008; Rennebood, 2006). In order to evaluate the impact of the merger on corporate performance in the most efficient way, the first issue concerns the establishment of theoretical and practical pattern of the research subject.

The literature review reveals the most rational approach to assess the corporate performance in the context of merger influence on it (Ismail, 2011, pp. 89–104). Despite the argumentativeness of the organizational paradigm of the corporate performance, the lack of consensus among the scholars relating to the measurement issues entails the necessity to adopt the financial toolkits to conduct a sound and consistent analysis. So, the first conclusion is that the consideration of corporate performance will be based on the financial perspective.

Enterprise in Turbulent Environment

The next issue is the choice of the appropriate financial metrics. Generally, the financial indicators break down into two groups: accounting- and market-based ratios. The dynamics of the these indicators is trailed as well. In addition, the comparative analysis with the industry averages (as being benchmarks of the industry performance over the considered periods) would solidify the analysis. It is essential to highlight that the consideration of PE (price to earnings) and EV/EBITDA (enterprice value to earnings before interest, tax and depreciation payments) ratios allow to assess the fair value of the companies in the prior and post to merger periods, since mix of these indicators is considered to be the optimal indicators of company value (Bryan, 2007).

The final analytical technique implies the event studies. Observation of the stock prices behavior over the merger period and over the medium term period is discussed to provide more sound analysis, since the abnormal results revealed would indicate an influence which needs to be scrutinized.

On balance, it is suggested that these types of analyses would provide an overall picture of the merger impact on the corporate performance. Moreover, the data on the market share amplification, shareholders' structure changes, and additional relevant information would reveal the outcomes of the merger in terms of possible integration effects.

3 PARTICIPANTS OF A DEAL WITHIN THE ALUMINUM INDUSTRY IN 2006-2011

To identify correctly the post-merger company position it is essential to determine the key issues relating to the aluminum industry in the prior to merger period.

3.1 Aluminum industry in the pre-merger period

The aluminum market is one of the largest markets among commodities in the world (Somer, 2006). Being second-ranked (after copper market) in terms of trading volume of metals, the aluminum market is considered to be one of the most prosperous in the past decade. In 2003-2006 demand over the period has constantly exceeded the supply, although both indices have experienced substantial growth approximately by 20% each. This leads us to the considerable feature of the industry – the supply is not catching up the rapid demand growth (Aluminum Industry, 2012).

The next feature of the aluminum industry is the geographical distribution of production. The global growth of production was driven by the emerging economies, e.g. China, India, South Africa, and Brazil, whereas the developed economies, e.g. the US and Norway, reduced the production level in the considered period. However, the leaders of the industry are represented by the following countries: China, Russia, the US, and Canada (International Minerals Statistics and Information, 2011).

The consumption growth is demonstrated by the developing countries over the considered period. The analysts predict the increase in demand in the following decades, mostly due to accelerating urbanization and industrialization in China. So, here is the third feature of the aluminum industry – the consumption epicenter is moving from the developed countries towards developing (Chen, 2003; International Minerals Statistics and Information, 2011).

Finally, one of the most significant features of the aluminum industry is the high level of concentration that is approximately estimated as 95%

(http://www.reuters.com/article/2007/03/27/aluminium-russia-merger-idUSL2713534620070327, 2012). In 2006, the world aluminum industry was mainly represented by Alcan Inc. (Canada), RusAl (Russia), Alcoa Inc. (US), Hydro Aluminium (Norway), Chalco (PRC), Hindalco Industries Ltd. (India). New entering into the industry is inherent with the substantial barriers as capital expenditures and time required to build the aluminum smelters and alumina refineries.

One more factor refers to the aluminum price fluctuation. Analysts comment, that the decline in prices is generated due to the combination of demand decrease and supply expansion in the further five years (Aluminum industry, 2012). At the same time, experts mention that the world power sector continues to generate strong demand for aluminium, so better buying can be expected soon from the construction and transport sectors (Bose, 2012).

All in all, the world aluminum market appears to be promising in terms of prospective advantages to the companies operating in this domain, in spite of the factors (e.g. global crises, fluctuations of commodities prices, export reduction) that could influence negatively the situation on the world market.

Against this background, the merger of key aluminum players such as OJSC RUSAL and OJSC SUAL, and aluminum assets of Glencore International Plc. have transformed the aluminum industry both locally and globally. The deal announced in the end of 2006 and completed on March 2007 was aimed at the strengthening of competitive position of the united company. The analysts predicted the positive outlook for the united company with the aggregate value of RUSAL and SUAL companies standing at $17-18 million. Additionally, the management of the company assessed the coming cash flows of approximately $3 billion during the next five years (Bank of Moscow, 2011). In this way, the parties engaged in the merger recognized the benefits of the deal in case of successful implementation.

3.2   Open joint stock company RUSAL

OJSC RUSAL (RUSAL) is the third largest aluminum producer (accounts for 10% of global output) and first-ranked in Russia (accounts for 75% of local output). RUSAL conducts its operations in 9 regions in Russia and 13 countries, and exports its products to approximately 50 countries worldwide. RUSAL company was established in March 2000 through the aluminum consolidation of Sibirskiy Aluminum and Millhouse Capital. The OJSC RUSAL is incorporated in Jersey (UK) in 2005 with the headquarters in Moscow. Since 2006 the En+ Group Limited holds the controlling interest in UC RUSAL (47,71%). In turn, the En+ Group Limited is established to control the mining, metals and energy companies which fall under the financial industrial group "Basic Element". The key information on the corporate performance over 2006 is presented as a table 1.

In the research the financial position of the company was considered using the ratio analysis. Excepting simple computations of the coefficients for RUSAL Company itself, the additional information of the companies operating within the industry was also used. The analysis was fraught with a reliability issue since the information was gathered from the published sources and official annual reports for particular companies (Bank of Moscow, 2011; RUSAL is the world's largest aluminium producer, 2012). To sum up, the main findings concerning the company's ratio analysis the following facts should be outlined.

Enterprise in Turbulent Environment

The liquidity ratios of OJSC RUSAL were below the theoretical benchmark which indicates a poor liquidity position. It implies that the company's assets are not sufficient to cover its liabilities as they come due. However, the comparative analysis with the companies in the aluminum industry denoted that the RUSAL is featured with an adequate liquid position or even more stable than other rivals, except for the quick liquidity ratio (http://www.rusal.ru/en/about/, 2012).

Table 1: Financial highlights on OJSC RUSAL, 2006 (http://www.rusal.ru/)

Indicator	$, million
Income Statement	2006
Sales	8429
Gross Profit	4243
EBIT	2954
EBITDA	3317
Profit before taxation	2860
Net profit for the year	2524

The capital structure ratios demonstrated that the company employed considerable external financing. However, the company's ratios were just over the general benchmark that implies a financial stability in 2006. In comparison with rivals of developed (Alcoa, Norsk) and developing (Hindalco) economies, the ratio of RUSAL exceeded the counterparts of pure leverage ratio which indicates lower financial stability, whereas for net debt-to equity ratio RUSAL bears approximate the identical financial burden. Meanwhile, the two remaining companies experienced significant impediments with the debt standing at more than five times than equity (Aluminum Industry, 2012).

In terms of profitability, the RUSAL displayed remarkably high indicators in overall aspects over 2006 year. The return on assets exceeded all the counterparts within the aluminum industry that could be particularly explained by the low cost position of RUSAL (high value of profit margin) which amplifies the operating and net profits of the company. The assets turnover indicator of the RUSAL highlighted the rational use of its assets. The company outperformed almost all the rivals in the aluminum industry, whereas in case of cash conversion period the company position is quite tense. However, comparing to companies-rivals, the conversion period is extremely long, and this suggested that the company needs to improve the current pace of operation (http://www.rusal.ru/en/about/).

To sum up the key characteristic relating to the performance of the RUSAL a SWOT analysis was conducted. In brief, such strengths as geographical diversification, advantages of vertical integration, favorable tax regime were discovered; high debt burden, location of bauxite factories in politically instable areas, disability to pay dividends in future years were noticed among weaknesses. New integration projects, aluminum price and increase of efficiency are mentioned as the main opportunities. Threats are connected with price increase on commodities (e.g. electricity), change in tax legislation, violations of debt covenants and fluctuations in currency exchange rates.

As the major problem the RUSAL Company could face during its operating activity the lack of resource self-sufficiency was defined.

3.3   Deal terms and expected benefits

The deal was firstly announced on the 9th October, 2006 (RUSAL, SUAL, Glencore complete aluminium merger, 2007). The bargainers signed an agreement to merge the aluminum assets of the companies under a newly created subsidiary of EN+ Group Limited, the United Company RUSAL. The merger assumed the ownership structure change in way presented as a chart 1.
Chart 1: Shareholding structure of UC RUSAL, 2007(RUSAL is the world's largest aluminium producer, 2012)

The Open Joint Stock Company "Siberian-Urals Aluminum Company" (SUAL) established in 2006 was the sixth-largest company globally and the second-ranked in Russia (25% of market share). The controlling interest of SUAL was held by SUAL Partners Limited, incorporated in Bahamas. The SUAL group was also structured as a vertically integrated company, comprising 20 production facilities that are located in 9 regions of the Russian Federation and Ukraine. The primary activity of SUAL is the production of aluminum and alumina, foil, aluminum alloys, silicon. The major advantage of the SUAL was the available resources and, in turn, the resource self-sufficiency (Aluminum industry, 2012).

Glencore International AG (Glencore) is Swiss-based leading commodities trader controlled by Amokenga Holdings Ltd (Bermuda). The company operates in such segments as metals and minerals, energy, agricultural products. The main value of Glencore is solid relationship with more than 8000 of clients and suppliers that span the automotive, steel, power generation, oil and food processing industries. Glencore aluminum division would become a merged part with RUSAL and SUAL's aluminum assets portfolio in exchange for a 12% stake in the merger company (Aluminum industry, 2012).

In this way, the merger would have contributed to the achievement of two main purposes of the OJSC RUSAL – the resource self-sufficiency issue and wide access to the international markets.

4   PERFORMANCE OF THE UNITED COMPANY RUSAL

As mentioned above, the first changes the merger has involved concern the shareholding structure. Then the company pursued other M&A transactions which brought new shareholders in the UC RUSAL. For instance, the acquisition of over 25% of MMC Norilsk Nikel shares has changed the shareholding structure in 2008. After that, in 2010, the UC RUSAL has undertaken IPO process on Hong Kong Stock Exchange that was reflected in the shareholding structure as well (chart 2).
Chart 2: Shareholding structure of UC RUSAL, 2010 (RUSAL is the world's largest aluminium producer, 2012)

The deal makes the UC RUSAL the largest producer of aluminum and alumina in the world and the unique producer of aluminum in the Russian market. Moreover, in the long term perspective the UC RUSAL holds its position of the leader in the aluminum industry.

The key financial indicators over 2007–2011 years show that in the recent years the UC RUSAL has managed to improve its financial position.

Table 2: Financial information on UK RUSAL, 2007-2011 (http://www.rusal.ru/)

Income statement ($, milion)	2007	2008	2009	2010	2011
Revenue	13588	15685	8165	10979	12291
Gross Profit	5232	4612	1455	3484	3505
EBIT / operating activities	3647	-1228	-63	2031	1749
EBITDA	4523	-198	523	2529	2267
Profit before taxation	3225	-6053	839	3011	610
Net profit for the year	2806	-5984	821	2867	237

The data shows that the leverage ratios experienced unfavorable fluctuations with an increased fraction of current and non-current liabilities. After these years, the company has reverted to the sound performance with bettering of capital structure ratios in 2010–2011. It is essential that over the mentioned period, the UC RUSAL ratios of capital structure have not generally outperformed the counterparts of rivals.

Regarding profitability ratios, it should be mentioned that the UC RUSAL has permanently outperformed its rivals (excluding the result of 2008) through gaining lucrative margins despite the difficulty in product differentiation in the materials industry. Another reason is related to the low cost position of the UC RUSAL.

Finally, the cash conversion cycle was optimized due to the impediments of inventories' conversion period.

5   EVALUATING THE IMPACT OF THE MERGER ON PERFORMANCE OF UC RUSAL

According to the methodological basis of the research of this paper, to estimate the influence of the integration deal on the business indicators of UC RUSAL the following approach has

been used: financial statement analysis; prospective comparison of management and financial factors of the OJSC RUSAL and the UC RUSAL including economic ratios and market multipliers; event study of the stock prices of UC RUSAL's competitors.

The main results of the merger are briefly outlined below. Of course, the situation was influenced by the events which have occurred over the considered period and affected the corporate performance: global financial crisis of 2008–2012; price escalation for electricity and other resources employed in the aluminum production over 2008–2011; price surge for aluminum in 2009; IPO in 2010; shares repurchase in 2011. To receive the relevant outcomes that provide the proper business picture the analysis was conducted on the basis of the most representative data that is computations on the fair value of the company in the pre- and post-merger period which are provided in the table 3.

Table 3: Valuation of OJSC RUSAL & UC RUSAL, 2006–2011 (http://www.rusal.ru/)

	2006	2007	2008[1]	2009	2010	2011
P/E	12,14	11,93	14,81	29,40	15,44	6,02
EV/EBITDA	6,14	7,69	6,86	15,11	7,59	10,56
Net profit for the year	2524	2806		821	2867	237
EBITDA	3317	4523	3544	591	2529	2267
Capitalization	*30650*	*33476*		*24137*	*44261*	*1427*
Debt	*4297*	*8185*		*12586*	*12101*	*12350*
Cash & Cash Equivalents	*241*	*261*		*236*	*491*	*646*
Enterprise Value (P/E)	34706	41400		36487	55871	13131
Enterprise Value (EV/EBITDA)	20353	34767	24312	8932	19190	23946
Fair Value	27529	38083	24312	22710	37530	18539

The positive outlook of corporate performance is confirmed by the fair value of the united company that exceeds the value of the company prior to the merger. Obviously, the crisis of 2008-2009 years deteriorated economic results. But then the company increased value, so the corporate performance was improved as well. This proposition is justified by the growth of EBITDA and Net Profit of the UC RUSAL in 2010. However, despite the stable operational performance of the UC RUSAL in 2011, the increase of operating expenses along with the other factors, influenced destructively the net profit resulting in low fair value of the UC RUSAL.

The performance of the company has experienced the ambiguous changes over 2006-2011. Whereas, in terms of market multipliers, the merger has not implied the improvement, the fair value of the company evaluated on the basis of industry averages outperformed the counterparts (Alcoa, Alcan) (Aluminum Industry, 2012).

Thereby, the indicators of company's performance reflect both positive and negative results of a deal for the current and future development. However, obvious achievements should be depicted.

---

[1] The market capitalization of UC RUSAL based on the multipliers is not estimated since the company reported negative net profit

Generalizing the financial of UC RUSAL as a result of merger the following points can be specified:

- positive outlook for the financial highlights, i.e. sales, net profit volumes;
- leading position in terms of cost-effectiveness among aluminum companies;
- stable liquidity position over long term;
- increased financial independence;
- deterioration of profitability;
- acceleration of turnover processes in both the short and long term.

Regarding such market indicators as a market niche and competitiveness it can be concluded that the deal has not led to the substantial shift of market shares within the aluminum industry since even before the integration OJSC RUSAL, SUAL group and Glencore International Plc. were the leading companies. Additionally, no significant impact of merger on rivals was trailed for a while.

However the purpose of the deal – the consolidation of assets and customers in order to create a globally largest producer and supplier of the aluminum – is achieved. The corporate performance of UC RUSAL has been demonstrating positive development during the-post merger period, and the following progress can be predicted.

6   CONCLUSION

The recognition of the Russian companies on the global markets entails the necessity to sustain their operational and financial soundness. Predominantly, within the mature industries with limited product differentiation options, the processes of development and extension are highly associated with the M&A activity, since it is considered as the last resort to achieve the long term solid performance. One of the pivotal deals following these changes was the merger of the OJSC RUSAL, SUAL group and Glencore International Plc. in 2007. Two Russian aluminum giants and a Swiss commodities trader have consolidated their aluminum assets in order to overcome their internal issues and to occupy the leading position within the aluminum industry. The transaction has quickened vital interest among the analysts since the date of the first announcement, and still delivers the value to the practitioners to assess the multi-faceted impact on the corporate performance of the merged company.

The general conclusion implies that the merged company UC RUSAL has outperformed the OJSC RUSAL. The stabilization of essential indicators (liquidity, capital structure, and turnover ratios) proves the positive integration results, even if the profitability of the company was deteriorated. The global financial crisis started since 2008 along with the share repurchase in 2011 resulted in the decrease of the net profits gained by the company over the considered period. Nevertheless, the favorable trends in overall financial indicators, fair value and market multipliers of the UC RUSAL for the last period predict positive outlook for the merged company. In this way, the merger appears to solidify the financial and market position of the company.

Focusing on the main issues of the research, this paper covers the most significant factor of a particular transaction in order to lay down basics of integration strategy and management decision making. In this connection the theme provides wide opportunities for research devoted to the potential of integration instruments in entrepreneurship context. Regarding the findings the following issues are considered: expansion and diversification of business operations; production of the aluminum-related goods; emission of bonds that can reduce the

debt burden of the company and optimize its capital structure; increasing the part of intangible, knowledge-oriented assets; new management approaches related to a modern, consistent with the current situation cost-effective program allowing the united company to stay afloat.

Enterprise in Turbulent Environment

FORMATION OF THE ACCOUNTING AND TAX POLICIES IN LOMBARDS

Farida Erdavletova
International Academy of Business, Republic of Kazakhstan
Vip.erdavletova@mail.ru

ABSTRACT

Organizations pawnshop unit of financial investments is a loan granted to one person, confirmed by collateral and collateral ticket. In accounting, the value of investments are recognized at cost on the account "Short-term loans receivable" in the amount of outstanding loans to the individual. Off-balance account "Securing obligations and payments." Investments in accounting are recognized in the amount of outstanding loans, and the mortgaged property - on the appraised value. During the disposal of investments - of redemption, or the implementation of unclaimed deposits - are written off in the amount of outstanding loans. On loans granted market value is not defined. Therefore, investments in pawnshops to be reflected in the accounting records and the financial statements of the reporting date at cost, ie the size of outstanding loans. Provision for impairment of investments is not created because the sustainable track significant reduction of loans impossible. The order for the accounting policy should contain a list of forms required for the current activity, based on this, the order of the accounting policies Lombard organizations must have contained the following primary documents and registers: a pledge card; acceptance report on unclaimed pledges of material responsible people at the auction, in which the mortgaged property is reflected in the two estimates - mortgaged property on the estimated value and the size of outstanding loans, the protocol of the results of trading, which covers information on each ticket as collateral in the two assessments and provides information about the buyer of the pledged property; inventory inventory of the mortgaged property - the value of collateral is reflected in the two estimates - on the assessed value and the size of outstanding loans, reports the daily commodity researchers-tellers, a statement of accounting mortgage tickets. Economically feasible in accounting policies pawnshops provide for separate accounting, taxable and non-taxable value added tax. The major share of income are interest on pawn loan and interest on the loan for the second month. According to the Tax Code of remuneration received from money loan are exempt from value added tax. In implementing the pledges were not redeemed at a public auction, the pawnshop shall withdraw financial results for each lot.

Keywords: Accounting policies, Lombard, Optimal accounting policy

1 INTRODUCTION

In the past decade in Kazakhstan is actively formed the services market. A special place in the market occupied by lombard organizations that provide specific types of financial services.

In modern conditions lombard industry attracts the attention of entrepreneurs due to the increased demand for services and pawn shops rather high yield of this sphere of business. Interest in this kind of activity on the part of the state due to their socio-economic significance, which is manifested in the fact that, as a source of short-term lending to citizens, lombards meet the respective needs of various segments of the population. As a result, to some extent reduced social tension in society and increases the effective demand for goods and services.

Lombards - new links to the financial services market and are of great interest for the development of this business as a network and provision of quality financial services.

As the demand for cash there and will exist, because people and businesses cannot live a normal life and function without financial support. In these circumstances, the activities of lombard organizations are popular, as people are willing to provide financial loans.

Lombards are the most popular credit and financial organizations with clients - middle class, having a regular job, but low wages or lost jobs. The needs of these people are usually ahead of the possibilities.

In world practice, by the end of the twentieth century, along with the development of accounting, based on information technology has developed four interrelated and complementary form of control over the activities of credit institutions: prudential supervision, external audit, internal control and internal audit. Unfortunately, the level of scientific understanding and practical use of the completeness of each of these types of controls and features of the financial and managerial accounting and analysis are far from uneven. For example, a lack of clarity in defining the essence of accounting and reporting differences in types of audit and control systems in the management of collateral organizations often leads to the fact that they are sometimes seen as substitutes (substitutes for each other). This occurs because the nature of the questions, place and role of accounting, auditing and analysis in the management of collateral organizations until recently have not been systematically and comprehensively explored in the scientific aspect. Thus, accounting, auditing and analysis continue to be undervalued management tools. In such a situation is difficult to expect a certain performance of lombard organizations.

2 ACCOUNTING POLICIES PAWN IN THE REGULATORY ACCOUNTING

In the system of regulatory accounting, the accounting policy of the organization is treated as a separate set of their chosen methods of accounting. The list identifies the primary monitor, cost measurement, the current group and the final compilation of economic activity.

Generates accounting policy chief accountant of the organization. However, he believes that we comply with the assumptions and requirements set forth in the regulatory accounting, basic principles of his constituents. The content of the accounting policies should include methodological, technical and organizational aspects.

Organizational aspects of accounting policies is a form of organization of financial management services.

Methodological aspect reveals the nature of individual objects of accounting, based on the current regulatory framework. Methods of accounting, which have a significant impact on the assessment and management decisions of users of financial statements should also be reflected in the accounting policies of the organization.

The technical aspect of the accounting policy provides tools implementing methodological aspects. It includes the development and approval:
a. The working chart of accounts based on a model chart of accounts;
b. Forms of primary documents in those cases when the administration of certain business transactions not covered by their standard forms;

c. Forms of documents for internal financial reporting;
d. A form of accounting;
e. About the inventory;
f. Methods of evaluation of certain types of assets and liabilities;
g. Rules and workflow processing technology of accounting information;
h. The duration of the first reporting year, if the organization has acquired legal personality after October 1.

The work plan is funded from the list of accounts, the need for which is established for each facility records. It includes accounts of varying degrees of detail and generalization within the current accounts of the Model Plan, approved by the Ministry of Finance of the Republic of Kazakhstan May 23, 2007.

The choice of accounting policies depends largely financial - economic stability of the organization.

The main normative documents regulating the principles of the formation and disclosure of accounting policy for accounting purposes, is a NOFA 2, approved by order of the Minister of Finance of the Republic of Kazakhstan (2007). This Standard is part of a system of regulatory accounting in the ROK, and shall be applied subject to other regulations on accounting. Procedure for making an accounting policy is also regulated by the Law of the Republic of Kazakhstan dated February 28, 2007 "On accounting and financial reporting."

In the development and approval of accounting policies Lombard organization has two main objectives: consolidation of selected methods of accounting, regulation (at the level of internal regulation), the maximum possible number of elements of accounting, including the organization of documents, organization of the accounting department, the organization of interaction with the accounting department other units and with the governing bodies and staff.

Existing regulations on accounting organization represented several ways of accounting for certain areas. Organization, based on the characteristics of economic activity, choose for yourself one of several ways to account for changes in the economic processes under the current legislation and regulations. If the regulations do not provide a method of accounting for the specific issue of its economic activity, it develops its own and reflects in its accounting policy.

3   CONTENT OF THE ORGANIZATION'S ACCOUNTING POLICIES LOMBARD
The accounting policies Lombard organization should include:
a. A working chart of accounts (with a synthetic and analytical accounts that the organization will use in their work);
b. Forms of primary documents used by the organization;
c. Procedure for making an inventory of assets and liabilities of the organization;
d. Methods of valuation of assets and liabilities;
e. Rules of documents;
f. Procedure for monitoring business transactions, etc.

Enterprise in Turbulent Environment

Accounting policy for tax purposes - is required to organize the rules under which taxpayers summarize information about their business operations during the reporting (tax) period to determine the tax base.

It should be noted, certain accounting policies used tool for tax planning and can within certain limits, to adjust the tax payments. The accounting policies gives the taxpayer an opportunity to systematize and consolidate in one document the methods and means which he deems it necessary to apply when calculating taxes.

Procedure for approval and the application of certain accounting policy for tax purposes is set in Chapter 7 of the Tax Code of RK (On taxes and other obligatory payments to the budget, 2008).

Accounting policy is accompanied by its activities since its inception and until the liquidation and changes only in exceptional cases. In the Tax Code of RK are two things that change and (or) amendments of the tax accounting policies:

1) approval of a new tax or accounting policies of the new accounting policy section, developed in accordance with International Financial Reporting Standards and the requirements of the legislation of the Republic of Kazakhstan on accounting and financial reporting;

2) changes and (or) additions to the existing tax or accounting policies section of the current accounting policy, developed in accordance with International Financial Reporting Standards and the requirements of the legislation of the Republic of Kazakhstan on accounting and financial reporting (On taxes and other obligatory payments to the budget, 2008; Article 60, paragraph 5).

Because the loans to the lombard to individuals, organizations are financial investments. Given the requirement of materiality in reporting Lombard organization shall be disclosed the following information:

− Ways to evaluate investments in their decision to embrace and disposal;

− The consequences of changes in methods of evaluation of financial investments in their retirement;

− The value of financial investments for which the current market value is not determined;

− The amount of reserves established for impairment of investments, indicating: the type of investments, the amount of provision created in the year, the amount of provision, recognized operating income of the reporting period, the amount of reserves used during the year.

Organizations lombard unit of financial investment is a loan granted to one person, confirmed the agreement of pledge and the pledge card.

In accounting, the value of financial investments are carried at historical cost in the account in 1110, "Short-term loans granted" in the amount of loans granted to an individual. In the off-balance sheet account "Provisions for liabilities and payments received."

Investments in accounting are recognized in the amount of loans granted, and the mortgaged property - on the appraised value.

During the disposal of investments - Redemption of mortgaged property, or the implementation of unclaimed deposits - are written off in the amount of loans issued.

For loans issued by the current market value is not defined. Therefore, investments in lombards be reflected in the accounting records and financial statements of the reporting date at cost, ie the size of loans issued.

Provision for impairment of investments is not created because a significant reduction in steady track of loans impossible.

According to the Law of RK № 234 - III «On Accounting and Financial Reporting," all business transactions conducted by the organization, supporting documents must be filed. These documents serve as the primary accounting documents, which is based on accounting.

Primary records are accepted for registration, if it is in the form contained in the release of standardized forms of primary records and documents in a form which is not provided in these albums should contain the following mandatory details:
a) The name of the document;
b) The date of the document;
c) The name of the organization on whose behalf the document is drawn up;
d) The maintenance of business operations;
d) Meters business operations in the physical and monetary terms;
e) The name of the persons responsible for committing operation and accuracy of its registration;
g) The personal signature of such persons.

Lombard organizations perform a specific activity, lending to individuals, so many business transactions, provided the main activity, there are no standardized forms.

Order of the accounting policy must contain a list of forms required for current operations, based on this in the order of the accounting policies Lombard organizations must have contained the following primary documents and records:
− A pledge card;
− The act of reception and transmission of unclaimed collateral material from the responsible persons at the auction in which the mortgaged property is reflected in the two estimates - the mortgaged property at the appraised value and the size of loans granted;
− The protocol of the results of trading, which covers information on each ticket as collateral in the two assessments and provides information about the buyer of mortgaged property;
− Inventory list of mortgaged property - the value of collateral is reflected in the two estimates - on the appraised value and the size of loans granted;
− Records of the commodity researchers, cashiers daily;
− Statement of accounting mortgage notes.

In the accounting policy for tax purposes lombard organization reflects the order of tax accounting in accordance with the rules defined by Chapter 7 of the Tax Code. Annexes to the accounting policy for tax purposes shall form tax accounting registers and the procedure to incorporate the analytical data of tax accounting, data source documents developed by the

lombard - the taxpayer itself. Tax and other authorities may not install the required forms to taxpayers, tax accounting documents.

To date, the legislation does not clearly defined composition and structure of the accounting policy for taxation purposes.

To avoid duplication of regulations, rules, regulations, techniques, methods used in accounting and taxation, in the preparation of the accounting policy for accounting and tax accounting, it should be allocated in two separate sections: the first - according to the rules of accounting, the second - on the tax accounting rules.

In the accounting policy for tax purposes should reflect the organization of Lombard method for determining the values that form the tax base (the methodological techniques and methods of tax accounting), and the general procedure of tax accounting (organizational - technical methods of tax accounting). At the same time applications to accounting policy for tax purposes shall be approved analytical form of tax accounting registers, which the lombard - the taxpayer is developing its own. In NK RK contains a direct reference to the need to reflect the accounting policy for tax purposes, the taxpayer applied methodological techniques and methods of tax accounting (the order of recognition of revenues and expenditures, special rates, limits and other expenses) as a required element of policy.

In the NC of RK also provides methods, rules and methods, which are bound by the reflection in the accounting policy for tax purposes is not installed. The taxpayer may identify those provisions of their own, which he will include in its accounting policy for tax purposes, along with elements of accounting policies (On taxes and other obligatory payments to the budget, 2008) Chapter 7.

In the accounting policies of organizations need to identify the lombard and consolidate the concept of "income." Income in the lombard organizations are remuneration (interest), accrued on the principal activities: interest on the loan, interest on loan for the second month, pay for storage.

In the formation of accounting policy in organizations lombard for value-added tax should be in accordance with Article 231 of the Tax Code to indicate the time of determining the tax base for the implementation of services for mortgage transactions.

Organization of the lombard, established in the accounting policy for tax purposes, the time the tax base upon receipt of funds - the day of payment for services - will be forced to maintain separate accounting and tax accounting.

Economically feasible in the accounting policy of lombards to provide for separate accounting of transactions taxable and not subject to VAT. The major share of income lombard interest on the loan amount and interest on the loan for the second month. According to the Tax Code of RK remuneration received money under the contract of loan shall be exempt from value added tax.

If implementation is not redeemed liens at public auction, the lombard shall be obliged to show financial results for each lot, as under the Civil Code, the amount exceeding the debt to the lombard must be returned to the client or, if the amount received for sale of the pledged

property is insufficient to fully meet the requirements of Lombard to the mortgagor, then the pawn receivable arises, unreal to recovery, which is taken into account when calculating the tax base for income tax.

4 CONCLUSION

In conclusion, the formation of the optimal accounting policy in Lombard organizations to manage financial resources of the lombard, to influence the formation of tax liabilities to the budget of the organization and affect the procedure for calculating taxes.

Alexander Kozhevnikov
National State University Higher School of Economics - Perm, Russia
a.d.kozhevnikov@gmail.com

ABSTRACT
Due to high dynamics of change in modern socio-economical environment, companies have to generate new methods of responsiveness to arising challenges. One of the ways to gain sufficient competitive advantage is quality orientation. Although Kaizen is deemed to be one of the core elements of quality improvements, its modern impact is being underestimated. Four basic components of the philosophy - essence, innovation, personal and quality control allows to frame an integrated quality system which will lead to performance improvement. Arising discussion is formulated as following - how to implement these four elements into organizational structure. The central contribution and novelty of this paper is a contemporary integrated approach on improvement internal organizational processes on the basis of Kaizen. The study uncovers several conceptual blocks: theoretical basis of Kaizen philosophy, comparative analysis of methods to implement Kaizen in organization; development of method to implement Kaizen concept, evaluation of «Kaizen effect». The research adopted case study method, collecting data from various sources - documentation investigation, structured questionnaire and interviews - in order to ensure its representativity. The paper would be useful not only for scientists discovering modern Kaizen impact, but also for experts willing to implement kaizen philosophy on practice.

Keywords: *Continuous improvement, Kaizen, Performance of organization, Quality, Quality-oriented strategy*

1   INTRODUCTION

In late 70's American companies faced fierce competition emerged due to the change of essence of the market - corporation «Ford» lost more that 3 billion dollar in 3 year period; «Chrysler» had to borrow money from the US government to evade bankruptcy; «Xerox» lost half of their markets (Imai, 2005). After some time it became obvious that competitive advantages of the new market leaders lie in the sphere of new kind of management. Core characteristics of the new approach became involvement, quality, statistical control of processes and others - Kaizen.

Despite the fact that Kaizen concept has not been developing for a long time, elaboration of Kaizen ideas gained especial actuality in the context of global economic crisis and understanding that not always new methods of management allow to attain maximum results.

A growing interest to the concept has been noticed nowadays - fundamental ideas and mechanisms of Kaizen concept are being used as a basis for quality standards development (for instance ISO 9000, ISO 10000 (http://protect.gost.ru/document.aspx?control=7&baseC=6&page=2&month=3&yaer=2009&

search=&id=174286), ISO 21500:2012). Moreover, Northern Europe commitment to ideas of continuous improvement should be marked - for example, «Volvo» company is one of the word leaders in the sphere of Kaizen ideas appliance.

Although Kaizen concept has strong theoretical framework, the concept has not explicit guidance on how to adapt it on practice. Due to this fact the aim of the papers was formulated as following:

Aim of the work is projecting of a complex approach to internal processes (involved in organizational quality management system) improvement on a basis of Kaizen concept.

A related series of targets was formulated in concordance with the set aim:
- Reviewing of Kaizen concept theoretical basis, accentuation of its fundamentals;
- Comparative analysis of Kaizen concepts implementation approaches into organization;
- Development of an algorithm of activities to Kaizen concept implementation into a particular organization;

The central contribution and novelty of this paper is a contemporary integrated approach on improvement internal organizational processes on the basis of Kaizen. The study uncovers several conceptual blocks: theoretical basis of Kaizen philosophy, comparative analysis of methods to implement Kaizen in organization; development of method to implement Kaizen concept, evaluation of «Kaizen effect». The research adopted case study method, collecting data from various sources - documentation investigation, structured questionnaire and interviews - in order to ensure its representativity. The paper would be useful not only for scientists discovering modern Kaizen impact, but also for experts willing to implement kaizen philosophy on practice.

2 REVIEW OF THE LITERATURE AND THEORETICAL FRAMEWORK

Since 1986 management as a science has been undergoing sufficient changes. A legendary book, which has changed the vision of managers on how to run their business was published that year. A book written by Masaaki Imai «Kaizen: the key to Japan's competitive success» became a foundation for further development of a new managerial concept based on continuous improvement and quality orientation.

2.1 Basic elements of continuous improvement concept

Analyzing theoretical basis of the considered theory it is possible to assume that Kaizen concept as a «system of systems» could be presented as an interrelation of elements. Structural relation between core elements of such a system is presented on figure 1.

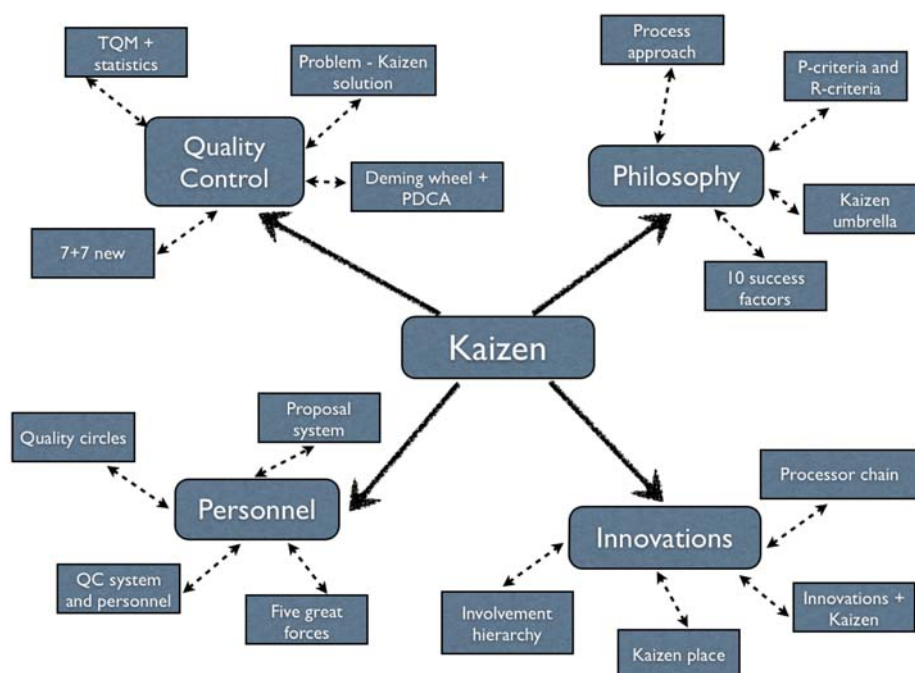
Enterprise in Turbulent Environment


Figure 1: Kaizen concept

- Kaizen philosophy - general insight into the concept of continuous improvement (http://www.kaizen.com/publications/total-flow-management-book.html; Imai, 2004), process approach (Laiker, 2008; http://www.12manage.com/methods_forrester _system_dynamics.html), Kaizen-thinking (Imai, 2004; http://www.emeraldinsight. com/journals.htm?);
- Improvement and innovations - allows to perceive the distinction between innovative development of a company and a continuous improvement oriented strategy with innovation accent (Imai, 2005; Imai, 2004; Wickens, 1987);
- Kaizen and quality control - considering TQC not only as quality control for a product/service but also as a basis for all of the organizational directions of development (Imai, 2005; Robinson, 1990; Wickens, 1987);
- Kaizen and personnel system - a core attribute of efficient organizational performance in the terms of considered concept is coherence between quality control and proposal systems (Imai, 2005; Imai, 2004; http:/www.juse.or.jp/e/; www.questia.com/PM.qst?a =o&d=5000136355).

2.2   Implementation of Kaizen concept

Based on a constructed theoretical basis central elements of Kaizen concept are: philosophy, innovations, quality control and personnel. Modern scientists propose four different approaches of continuous improvement concept implementation: parallel, integrated, coordinated, project.

Parallel approach – improvements are implemented parallel and separately from common activity of the company (http://www.emeraldinsight.com/journals.htm?articleid=850716 &show=abstract; www.tandfonline.com/doi/abs/10.1080/09544120020010084).

Improvements are analyzed and implemented by experts or small groups (including cross-functional teams and project groups with limited involvement into operations) (www.emerald insight.com/0025-1747.htm; Docherty, 1996). Advantage of the approach is transfer of knowledge provided by cross-functional teams. Weak point of the approach is limited involvement of experts.

Integrated approach – improvements are part of everyday activity (http://www.emerald insight.com/journals.htm?articleid=850716&show=abstract; Sako, 2004).

Improvements are analyzed and implemented by operators (individually or in groups). Strength of this approach is that autonomy of operators allows attain higher level of freedom in implementation of changes and stimulates knowledge transfer as a part of everyday job (Ellstro¨m, 2000; http://oer.guenther.ws/node/4).

Coordinated approach – summarizes integrated and parallel approaches and combines experts-driven cross-functional teams for temporary projects and self-managed changes as part of everyday job (www.emeraldinsight.com/1756-669X.htm).

Project approach – some improvements are viewed as projects. Every project has limited time bounds and a point of beginning and ending (Krishnan, Shani, Grant and Baer, 1993). When an improvement is viewed as a project there is a certain risk that if first results would not give sufficient changes - priority of a projects would be lowered (www.emeraldinsight.com/1756-669X.htm). In the context of Kaizen process of changes is perceived as a future-oriented continuous improvement therefore its results could be evaluated only after period of time.

In the considered context one of the most interesting papers is D. Swartling and D. Olausson "Continuous improvement put into practice: alternative approaches to get successful quality program" (www.emeraldinsight.com/1756-669X.htm). In the article authors used case analysis to educe differences in implementation of the four approaches.

Furthermore, papers of great importance on the topic are Lindberg and Berger (1997, 2001) (http://www.emeraldinsight.com/journals.htm?articleid=850716&show=abstract; www.tandfonline.com/doi/abs/10.1080/09544120020010084). In the articles the authors explored implification of Kaizen philosophy as a basis of quality system performance in organization and different approaches for its implementation.

3   METHODOLOGY
Arising question is as following - how to combine advantages of different approaches and to turn improvement process in an organization into a continuous process. According to D. Swartling and D. Olausson results (www.emeraldinsight.com/1756-669X.htm) the most efficient approaches to implementing continuous improvement into a company are parallel and integrated approaches.

 In our paper a new concept that combines characteristics of parallel and integrated approaches will be presented. In Berger (http://www.emeraldinsight.com/journals.htm?articleid=850716&show=abstract) coordinates («basic constructions of task realization» and «task of improvement») a new concept called «combined approach» is located in the same position as coordinated approach - figure 2.

Figure 2: Combined approach in terms of Berger concept coordinates

Core characteristics of the developed concept are:

1   Initial participation of a team of experts as a new element of organizational structure which and transformation into a cross-functional division at a later stage. A new division will act as a permanent «generator of improvement» in organization;

1.1 Participation of experts allows making objective evaluation of processes and overall situation in organization (parallel approach);

1.2 Enjoyment of highly professional experts allows solving complicated problems, which can not be solved by internal organizational resources (parallel approach);

1.3 Formation of a cross-functional improvement generating team (parallel approach).

2   Groups of continuous improvement realize classical Kaizen function. These groups continuously improve processes of their direct influence;

2.1 High level of involvement and motivation of personnel allows achieving continuous process of improvement in organization (integrated approach);

2.2 The groups can independently initiate, plan, implement and evaluate improvement in organization (integrated approach);

2.3 Availability of «cancel of improvement» - members of a group can return to primary standards and patterns without sufficient loss if an improvement does not introduce expected results (integrated approach).

4   RESEARCH METHODS

To analyze the implementation of developed model case method was selected in the work. Case study was conducted on a basis of regional Russian IT company - LLC «Instar Technology». Instar Technology is a regional IT system integrator operating in Perm krai. Number of employees of the company is 75 people. Analysis was conducted in several stages:

- Content analysis of basic strategic documents of the company to educe their compliance with kaizen philosophy: mission, strategy, commitment to excellence, structure of the company;
- General analysis of quality system in the company - quality documents of the company (particularly ISO 9001:2008 certificate) were analyzed;
- Several in-depth interviews (3 interviews with members of the board of management,

7 interviews with managers of functional departments). The interviews accompanied by general analysis allowed to detect the center problem faced by the company;
- Random questionnaire survey of functional division employees of the company (number of respondents - 20 people)
- A «diagram of reasons and relations» was constructed on the basis of obtained results.

5 RESULTS

A critical task for LLC «Instar Technology» revealed in the process of in-depth interviews was formulated as following - transition of quality system in organization into continuous improvement stage. Main problems detected on the basis of in-depth interviews and a survey are absence of system development of improvement and high level of involvement of board of managers into direct control of business processes in organization. Pareto diagram was constructed to understand the reasons of educed problems - chart 1.

Department managers: delegacy skills underdevelopment
Department managers: can not solve complex problems quickly without engaging of higher level of management
Innovation development is driven mainly on the board of management level
Leadind experts of departments: conflict solving skills underdevelopment
Inefficient intercommunication of departments

Chart 1: Pareto diagram for LLC «Instar Technology»

Improvements in the organization are not system due to the reason that «quality control department» mechanism was declined by organizational structure therefore improvements are driven mainly by board of managers. This situation reveals weak points of parallel approach because quality control department was designed by external consulting company. The arising problem can de solved by projecting of alternative mechanisms, which will be organic for the company and will encourage improvement development on a system basis.

5.1 Development of Kaizen concept for LLC «Instar Technology»
The company made a decision to create a new software department, which is cross-functional because experts of the department directly interact with all the other departments of the organization. Software department was selected as a potential expert group of improvement

implementation due to the following reasons:
- Flexibility of the department operational behavior because it is yet not strictly built into organizational structure and interactions;
- Possibility of in-depth interviews and targeted guiding seminars due to the paucity of personnel of the department;
- Cross-functional type of interaction with other departments.

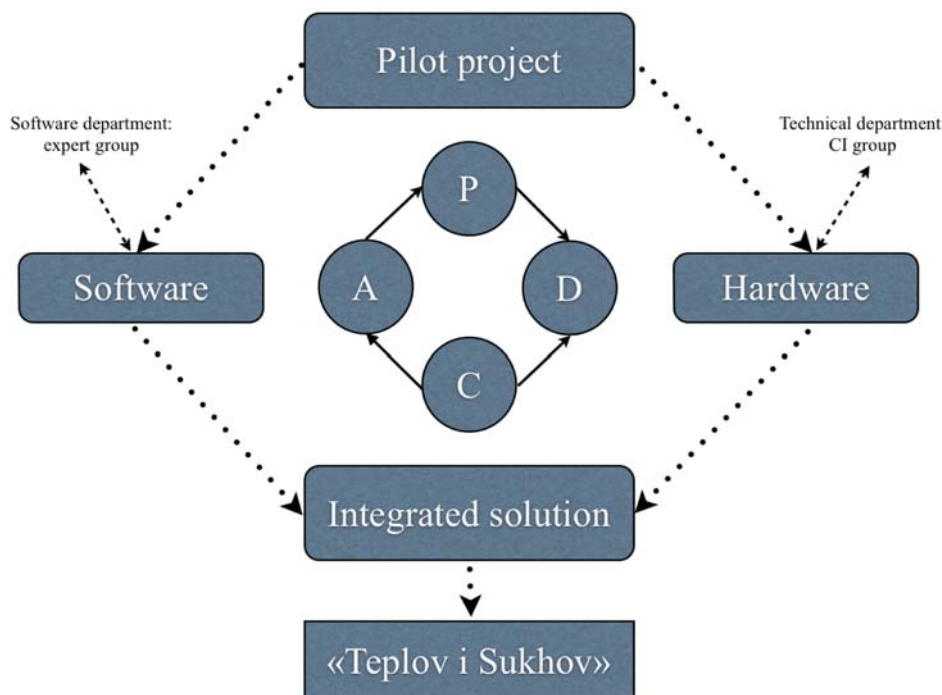
Concept of continuous improvement implementation for LLC «Instar Technology» is embodied in initiation of a pilot project through interaction of technical and software departments. Interaction of the two departments leads to creation of a unique product that is oriented on a particular client. The product is called «an integrated solution» and is a combination of software and hardware components. At the moment LLC «Instar Technology» intends to realize an integrated solution for LLC «Teplov i Sukhov» (figure 3).


Figure 3: Combined approach of Kaizen concept implementation for LLC «Instar Technology» on a basis of realization of integrated solution

An integrated solution is a completed cycle and demands continuous improvement, refinement and specification on every stage of production. Due to that reason special recommendations on how to form the idea of continuous improvement in software and hardware departments have been proposed:

Stages of integrated solution concept realization:
1. Formation of common information field where experts from both departments in the process of communication could optimize chosen methods - both hardware and software;
2. Creation of an expert group of continuous improvement concept implementation in the software department. In the pilot project the expert team would be oriented on software sphere - specification of software in accordance with the need of the client on the basis of PDCA cycle, process thinking during development of the integrated solution);

3. Creation of continuous improvement group in technical department, which will help to find optimized hardware solutions for the need of the client and to improve processes of equipment assembly;

4. Discussion on the solution's integration in the common information field (everyday meetings). Two-way interaction in the case is the key factor of success due to the reason that it allows to optimize process of integrated solution development and to bring it into maximum compliance with the customer's requirements;

5.2 Expert groups of software department

It is proposed to hire an external expert in the sphere of continuous improvement and business process engineering. Furthermore, it is strongly recommended to find an expert with coaching experience in order to stimulate transfer of knowledge to other departments. Personnel of software department will attain competencies and skills of process thinking, PDCA cycle, continuous improvement during team-work and seminars with the expert. Therefore software department personnel would become a «generator of improvement» in the project of integrated solution development. A new task will be set for software department experts when the project will be finished - transfer their knowledge throughout the organization (which will be realized through cross-functional interactions and series of seminars).

5.3 Continuous groups of technical department

It is proposed to use similar method as quality circles. Special meeting among the group of technical experts (3-5 people) would be organized in order to discuss directions of improvement of the project from technical point of view. After that transfer of knowledge will proceed throughout the technical department. Also it is planned to introduce proposal system and to change motivation system in order to stimulate improvement in organization.

6 FINAL CONSIDERATIONS

Implementation of Kaizen concept in the organization is divided into two directions: expert group's competencies formation from one side and creation of continuous improvement groups, explanation of Kaizen concept and lower level personnel involvement from the other side. Moreover, modernization of interrelation system between board of managers and personnel, division of innovation and maintenance functions. Final considerations on how to launch an initiative impulse of continuous improvement in the organizations are presented in table 1.

Enterprise in Turbulent Environment

Table 1: Kaizen strategy - combined approach for LLC «Instar Technology»

Kaizen		Philosophy	Innovations	Personnel	Quality Control
Management		Seminars + training	Division of innovation and maintainance functions + training	Five forces of relations between an employee and organization	Seminars + training
Group	Experts	Seminars + training	Seminars + training	Seminars + training	Seminars + training
	CI	Explanation of Kaizen concept	«Classical Kaizen»	Proposal system	Creation of Continuous Improvement groups
Individual		Explanation of Kaizen concept			

7 FURTHER DISCUSSION

Implementability of Kaizen concept on a basis of combined approach for LLC «Instar Technology» was analyzed in the article. First stage of Kaizen concept implementation for the company was also proposed. In the aggregate it is possible to start implementation of Kaizen concept on the basis of current quality system in organization. Expert team that provide training and organize Kaizen seminars subsequently become an organic part of organization and stimulate continuous improvement. Experience gained during realization of pilot project will allow to evaluate the effectiveness of the concept and conclude on advisability of developed mechanisms' scaling enterprise-wide.

Adaptability of developed concept depends on the degree of implementation because Kaizen concept presume complex integration. Separate elements of the system will introduce improvements into organization. However, only four Kaizen elements: philosophy, innovations, personnel and quality control on three concept levels (management, group, individual) allow attain synergy in department interaction and a company will actualize its own «Japanese wonder».

ABSTRACT
In the current socio-economic conditions the level of conflict and work stress in the workplace increases. This is due to different economic, social, demographic and psychological reasons, one of which is the lack of an adequate level of conflictological competence among managers of the organization. However, organizational conflict management skills in the workplace are an important management tool for a manager, as a conscious application of the principles, methods and technology helps to shape and develop the human resources of an organization. The purpose of developing the technology of conflictological training as part of the skill development training is defined as the rationale for formation of an integrated management tool of conflictological competence of the managers and staff of the organization. Programs for conflictological competence of managers and staff of the organization should be comprehensive and allow organizations to choose a variety of management and teaching techniques for major components of conflictological training. Prevention of social and labor conflicts should be aimed at creation of the institutional conditions that minimize the occurrence of destructive conflicts in the organizational and management environment, and based on a comprehensive diagnostics of specific characteristics of the organizational environment and interpersonal relationships in the team. Effective methods of conflicts prevention in an organization are the following: organizational-managerial methods of conflicts prevention, aimed at optimization of activity of organizational and management structure; psychological methods of interpersonal conflicts prevention. Efficiency of this work on conflicts management should be assessed according to dynamics of indicators of employees' readiness to constructive solving of organizational and interpersonal conflicts. Prevention of occupational stress is a system of agreed measures, aimed at development and implementation of the program for prevention of occupational stress among employees as well as further monitoring of the results.

Keywords: Conflictological competence, Occupational stress, Organizational conflict

1 INTRODUCTION

In the current socio-economic conditions the level of conflict and work stress in the workplace increases. This is due to different economic, social, demographic and psychological reasons, one of which is the lack of an adequate level of *conflictological competence* among managers of the organization. *Organizational conflict* management skills in the workplace are an important management tool for a manager, because managers' activity

is always connected with solving of various workplace problems, which can take the form of destructive occupational conflicts, influencing on socio-economic efficiency of an organization activity. Management practice vital demand for development of conflictological competence among organization employees is determined by the following factors:

- poor formation of managers and employees' objectives concerning formation of conflictological competence;
- no complex organizational and methodical guides, ensuring realization of conflictological competence formation;
- uncertainty of organizational and psychological conditions for realization of this process etc.

Development of scientific and methodical and organizational and methodical guides, ensuring realization of conflicts management technology, is the main task of this research.

2 FORMATION OF CONFLICTOLOGICAL COMPETENCE IN THE PROCESS OF MANAGERS" PROFESSIONAL TRAINING

The issues of formation of conflictological competence among organization's managers and employees, creation of technology for conflicts and stresses management, focused on prevention of destructive organizational and social-labor conflicts are relevant.

An opinion poll (2008–2012) was held in the process of this investigation; 15 managers of various Samara region industrial enterprises and organizations participated in this survey. Representativeness of the judgment-based selection was assured by various directions of activities of the investigated organizations (industrial enterprises, state and municipal establishments, agrarian organizations, medical and educational institutions). Alumni of the engineering-economic faculty of the Samara State Technical University were the second group of respondents in the frame of the investigation. 93 alumni were quizzed in 2008–2011. Students of the engineering-economic faculty of the Samara State Technical University were the third group of respondents. 117 2,3,4-year full-time students were quizzed. So, 165 people from these three groups were surveyed in the frame of this part of an experiment.

The study was undertaken by means of questionnaire survey, the authors used the methodic of K. Staroverova. Every group of respondents was offered to answer the questions in the questionnaire, which offered to assess the necessity of conflictological competence for manager's professional activity. For the purpose of substantiation of necessity of conflictological competence for a manager, alumni and managers were offered to evaluate the significance of conflictological knowledge and skills for their professional activity. The results, received concerning this issue, are represented in Table 1.

Table 1: Evaluation of significance of conflictological competence for managers' daily professional activity

Types of knowledge and skills	4-5 year SamSTU students		Alumni of IEF of SamSTU		Managers of organizations	
	Average score	Gave more 3 scores, %	Average score	Gave more 3 scores, %	Average score	Gave more 3 scores, %
Knowledge and skills in the field of organizational conflicts diagnostics	4,4	80,3	4,3	84,5	4,5	85,3
Knowledge and skills in the field of prevention the occupational, working and job stresses	4,2	74	4	72	4,4	82,3
Knowledge and skills in the field of managing the organizational conflicts and occupational stresses	4,4	85,2	4	80,5	4,2	85
3 Knowledge and skills in the field of taking measures in the frame of anticonflict program	4,3	77,5	4,5	91	4,7	87,1

The questionnaire results show, that knowledge and skills in the field of organizational conflictology play an important role for professional activity of alumni and managers of organizations. Skills in the field of organizational conflicts diagnostics as well as in the field of management of organizational conflicts and occupational stresses have the highest rates from the standpoint of relevancy. All the groups of respondents were asked the following question: Which knowledge and skills in the field of conflicts management in an organization must manager have. 85% of students, 77% of alumni and 73% of managers said that the following knowledge and skills are among the vital ones: knowledge of basics of occurrence and resolving the labor disputes and organizational conflicts in work collective and ability to put this knowledge into practice; ability to prevent professional deformation and professional burnout among employees.

As for important skills, the managers and alumni also mentioned ability to manage conflict process and correction their behavior in the process of conflict; mastering the technology of mediation activity for solving the conflict situations, taking into consideration individual and psychological characteristics of business and interpersonal communication. Answers of alumni and managers to a question: "In what sphere would you like to improve your knowledge and skills?" are turned out to be significant. Almost all the alumni (84%) and every second manager (54%) would like to improve the level of their conflictological competence (54%). In the process of discussions with alumni it was discovered, that nowadays enterprises need competitive, initiative, competent, stress-resistant and

communicative managers, who are able to analyze conflict situations and reach managerial decisions. Discussions with employers has shown, that modern organization needs highly qualified specialists, who are able to self-evaluation and ready to research work; they also must be conflict-resistant and focused on professional and personal development. To achieve the goals of an organization one should constantly pay attention to the fullest disclosure of individual and personal abilities of employees and their rational use; and to assure this one should provide organizational conditions for vocational education and development of organization's managers and employees.

Special conflictological training and formation of employees' conflictological competence allows them to fulfill their professional duties under more favorable conditions. System of personnel education and professional development fulfills series of functions, assuring growth of human resources value and quantitative worthiness as well as sustainable competitiveness of an organization. Conditions, needed for providing the corporate training, are the following: availability of long-term organization's development strategy; formation of active personnel policy on the base of organization's development strategy; providing of professional HR service; systematic investments for personnel development; participation in work on system for top managers' professional training and development.

In 2010–2011, the authors of this research held an opinion poll among 5 year students and alumni of engineering-economic faculty of the Samara State Technical University. The aim of this research was clarification of the respondents' opinions (120 respondents) concerning efficiency of various modes of study. Analyses of the respondents' answers has shown, that traditional modes of study (lectures, seminars) have got the lowest appraisals among all the groups of respondents as opposed to the modes, better activating creative and searching activities of students. The highest results deserved active modes of study, implying maximal practical use of knowledge, gained in the process of learning of conflictology.

So, in the process of managers' conflictological training one can use four groups of methods, related to stages and levels of team working:
- methods for providing the positive motivation (consideration of personal educational achievements, providing the psychologically comfortable learning environment);
- methods for organization of interactive and cognitive as well as practical activity of a student (discussions, solving tasks on the base of analyses of particular situations, preparations of presentations and reports, research and development projects);
- reflexive and estimating methods (analyses of control, intercontrol and selfcontrol results, diagnostics of difficulties, connected with education);
- methods for development of personal educational milieu (attracting the personal experience of a student, practical orientation, working with additional sources of information).

Personnel conflictological training, focused on formation of conflictological competence, encourages development of professional knowledge and skills of employees; and this, in its turn, encourages the growth of competitiveness on the job market and increases the value of organization's workforce capacity. Personnel's training gives an opportunity to find out potential leaders and form a candidate's pool.

2.1 Methods

In the process of this investigation the following group methods were used:
- theoretical and constructive methods: analyses and design, comparison, modeling, classification;
- empirical methods: particular methods (direct, indirect and participant observation, polling, discussions, testing, generalization of independent characteristics);
- methods of mathematics-statistical data processing.

2.2 Results

In the result of empirical study, the mechanisms of formation of organization employees' conflictological competence have been revealed. Study materials are destined to help managers of all levels to find out and prevent destructive organizational conflicts.

3 RECOMMENDATIONS

Realization of the proposed technology should be followed by creation of favorable organizational conditions, encouraging efficiency of process of managers' conflictological training. The main direction for realization of this technology should be creation of organizational conditions for professional training and development of personnel. Programs for formation of conflictological competence among organization's managers and personnel should have complex character and allow organization to create different managerial and pedagogical techniques and tools according to the main components of conflictological training and with clearly predefined expected results.

4 CONCLUSION

The authors set the further research tasks:
1. Develop purpose-oriented program for formation of conflictological competence.
2. Reveal organizational conditions, encouraging formation of employees' positive attitude to realization of technology for organizational conflicts management.

ABSTRACT
The Balanced Scorecard (BSC) of the firm's human capital, which considers Russian special features of industrial firm's development and based on the process approach, has been proposed. The model, developed by the authors, involves firm's financial indicators, quantitative and qualitative indicators of the human capital, economic indicators of the human capital and firm's marketing metrics. The model is characterized by the following principles: complexity, purpose correspondence and specificity.

Keywords: Firm, Human capital, The Balanced Scorecard

1   INTRODUCTION

Modern development of economics proves that people play a very important role in a *firm* and forms the concept "*human capital*". Using the concept "human capital", introduced by T. Shultz and G. Becker (1975) in 50–60 of the XX century into terminology of economical analyses, in this work we try to make it more specific and define it as "firm's human potential" as well as to create a scorecard for human capital evaluation in the frame of a firm.

2   THE BALANCED SCORECARD OF THE FIRM'S HIMAN CAPITAL

The information period, appeared in second half of the XX century, has led to changing the measures of efficiency evaluation and creating a new scorecard; Robert S. Kaplan и David P. Norton were the authors of this scorecard. *The Balanced Scorecard* (BSC) was developed in 1990–1992; now it is improved and used by many companies throughout the world (Norton and Kaplan, 2010). First and foremost, it is based on the following: comprehensive consideration of various changings for purposes of a firm and increase of human role in a firm.

Using content analyses and questionnaire survey, the authors discovered which instruments and technologies are used for assessment of firm's human capital and efficient from the standpoint of management of Russian firms (Table 1).

Table 1: The most important instruments and technologies for assessment of firm's human capital (the poll's results of managers of Russian firms, 2012)

Method of assessment	Number of responds	Arithmetic mean	Median	Standard deviation
Budgets	151	4,50	5,00	2,20
Analyses of deviations	148	4,14	4,00	2,02
Continuous forecasting	147	4,75	5,00	1,92
Strategic management account/controlling	148	4,92	5,00	1,91
BSC	138	3,68	4,00	1,81
ABC	150	4,99	6,00	1,97
VAA	148	3,79	4,00	2,05
EVA	145	3,83	4,00	2,05
Total quality management	150	4,67	5,00	2,00
Standard costing method	145	3,62	4,00	2,04

Response dispersion in importance of the technologies is much the same and vary between 1,81 and 2,20. It means that no technology dominates over other technologies.

From our point of view, BSC has been undervaluated because respondents don't know enough about it. The first publications appeared in Russia only in 2002 (Nikolaeva and Alekseeva, 2010). Meanwhile it is very useful, because it allows better agreement of current interests and goals of the main business participants. Many respondents considered it's necessary to combine several technologies.

According to our predictive estimation, in the coming years such technology as the Balanced scorecard in the context of the human capital as assuring and supporting resource will be most perspective for Russian firms for business development.

So, on the base of the Balanced scorecard, Fitz-enz proposed "the example of the Balance scorecard of corporate human capital", which includes financial indicators (profit from the human capital , expenses for the human capital, added value of the human capital, commercial value of the human capital) as well as "human indicators", such as percentage of employees with standard working day, percentage of part-time employees, indicator of increase in workforce, average percentage of profit from all the expenses for the workforce and investments in the improvement of employees (Fitz-enz, 2006).

"The example of the Balance scorecard of corporate human capital", proposed by Fitz-enz, contains specific indicators, which are not typical for Russia, such as "added value of the human capital", that's why it is not convenient to use its original version for assessment of the human capital in Russian firms. But it can be adapted and taken as a basis for the Balanced scorecard of assessment the firm's human capital, considering special features of Russia.

Its authors believe that one of the main conditions for successful use of BSC is availability of information for employees of all the levels. If top-managers must know what will lead the firm to long term financial success, then employees, communicating with clients, must understand the financial consequences of their decisions, concluded in the process of their duties performance. The aim of BSC is to transform the mission of the firm into certain measurable indicators. In such a case, keeping in mind the meaning of the system's name, the balance must be reached between external reported data for possessors (shareholders, state), consumers and internal characteristics of the most significant business processes, innovations, training and growth. For the modern firms BSC is not only tactical assessment system, it is also a tool of strategic management.

When forming the Balanced scorecard for assessment of firm's human capital, the authors based themselves on analyses and evaluation of contingence of commercial entities performance indicators. Contingence of indicators means particular and their magnitudes relation which is in compliance with general notions about progressive development or predetermined targets. Contingence may be direct or indirect, depending on cause-effect definiteness of the correlated indicators. As a rule, the indicators are in stochastic dependence (i.e. the dependence develops not in every case, it develops in general, considering a big number of investigations); this dependence is developing in the process of managerial monitoring of these indicators.

To reflect the operable linkage in the sort of "double loop" (Norton and Kaplan, 2010), the authors reveal dependences. Strategies in the field of development of the firm's human capital are derivatives of the firm's business-processes. The business processes are mediated by resources, which the firm possesses. The required resources are determined by indicators of the firm's activity results.

Taking all the before said into consideration, to define the indicators, composing the Balanced scorecard for assessment of the firm's human capital, it's necessary to take a complex of interdependent measures:

1. on the base of the expert poll, to reveal the indicators of the firm activities results, which are the most valued and required from the perspective of various groups of consumers, such as shareholders, particular commercial entities, branches of national economics as a whole;
2. on the base of the analyses of the business internal condition, to find out the resources, attracted for running of the firm as well as how these resources are used for realization of the business processes;
3. to assess the relationship between the resources, business processes and strategy in the field of the human capital development, taking into consideration three groups of relations:
   - indicators of results– resources;
   - resources – business-processes;
   - business-processes– strategies in the field of development of the firm's human capital.

Let's give a form to three groups of relations. If by X = (X1, X2, …, Xn) one symbolizes the indicators of results, by Y = (Y1, Y2, …, Ym) one symbolizes the resources, by Z = (Z1, Z2, …, Zk) one symbolizes business-processes, by C = (C1, C2, …, Cl) one symbolizes

strategies, then the relations, established between the selected groups can be posed by certain matrixes − {XY}, {YZ}, {ZC}, represented on figure 1.

Y Z *Matrix of resource use for the process realization*						**Resources of the firm**	*Matrix of indicator of results' XY dependence on characteristics of the resource*					
Z11	Z12	Z13	Z14	Z15	Z16	Human resources	X11	X12	X13	X14	X15	X16
Z21	Z22	Z23	Z24	Z25	Z26	Management competences	X21	X22	X23	X24	X25	X26
Z31	Z32	Z33	Z34	Z35	Z36	Intangible assets	X31	X32	X33	X34	X35	X36

Z61	Z62	Z63	Z64	Z65	Z66	Information resources	X61	X62	X63	X64	X65	X66

The firm's business-processes in the field of: Recruitment and adaptation; Estimation and attestation; Training and development; Motivation and stimulation; Formation of candidates pool; Internal PR

Human capital of the firm

Indicators of the firm's activity results: Work performance; Profit; Breakeven; Pay-off from investments to the human capital; Maximization of net assets; Enhancement of the commercial goodwill

Y11	Y12	Y13	Y14	Y15	Y16	Strategy 1	C11	C12	C13	C14	C15	C16
Y21	Y22	Y23	Y24	Y25	Y26	Strategy 2	C21	C22	C23	C24	C25	C26
Y31	Y32	Y33	Y34	Y35	Y36	Strategy 3	C31	C32	C33	C34	C35	C36
Y41	Y42	Y43	Y44	Y45	Y46	Strategy 4	C41	C42	C43	C44	C45	C46
Y51	Y52	Y53	Y54	Y55	Y56	Strategy 5	C51	C52	C53	C54	C55	C56
Y61	Y62	Y63	Y64	Y65	Y66	Strategy 6	C61	C62	C63	C64	C65	C66
ZC *Matrix of process's dependence on the type of the strategy*						**Strategy for development of organization's human capital**	**XC** *Matrix of indicator of results' dependence on the type of the strategy*					

Figure 1: Model of the Balanced scorecard for assessment of the firm's human capital

Arrows denote the connections inside the group; in cells of certain matrixes, the quantitative estimations of dependence level between indicators of results and resources, resources and business-processes, business-processes and strategies for the human capital development are sequentially specified on five-grade scale using the expert method.

To estimate the dependence between indexes of results and strategies in development of the firm's human capital, one determines the level of certain business-process's impact on formation of particular indicator of results through computation of weighted average mean of resources use rate in realization of this business-process, weighted according to the level of dependence on this resource characteristics of every indicator of results:

$$\{XZ_{ij}\} = \frac{\sum\limits_{k=1}^{m} YZ_{kj} \times XY_{ik}}{\sum\limits_{k=1}^{m} XY_{ik}} \tag{1}$$

where:

XZij – assessment of certain business-process's impact on formation of the particular indicator of results;

YZkj – assessment of resource use level in realization of the business-process;

XYik – assessment of the level of indicator of results' dependence on characteristic of resources

So, on the base of the received matrix, in the same way one defines the level of indicator of results' dependence on the strategy for development of the firm's human capital:

$$\{XC_{il}\} = \frac{\sum\limits_{j=1}^{k} ZC_{jl} \times XZ_{ij}}{\sum\limits_{j=1}^{k} XZ_{ij}} \tag{2}$$

where:

XCil – assessment of the level of indicator of results' dependence on the strategy for development of the firm's human capital;

ZCjl – assessment of the level of manageability of business-process strategy.

On the base of the received interdependent business-processes, resources, strategies and indicators of results, one reveals weight numbers of strategies for development of the firm's human capital:

$$Wl = \frac{Cjl}{\sum\limits_{j=1}^{l} Cj} \tag{3}$$

Wl – weight number of l strategy for development of the firm's human capital;

Cjl the sum of assessments of the level of indicator of results' dependence on 1 strategy for development of the firm's human capital;

Cj – the sum of assessments of the level of indicator of results' dependence on the strategy for development of the firm's human capital.

3   CONCLUSION

From the perspective of modern requirements to assessment of the *human capital*, the proposed model outstanding features are the following. Firstly, the realization of "complexity" principle is typical for this model; it means that both quantitative and qualitative components of *firm's human capital* as well as its impact on *firm's* financial indicators and its position on the market are analyzed. Secondly, the realization of the "purpose correspondence" principle, that is expressed in transformation of *firm's* strategic goals into operative goals and bringing them to particular performers. Thirdly, "specificity" principle is realized, because the model is developed subsequent to the results of content analyses of the reporting and current information, received in Russian industrial *firms*.

ABSTRACT
In the era of the new economy and in the time of economic crisis, higher education institutions are facing with various business problems. Everyday increase in the number of business schools intensifies competition in the market, and reduction of student's income affects most of business schools revenues. Due to these problems we need to find an answer to the question: how to attract potential students to our school? This paper wants to show one of the methods to attract potential students, i.e. clients of a business schools, and that method is improvement of promotional activities of the school. This paper presents the results of the empirical study (N = 600) in the period from the year 2008 to the year 2012. The study was conducted with students at Libertas Business College in Zagreb. The analyzed data provide us with information's and school requirements that are crucial for students' decision of continuing education at this College. The practical implications of the research are reflected in the acquisition of competitive advantages in the field of higher education.

Keywords: Competitive advantages, Entrepreneurship, Higher education, Marketing Promotional activities

1 INTRODUCTION

The role of knowledge and education in contemporary society has been considerably extended and conditioned by great expectations for the impact on development of the community. Given today's presence of the labor market and the market knowledge, the institutions of higher education are making the request for an increase in marketing orientation in their business (Šimić and Čarapić, 2007). Marketing is a two-way communication system and represents an analysis, planning, implementation and control of carefully developed programs aimed at achieving voluntary exchange in specific markets. It relies on the needs and desires of the target groups, effectively pricing, promotion and distribution in order to inform, motivate and serve the market (Kotler and Fox, 1985). Furthermore, marketing of education has assumed an increasingly important role both in the means of classic advertising (e.g., newspapers, billboards, radio, television), as well as a new means of communication through mobile telephony and information technology (e.g., text messages, web pages, social networks, email) (Kos, Trstenjak and Kralj, 2011). In education, the application of marketing activities has certain characteristics because the mission and objectives of the educational institutions, as nonprofit organizations, differ from the goals and objectives of profit

organizations (Mihanović, 2008). In other words, marketing of non-profit organizations is a set of activities that creates and facilitates planning, implementation, dissemination and communication of organizations that provide some specific public interest (Pavičić, 2003). Given that education has its educational function, which implies a certain behavior that we would like that target audience accept, marketing in education is defined by the following characteristics: the final product is in the form of intellectual services that is paid indirectly, promotion is usually by word of mouth and it consist of personal observations and expectations, the rational motives dominate over the emotional motives, once acquired loyalty to a particular educational institution is relatively difficult to abandon it (Meler, 1994).

Today in economics, as in other sectors, great attention is given to the concept of lifelong learning which has led to many countries, including the Republic of Croatia, to the establishment of new higher education institutions (Agency for science and higher education in Croatia, 2012). In order for those institutions to gain competitive advantage in the market, the knowledge and the accurate information about potential students / business clients is one of the basic requirements for the business. The aim of this paper is to show the ways of gathering information, by prospective students, about opportunities which studying at Libertas Business College gives to them.

2   PROMOTIONAL ACTIVITIES OF LIBERTAS BUSINESS COLLEGE

Libertas Business College is a private higher education institution, in accordance with the Bologna Declaration and the Croatian legislation, which is implementing professional study of economics based on the "3 + 2" system (e.g. studies of undergraduate business economics in the duration of three years, and graduate professional studies in the duration of two years). Professional Studies and Graduate Studies performed by Libertas Business College represent improved, streamlined and fully customized programs designed for specialized professional study groups of future economic experts. In order to successfully compete with other business schools Libertas Business College is using promotion as a method of introduction of the study programs to the new and prospective students. Promotion is any form of communication with the role of information, persuasion and / or reminding people about products, services, image, ideas and social inclusion, and includes a systematic decision-making of an individual or organization (Belch, 1988). Advertising is done through interactive ads in newspapers, television and radio spots, painting trams with Libertas Business College, posters, brochures, and a slogan "Knowledge is freedom". Every year, in almost every high school in Croatia, Libertas organizes presentations to seniors about possibilities and programs at the Libertas Business College. Furthermore, it organizes the "Days of open doors" in order that potential students could see the space, meet the teachers, talk to students and attend if desired specially organized lectures and workshops. Libertas Business College, together with its employees, presents itself every year at festivals of Zagreb University. As an indispensable channel of communication in the placement of information on opportunities to study, data collecting and interaction with potential students, Libertas is using the opportunities of the Internet and information technology. Internet and the website are a sort of permanent showcase of available information about the study and assisting in the collection of data (e.g. by registering online for the study) for potential students, and establishing further communication (e.g. sending various notifications by e-mail). Following the technological advances and social interactivity Libertas joined the popular social network Facebook in order to distribute relevant information's on an informal, accessible, quickly and effectively way.

3   ANALYSIS OF EMPIRICAL RESEARCH

This empirical research included 600 potential students while accessing entrance examination for the period from 2008 to 2012 (Table 1). In the survey carried by potential students, filled in the accession of the entrance examination, questions were enquired about the source of information that students have about Libertas Business College. In doing so survey offered the following answers which students needed to answer by circling: a) orally from current or former students of Libertas Business College, b) orally from teachers of Libertas Business College, c) orally from people who are not directly associated with Libertas Business College, d) from Libertas Business College at the presentation in my high school, e) by Internet, f) through fairs / festival, g) through flyers / posters, h) through newspapers, i) by radio, j) by TV, k) by any other means. Data collected by the questionnaire were analyzed by descriptive statistics and summarized in the following tables and graphics.

Table 1: Summary results for the number of respondents in the period from 2008 to 2012 (research by authors)

Year	Number of responders
2008	206
2009	113
2010	166
2012	115
Total	**600**

Chart 1 shows that 48.65% of the responders in the year 2008 identified the source of information about Studies at Libertas Business College as orally; 35,81% orally from present or former students of Libertas College, 1,35% orally from Libertas professors, 11,49% orally from people not directly associated with Libertas College. At second place responders identified Internet (27, 70%) as a source of their information about Libertas Business College, and at the third place is presentation at students' high school with 7, 77%.

Chart 1: Representation of the source of information about Libertas Business College among potential students in the year 2008 (research by authors)

Enterprise in Turbulent Environment

Chart 2 shows that 59.86% of the responders in the year 2009 identified the source of information about Studies at Libertas Business College as orally; 49,30% orally from present or former students of Libertas College, 1,41% orally from Libertas professors, 9,15% orally from people not directly associated with Libertas College. Again, at second place responders identified Internet (29, 58%) as a source of their information about Libertas Business College, and at the third place is presentation at students' high school with 4, 23%.

Chart 2: Representation of the source of information about Libertas Business College among potential students in the year 2009 (research by authors)

Chart 3 shows that 35.91% of the responders in the year 2010 identified the source of information about Studies at Libertas Business College as orally; 24,09% orally from present or former students of Libertas College, 2,27% orally from Libertas professors, 9,55% orally from people not directly associated with Libertas College. At second place responders identified Internet (30%) as a source of their information about Libertas Business College, and at the third place is presentation at students' high school with 20, 91%.

Enterprise in Turbulent Environment
Chart 3: Representation of the source of information about Libertas Business College among potential students in the year 2010 (research by authors)

Chart 4 shows that 45.97% of the responders in the year 2012 identified the source of information about Studies at Libertas Business College as orally; 28,35% orally from present or former students of Libertas College, 6,51% orally from Libertas professors, 11,11% orally from people not directly associated with Libertas College. At second place responders identified Internet (30%) as a source of their information about Libertas Business College, and at the third place is presentation at students' high school with 20, 91%. In this academic year Libertas Business College introduced some new ways of communication with potential students with Facebook and Libertas own web page. From the next chart we see that was very smart action because with those methods Libertas Business School introduced itself to 23,75% of potential students. Furthermore, in the year 2012 Libertas introduced a questionnaire to all enrolled students in order to examine why did students come to Libertas Business School, and what made the crucial impact on them in order to study at Libertas (Chart 5). From the results we can notice that majority of students is enrolled at Libertas because of quality of study program 30,30%, on the second place is quality and ways of teaching 24,62, and on the third place is opportunity to find adequate employment after finishing Libertas Business School 20,83%.
Chart 4: Representation of the source of information about Libertas Business College among potential students in the year 2012 (research by authors)
Chart 5: Advantages of studying at Libertas Business College (research by authors)

4 CONCLUSION

The result of the empirical study shows that the most common source of information, among potential students, about the study at Libertas Business College is orally transmitted by current or former students. This indicates satisfaction with the choice of studies at Libertas Business College by current and former students. Also, satisfaction in studies is proved to be successful promotional activity in others higher education institutions in Croatia. The second most important source of information, among potential students, about the study at Libertas Business College is Internet. Given that for the population of young people in the modern age is almost imperative to use the Internet and Social networks, Libertas Business School started to use those methods of communication in year 2010. In the year 2012 promotional campaign

on Facebook has been extended with interviews with professors, notifications about daily news from the economy, notification about student travels with photo-documentation, invitations of students to take a part in humanitarian actions (e.g. the purchase of incubators for premature births infants), and organization calls for various students gatherings.

Presentation of Libertas Business College, as a source of information for potential students, to seniors in high schools was significantly represented in year 2010 with 20.91%. Other used interactive forms in that year, such as advertising through various media, did not give sufficiently good results. However, it is common that educational institutions advertised itself through newspapers, radio, TV shows, flyers, and others; therefore, it is necessary for Libertas Business College to be present at those markets and at those forms of presentation.

Through the analysis of this empirical study we see the necessity of continuous quality improvement in academic programs, improvement in the performance of the teaching process, improvement in the quality of the teaching staff, and improvement of personalized relationships with current and former students. Furthermore, these improvements are necessary because only satisfied students will promote a school that gives them a quality education and provides a competitive advantage in the labor market. This research was focused on customer satisfaction because of everyday pressure of the state and society. Moreover, institutions of higher education need to achieve the best possible relationship between what they provide and the funds they receive. We believe that it is evident from the research that Libertas Business College is doing a great job as a one of the higher educational institutions in the Croatia and therefore, successfully draws more and more new students from year to year.

ABSTRACT
Purpose *– The purpose of the paper is to present differences in the process-oriented management in organizations of the public and private sector and their consequences and to suggest areas for further research.*
Design *– This is a theoretical paper based on a literature review.*
Findings *– The processes management is based on the foundation that actions should be optimized from a perspective of processes, which create the dynamic image of the organization's operation. And processes are nothing else as sequences of activities transforming ideas and efforts of members of the organization into the effect desirable by the client. Therefore implementation of the process-oriented management in organizations of the public administration could facilitate tracking current state of clients' needs and recognition of new states resulting from changes of citizens' needs or legal requirements.*
Research limitations/implications *– The paper is theoretical, and empirical research to test the results is required.*
Practical implications *– The findings can be used to enhance process-oriented management systems within both the public and private sectors.*
Originality/value *– The paper provides an overview of the state of process-oriented management and their consequences within public sector organizations and explains the possible difficulties of process-oriented management especially in public sector.*

Keywords: Private sector organizations, Process-oriented management, Public sector organizations

1 INTRODUCTION

Process management is based on the assumption that activities should be optimized from the perspective of processes, which constitute dynamic picture of functioning of organization. These processes are nothing else like sequences of activities, which transform ideas and efforts of members of organization into expected by a customer outcome. Therefore implementation of process management into public administration organizations could facilitate tracking customers' current needs and identifying new needs, which result from either changes of needs of citizens or changes of legal requirements. The process character of organization may also facilitate organizational involvement of its members and cooperation between them; it may also make internal communication more efficient. In functional approach, which is the most widespread in public sector public entities, manager assigns and enforces tasks in compliance with strictly specified procedures; to meet manager's

---

expectations seems to be the top priority. It may result in shift of the sense of accountability: results of activities are less important than modes of activity and acting in compliance with instructions is perceived as a warranty of efficiency.

The interest in public sector organizations stems first of all from significance they have for economy of each country. Secondly, it is related to the impact they have on lives of all citizens. Characteristic features of these organizations, which make them different from private sector organizations, are political and social rationality, which rarely go hand in hand with economic rationality. Action strategies, which are adopted are the result of political game, which is not conducive to setting difficult to measure and/or long-term goals (Kożuch, 2006, p. 89). Due to political sensitivity of these organizations and cyclical changes of authorities, they function in less stable environment than private sector organizations. In spite of the fact that market pressure on public sector organizations is smaller than on private sector organizations, their position is not privileged. It is connected with double role citizens play. On the one hand, as inhabitants, citizens and taxpayers living in a given country they are subordinate to it. On the other hand, as service receivers they are in superior position.

In recent years, both in Poland and in the world, very dynamic changes in the sphere of public administration have taken place. Part of them was related to use of concepts and methods of management drawn directly from private sector (Heracleous and Johnston, 2009, pp. 373–374). Process management is one of them (MacIntosh, 2003, p. 327). Process approach has been known since the time of the Classical School, yet since then it has changed significantly and has evolved into BPM (Business Process Management) (Grajewski, 2012, p. 21). The concept of BPM in its current shape emerged in 1990s.; it was inspired by earlier frameworks such as TQM (Total Quality Management) and BPR (Business Process Reengineering) (Brocke and Sinnl, 2011, p. 357). Many authors who explore the concept of BPM focus mainly on its 'hard' aspects, such as organizational structure, development of processes and use of new information technologies (Gulledge and Sommer, 2002, pp. 364–376; MacIntosh, 2003, pp. 327–344; Sentanin, Santos and Jabbour, 2008, pp. 483–496).

2   PROCESS MANAGEMENT

Process management in private sector was the most popular in the middle of 1990s (Houy, Fettke and Loos, 2010, p. 637), it was then when first publications on this concept in the context of public sector began to appear. However, the topic of process management in the context of public sector was much less discussed than in the context of private sector. And a few publications, which addressed the subject, focused on re-engineering organizational structure from functional one to process one (Gulledge and Sommer, 2002, pp. 364–376), identification (Sentanin, Santos and Jabbour, 2008, pp. 483–496), optimization (Hesson, 2007, pp. 707–727), efficiency (Coulson-Thomas, 1997, pp. 118–132; MacIntosh, 2003, pp. 327–344), identification of processes owners (Ongaro, 2004, p. 81–107), linking these processes with IT tools (Gulledge and Sommer, 2002, pp. 364–376), drawing attention to customer's perspective (Ongaro, 2004, pp. 81–107), (Coulson-Thomas, 1997, pp.118–132), and impact of external factors on implementation of process management (MacIntosh, 2003, pp. 327–344; Helfert, 2009, pp. 937–952).

Implementation of process management in public administration is advisable since there is a necessity to understand customers' current needs and to identify new needs resulting from changes of citizens' needs or legal requirements (Krukowski, Siemiński, 2011, p. 23). These are not only arguments in favor of it. Elements that prove inefficiency of functional approach

(the opposite of process approach) are connected with focus on meeting expectations of manager, who assigns and enforces tasks in compliance with strictly specified procedures. It may result in shift of the sense of accountability: outcomes of activities are less important than modes of activity and acting in compliance with instructions is perceived as sufficient warranty of efficiency (Sikorski, 2000, p. 110).

Thus generated bureaucracy brings about depersonalization of interpersonal relationships, which is a result of formalizing communication and peculiar superiority of stamps and signatures on documents over people, their actual problems and organization as a whole (Kołodziejczak, 2011, p. 465).

It may trigger so called local attitudes, that is situations when employees concentrate solely on things, which concern their work and tasks. In consequence, wider perspective may be lost (Sikorski, 2000, pp. 175–179). The result of such an attitude may be conservatism oriented towards stabilization and strengthening of existing norms, values and patterns of behavior; changes are unwelcome and past is a guide for the future (Kołodziejczak, 2011, p. 465).

The most common stages of process management implementation are as follow:
1. Benefits realization. The most common mistake at this stage is a lack of full understanding of what process management consist in. In many cases even supporters of process management lack comprehensive knowledge on methodology, the core and challenges of the method. Lack of awareness is a result of lack of experience, which is crucial to create, develop and sustain the awareness
2. The desire to implement. This is the critical stage that requires a leader and a master, who are able to represent different parts and levels of organization; they may be top-level managers, managers of departments or units, or heads of teams
3. Implementation on the level of a chosen process is connected with strengthening of potential and credibility of the method. At this stage employees the most often start to identify themselves with the method since they realize personal benefits from employing it.
4. Implementation on the level of the whole organization. This stage may take three to five years. It requires designing methodology and choosing methods, techniques and tools, which take into account organization peculiarity; they have to be documented, implemented, passed on and actively sustained. It is achieved by mapping processes; it allows to define modes and subsequent stages of organization improvement. When accountability is assigned and mapping of processes is accepted, carriers of process management should be scrutinized once again
5. Organization has full awareness of its processes and process management center of excellence is created (Rosemann, 2008, p. 1).

Passing through subsequent stages until process maturity is achieved takes different shapes and depends on organization. However, one may identify six key factors, which have an impact on effective implementation of BPM (Bandara, Alibabaei and Aghdasi, 2009):
1. Strategic alliances – ongoing integration of organizational priorities and organizational processes, which enable to achieve business objectives
2. Culture and leadership, collective values and beliefs, which shape attitudes and behaviors related to a process
3. People, units and groups who are on a daily basis responsible for the processes
4. Management, defined accountability and transparency in decision making processes

5. Methods, modes and techniques of supporting the processes
6. Information technology.

According to research conducted in 2009 by service PROCESOWCY.PL within group of 480 people who worked in entities representing different sectors and branches, the process maturity level of large part (38%) of Polish organizations, measured by slightly modified hierarchy CMMI (Capability Maturity Model Integration), is intermediate. It indicates full awareness of processes, which take place in organizations as well as existence of defined measuring system; it does not, however, translate into management decisions. Processes do not bring about answers with regard to realization of strategic objectives. Only 7% of entities consciously identified, measured and managed their processes. 19% of scrutinized entities belonged to public sector, their process maturity level was assessed as below Polish average. Within group of public sector units there was not a single one that would consciously identify, measure and manage its processes; in these entities processes were at most identified (PROCESOWCY.PL).

Similar research is being carried out by C. Wolf and P. Harmon on BPTrends (Wolf and Harmon, 2012, p. 17). Since 2005, every two years, they publish reports on current trends in process management in organizations all over the world. The recent report is based on research, which was conducted in 2011 among 399 entities from Europe, America, Australia, New Zealand, Asia and Africa (out of which over 50% was located in Europe and America). This research has shown that over a span of last years the level of process maturity of organizations has been slowly growing. Authors of the report have come to conclusion, however, that more mature picture of organization has been not related to overall growth of level of process maturity, but have been an outcome of strenuous work of several entities (Wolf and Harmon, 2012, p. 17). It is also worth mentioning that more European organizations than American organizations have achieved the highest level of process maturity.

Table 1: Levels of process maturity of organizations at the whole (Wolf and Harmon, 2012, p. 17)

Level of process maturity of organization	2009	2011
1	10%	11%
2	46%	39%
3	24%	25%
4	16%	19%
5	4%	6%

3 PROCESS MANAGEMENT IN PUBLIC SECTOR ORGANIZATIONS AND PROCESS MANAGEMENT IN PRIVATE SECTOR ORGANIZATIONS

R. Tregear and T. Jenkins (2007) identified nine potential differences between process management in public and private sector. They are as follow (Tregear and Jenkins, 2007, p. 1):
− Public interest
− Accountability
− Political Sensitivities

Enterprise in Turbulent Environment

  – Whole-of-Government Ecosystems
  – Budget cycle complexity
  – Information exchange
  – Regulating Society
  – Machinery of Government
  – Culture.

While some of these factors have been recognized by the authors as conducive to process thinking, the other have been considered a hindrance. There are also factors that are both catalysts and inhibitors of process management: public interest, accountability, whole-of-government ecosystems, budget cycle complexity, regulating society and machinery of government.

Public interest
Public interest, to a greater or lesser extent, is inscribed into mission and vision of public sector organizations. In fact, they were created to realize public interest goals. However, due to complexity of the issue, to measure the degree of realization of these goals is a very difficult task. Likewise it is difficult to define precisely a customer and his needs.

Accountability
Richard Mulgan (2000, pp. 94–95) in his article on comparison of accountability in public and private sector emphasizes that structure of accountability seems to be more rigid in case of public sector. In general, he indicates four elements, which make accountability in two sectors different. In public sector, apart from rigidity, there are constant political pressure and wider scope of accountability; and in case of private sector it is a lack of equivalent of such an institution as parliament.

Political Sensitivities
Accountability of those who take care of management in public sector has both political and organizational dimension, and their work is the focus of interest of public opinion. Even the most efficient manager may loose his job when he is not supported by society.

Whole-of-Government Ecosystems
Close cooperation between many entities for the benefit of public interest is one of the most important determinants for public sector organizations. Yet, to coordinate activities of organizations, which are subject to different, separate legal acts, is an extremely difficult task

Budget cycle complexity
Much more components and determinants have to be taken into account while drafting a budget in public sector entities than in private sector. The budget of public sector entities is one of the most important political, economic and social documents.

Information exchange
Interaction between citizens and public sector organizations has dualistic character. On the one hand, citizen is subject to them (as taxpayer), but on the other hand, they are to serve citizen. The institutions pass on information on governmental politics and programs. One of the most important tasks of government agendas is to create, manage, promote and supply information according to needs of society. It is complicated, however, since the information citizen expects rarely concerns only one entity or/and localization.

Enterprise in Turbulent Environment

Regulating Society
Governments create regulations, and private sector entities have to act in compliance with them.

Machinery of Government
The scope and impact of changes resulting from electing new government may be much bigger than impact of changes, which result from restructuring, fusion or takeover in private sector organizations

Culture
Typical public sector organization has strictly defined regulations and procedures, established hierarchy, extended decision making process; it is oriented to acting in compliance with regulations and rules, and it is subject more to political than market control. In comparison to private sector entities, public sector organizations are to a lesser extent innovative and oriented to development; they are also more passive with regard to risk. Attitudes and values of public sector employees also significantly differ from attitudes and values of private sector employees. The public sector employees are more altruistic and more willing to engage into activities for the benefit of social development and public interest.

To assess a relative impact of identified differences Kurt Lewin's Force Field Analysis (FFA) technique is used; it enables to understand behaviors by identifying forces, which determine them.

Enterprise in Turbulent Environment

Table 2: Force Field Analysis (Tregear and Jenkins, 2007, p. 9)

DRIVING FORCES		RESTRAINING FORCES
Public interest:		**Public interest:**
impact of success is much higher		customers harder to identify
'due process' supported by a process view		outcomes, harder to measure
Accountability:		**Accountability:**
risk management supported by process view		intense social and political pressure
transparency supported by process view		monopolistic complacency
more resources to be saved		**Political Sensitivities**
Whole-of-Government Ecosystems	**Change Target** Reach success, ongoing process management in public sector units.	repercussions of failure
WoG approach supported by process view		transparency exposes problems
high profile incident mgt profile centric		broad group of stakeholders
facilitate understanding and consensus		election cycle disruptive
Budget cycle complexity		**Whole-of-Government Ecosystems**
higher potential for efficiency savings		complex, multi-jurisdictional process
Information exchange		admin frameworks are not supportive
higher digital content in service		complex agreements required
regulating society		**Budget cycle complexity**
able to change ragulations		high public visibility
red tappe reduction supported by process view		resource intensive processes
Machinery of Government		focus on cost management, not profit
Forces review of process		well established processes
MoG enhanced by process view		complex, multi-agency processes
		Culture
		more risk averse
		less flexible structures
		less motivation for change
		Machinery of Government
		causes operational discontinuities
		Regulating Society
		highly regulated environment
		may require legislative changes

The most common mistakes related to implementation of process management are as follow (PROCESOWCY.PL):

1. Wrong identification of the process owner or, in fact, lack of the owner; mapping it in a wrong place within structures of organization. Merely 34% of organizations, which have identified their processes have process owners and usually they hold director positions, it results in limited accessibility and in consequence is tantamount to lack of

process ownership
2. Too wide portfolio of processes, which organization wants to manage; implementation from the start apart from the basic process management its derivatives, which should be implemented after some level of process maturity is achieved
3. Wrong order of implementation – 37% of organizations, which have identified their processes admits that works on processes are part of projects of information system implementation. Whereas, it is BPM that should be the point of departure, and measuring of processes and their analysis should decided whether information system should be implemented or not
4. Inefficient system of communication – only 28% of organizations, which have identified their processes, put process documentation in easily accessible place. In consequence, participants have no access to information on current state of affairs and on implemented and future changes.

On the basis of experience of leading public sector entities in Australia one may indicate following keys to success in process management (Heracleous and Johnston, 2009, pp. 373–379):
1. Technology or rather the way we make use of it. The main goal is not to employ advanced technologies to support existing processes, but to use technology strategically thus it brings about benefits, which can not be easily achieved in another way
2. Proactive change, which in its core has innovative organizational culture and awareness of necessity to remain competitive
3. Ongoing and critical exploration of environment in order to find ways to achieve balanced diversity, to implement innovations and to redefine activities.

4   CONSLUSION

Process management in public sector, by changing viewpoint from vertical to horizontal, aims at engaging citizens, both on state and local administration level. Therefore people responsible for management in public sector have to act within network. They also need negotiation and cooperation skills to be able to build and to sustain relationships with citizens, which are based on partnership and to make these relations source of power stemming not from authority, but from cooperation. The examples of inclusion of citizens into the process of governing are, for instance: deliberative democracy, e-democracy, public conversation, participatory budgeting, citizen juries, study circles, focus groups, roundtables, new forms of town meetings, choice work dialogues, cooperative management bodies, and other partnership arrangements (Bingham, O'Leary and Nabatchi, 2005, pp. 54–61).

One shall bear in mind, however, that use of suggested tools is culturally conditioned. Implementation of process management in public sector seems to be more complicated than in private sector. However, given the direction that public sector reforms took in Poland it seems to be inevitable.

EMPLOYER BRANDING – A HUMAN RESOURCE STRATEGY FOR COMPANIES IN A TURBULENT ENVIRONMENT BASED ON THE EXAMPLE OF NORTHERN AUSTRIA[1]

ABSTRACT
Human capital is a precondition for regional development and influences, to a great extent, the value or worth of a region. Especially in a turbulent environment, human capital is a key factor to keep a region competitive and innovative. This paper addresses employer branding as a sustainable strategy for companies, located in the border region of Northern Austria, to manage their human resources. The region is characterized by mostly small and medium sized enterprises which increasingly face labour shortage because numerous residents commute to more urban areas. Hence, employer branding contributes to regional development by attracting and retaining qualified people who not only live in the region but are also willing to work there and invest their talent into the development of new and innovative products or services. An empirical study was conducted to gain insight into how precious human capital can be secured in order to reinforce regional development and encounter the labour shortage problem. Interesting information about employers' and employees' values was discovered. Based on the results, companies in the target region require an enhanced human resource strategy in order to be visible for potential employees and to retain existing employees. That is to say, companies that are noticeable and attractive have better chances to entice qualified people which, in turn, positively influences regional development, as people not only live but also work in the region and invest their potential. Talented people not only spur the innovative strength of a company but also determine the success of an organisation. New approaches towards managing human capital and their impact on the target region are presented in this paper.

Keywords: Employer branding, Human capital, Labour shortage, Regional development

1 INTRODUCTION

In the framework of an intercultural European Union Project, a comprehensive cross-border empirical investigation has been carried out. The survey was conducted in order to explore the labour shortage problem in the rural region of Northern Austria. The project 'RegioTalent' focuses on the human capital as the most important resource of a region, regardless if it is a rural or urban region. We suppose that focusing on the human factor is a condition precedent to further develop a region.

The working situation in Northern Austria is characterized by certain issues discussed intensively within the field of work. The main challenges are the lack of skilled workers and

---

[1] The authors wish to thank the respondents of the survey for their valuable input and cooperation as well as the strategic partners of the project for discussing and verifying the results and findings.

apprentices and a lack of adequate and transparent working possibilities for young and qualified persons, as well as a high rate of commuters. Approximately 52 % of the employed population commutes outside of one of the four districts on a daily basis (Statistik Austria, 2010).

Based on an extensive literature review, the importance of human capital is stressed by various authors (Mandhanya and Shah, 2010; Moroko and Uncles, 2008). Employer branding offers the organization the possibility to position itself as an attractive employer. It can be used as a strategy to enhance the visibility and noticeability of an employer. This increases the transparency of working opportunities for people who live in the region. In further sequence, this contributes to regional development by motivating persons to not only live in the region but also work there and invest their potential. A prerequisite of successful employer branding is the identification of values on two sides, employer's and employee's. These values have to correspond to each other in order to enable a positive working environment.

2   LITERATURE REVIEW

In today's economy, firms are facing increasing competition to attract suitable employees. Authors emphasize the importance of human resources: *"In today's world employee is a very important aspect in any organization. Maintaining them and retaining them as well as attracting skilled persons are a very important task [..:]"* (Mandhanya and Shah, 2010, p. 44). It is getting more and more important to pursue strategies in order to attract and retain staff due to the fact that markets progressively recognize human capital or the skills, experience and knowledge of employees as sources of value to the company and to its stakeholders (Moroko and Uncles, 2008). Companies are increasingly realizing that human capital is a crucial resource for staying competitive. Hence, organisations have to make efforts to retain and find qualified employees on the labour market. In this context, Wilden et al. state that *"firms need to develop strategies to ensure that their human-resource base remains adequate for the challenge of doing business."* (Wilden, Gudergan and Lings, 2010, p. 56). One of these strategies is to build a strong brand so that people are able to associate specific values with it. Therefore many companies make efforts to strengthen brand management, particularly on product and corporate branding. However, brand management can also be applied in the area of human resource management (Backhaus and Tikoo, 2004) with the overall objective to attract potential employees, so that they immediately recognize and associate certain values with the employer, and to maintain existing employees. Employer branding increases the transparency of available job opportunities. Shah (2011, p. 30) refers to employer branding as a tool that can be used *"to manage the scarce resource called talent"*. Especially in a turbulent economy, when the war for talent is intense, employer branding can be used as a strategy to attract and maintain talents. *"Retaining employees is more important than hiring them, as talented resources have many opportunities available."* (Chhabra and Mishra, 2008, p. 50) Employer branding is not about a bundle of actions, it is first and foremost an applied corporate philosophy. The aim of being an attractive employer for both, current and prospective employees, can only be reached through multidimensional thinking and actions (Stotz and Wedel, 2009).

3   METHOD

As mentioned in the previous chapter, human capital is a key success factor for regions and companies. The purpose of this research is to identify how human capital can be secured in the region of Northern Austria in order to contribute to regional development. Employer

branding is one of various attempts that try to hold and attract human resources. The research questions derived from the aim of research are:

- Which values do people who live in the region have?
- Why do qualified people migrate from the region?
- Which values do employers in the region have?
- What is required to make people stay in the region?
- How can regional employers attract people?

3.1 Research Design

3.1.1 Data Collection

In order to answer the research questions, an empirical interpretative study was carried out by a qualitative research design, the so-called semi-structured interview. *"It typically refers to a context in which the interviewer has a series of questions that are in the general form of an interview schedule but is able to vary the sequence of questions"* (Bryman, 2012, p. 212). Due to great interest regarding the experience and perceptions of the interviewees, a quantitative research method was impossible to use. Accordingly, Bortz and Döring (2006) pointed out that qualitative material contains more details than a measured value. Based on this qualitative technique, subjective perceptions of the interviewees are investigated. For the purpose of this research, 34 face-to-face interviews as well as one focus group were the chosen methods for obtaining the required information. In the course of the face-to-face interviews the so- called laddering technique was applied in order to uncover core values (Reynolds and Gutman, 1988).

3.1.2 Sample Determination

The respondents were chosen on the judgment of the researchers based on the strengths of the respondents' experience of the phenomenon under study (Collis and Hussey, 2009). The respondents are either living or working in the region of Northern Austria. The participants were selected by using a purposeful sampling strategy (Patton, 2002). The interviewees were selected through the use of personal references of peers and according to their regional belonging to the target region. This sampling method does not entail costs and it is convenient and quick (Malhotra and Birks, 2007). Due to subjective sampling, it does not allow direct generalisations to a specific group. However, it allows exemplary generalisations (Wahl et al., 1982, p. 206; referenced by Bortz, Döring, 2006, p. 335).

Table 1: Description of respondents (own illustration)

Target groups / Respondents	
Face-to-face interviews	
Entrepreneurs (SME's up to large-scale, sectors involved: information systems and engineering, metal, handcraft, production of textile, windows)	12
Talents (pupils, students, apprentices, employees, artists)	12
Inhabitants of Northern Austria	7
Representatives of the region Northern Austria (mayors)	3
	34
Focus Group	
Young People (pupils, students, employees aged from 17-28)	12
Total Respondents	46

3.1.3 Data Processing

```
Constructing of category system

```
Figure 1: Analysis of data (modified from Gläser and Laudel, 2006, p. 42/194)

The qualitative data collection methods generated texts, such as documents and interview transcripts. These texts are the raw data that were analysed. In contrast to quantitative methods, the texts are diffuse because it is not clear yet which information of the texts is relevant for the study (Gläser and Laudel, 2006). Also Robson (1993, p. 370) observed this challenge that there is *"no clear and accepted set of conventions for analysis corresponding to those observed with quantitative data."*

The qualitative content analysis by Mayring, described in Gläser and Laudel (2006), was chosen as the method for analysing the generated data. The texts were analysed by extracting information in a systematic procedure. For that purpose, the texts were scanned with an

analysis grid for relevant information. Relevant parts of the texts were then allocated to the analysis grid and were independently processed further. This qualitative analysis method did not take the entire texts of the interviews into account; it merely extracted the relevant information. The analysis grid was defined beforehand, meaning that the categories, in which extracts of the texts were allocated to, had been developed ex ante. Such a category or code could be a keyword or a numerical sequence.

The qualitative data and content analysis software MaxQDA was used for data processing as it facilitates a structured qualitative analysis of the transcripts. First, the pre-defined category system was imported into the programme. Then, extracts of the texts were added into the categories and were thus coded. The purpose of coding the data and the preparation of the data should improve the quality by summarising scattered information and eliminating redundancies (Gläser and Laudel, 2006). The aim of the evaluation of the data was to answer the posed research questions and to identify causal relationships.

4   RESULTS AND MAIN FINDINGS

All in all, six propositions were formulated based on the evaluation and interpretation of the collected data. These propositions provide insight into the situation in the target region and contribute to answering the research questions.

The main results and findings of the qualitative survey show the importance and meaning of the close connection of employment and quality of living. The satisfaction with the employment situation of the inhabitants of Northern Austria is closely related to the assessment of the quality of living. It is significant, that employers and entrepreneurs are aware of this connection in order to be able to attract, satisfy, and bond the human capital. Moreover, appropriate job opportunities in the region are an important factor for bonding inhabitants, in particular young people and creative potential to the region. Besides the working situation, social contacts and family, habitation and spare time are factors influencing the perception of quality of living – it is the sum of these influencing aspects that hold people in a certain region. From the perspective of regional development and the development of rural regions, particularly the possibility for people to work in the region is decisive.

Proposition 1: "Regional work is a major factor of the subjective perception of the quality of living and thereby the quality of work is important."

The main result from the gathered data is that regional work is a major factor of the subjective perception of the quality of living and thereby the quality of work (that is to say, challenging content, career opportunities, training and qualification and remuneration) is important. In this context, Csikszentmihalyi states that *"involvement in interesting activities, including engaging work, is a major source of well-being"* (Myers and Diener, 1995, pp. 15–16).

Regional working opportunities and jobs enhance the quality of living and enable people who live there to stay in the region. According to the respondents, there is a direct connection between the quality of living and having a job in the region. It has to be considered that, besides the regional aspect, the requirements regarding working conditions are multilayer and therefore the survey additionally investigated the main values of employees, which will be discussed in a subsequent section.

Nevertheless, the company structure in the investigated region consists mainly of small and medium sized enterprises which cannot supply the demand for regional work. Thus, commuting seems to be the most obvious alternative. According to Florida (2008), commuting is the one thing which makes us most unhappy in life. Interpersonal relationships (family, friends), a high quality of living (nature, infrastructure), and regional job opportunities are those things which raise our feeling of well-being, trusting the results of the available qualitative survey.

Proposition 2: "Employer Branding is of high importance for regional and localentrepreneurs in order to be visible in the labour market and to attract (regional) workforce."

Derived from the qualitative data, employer branding and talent management are of high importance, particularly in remote rural areas. There are special conditions for entrepreneurship in rural regions as they seek for a skilled and specialized labour force. One main advantage of firms in rural areas is that they use small and medium sized structures and thereby foster trust in their customers. Enterprises in urban areas can learn from enterprises in rural areas in the framework of the information society, where anonymity in business is common.

According to the results of this empirical investigation, the commuting behaviour which is at a very high level results not only from missing regional job opportunities but also from the ignorance of actually having available job options. Ignorance exists on both sides, employees as well as employers. Asking graduates, they often do not even think about searching for regional job opportunities. Besides, employers do not see any need to be present in the regional job market. They think it is sufficient to announce the job as the need arises but do not invest in anything in advance. Employer branding in terms of being present on the regional job market, cooperating with local education facilities, and gaining a good reputation, is not always considered to be important. These companies are more likely to be affected by skill shortages than those who invest in employer branding measures.

4.1 Employer branding in the context of rural and urban areas

Firms in urban areas could use strategies, such as employer branding and talent management as a positive example and tool to attract talents and regional human capital. According to Mandhanya and Shah (2010, p. 43), *"Talent Management refers to the process of developing and integrating new workers, developing and keeping current workers and attracting highly skilled workers for company"*. The definition of 'Employer Branding' by Hochgatterer (2012, p. 24) is: *"Employer branding is the effort of attracting potential employees, retaining current employees and communicating the employer brand internally as well as externally. Employer branding makes it possible to differentiate from competitors and to win the war for the scare resource called talent."*

Proposition 3: "Recruitment strategies in rural regions are different from recruitment strategies in urban regions."

The research identified different approaches of the remote rural areas and urban areas concerning recruitment strategies and measures. Applied and effective recruitment measures observed in the rural area of Northern Austria are in the first place, word of mouth and recommendations by acquaintances. In addition, the close cooperation with schools is

Enterprise in Turbulent Environment

essential and there is still potential for further expanding and intensifying the cooperation with regional schools and education institutions. Activities related to cooperation with schools could include frequent company visits at regional schools and e.g. give lectures, realize projects together and post job advertisements directly at schools. Furthermore, activities and events, such as an open house, using regional media, sponsoring, and the regional labour market service are well used in rural companies. New media is currently not very commonly applied. A decisive aspect for a successful recruitment process is the image and reputation of the companies and firms in the region and this is where employer branding comes into play.

Firms in remote rural areas establish their own employer branding strategies, especially focusing on regional reputation and early involvement of future employees. Skills shortage is not a problem they have to deal with, as they are known as valuable employers who invest in their innovative potential in terms of personnel development.

Proposition 4: *"Companies that are fostering intrinsic motivation and offering their personnel incentives benefit from a high level of loyalty and are able to find skilled workers and qualified staff."*

Such activities that are fostering intrinsic motivation are, as mentioned by the companies in our study, for instance further education, job rotation, management by objectives, premiums, paying more than the collective contract forces, social events in order to enhance the feeling of solidarity and social cohesion.

The survey revealed that some firms in even very remote rural areas are not affected by a labour shortage problem. These companies have been asked for the reasons, how they manage to find skilled workers and qualified collaborators. The key finding is that these companies apply various employer branding measures. From an internal point of view, organizations offer sufficient training opportunities for employees and apprentices, good working and family atmosphere, and voluntary social contributions. Respondents argue that in their companies trust, appreciation and empathy for employees can be found at all levels. These incentives lead to highly motivated employees and, in turn, enhance the image of the employer brand. Engaged and enthusiastic employees are able to achieve maximum performance and therefore generate better outcomes and results. This again, leads to higher resources that the company can use for social benefits or other employer branding activities. Internal employer branding activities are essential to meet the expectations of existing employees and to keep the 'promise' that was transmitted by external activities beforehand. If employees are satisfied and their expectations are met, it prevents them from switching to the competition and encourages them to communicate their positive experiences with their acquaintances.

4.2 Values of Employers and Employees

In order to implement an employer branding strategy, the values of a firm are of great importance. The compliance of the values of employers and employees is a key factor for finding and holding skilled workers, qualified employees and talents. In the frame of this study, the value systems of entrepreneurs and employees have been investigated by asking each of them the following questions:
- What is important for you related to WORK?
- What is important for you related to LIFE and LIVING as a whole?
- What is important for you related to the REGION you live in?

According to the Laddering Technique (Reynolds, Gutman, 1988), after asking one of these questions the interviewer has to ask three times, why the mentioned answer is important for the person. The laddering technique which has been applied in this study is a research interview technique for uncovering core values.

4.2.1 The employee's perspective

The most frequently mentioned answers regarding the personal values of the interviewed employees are:

- Having sole responsibility, working independently
- Room to maneuver and scope for development
- Advancement in one's position and career perspectives
- Flexibility concerning working time and scheduling
- Flexibility concerning work content (interesting and challenging)
- Working atmosphere (relation to colleagues, seniors, working environment)
- Creativity, challenge, manifoldness, job variation
- Continuing education and lifelong learning
- Pleasure and enjoyment with work

Respondents stressed that values, such as creativity and room to maneuver contribute to their individual fulfillment. These findings are in line with a statement of Bergmann, that *"the spirit and sense of one's activities, a job which we absolutely want to have, is better than any kind of therapy"* (Bergmann, 2004, p. 119). According to the respondents, the main point is the mixture between the adequate work content, the working atmosphere and appropriate rewards.

4.2.2 The employer's perspective

From the employer's point of view, the values that were commonly mentioned by employers and entrepreneurs in the region of Northern Austria are:

- Quality of products and processes as success factors
- Honesty and fair-mindedness, reliability, trustworthiness, gentlemen's agreement
- Sense of cooperation and fairness
- Sense of community: solidarity, social cohesion and team spirit
- Societal and social responsibility, socially mindedness
- A climate of appreciation and respect in the company and working groups

Moreover, the values of employers related to human capital management and the leadership of employees have been explored:

- Participation, involvement and information (regarding working processes and assignment of tasks)
- Clarity and transparency concerning processes, course of action systems and remuneration
- Openness related to communication, distinctive orientation
- Appreciation, recognition and respect of personnel
- Further education and qualification, lifelong learning, human capital development, fostering talents and personnel development
- Career development and future perspectives
- Leadership and management: management by objectives, teambuilding, workplace design

- Offering challenge, manifoldness and job variation

Regional work is the key for regional and economic development and innovation of sustainable regions. Therefore, in order to attract and hold regional workforce, it is crucial for local entrepreneurs and employers to focus on meeting the expectations of the employees regarding the values of career advancement possibilities, flexibility, continuing education, working atmosphere and reward.

4.3 Overcome challenges of the future

Proposition 5: "New forms and concepts of work will be required in order to meet the challenges of the future."

Another important result is that the term 'work' has to be reconsidered and new concepts and forms of work will be required in order to meet the challenges of the future, e.g. tele-working, qualification in firms, life-cycle-oriented work models allow more flexibility and self-determination. Flexibility in working time will become more important in the future and there will also be a need for more flexibility in terms of working forms, especially considering the situation of families with a duty of childcare and well-established employees. There is a huge potential of creativity drowsing in women, who stay at home due to childcare. To summarize, new models of work should be considered as for instance life-cycle-oriented work models for women, as well as for men taking into account the private, family situation and age.

Proposition 6: "In addition to regional work, regional education and training, infrastructure and habitation are essential in order to bond and keep skilled workforce and in particular, young talents."

Supplementary to regional job opportunities, increasing the quality of living, regional education and training is one more factor making life interesting for people in Northern Austria. Especially young respondents highlight that sufficient infrastructure and appropriate habitation is essential and contributes to their quality of life. Infrastructure pertains to adequate public transport, in order to guarantee mobility, and notably different locations for young people to meet each other, entertainment opportunities, cultural events and sport options. In addition, for the respondents, adequate and affordable habitation possibilities in rural regions are fundamental for the decision of the place of residence, especially for young people.

5   IMPACT OF RESULTS ON REGIONAL AND SOCIAL DEVELOPMENT

Regional job opportunities are the decisive factor for bonding people, especially young talented people, to the region. The settlement of companies and entrepreneurship has to be fostered, also taking into account the regional requirements and the support of small and traditional structures. Furthermore, applying employer branding measures, such as incentives for existing employees as well as external activities for being noticeable for potential employees, will strengthen companies in the region. Especially for small and medium sized enterprises (SMEs) employer branding can be the key strategy to attract and bond qualified staff. These small structured companies in Northern Austria do not have a separate human resource department and therefore might not apply employer branding measures. However, employer branding strategies do not implicitly require big budgets; truly living the values that are promised externally to potential candidates is important. Additionally, new forms of work and the cooperation of local companies and schools in order to merge employers and

employees will contribute to enhance the situation of Northern Austria. In addition to working opportunities, education and training opportunities are required in the region.

6   CONSLUSION

The study has revealed that regional job opportunities influence and enhance the quality of living. Therefore, it is advisable for companies in Northern Austria to apply employer branding measures as this increases the visibility of local companies, especially in remote rural areas. This encounters the migration of local people and talents as they are given the possibility to recognize local job opportunities. Furthermore, we detected differences in the recruitment strategies of urban and rural companies. In rural areas word of mouth recommendations are widely used to learn about an employer. Regarding employer branding, it is crucial that the values of employees and employers correspond with each other. The values have to be an honest representation of what the employer stands for. This enables the employees to identify whether these values match his or her expectations.

7   LIMITATIONS AND DIRECTIONS FOR FURTHER RESEARCH

The research findings are restricted to a specific region, namely the area of Northern Austria. Hence, the results from the qualitative research are not representative for the population. According to Bryman (2012), the findings of qualitative research are to generalize the theory but not the population. It is the quality of the theoretical inferences that are made out of qualitative data that is crucial to the assessment of generalization (Bryman, 2012). This view of generalization is called "analytical generalisation" by Yin (2009).

Further research concerning the regional employer branding strategies and measures in the region of Northern Austria will be applied by performing scientific case studies with local companies.

ABSTRACT
Few researchers, such as Hansen, Sandvick and Selnes (2003) and Jones, Taylor and Bansal (2008), have mentioned about the effect of employee's commitments and individual commitment on consumer's loyalty for products. This study aims to integrate the organizational commitment provided by Hansen, Sandvik and Selnes (2003) with the affective commitment and the calculative commitment presented by Jones et al. (2008) to explore the three types of commitments which affect customer's loyalty to the providers. Individual commitment, employee commitment, affective commitment and calculative commitment are selected as research variables. The research attempts to understand the factors and the effects of different commitments on consumer's loyalty and consumer's willing to continue consumptions under the agent's services from the different insurance companies. The 300 consumers serviced by insurance agents are selected as research samples. The research method is applied questionnaires analyzed by multiple Hierarchical Regression analysis. The research results show that employee's commitments and individual commitments positively influence the calculative commitment and the affective commitment which affect consumer's loyalty. Transaction cost does not have positive effect on consumer's loyalty.

Keywords: *Affective commitment, Calculative commitment, Employee commitment, Personal commitment, Transaction costs*

1 INTRODUCTION

According to national policy to push forward insurance policies, many people have experiences to interact with insurance agents for transportation or medicare insurances because of risks increase in the living environments. The interaction relationship between agents and customers may influence customer's interest and rights. Therefore, this study aims to explore the influential factors which will affect customer's intentions of consumption or commitments to continue accepting services from the same agents or the different agents to maintain their insurance interests.

Relationship marketing is currently one of research important subjects in the marketing field aiming to build, develop and maintain the mutual interest relationship between transaction parties (Morgan and Hunt, 1994). In fact, customer's intention to stay with the same agent is easily shaked at the high competitive financial market. Customers change their retention according the insurance interests provided by insurance agents; therefore, those who offer better insurance plans they keep relationship with them. The key point for financial businesses to maintain competitive abilities is to keep good and trustworthy long relationship with customers; that is, the commitments from consumers to keep with insurance agents is influential factor for insurance providers to retain competition in the financial market.

Commitment (desire to keep the important relationship) is seen as a relationship established in market (Moorman, Zaltman and Desphande, 1992). Commitment, generally described as a desire to maintain a valued relationship (e.g., Moorman et al., 1992), is recognized as one of the building blocks of relationship marketing (Palmatier et al., 2006). Therefore, commitment as a research indicator can be found in the different forms and dimensions (Meyer, Becker and Vandenberghe, 2004). According to researches studied by Jones et al. (2008), commitment as an indicator has two different perspectives, from the perspective of existence it can be divided into two relationships: between consumers and service organization and between consumers and individual employee; from the perspective of role application it means business friendship. Therefore, both relationships exist in the internal one between customers and employees, and the external relationship of service provides, for example friendship. Further, based on the existence perspective Jones et al. (2008) divided commitment into three indicators as organizational commitment, employee commitment and individual commitment based on essence (organization to employee) and role (service provider to friendship). According to the perspective of role application, added value is proved as friendship between service providers and customers which can increase towards the loyalty of service organization. Further, Hansen et al. (2003) divided organizational commitments into affective commitment and calculative commitment with the interactions between service employees and companies. Therefore, Jones, Reynolds, Mothersbaugh and Beatty (2007) also distinguished affective commitments with calculative commitments; therefore, the former one to stay is to want because of the internal desire; the latter one to stay is necessary based on the certain consideration.

At the past time, the researches related to employee and individual commitments are rare (Jones et al., 2008), but both commitments are important for customer's willing to stay with service providers. Organizational commitment is divided as affective commitment and calculative commitment provided by Hansen et al. (2003). Jones et al. (2008) provided organizational, employee and individual commitments. This research aims to integrate the commitments provided by Hansen et al. (2003) with three commitments provided by Jones et al. (2008) through the concept of transaction costs as interfered variable proposed by Jones et al (2007). The purposes of the study are (1) to explore the effects of employee's and individual's commitments on emotional and calculative commitments, and (2) to examine the effects of emotional and calculative commitments on customer's loyalty to maintain consumption; (3)finally to explore the interfering effects of transaction costs concerning affective and calculative commitments on consumer's loyalty to continue consumption. The research method applies multiple Hierarchical Regression analysis. 300 customers serviced by insurance providers are selected as the research samples in order to explore customer's loyalty to stay with their insurance agents.

This research is a quantitative study. This study proceeds as follows: Section Two reviews the theoretical arguments and some existing findings related to affective, calculative and individual commitments, and loyalty. Section Three illustrates the research design, including research model and hypotheses, research methods (i.e. sampling and measurement). Section Four presents the data analyses and hypotheses testing results. Section Five discusses our research findings, and finally, Section Six draws conclusions and provides suggestions to maintain loyalty between consumers and agents.

Enterprise in Turbulent Environment

2 THEORETICAL BACKGROUND

Consumer's intention to stay is seen as the same dimension as consumer's loyalty, re-consumption or behavior. Jones, Mothersbaugh and Beatty (2000) used re-patronage behavior or intentions to study consumer's decisions to continue or terminate credit card membership. Consumer's intention to stay is often mentioned regarding the relationships between buyers and sellers aimed to keep current consumers, but not new consumers (Harley, 1984; Crosby, Evans and Cowles, 1990). As Ajzen and Fishbein's (1980) studies, good quality services, concern with consumer's demand and good prices for consumers are helpful to solidify the relationships between consumers and service providers. According to the mentioned researches, intention of patronage is easier than factual behavior to evaluate and study; therefore, many researches, such as Garbarino and Johnson (1999), Zeithaml, Berry and Parasuraman (1996), applied the intention to re-patronage to study consumer's intention to stay. Bolton et al. (2000) and Gerpott et al. (2001) defined the intention to stay as consumer's intention to re-patronize or re-buy certain products or services. This study uses the concept of intention to stay as one of research variables provided by Bolton et al. (2000) and Gerpott et al. (2001).

In addition, commitment is an influential factor to maintain mutual relationship and long-term interests. Commitment is an intention including promise, pledge and undertaking (Dwyer, Robert and Schurr, 1987). Moorman et al. (1992, p. 316) defined commitment as a continuous desire to keep important relationship. Relational commitment is meant trading partners, that is, it is essential to keep continuous relationship (Morgan and Hunt, 1994, p. 23). Garbarino and Johnson (1999, p. 73) perceived commitment as consumer's feeling, loyalty, concern with welfare and identity. Geyskens, Steenkamp, Scheer and Kumar (1996) divided commitment into two factors: affective commitment and calculative commitment, both are stable attitude and belief, but both motivations to keep relationship are different; the former illustrates the existence of joy and belonging to provide intention to maintain the relationship; the latter expresses to recognize the costs of termination and transaction when removing the relationship, therefore, to keep relationship is necessary. Dwyer et al. (1987) perceived the concept of commitments as absolute, clear and definite promise between trading partners. Brown et al. (1995) provided instrumental commitment and normative commitment, and Geyskens et al. (1996) used calculative commitment and affective commitment. Gilliland and Bello (2002) provided calculative commitment and loyalty commitment to explain the relationships between two partners. In this study, calculative and affective commitments are applied as research variables illustrated as follows:

(1) The relationship between affective commitments and the intention to stay.

Konovsky and Cropanzano (1991) provided that the relationships between consumers having consumption commitment and trading partners existed positive and closed affective relationships. The company having affective commitments possesses enterprise philosophy, goal and the sense of value, which have produced the perception of unity (Kim and Frazier, 1997a), and the emotional connection, then these perception and connection make both partners want to continue cooperation (Allen and Meyer, 1990; Meyer and Allen, 1991). In the relationship of distributions, affective commitment is overlapped with calculative commitment. Both have the element of continuous relationships existed at the same time, but both commitments are made by different factors (Gilliland and Bello, 2002). Bansal et al. (2004) provided affective commitment influenced by satisfaction and trust, and calculative commitment influenced by transaction costs and the choice of partners. If consumers have high affective commitments towards service companies which make them to keep the relationship and the intention to stay with companies. This commitment, excluding the evaluations of instrumental cost and benefit, develops from happy relationship and

cooperation partnership. Therefore, affective commitment in any dimension trend to keep status quo (Mathieu and Zajac, 1990; Kumar et al., 1994; Wieselquist et al., 1999), therefore; commitment is a kind of positive behavior. Selnes and Gronhaug (2000) found that affection and providers have mutual influences which make consumers have higher intentions to keep relationships and to stay in organizations, further to share their experiences with others. According to the findings done by Hansen et al. (2003), affective commitment has positive influence on consumer's intentions to stay. Therefore, affective commitment is chosen as research variable in this study.

(2) The relationship between calculative commitments and the intention to stay

The power of partners having calculative commitments to maintain cooperation comes from the consideration of economic dimensions, such as interests or costs (Allen and Meyer, 1990; Meyer and Allen, 1991). If terminating cooperation, the interests are scarified which caused loss (Brown et al., 1995; Geyskens et al., 1996; Gilliland and Bello, 2002); therefore, under considering the interests, it needs to continue cooperation (Kim and Frazier, 1997b; Meyer and Allen, 1991). Calculative commitments belong to rational and assignable orientation; that is, in calculating the interests with continuous relationship and loss because of the termination of relationship, the practical perception of commitment is generated; moreover, calculative commitment is a promise afer rational and economic calculation (Brown et al., 1995; Gilliland and Bello, 2002). Calculative commitment has the element of continuous relationship, but this commitment has positive relationship with opportunistic behaviors, and also has positive relationship with other provider's cooperation. If other providers can offer better economic conditions, the retails are willing to terminate current cooperation with the current provider (Gilliland and Bello, 2002). Therefore, according to the mentioned, calculative commitment is chosen as a research variable.

3   RESEARCH DESIGN

3.1   Research Variables and Research Structure

According to literature reviews, the research focuses on eight dimensions: affective commitment, calculative commitment, process transaction cost, social transaction cost, loss interest cost, employee commitment, individual commitment and the intention to stay which construct the research structure as figure 1. The research regarding the intention to stay applies Hansen et al. (2003) study to divide commitments into affective commitment and calculative commitment to explore the effect of service employee on the intention to stay, and the evaluation questions are referred the scale provided by Allen and Meyer (1990) and Kumar et al. (1994). Jones et al. (2007) offered transaction cost as interfered variable to explore the affect of affective and calculative promises on the relationships among process transaction cost, social transaction cost and loss interest cost. The questions regarding transaction costs are refereed by Anderson and Gerbing's (1988). Finally, Jones et al. (2008) and Anderson and Narus (1990) provided the scale regarding organizational commitment, and the scale concerning service loyalty done by Jones et al. (2007) are used as two research dimensions: employee's commitment and individual commitment.

Enterprise in Turbulent Environment
Figure 1: Research structure

According to the above mentioned literature and research structure, the research hypotheses in this study are as Table 1.

Table 1: Research Hypotheses

H_{1a}：Affective commitment positively influences consumer's intention to stay.
H_{1b}：Calculative commitment positively influences consumer's intention to stay.
H_{2a}：Employee's commitment positively influences affective commitment.
H_{2b}：Employee's commitment positively influences calculative commitment.
H_{3a}：Individual commitment positively influences affective commitment.
H_{3b}：Individual commitment positively influences calculative commitment.
H_{4a}：Process transaction cost interferes in calculative commitment with the relationship of the intention to stay; that is, under high process transaction cost, calculative commitment reduces the influence on the intention to stay.
H_{4b}：Social transaction cost interferes in affective commitment with the relationship of the intention to stay; that is, under high social transaction cost, affective commitment reduces the influence on the intention to stay.
H_{4c}：Loss interest cost interferes in affective commitment with the relationship of the intention to stay; that is, under high loss interest cost, affective commitment reduces the influence on the intention to stay.

3.2 Research Sampling and Questionnaire

Consumers who have accepted services provided by insurance agents are chosen as the research sample. By referred to the research samples (220~484 people) chosen by Jones et al. (2008), Jones et al. (2007) and Hansen et al. (2003), this study sent 300 questionnaires to respondents from December 2010 to May 2011. As the questionnaires from 34 respondents were excluded for being incomplete, there were only 266 valid samples, which comprised

88% of all respondents. Participants were asked to respond to three dimensions using a 5-point Likert scale from 1 (agree strongly) to 5 (disagree strongly).

Questionnaire is divided into four parts: the first part explores employee and individual commitments according to organizational scale done by Anderson and Narus (1990) and the scale of service loyalty provided by Jones et al. (2007). The second part examines the relationship between different commitments (including affective and calculative commitments) and the intention to stay according to the scale done by Allen and Meyer (1990) and Kumar et al. (1994). The third part studies the relationships between different commitments (affective and calculative commitments) interfered by transaction cost and the intention to stay upon the scale provided by Anderson and Gerbing (1988). Finally, the fourth part is related to personal data such as gender, age. The research method is applied questionnaires analyzed by multiple Hierarchical Regression analysis via SPSS 12.0.

4   RESERCH ANALYSIS

According to the analysis of the respondent demographic data, 50.60% of the respondents were female. Nearly 48% of the respondents were less than 30 years old. Around 56% of the participants were unmarried. 38% of the participants were civil servant and teachers. Around 74% of the respondents had bachelor degree. In addition, 46% of the participant's salaries were yearly 1356~3390 (USD). 34.50% of the respondents have contacted with insurance agents less than 4 years.

Cuieford (1965) provided the value evaluation of Cronbach's α. If the value of Cronbach's α is higher than 0.70, then, the reliability is highly accepted (Cronbach's $\alpha \geqq 0.70$). In this research, except the dimension of employee's commitment and the intention to stay (Cronbach's $\alpha \leq 0.62$), all items remaining on the questionnaire have a value of Cronbach's alpha greater than .70., including transaction cost (Cronbach's $\alpha \geqq 0.70$). Therefore, the reliability of the research is accordance with Cuieford's (1965) evaluation.

The research results are analyzed by multiple Hierarchical Regression analysis via SPSS 12.0, illustrated as follows.

4.1   Affective commitment

Employee commitment to the intention to stay is analyzed by Regression analysis. According to Model 1, employee commitment significantly and positively influences the intention to stay (R^2=29.80%; F=112.76; $P \leq 0.001$; β=0.55). From Model 2--employee commitment to affective commitments, employee commitment has significant and positive effect on affective commitment (R^2=34.60%; F=140.37; $P \leq 0.001$; β=0.59), thus, H$_{2a}$ is supported. From Model 3, employee commitment significantly and positively influences the intention to stay via affective commitment as the medium (R^2=34%; F=67.98; employee commitment β=0.40; $P \leq 0.001$; affective commitment β=0.25; $P \leq 0.001$). Meanwhile, affective commitment positively and significantly influences consumer's intention to stay; thus, H$_{1a}$ is supported.

As the results of individual commitment to the intention to stay shown in Model 1, individual commitment significantly and positively influence consumer's intention to stay (R^2=36.40%; F=151.65; $P \leq 0.001$; β=0.6.30). As shown in model 2 individual commitment to affective commitment, individual commitment has significant and positive effect on affective commitment (R^2=39%; F=169.13; $P \leq 0.001$; β=0.62); thus, H$_{3a}$ is supported. As shown in

Model 3, via affective commitment as the medium individual commitment has significant and positive effect on consumer's intention to stay, that is, affective commitment positively and significantly influences consumer's intention to stay (R^2=38.40%; F=10.31; individual commitment β=0.18; $P \leq 0.01$; affective commitment β=0.49，$P \leq 0.001$); thus, affective commitment is an effective medium for individual commitment to consumer's intention to stay.

4.2 Calculative commitments

By employee commitment to the intention to stay in Model 1, employee commitment has significant and positive effect on consumer's intention to stay (R^2=29.60%; F=112.76; $P \leq 0.001$; β=0.55). In Model 2, employee commitment significantly and positively influences calculative commitment (R^2=6.50%; F=18.31; $p \leq 0.001$; β=0.25); thus, H_{2b} is supported. As shown in Model 3, employee commitment via calculative commitment has significant and positive effect on consumer's intention to stay (R^2=30.60%; F=59.71; employee and calculative commitment β=058 & β=0.12, respectively, $P \leq 0.001$); thus, H_{1b} is supported.

According to individual commitment to consumer's intention to stay shown in Model 1, individual commitment has significant and positive effect on consumer's intention to stay (R^2=36.40%; F=151.65; $P \leq 0.001$; β=0.63). Based on individual commitment to calculative commitment in Model 2, individual commitment positively and significantly influences calculative commitment (R^2=7.90%; F=18.31; $P \leq 0.001$; β=0.18); thus, H_{3b} is supported. Individual commitment via calculative commitment does not have positive effect on consumer's intention to stay (R^2=5.50%; F=5.80; individual commitment and calculative commitment β=0.43 & β=0.08, respectively; $P \leq 0.001$ & $P<0.05$, respectively).

4.3 Transaction cost as interfered variable

The research applies multiple Hierarchical Regression analysis to test interfere variable (Kleimbaum, Kupper & Muller, 1998). In Regression Models, the independent variables in Model 1 including affective commitment, calculative commitment, social transaction cost, loss interest cost and process transition cost respectively and positively influences consumer's intention to stay (β=0.27, β=-0.03, β=0.13, β=0.17, β=0.36, respectively; $P \leq 0.001$, $P \geq 0.613$, $P \leq 0.05$, $P \leq 0.01$, $P \leq 0.001$, respectively); meanwhile, explanatory variables of this model is 45.60% and F=43.701(R^2=0.46; F=46.70). After testing Model 2 based on the effect of interaction, H_{4a}, H_{4b} and H_{4c} are rejected, illustrated as Table 2.

Table 2: The results of Research Hypotheses

Hypotheses	Items	Results
H_{1a}	Affective commitment positively influences consumer's intention to stay.	Supported
H_{1b}	Calculative commitment positively influences consumer's intention to stay.	Supported
H_{2a}	Employee's commitment positively influences affective commitment.	Supported
H_{2b}	Employee's commitment positively influences calculative commitment.	Supported
H_{3a}	Individual commitment positively influences affective commitment.	Supported
H_{3b}	Individual commitment positively influences calculative commitment.	Supported
H_{4a}	Process transaction cost interferes in calculative commitment with the relationship of the intention to stay; that is, under high process transaction cost, calculative commitment reduces the influence on the intention to stay.	Rejected
H_{4b}	Social transaction cost interferes in affective commitment with the relationship of the intention to stay; that is, under high social transaction cost, affective commitment reduces the influence on the intention to stay.	Rejected
H_{4c}	Loss interest cost interferes in affective commitment with the relationship of the intention to stay; that is, under high loss interest cost, affective commitment reduces the influence on the intention to stay.	Rejected

5   CONCLUSIONS

Through calculative commitment as a medium, employee commitment and individual commitment positively influences consumer's intention to stay. In addition, calculative commitment plays an important role and strengthens influence on consumer's intention to stay. Calculative commitment positively influences consumer's intention to stay. Under high calculative commitment, consumers choose to continue staying with agents because of reciprocal relationships.

Through affective commitment as a medium, employee commitment and individual commitment positively influences consumer's intention to stay. With high affective commitment, consumers are willing to continue staying because of trust between both parties. Employee and individual commitment have significant and positive effect on calculative and affective commitment, that is, the relationship that consumers have long cooperation with insurance agents positively influences consumer's strong belonging to insurance agents. Therefore, through affective and calculative commitments as mediums, consumers treat insurance agents as cooperative parties or friends or long-term partners. Their relationships influence consumer's intention to stay because of calculative and affective commitments. Moreover, consumers decide to continue services because of insurance agents as friends, even though the service cost is increased.

In sum, employee commitment assists to strengthen organizational commitment. Higher

individual commitment is helpful to build consumer's commitment towards organizations. The effect of employee commitment on organizational commitment means that the company should pay attentions on the cultivation of employee commitments. Employees have to recognize consumer's demands and remember their names; further, when providing services, they have commitment and trust for each other.

ABSTRACT
During the last two decades corporate international diversification became a widely used growth strategy. However, the majority of scientific researches insist on its value-destroying pattern. Those of them which were based on accounting studies' methodology and used current performance measures are likely to make an incomplete evaluation of corporate performance by accounting either for operating performance or financial (cost of capital) effects of internationalization. The current paper proposes a new approach for estimation of internalization-performance relationship which is based on economic profit concept. It allows to control simultaneously both operating and financial effects of internationalization on the firms' current performance. The proposed model has been empirically tested on a sample of large companies from one of emerging economies - Russia. The results identify a non-linear U-shape relationship between a degree of internationalization and companies' residual income (economic profit). The relationship is mainly determined by operating performance effects on economic profit while cost of capital has a modest effect. Overall for the majority of companies international diversification refers to decrease in economic profit. The results are compared against the Q-Tobin measure which incorporates expectations about future performance. A joint analysis of current performance (economic profit) and long-term performance (Q-Tobin) allows to expect the internationalization benefits to be realized in future. As an implication of the present research for corporate decision makers it may be stated that at the initial level of international diversification the internationalization decisions should be made with a high degree of caution. There should be a clear internationalization strategy based on definite mechanisms of performance improvement. The prestige and other irrational motives which may lead to the value destruction should be pruned.

Keywords: *Corporate international diversification, Corporate performance, Internationalization, Multinational corporations, Residual income*

1   INTRODUCTION

During the last two decades the level of corporate international diversification (CID) has been significantly growing. As an example in 2003–2006 a number of cross-border M&A deals grew by 40% per annum in manufacturing industries of some of European countries (Coeurdacier et al., 2009). In recent years the companies from emerging markets have also enhanced internationalization strategies, e.g. in China outbound M&A activities have doubled in terms of annual number of deals and increased five times in terms of value in period from 2002 to 2005 (Tan and Ai, 2010). In year 2000–2007 an average growth rate of outbound foreign direct investments of Russian companies was about 40% per annum (Plotnikov, 2010).

According to the majority of researches on performance of cross-border diversification the companies get into the internationalization paradox - the scholars demonstrate that the internationalization activities are mainly value-destroying.

Under corporate international diversification (CID) we mean an intensification of international activity of a company in terms of either exporting the products to foreign markets or employing resourced and allocating production units abroad or both. Following Hitt et al. (2006) the terms international diversification, cross-border diversification and internationalization are used in the paper as synonyms.

In fact most part of the researches which are based on accounting studies' methodology use operating performance measures (such as operating profit margin, return on assets or return on equity) and are missing the financial-side effects which are mainly resulted in the change of the cost of capital. These financial effects are mostly related to change in overall level of risks, access to integrated (global) capital markets, tax optimization and change in capital structure (Singh Manohar and Najadmalayeri Ali, 2004). Thus a neglect of these financial effects may lead to an incomplete evaluation of current performance[1] of internationalization. Both financial and operational effects should be analysed in order to fix the impact of internationalization on current performance. Meanwhile the current performance of internationalization may not represent its' long-term performance. Thus the current performance of internationalization should be compared to long-term measures such as Q-Tobin or market multiples which incorporate market expectations on future performance of a firm.

This paper contributes to the existing literature by developing a new approach for evaluation of internationalization-performance relationship which is based on a concept of economic profit (residual income). The method allows us to control both operating and financial effects of internationalization. Our second contribution is derived from the application of our original model to empirical identification of internationalization-performance relationship of the firms from the emerging capital markets, mainly Russian companies, which still remained unexplored as compared to the developed markets.

The paper is structured as follows: in the next section the theoretical background is summarized on the basis of existing researches and the hypotheses are formulated. The data and the methods are explained in section three. In section four we discuss the empirical results. Finally, the overall conclusions and policy implications are presented.

2 THEORETICAL BACKGROUND AND HYPOTHESES

2.1 Research approach

The internationalization-performance relationship is typically studied in two paradigms[2]: event studies and accounting studies. While the first is based on the analysis of corporate performance change within a time window around a cross-border M&A deal, the second approach is based on identification of relationship between corporate performance (typically accounting-based measures) and a degree of internationalization of business (DOI). One may

---

[1] Under current performance we mean the results of a firm in a particular time period, for example for a particular year

[2] There exists the third paradigm of case studies analysis, but it remains a rather niche study-field.

find a thorough review of research literature of both event-based and accounting-based internationalization studies in the papers of Bruener (2004) or Hitt et al. (2006).

The current research is based on the approach of regression analysis of influence of degree of internationalization on corporate performance measures. The existing researches differ a lot by the use of both performance indicators and measures of degree of internationalization:

- depending on the choice of measure of DOI it is possible to control different internationalization patterns. Usually international diversification is classified into two classes – diversification of assets and diversification of markets. The most commonly used measures of these types of CID are foreign-assets-to-total-assets (FATA) and foreign-sales-to-total-sales (FSTS) ratios correspondently. In opposite to event-studies approach the use of FATA measure allows to analyze not only non-organic foreign growth (cross-border M&As) but also foreign greenfield investments;

- a use of different corporate performance indicators also allows to study different types of effects of internationalization in different time horizons. Typically researches use the following two types of corporate performance measures:

  1) The first group of measures represents the current corporate performance during a particular period of time (usually 1 year) but does not incorporate expectations of potential efficiency changes in the future (usually benefits from internationalization are fully realized in the period of several years). The group of these measures consists of operational (revenue, operating cash flow, EBIT-based measures (EBIT margin, ROS, ROE, ROA, etc.), others) and financial performance measures (WACC and other cost-of-capital related measures) which are studied separately. The following papers represent this class of studies: Qian and Li (2002), Guler et al. (2003), Moeller and Schlingemann (2004), Lu and Beamish (2004), Contractor et al. (2007), Bobillo et al. (2010), Rugman and Chang (2010), Singh and Nejadmalayeri (2004), Joliet and Hubner (2006);

  2) The second group of measures incorporates expectations of the future corporate performance by combining accounting measures with market-based metrics in different multiples (Tobin's Q, PE, market-to-book ratio, others; see Bodnar et al. (2003), Chang and Wang (2007), Rugman and Chang (2010)).

The weakness of the first group of measures is that they do not simultaneously count for operational and financial efficiency effects of internationalization. In fact the change in operational efficiency measures should be compared to the change in opportunity costs measured by the change in the cost of capital. This paper proposes a new approach for solving the problem of a simultaneous analysis of operational and financial efficiency change related to corporate international diversification. The current model is based on the economic profit concept. Since economic profit comprises the cost of capital, which represents the risks associated with a firm and its internationalization decisions, it is an appropriate measure of *strategic performance* of a firm. The economic profit or residual income is measured as follows:

$$RI_{it} = (ROCE_{it} - WACC_{it}) \cdot CE_{it} \qquad (1)$$

where *RI* is the measure of economic profit of company *i* in period *t*, *ROCE* – return on capital employed, *WACC* - weighted average cost of capital, *CE* – amount of capital employed.

As an economic profit measure for estimation of internationalization-performance relationship the ratio of residual income to capital employed may be used. Thus, both ROCE and WACC as functions of the degree of internationalization and other control variables should be estimated.

2.2 Hypotheses

Based on existing studies as well as our analysis of internationalization processes in Russia we have formulated several research hypotheses for a sample of Russian companies.

2.2.1 Hypotheses for ROCE-DOI relationship

The majority of internationalization-performance researches state for a non-linear pattern of relationship between DOI and operational efficiency measures. Lu and Beamish (2004) identified the most general pattern of this relationship demonstrated by horizontal S-shape curve which was also supported by Bobillo et al. (2010), Rugman and Chang (2010). The S-shape curve consists of 3 sequential intervals:

1) at a low level of international diversification the operating performance is decreasing with an increase in DOI since internationalization-related costs (learning costs, cost of coordination and control of abroad divisions, other transaction costs) are too high in comparison with a low marginal increase in efficiency and growth of abroad sales;
2) at a medium level of internationalization the performance is supposed to increase due to significant benefits (economy of scale and scope, diversification of country risks, access to foreign knowledge and cheaper resources, increase of market power, etc.) which are higher than transaction costs;
3) at a high level of DOI the performance may start descending again due to the unmanageable international complexity of organizations (over-internationalization stage).

For the developed countries the most typical result of estimation of the relationship is a horizontal S-shape curve, but there are some studies which also identify a U-shape curve[3] (which represents only the first and the second stages of the S-shape curve) and an inverted U-shape curve[4] (which represents only the second and the third stages of the S-shape curve). For the emerging markets (India) a U-shaped relationship has been identified by Contractor et al. (2007). It is presumed that the companies from the emerging markets typically do not reach such degree of complexity related to an over-internationalization stage when further internationalization becomes value destroying.

Hypothesis 1.1: The relationship between ROCE and DOI is non-linear and follows an U-shape pattern for Russian companies

2.2.2 Hypotheses for WACC-DOI relationship

Singh and Nejadmalayeri (2004) have identified an increase of liabilities in capital structure related to corporate internationalization. The fact is motivated by a corresponding increase of debt supply on capital market which is driven by diminishing bankruptcy risks of internationalizing firms due to overall risk diversification. But conversely there exist other studies that state for a downturn in debt supply related to corporate internationalization due to the following factors (see e.g. Doukas and Pantzalis, 2003):

---

[3] For instance see Capar and Kotabe (2003), Ruigrok and Wagner (2003).

[4] For instance see Hitt et al. (1997).

Enterprise in Turbulent Environment

a) typically internationalization is associated with higher growth rates and a growing complexity of organizational design of a business both of which increase agency costs of debt holders;

b) amount of intangible assets are likely to increase with international diversification of business which implied additional risks to debtholders as these assets cannot be monetized in case of bankruptcy.

Since there is no theoretical base for hypothesizing a prevailing of one effect above another as a hull hypothesis we assume that the effects compensate each other and capital structure is not supposed to change due to internationalization.

Hypothesis 2.1: A combination of debt and equity in capital structure does not depend on DOI for a sample of Russian companies.

Corporate international diversification influences cost of equity through the following three factors:

a) change in level of risks: there may exist a non-linear relationship between DOI and level of risks to shareholders due to an addition of new internationalization-specific risks on initial stage of international diversification, meanwhile on a later stages of CID one could expect a decrease of shareholders' risks due to their diversification;

b) rise of shareholders' agency costs: it is supposed that with growth of DOI the costs of monitoring and controlling company's management also increase;

c) change in capital structure: different levers are described in above in paragraph related to Hypotheses 2.1.

Singh and Nejadmalayeri (2004) state for a higher risk price for shareholder determined by beta coefficient for MNCs.

Hypothesis 2.2: Cost of equity increase with international diversification. There may exist a non-linear relationship of U-shape form between cost of equity and DOI for a sample of internationalized Russian companies

The most significant debt-specific factors are as follows:

a) change in debt maturity: as it was identified by Singh and Nejadmalayeri (2004) that MNCs typically raise a longer-term debt than domestic firms do. It is thus resulted in higher cost of debt;

b) change in efficient tax rate related to a move of profit centers in other countries: this factor directly influences the after tax cost of debt.

Hypothesis 2.3: Cost of debt is growing with an increase in DOI for a sample of Russian companies.

2.2.3 Hypotheses for Q-Tobin – DOI relationship

The Q-Tobin represents expectations of shareholders regarding future company's performance (mostly strategic investors, who are focused on long-term development of a firm). Given that internationalization strategies are used widely, we can expect that they create value in long term even if a short-term (current) internationalization effects may be negative. This may be explained by several factors such as a long-term benefits which could not be gained in short term (benefits from access to new technologies and R&D results), or

short-term internationalization costs may be considered as investments in maintaining market position in long-term (for example a purchase of an abroad company way lower current performance but make a company better-off comparing to a case when a competitor makes this purchase), etc.

Hypothesis 3.1: Q-Tobin increases with increase of degree of internationalization for a sample of Russian companies. With low current performance related to internationalization Q-Tobin would be also lower.

3 THE METHODS

3.1 The sample
The proposed research framework is applied on a sample of Russian companies. We have collected the data of 50 Russian companies which included:
- 40 internationalized companies which have made at least one cross-border acquisition in the period from 2000 to 2010;
- 10 domestic companies with a zero internationalization level which are included in the list of 200 Russian companies with the highest capitalization.

All chosen companies are public and disclose all the key information which should be used in the current research. The data is derived from Bloomberg database. The data has been collected for a time span from year 2005 to year 2010. Overall we have an unbalanced panel of 183 observations. Moreover there exist some observations with missing values for some of the variables. Descriptive statistics for key variables in the dataset is depicted in Table 1.

Table 1: Key variable's description and statistics for the sample

Variable	Description	Obs	Mean	S. D.	Min	Max
Efficiency measures						
ROCE	Return on capital employed (%)	178	24,16	18,53	-19,58	108,44
WACC	Weighted aver. cost of cap. (%)	183	9,32	3,19	1,33	20,11
Internationalization measures (DOI)						
fsts	Foreign sales to total sales	183	0,32	0,32	0,00	0,98
fata	Foreign assets to total assets	103	0,10	0,19	0,00	1,00

3.2 Modeling procedures
We do separate estimations of ROCE, WACC and Q-Tobin's equations on panel data for years 2005-2010. We employ GLS estimates under assumption of random effects. A Hausman test is also used in order to test an endogeneity problem in panel data regressions. We also test for non-linearity and other formulated hypotheses. RI is calculated analytically based on the estimations of ROCE and WACC.

As for DOI the FSTS measure is used. We do not employ into the regressions the FATA measure because of its low availability. Nevertheless, due to a sample selection procedure where we have chosen the companies which conducted at least one cross-border M&A in the last decade, both assets and market international diversification are analyzed.

Enterprise in Turbulent Environment

An equation for ROCE has the following form:

$$ROCE = X \cdot \delta + \alpha_1 \cdot fsts + \alpha_2 \cdot fsts^2 + \alpha_3 \cdot fsts^3 + \varphi \qquad (2)$$

where X is a matrix of the following control variables: firm size (measured by logarithm of sales), product diversification (measured by Herfindahl-Hirschman Index calculated on the basis of product segmentation disclosed by firms in their financial statements), book value of intangible assets normalized by total amount of assets, managerial agency costs (inverse of assets turnover ratio) and composite variables of DOI and product diversification as well as DOI and intangible assets ratio.

For testing the hypothesis 2.1-2.3 an equation for WACC has been decomposed into three parts: 1) financial leverage (share of debt in the capital employed), 2) cost of debt and 3) cost of common equity:

$$WACC\,(fsts) = \frac{D}{D+E}(fsts) \cdot CoD\,(fsts) + (1 - \frac{D}{D+E}(fsts)) \cdot CoCE\,(fsts) \qquad (3)$$

where D states for amount of debt, E – common equity, CoD - cost of debt , CoCE - cost of common equity. A share of preferred equity in capital structure is extremely low in the studied sample and constitutes no more than 0.1% of capital employed and is not taken into analyses in the present research.

Thus according to the defined approach we estimate the following equations (4) – (6):

$$Debt\_to\_assets = \beta_0 + \beta_1 \cdot fsts + \beta_2 \cdot fsts^2 + \beta_3 \cdot fsts^3 + \beta_4 \cdot ROE3 + $$
$$+ \beta_5 \cdot growth3 + \beta_6 \cdot \ln\_sales + \beta_7 \cdot dummies + \varepsilon \qquad (4)$$

$$CoD = \varphi_0 + \varphi_1 \cdot fsts + \varphi_2 \cdot fsts^2 + \varphi_3 \cdot fsts^3 + \varphi_4 \cdot ROE3 + $$
$$+ \varphi_5 \cdot growth3 + \varphi_6 \cdot \ln\_sales + \varphi_7 \cdot debt\_to\_assets + \varphi_8 \cdot dummies + \varepsilon \qquad (5)$$

$$CoCE = \gamma_0 + \gamma_1 \cdot fsts + \gamma_2 \cdot fsts^2 + \gamma_3 \cdot fsts^3 + \gamma_4 \cdot ROE3 + $$
$$+ \gamma_5 \cdot growth3 + \gamma_6 \cdot \ln\_sales + \gamma_7 \cdot debt\_to\_assets + \gamma_8 \cdot dummies + \varepsilon \qquad (6)$$

where *dummies* states for dummy variables representing industry of a firm and profitability shift related to crises years 2008 and 2009.

For testing the hypothesis 3.1 we estimate the following equation:

$$Tobin's\_Q = Y \cdot \delta + \alpha_1 \cdot fsts + \alpha_2 \cdot fsts^2 + \alpha_3 \cdot fsts^3 + \varphi \qquad (7)$$

where *Y* is a matrix of control variables, which include: firm size (*ln_sales*), product diversification variable (*prod_divn_hhi*), proxy for agency costs measure (*asset_turnover*), measure for book value of intangible assets (*intang_to_tot_assets*), composite variables of DOI and product diversification as well as DOI and intangible assets ratio (*diverse* and *intasssales_to_fsts* correspondently), debt to assets ratio (*Debt_to_Assets*), three year average

return to equity (ROE3), EBIT margin in current year (*Ebit_margin*), three year average sales growth rate (*Growth3*), dummy variables for industries using SIC and for a control of crisis period 2008–2009. The chosen variables are key variables, which influence Q-Tobin of internationalizing companies (for a detailed analysis of variables choice see Lu and Beamish, 2004; Chang and Wang, 2007).

4   FINDINGS

4.1   Testing the ROCE to DOI relationship

In order to define a proper functional form of the ROCE-DOI relationship all variables have been initially included in the equation (2):

- To measure a direct internationalization impact on performance the cubic polynomial function components has been employed ($fsts$, $fsts^2$, $fsts^3$). It allows to test the formulated hypothesis of non-linearity of internationalization impact;
- To test two other hypotheses of an influence of product diversification and intangible assets on ROCE-DOI relationship two additional variables were used: composite variables of DOI and product diversification as well as DOI and intangible assets ratio.

The results of estimation are represented in Chart 1. Our main findings are as follows:

- We found out that the ROCE-DOI relationship follows a U-shape pattern (see Chart 1). At the early stage of internationalization (when the share of foreign sales is in the interval between 0% and approximately 50%) cross-border diversification significantly diminishes the return on capital employed. At the later stages of internationalization (when the share of foreign sales exceeds half of total sales) a sharp increase in profitability has been identified. As it is shown the initial drop in efficiency is compensated by its subsequent growth only at the level of absolute internationalization (FSTS > 90%). The significant drop in ROCE at the early stage of internationalization of Russian companies may be explained by both strategic motives (which presume return in the long run, e.g. a motive of acquisition of innovative technologies or new knowledge) and at the same time by possible irrationality of managerial behavior (such phenomenon as managerialism and hubris are studied in Seth et al. (2000)).

Enterprise in Turbulent Environment
Chart 1: Q-Tobin - Internationalization relationship compared to relationship of internationalization and current performance (RI)

4.2 Testing the WACC to DOI relationship

According to the methodology described in the above section a separate estimation of influence of DOI on capital structure, cost of debt and cost of common capital has been carried out. The results are as follows (see also Chart 2):

- We identified no significant influence of DOI on capital structure (i.e. the choice between common equity and debt; these results of estimates for eq. 4 are not depicted in the paper);
- Cost of debt positively and significantly depend on DOI. The fact is described by the change in the time structure of debt – with an advancement of international diversification companies launch longer term projects which require external financing for longer periods of time. As it is commonly known longer term financing is typically associated with higher required return to debt;
- For the cost of common equity (CoCE) we found a non-linear relationship form. This form may be described by the proposition that at low degrees of internationalization shareholders consider CID as an addition of new internationalization-specific risks while at the later stages of internationalization they regard a firm as a well diversified portfolio of businesses in different countries, characterized by comparably lower level of risks;
- An estimation of weighted average cost of capital is computed analytically with a use of the given capital structure of each firm in each year (see Chart 2). We can conclude that CID typically increases the cost of capital employed (if compare to domestic firms).

1072

Enterprise in Turbulent Environment
Chart 2: ROCE to DOI relationship: a U-shape curve

4.3   Estimation of economic profit

In present research the current performance measure is defined by an economic profit spread (or residual income spread) which equals to a difference between return on capital employed (ROCE) and weighted average cost of capital (WACC), see Chart 1. The results show that residual income ratio mainly follows the ROCE pattern. Influence of WACC on the economic profit margin is significant but rather low. The overall internationalization-performance relationship of Russian companies seems to follow a U-shape curve with a rather high variance in performance.

4.4   Estimation of Q-Tobin – DOI relationship

The estimation of Q-Tobin - internationalization relationship is depicted on Chart 1[5]. It is shown that the relationship follows a horizontal S-shape curve, which consists of 3 stages:

- Stage 1 – start of internationalization (DOI is between 0 and 0.2). On this stage there may appear a value creation due to low dependence of the whole business on international affairs but potentially significant benefits (access to technology, markets which are similar and close to domestic, etc).;
- Stage 2 – adaptation to internationalization (DOI is higher than 0.2 and lower than 0.7). The business suffers from increasing transaction costs and a need for transformation in order to adapt to new international structure;
- Stage 3 – matured multinational (DOI higher than 0.7). The business is well adapted to the international structure, it gains the whole number of benefits, but not tackles with the problem of over complexity (where efficiency starts decreasing).

In comparison of the Q-Tobin – DOI and RI – DOI results it should be stated that on overall the internationalization strategies are expected to create value in long term regardless to a drop in current performance of a firm. Thus a drop in current performance should be mostly explained not by irrational motives of management, but mostly by strategic aspects which presume competitive advantages in long run.

5   CONCLUSIONS AND POLICY IMPLICATIONS

This paper contributes to the internationalization-performance literature by proposing a new approach for measuring corporate performance related to internationalization which is based

---

[5] Chart 1 represents the Q-Tobin – DOI relationship for an average degree of product diversification.

on economic profit concept. This new method simultaneously accounts for a change in profitability (measured as return on capital employed) and opportunity costs (measured by weighted average cost of capital) related to a level of cross-border diversification. The methodology of empirical estimation of internationalization efficiency has also been developed.

The proposed methodology has been used for estimation of efficiency of internationalization strategies of large Russian companies. It has been shown that internationalization-performance relationship follows a U-shape curve (the finding is consistent with the results of Contractor et al. (2007) derived for another emerging market - India). At the initial stage of international diversification corporate performance declines while at further stages of diversification it grows up. This form of regularity is driven mainly by companies' operating performance (return on capital), while opportunity costs (cost of capital) changes also in a non-linear pattern but with a lower effect. Regardless a drop in current performance related to internationalization the stock market expects that in long run the internationally diversified firm could create higher value than the local peers.

As an implication of the present research for corporate decision makers it may be stated that at the initial level of international diversification the internationalization decisions should be made with a high degree of caution. The prestige and other irrational motives which may lead to the value destruction should be pruned. During the analysis of internationalization efficiency not only operational, but also financial effects should be counted. Companies should also be ready for a probable initial decline in operating performance motivated by an excess of internationalization costs over corresponding benefits.

As for long run internationalization strategy on average we state the following two are likely to be the most sustainable: a) *local focus strategy* with low degree of internationalization (get missing technology or go to nearest well-known abroad markets) and proposition of well customized local products, b) *fully internationalization strategy* with lower level of country-specific customization, but higher operating efficiency.

ABSTRACT
Marketing methodologies today are changing significantly. Because of the widespread use of computers and the Internet, former practice does not show good results anymore. On the other hand, application of new marketing methods enables much stronger impact on the market than before, as well as multiplied profit. There are numerous reasons why things are such. Also, there are multiple reasons for changing current practice. For example, advertising budget of some companies has doubled in the last 4 years, but the intensity of investments is lost at the beginning by the distrust of potential buyers. TV house revealed that only 1 of 8 viewers of television ads believes to promises of these ads. Such trend of declining confidence is seen in every media. As response to these trends, the current marketing practice provides companies a strong influence at the market. New marketing methods contribute to a significant increase of money when investing in attracting clients. One such method is the long-term management of relations with customers. In the modern approach, there is a shift is in the focus – from traditional marketing tools and business orientation, to the orientation on consumers, value and service dimension with strong hold on a long-term relationship with consumers. Cycle of the marketing value of the product and consumers is reflected in the fact that product value decreases over time, and customer value grows over time. In the context of the above mentioned, very important are consumers' lifecycle, consumers' value over the long term, identification and winning over the consumers, expansion of the customer base and retaining of customers. All of these are supported by the modern digital technology. This approach is called the red thread of the modern marketing concept by number of theoreticians and this is the matter we want to elaborate in more detail in this paper.

Keywords: Long-term customer relations, Marketing, Marketing concepts, Modern approach to marketing

1 INTRODUCTION

At the end of the 20th century, a series of new marketing concepts arises giving a new long-term dimension to the role and importance of consumers, and their interests are not only the loyalty of consumers but having long-term relations of cooperation and partnership with the key customers and consumers, with significant form of personalization of these relations.

Strong correlation between satisfaction, loyalty and profitability has been proven in practice. Main prerequisite to loyalty of consumers is satisfaction. Namely, despite great achievements that are related to the study of consumers, they still haven't, at least not completely, answered the question why consumers behave the way they do in the purchase and consumption of products and services. Scientists of different profiles find human brain mostly incomprehensible. Consumer behaviour as a discipline, aimed at broader range of issues

Enterprise in Turbulent Environment

related to the development and characteristics of man as a consumer is not concerned with defining strategies of establishing and maintaining relationships with customers.

These new trends in marketing have a completely new approach to relations with customers and other key stakeholders in the business. Their creation is a result of new information and understanding and so convergence of science and practical problems in the economy and society. Development of technology also had significant role, especially IT, which was a major precondition for the development of these concepts.

Recently, there has been developed a number of concepts that essentially more or less differ, but they all focus on developing long-term relations with customers as: Relationship marketing (marketing of relations), database marketing(marketing supported by databases), Customer Relationship marketing CRM (customer relationship management). In addition to the above mentioned, one can find the following expressions in the literature: Retention marketing, Interdependent Marketing, Loyalty Marketing, 1:1 (one-to-one), Partnership Marketing, Marketing with Permission, Frequency Marketing, Real-Time Marketing.

The most prevalent direction of analysing the development of long-term relationships with customers and other partners, is relationship – marketing. There is no generally accepted definition of this term. Usually, Gronroos's definition is taken as most complete, and it states the following: "Relationship marketing represents establishment, development and maintenance (and break if needed) of relationships with customers and other stakeholders, with gaining profits, and in the way that enables reaching the goals of all parties, which is achieved by common sharing and fulfilling of expectations" (Harker, 1999, pp. 13–20).

The essence of relationship is in the distinction from the classical transactional marketing in several ways, as shown in the following table (Table 1).

Enterprise in Turbulent Environment

Table 1: Transaction vs. Relationship Marketing

	Transaction Focus	**Focus on Relationships**
Time perspective	Short term	Long term
The dominant marketing function	Marketing mix – classical 4P	Interactive marketing (supported by the management activities of marketing mix 7P)
Price elasticity	Consumers are more sensitive to price changes	Consumers are less sensitive to price changes
Dominant dimensions of quality	Focus on attributes – technical dimension of quality. Quality is care of "production" personnel	Focus on consumer value Quality and interaction. Quality is care of all personnel
Measuring customer satisfaction	Indirect - through market share i.e. realized sales	Direct management of customer base
Gathering information about customers	Discontinuous relationship with customers. Research is carried out from time to time	Continuous contact with customers
The basic orientation of business operations	Orientation on individual sales	Orientation on retaining of customers
Interdependence between marketing operations and personnel	Weaker cooperation and trust	Cooperation is of strategic significance
Additional services to customers	Deemphasized consumer services. Limited engagement in relation to the fulfilment of customers' expectations.	Emphasis is on customer services. Great engagement in relation to the fulfilment of customers' expectations.
Internal marketing service	Internal marketing is with or without limited significance for the success of business operations.	Internal marketing has strategic significance for the success.
Product type	Consumer--> <-- Permanent--> <--Industrial--> <--Services <---> goods consumer goods goods	

It is used in all economic fields, and it is gaining more importance in the consumer goods and services. It is usually analysed on three basic levels (Veljkovic, 2009, p. 174):
- Tactical level (similar to the activities of sales promotion);
- Strategic level (emphasis on development of partner relations with customers);
- Philosophical level (it reflects the essence of the philosophy of marketing – the whole organization is focused on delivering total satisfaction to customers and maintenance and development of their business).

It may be concluded, in general, that there has been a change in the overall logic of consideration at companies from different sectors of the economy. Modern age requires companies from various industries to behave in a way so that they fully respect their partners and develop long-term relationships with their major customers, which is the highest stage in the evolutionary development of business logic.

2 LOYALTY AND SATISFACTION OF CONSUMERS AS THE BASIS FOR BUILDING LONG-TERM RELATIONSHIPS

Correlation between satisfaction, loyalty, and profitability of customers has been empirically proven (Hallowell, 1996, pp. 27–42).

Satisfaction is the main prerequisite for consumer loyalty, but not the only one. One should, in this context, look for a deeper approach, which involves the intensity of satisfaction and the intensity (positive or negative) of the reaction of consumers to company's offer. For example, if you have two competing companies which came to same results of measuring satisfaction that 85% of consumers are satisfied with the products or services of the company, it is quite different position than of the company which has 55% extremely satisfied, 20% very satisfied and 10% satisfied, from another company in which the ratio is 10% extremely satisfied, 25 % very satisfied and 50% satisfied. The experience shows that it is 42% more likely that the loyal consumer will be the one who is "extremely satisfied" than that one who stated to be "satisfied". Consumer may be satisfied with a product/service until such time as he/she sees a brand that better meets his/her needs and expectations. Satisfaction may decrease in time, either because of the higher expectations or for the reasons of lower performances.

Extremely loyal and enthusiastic consumer is not only satisfied, but this is the person that buys the products and services of the company and expands positive oral propaganda and obtains new customers for the company.

Trust and commitment have major role in forming of loyalty of consumer to the brand and company. We conclude that the loyal consumer is a precondition to a successful business.

The question is how to define loyalty. There are two approaches. One starts with consumer attitudes, that is their preferences, based primarily on satisfaction they had in the previous shopping. Alternative approach is behavioural approach, based on the actual situation and the actual purchase. This type of measuring satisfaction, having in mind the modern scanning systems and other types of sales that can accurately determine the buying behaviour became more appealing to managers. Applying the two known methods of measurement, all consumers can be divided into four categories, depending on the degree of loyalty measured by purchases/visits to service companies:
- Absolute loyalty;
- Unsteady loyalty;

Enterprise in Turbulent Environment

- Relative loyalty;
- Disloyalty.

Consideration of this matter is much more subtle, because loyalty of customers is different at particular segments of the market. This approach does not answer the question why a consumer buys certain brand. That is why one-dimensional observation of loyalty cannot give complete and accurate answers. Consumer's attitudes and preferences to some service companies must be monitored, as well as their real buying behaviour. It provides a framework that defines loyalty as the favoured attitude towards a particular brand, which results in constant purchases over time (Asael, 1992).

It is possible to identify four types of loyalty, depending on the frequency of re-buying and intensity of attitudes towards a particular brand, such as: false loyalty, latent loyalty, stable loyalty, no loyalty. There are common cases and situations where loyalty does not exist. Customer simply does not see the difference between alternatives and does not prefer any of them, and the purchase is done mostly on a random choice. In practice, it is often assumed that profit is a measure of the importance of customers. The results show that each form of loyalty is not profitable for the company, i.e. a good part of the loyal customers is not profitable, and therefore there is a need for a strategic approach to loyalty. According to this principle, one should take into account not only profitability, but also estimation of the relationship between profitability and long term cooperation with some clients.

For the company to recognize the true benefits, it must accept the concept of value, which means that profitability is essential, but there are other benefits that can indirectly affect the business results of the company, but also the loyalty of the employees, competitive companies, etc.

3 STRATEGY OF DEVELOPING LONG-TERM RELATIONSHIP WITH CONSUMERS

Basis for the development of long-term relationship is strategic focus. The main goal is to, by delivering a quality product/service (by the standards set up by consumers), influence the long-term satisfaction of consumers, which is a prerequisite for full loyalty. When a company has motivated and satisfied employees, from the first line of serving to the managerial position, with the corporate culture, success is guaranteed. Loyalty of RELATIONSHIP to business practice is placed in a square: Satisfaction of consumers – quality of product/service – customers' loyalty and increased profit - satisfaction and loyalty of employees.

The basic elements of the long-term relationship derive from elements necessary for the proper functioning of marketing. Therefore we can say these elements are the following:
- Knowledge of consumers' needs and desires, characteristics, and effects of some factors on their behaviour;
- Real marketing i.e. marketing way of thinking;
- Achievement of modern concepts that address the development of long-term relationships with customers;
- Options and needs of companies;
- Understanding the role and importance of all those involved in the process of creating and delivery of products/services (value);
- Long-term way of thinking and behaviour; and
- Company working as a whole.

The very process of long-term relationships can be separated into the following steps:
- Interaction with consumers;
- Recognition (personification) of consumers - treating each customer as an individual through personal contact or automated process;
- Creating a loyalty program - rewards and added value;
- Continuous improvement of concepts (control, measurement and feedback of information);
- Corrective actions - management of consumer dissatisfaction.

By creating a dialogue with customers one can come up with valuable information, which is converted into knowledge, and knowledge is the basis for the adjustment of supply and taking action on establishing long term relationships. Further, efficient and effective action leads to satisfaction of consumer, creating confidence and familiarity. Satisfaction, trust and commitment lead consumers to loyalty and loyalty leads to profit. Profitability of the company and satisfaction of consumers is initiated and supported by interaction with consumers (Nova Trgovina, 2001, pp. 53−60).

Personalization and customization are different in the fact that the personalization often involves automatic adjustment until the adjustment is done automatically, but at the request of user. It usually refers to adjustment of: products, services, price and payment terms, distribution channels and adjustment of communications.

4   THREE FORMS OF TRUST AND THE EXAMPLE OF THE BANKING SECTOR

Priority of the management for customer relations (Customer Relationship Management-CRM) is creation of loyal customers. The key to creation of loyal customers is in creation of the feeling of confidence. Certain number of authors in the field of management (Rousseau, Sitkin and Cramerer, 1988) developed the model of confidence. This model has been successfully applied in corporate banking (Saparito, Chen and Sapinenza, 2004) and is applicable to other areas.

The next model makes the distinction between three modes of trust: calculated trust (calculus based trust), trust based on relations (relational trust) and trust based on identification (identification based trust).

Calculated trust is the basic form of establishing a relationship between the users of a company. The cooperation with the company is reduced to the exchange without creating social and emotional basis of relations. Calculated trust is established on the principle of mutual interest.

The key to achieving successful relationship of transactional trust is consistent behaviour. Fulfilling given promises motivates users to continue the cooperation with the company. The largest number of users base their relations with the company just on the feeling of calculated trust.

Developing a sense of mutual trust culminates by establishing feelings of trust based on identification. It is no longer enough to show a consistent behaviour and fulfil the promises. The trust based on identification is characterized by the existence of common goals, respect of

the same system of values, and mutual ability to predict the reactions of the other party (Pearson, 2006).

Only a small number of users develop a sense of confidence based on the identification with the corporation. They are willing to continue to cooperate with the company even in the case they suffer discomfort, i.e. develop a sense of loyalty.

Establishing a relationship of relation trust or trust based on identification provides the following advantages (Saparito et al., 2004):
- Likelihood to switch users to a firm that offers more favourable conditions is smaller. Users are making no effort to finding companies that offer more favourable terms.
- Users are motivated to continue cooperation with the company, although suffering embarrassment, because they cannot easily transfer relations that are created to another company.
- Relational trust and trust through identification leads to the creation of loyal customers.

Intangible assets are among the most important sources of competitive advantage in the banking industry, for example. In order for it to be a source of competitive advantage, intangible property must offer (a) a unique value that is (b) relevant to users. Then, intangible assets enrich the offer because it points to the uniqueness of the company in comparison to the competition.

Marketing has a key role in the creation of elements of intangible assets as: corporate reputation (corporate reputation), the corporate ethos (corporate values), the intangible value of the brand (brand equity) and so on.

Example: Merging of Bank Intesa and Sanpaolo IMI Group, first one from Milan and the other one from Turin. Merging entered into force in January 2007 by which the Intesa Sanpaolo Group emerged as the largest banking group in Italy and the third one in Europe on the basis of total assets.

This merging represented a consolidation of several marketing challenges: (a) positioning the brand Intesa Sanpaolo in the same way in a larger number of markets, and (b) the creation of a common vision and corporate culture, which will be able to create a sense of belonging and commitment to the new group (*Intesa Sanpaolo*, 2008, October).

Positioning of brand Intesa Sanpaolo Group and the creation of a common vision and a corporate culture is based on corporate system of value as one of the most important elements of intangible assets. This system takes central position in all internal and external communications and makes a basis of all marketing activities.

In order to define the corporate value system, qualitative research by method of brainstorming was conducted with representatives of all local banks.

Brainstorming defined key insights of the users at the local level, after which they were crossed with the profile of brand Intesa Sanpaolo, which "leads to large values that transcend borders and unite people; they are close to people from all countries and at the same time belong to the group" (Intesa Sanpaolo, 2008).

Corporate system of values of Intesa Sanpaolo Group communicates: imagination, humanity, stability and hope. For example, for the practical application of this system of value, one of several of these, is the slogan: We think ahead with you (Intesa Sanpaolo, 2008). How to define global identity: Case history of Intesa Sanpaolo subsidiary international banks).

5   MULTIDIMENSIONAL RELATIONAL MARKETING

Without neglecting the emotional effects, the company must come up with what consumer wants and expects, in what way consumers want a company to treat them as well as products close to them: In order to incorporate demands in the corresponding profile of the product or service, marketing companies must understand the demands of consumers. Using and achieving mutual lasting business relationships with individual customers is priority and the pledge of successful business. That is why it can be argued that the value of the product declines over time, and customer value grows over time, in which the consumer life cycle (CLC) is of utmost importance. CRM is a strategic framework for the rational marketing. CRM can be expressed as an umbrella that covers: Winning over ------------→ - Taking over and expansion of the customer base --------- → Retention.

CRM is a widely established approach that is primarily oriented to individual consumers and their individual demands. As company develops individual relationships with each of customers ETFS stage - Engage, Transact, Fulfil, Service – they imply that such a cycle refers to the stages through which a consumer passes with each purchase, and that such a cycle is repeated over again (their relationship is made up of a series of such cycles). Concept of customers' lifecycle is usually used by companies for CBM activities which include modelling of consumer behaviour (Customer behaviour modelling). Nowadays it is widely accepted the understanding that among the main indicators of modern marketing metrics are: 1) the total number of consumers, 2) revenue per customer, 3) customer satisfaction, 4) customer retention rate, 5) an increase in sales and 6) the cost of acquiring customers, 7) cost of sales, 8) costs of servicing customers and 9) the cost of retaining customers.

Therefore, there are two groups of specific indicators – one on the revenue and the other on the cost side – overlapping to certain extent with the information offered by traditionalists.

Experience shows that majority of companies is focused on the first five categories, while less to the others. CRM indicators are in direct connection with the profitability of consumers and the greatest attention should be given to them.

6   CONCLUSION

Customer relationship management represents the activity of complying business strategies, organization structure and culture of the company, information on customers and IT with the aim in continuous satisfaction of customers' needs and, at the same time, gaining business benefit and profit. Stages of implementation of the strategy are as follows: operational management that implies automation and optimization of sale – so called operational CRM, automation of marketing, measurement of marketing performance, monitoring contacts with customers, as well as automation of support to the users through call centres.

Segmentation represents the second stage of implementation of CRM which principles imply creation of the market map, where target segments may be distinguished according to the similar behaviour of customers.

The principle of targeting directs marketing towards efficient allocation of business resources. The principle implies adequate determination of the target group for certain package of the offer.

This is followed by the model of trust: calculated trust, relational trust, development of mutual trust that achieves its maximum by establishment of trust based on identification.

Today, competitive advantage may be provided only by user-oriented strategies (Customer-centric), which means that companies build their positions based on how well they serve their customers. The user-oriented strategy is not the aim that may be achieved or proclaimed, but it is a "moving target" and constant orientation and manner in which the company must operate. This is enabled by CRM, which secret lies in the fact that it is different to every company, that does not exclude to possibility that it may be learned from the experience of others. There are three key reasons due to which CRM is getting increasingly more important: competition is growing day by day, it is more profitable to keep the existing customers than to obtain the new one, and technology that enables this has reached the satisfying level.

It is clear, today, that the CRM is a business philosophy and related strategy of advanced management of relations with customers according to the principle of respect of individual importance of every consumer and this is where it's true perspective for development of marketing in the future at the global level.

THE AFFECTS OF THE PROCESS IMPROVEMENT TO BUSINESS PERFORMANCE

Yesim Kaygusuz
Uludag University Bursa, Turkey
y.kaygusuz@uludag.edu.tr

ABSTRACT
The main aim of the businesses is to make profit and grow sustainably accordingly. The elements which enable companies to reach this aim are price, cost and customer satisfaction. While the price is determined in the competitive market, cost is shaped in the business processes. The customer satisfaction, on the other hand, is to what extent the output of these processes satisfied the customers. Process consists of the stages which start with taking an order from the customer and end with the delivery of the order. Should the business be likened to a chain, each link represents a process (a function). In order to improve the performance the weak link needs to be strengthen. Strengthening the weak links will only be possible by determining the halting points of the process and removing them. When the notion of the process and its improvement dealt with, the notion of value emerges. The value created in the process means cost in the output, quality and speed improvement for the company. Hence, creating values results with the customer satisfaction. Process value analysis, is the overall operations of the definition and analysis of some certain processes. It defines all the activities from production stage to its presentation to the customer, the inputs used in the operations. At the end of the analysis whether the activities in the process are necessary and if they create added value or not is considered Activity creating an added value adds value to the product the customer wanted, whereas the ones which didn't create added value cause cost and spent time to increase and do not add value to the product from customer's point of view. The use of excessive amoun of input, cause the costs of the product not creating added value and accordingly in the product costs to increase. The removal of these activities would provide a decrease in the expenses and strengthen the competitive situation of the company. The implementation focusing on the process and activities forming it, analyzing these methods and improvement efforts must be continuous. Continuous improvement works would return to the company in the end, as profit increase, shareholder, customer satisfaction. In this study, effects of the process improvement to the business performance will be studied.

Keywords: Business performance, Process improvement, Value analysis

1 WHAT IS PROCESS?

Process, simply, is the whole process of stages where inputs become outputs. When it is only considered in terms of production, it is seen as a place where materials are converted into products. However, this point of view means excluding the components of supplier and customers from the extent. Process is composed of the processes which start with taking an order from the customer and end with the delivery of the order. Process is defined as a component of seven elements (ability, tasks, team, technics, time and devices) by Prasad (1999, p. 178). Process is a structure bringing these seven components together in the most optimum way, using and managing it. This structure may as well be called as process management. Actually, when these seven components are dealt, it is seen that in the base of business management, the management of the processes takes place.

On the other hand, when process is considered from the customer's point of view the notion of value emerges. Value is the most important output of the process both for the business and the customer (figure 1). Customer satisfaction emerges as the process enables the inputs to be used effectively for the customer. Some elements such as cost, quality and speed effects the most important output value of the process.
Figure 1: Proceess and Value

The thing creating the value is the process, effecting the process are the operations and effecting operations are the inputs. In order for the business to reach its aim, some operations increasing the value constantly and which are more effective and efficient according to the previous ones. The focus of the treatment works done by most businesses is to create a value. Should the business be alikened to a chain, each link represents a process (a function). Supply, production and distribution are the links which form the chain. In order to be effective in the chain management, the links need to be managed effectively. The weak link will prevent the other links and the chain in general from reaching its aim or will delay it. In brief, the performance of the business will be effected negatively In order to increase the performance of the business, weak links need to be strengthened. Strengthening the weak links will only be possible by determining the halting points of the process and removing them.

2 PROCESS IMPROVEMENT

Continuous upgrade, improvement, process improvement and reengineering are the notions being used substitute each other. All the businesses operating in a competitive environment need to modernize themselves about providing the perfectness continuously. Continuous improvement is a kind of strategy weapon which provides the business to be a competitive power against its rivals. Continuous improvement efforts both improve the current implementations and methods continuously and encourage the improvement in the business (Ripley, 1996, p. 1). Furthermore, continuous improvement should be seen as a follower improvement in the representation of the value to the customer and improvement (Turney and Anderson, 1989, p. 38). Conntinuous improvement in general meaning (Lenhardt and Colton, 2003, p. 46) are practices for:

  (1) Decreasing the cost of the products
  (2) Improving the quality of the products
  (3) Decreasing the time spent for process

Continuous improvement, is valid not only the processes forming the businesses but for every level. In business improvement by continuous improvement, focusing on the process, not the result, is in question. The understanding of focusing on the process actually means the operations forming the process. If the enhancement of the results is desired, improvement of

the processes affecting the results is a must. In order to improve the process, before anything else, process and operations taking place in the process should be defined and analyzed.
In short, continuous improvement is a device which provides customers to be served a better product and service and the business to be more powerful in a competitive environment and continuous improvement practises should be started at operation level.

Continuous improvement expresses the necessity of continuous learning and an innovative understanding of system in order to provide perfection in all the processes (production, engineering, arketing and accounts) of the business and in these processes the following works for the continuous improvement should be realized (Turney and Anderson, 1989, p. 38):

- Some works for the perfection in the production, improvement in the quality, decrease in the inventory level, on time production of tje products wanted by the customer, reducing the costs by decreasing production losses at a minimum level are needed.
- Perfection in the engineering requires the design of some products which are simplified, provide continuous improvement and use common parts. Simplified designs decrease the production time and inventory level.
- Perfection in marketing focuses on the understanding of customer needs and fulfill these needs in a cost effective system. The function of the marketing is to provide competitive advantages by reduce in the cost besided the improvement in the flexibility.
- Accounts should also be a side in the continuous improvement works. Especially it has a role of supporting the continuous improvement works in the other areas such as production, engineering and marketing. Besides, it has to make reports which shows the effects of the continuous improvement works on the performance of the business with financial and nonfinancial indicators.

3   THE REASONS WHY PROCESS IMPROVEMENT IS REALIZED

Contracting product lives, changing customer needs and expectations, faster entrance of the new rivals to the market are the main determiners of the electronic trade competitive market. The business has two alternatives: continuing or pulling out of the market. In order to prefer to continue; that is to be a competitive power, not only adapting to necessities of the market, but also being different in the market is necessary. Surely there are a lot of elements causing the business to realize process improvement; reducing the costs, increasing the efficiency, quality, decrasing the amount of loss, failback, enhancing the efficiency of the process, speed etc. Briefly, in order to strengthen the element affecting the competitive power of the business positively and reduce or remove the ones affecting them negatively process improvement is reqired.There are internal and external factors (Chan and Peel, 1998, p. 45) which cause the business to realize process improvement. These factors are shown in figure 2.

4   PROCESS VALUE ANALYSIS

Process value analysis is a device which enables continuous improvement works to ve examined and analyzed. Process value analysis is a method which searches ways to improve the process by analyzing operations in a certain process and to reduce costs. In this method, the in put use and factors causing the cost. Process value analysis is based on an understanding that cost emerges during the use of production input. For this reason, efforts for managing and reducing the costs must be realized during the operation and process level. Costs are calculated by taking inputs used in the process, intensity of the process, stream

Enterprise in Turbulent Environment

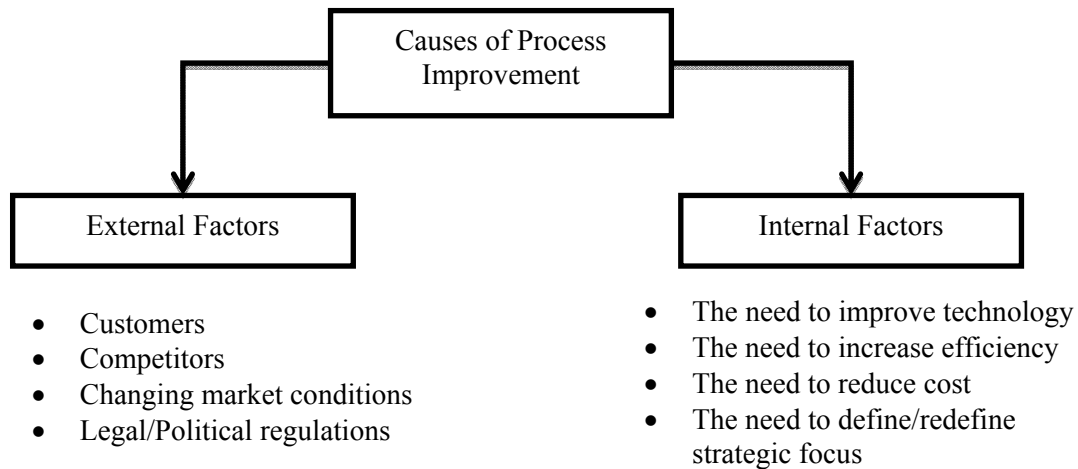
mechanism, stream flexibility and similar properties into account (Ostrenga and Probst, 1992, p. 2).


Figure 2: Causes Of Process Improvements

Process value analysis enables not only the ones in the process, but also the operations taking place in the sub and top components to be analyzed. Process value analysis is the entire of all the operations of the analysis and definition of certain processes in a business. These processes consists of certain operations and the analsis of these operations offer a chance to reduce the costs and increase the value. Process value analysis increase the reciprocal dependency among the operations in the process. The analysis of this reciprocal dependancy enables the events which actuates the business process to be identified. By keeping the events actuating the business process under control, the costs of the operations will be kept under control as well.

The analysis of the operains necessary for the production of an output systematically constitutes the basic structure of the process value analysis. Process value analysis defines all the operations taking place in the production of a product and its presentation to the customer and analyzes these operations from certain points. Process value analysis forms the main structure when the same understanding and basic business logic is implemented. Process value analysis is eminently valid method for analysing the cost structıre of the business. This method, helps the managers understand the systems of production and cost (O'Guin, 1990, p. 54).

The ways that a product follows has different processes. A number of input shaping operations and outputs take place in each process. Product costs and valid performance standarts should reflect the difference in the operations used to support each par tor product. By force of the understanding of an effective cost management of the businesses, the structure of the process value analysis should be formed. In this structure to be formed, following stages should be followed:
  (1) Preparation of the process stream diagram
  (2) Determining whether the operations are necessary or not
  (3) Determining whether the operations are creating added value or not
  (4) Forming a matrix about the process analysis by combining the 2nd and the 3rd stages
  (5) Testing the continuous improvement works

5   VALUE ADDED ANALYSIS

The process consists of different operations. Managers should apply a neccessity analysis to determine whether these operations are necessary from the pint of process. 1. Analysis in the time frame 2. Analysis in the types of operations. In order to complete the production a number of operations must be realized all together. However, whatever type of operation it is, it must be completed in a standart period of time settled. Should an operation be realized over the settled period of time, while standart time period of its total period of time is a necessary operation, the period of time which is over the standard time is an unnecessary operation. The analysis which is carried out in the type of operation, the reasons why these operations are realized must be based on. Namely, activities such as waiting, delay, producing more than necessary and reprocessing are the unnecessary activities for completing the production. These types are the negative indicators of the operability and efficiency of the production process.

Besides, whether each operation in the process create added value by being subject to added value analysis. While practising this analysis a manager should ask herself this question: Does a removal of a stage or an operation cause our customers ' satisfaction level to decrease? If the answer is no, reducing the treatment of the excessive amount of material, unneeded adjustments or the inventories wouldn't decrease the satisfaction of the customer, on the contrary as it enables a fadter delivery there would be an increase in the level of customer satisfaction. The activities during the process must be analyzed for whether they added value to the process output or not. The most important indicators in this analysis are the stage in the process and its positive and negative effects on the level of customer satisfaction level. Customer is not only the user of the end product. It must not be forgotten that the next stage in the process is also the customer.

Should the activities used by the customer and during the production of the products and take place in the process cause a rise in the satisfaction of the customer, they are the ones which create added value, if it cause customer satisfaction to decrease they are those which do not create added value. It is concluded that when the operation, examining, transportation, waiting and inventory activities are examined, it is understood that the activities do not create added value (Polimeni et al., 1992, p. 446).The activities creating added value is adding a value to the product whşch the customer has wanted, while the activities not creating added value cause time spent and cost to rise, however, it does not add value to the product from the point of the customer. Certain activities effect the cost and the performance of the process. By taking these activities under control costs are also taken under control. The use of excessive amount of input , cause the cost of the products not dreating added value and accorigly the product cost to increase. Removal of these activities would cause the expenses to decrease and the competitive position of the business would get stronger (Forrest, 1994, p. 313). So as to control and decrease the cost of the products produced during the process, the following processes must be realized respectively:

- The definition of the activities which add or do not add value to the products
- Some work for reducing and removing the activities which do not create added value
- The use of added value activities effectively

Different activities are realized during the processi these activities differ according to the product to be produced and this difference is reflected in the input use of the activities. These differences must be analyzed and associated with the product costs. The activities which are

previously classified according to the necessity analysis, are classified in chart to in terms of creating added value.

As it is seen, all the activitşes except for the operation activity do not add value to the process and the product and cause costs to increase. The researches done show that 10% of the activities in the process create added value on the product, the 90 % part do not create added value at all (Barfield et al., 2004, p. 24). The most important point of these researches which must be percieved by the business management, the necessity of focusing on the activities realized before and after the machinery rather than the activities realized on the machinery.

Table 1: Matrix of Activities

Activities	Necessary	Non-Necessary	Value-Added	Non-Value-Added
Operation	✓		✓	
Transport	✓			✓
Waiting		✓		✓
Control	✓			✓
Stockholding	✓			✓
Re-work		✓		✓

The activities in the process analysis, are classified according to the principals of "necessity" and "creating added value "
- Activities which are necessary and create added value
- Activities which are necessary but do not create added value
- Activities which are not necesary but create added value
- Activities which are not necessary and do not create added value

This classification is shown in table 2 as a 2x2 matrix.

Table 2: Classification of Activities by Managerial Perspective (Surendra et al., 2006, p. 19)

	Value-Added	Non Value-Added
Necessary	*Strategical* **A** Improve	*Managerial* **B** Decrease
Unnecessary	*Technical* **C** Decrease	**D** Eliminate

The business managers are needed to manage these activities according to the classification. In order to provide an effective process management and customer satisfaction, the activity groups in the matrix must be managed by being handled in a different way.

The activities in the A group are classified as strategic activities when they are considered in a managertal point of view for business. Business management is needed to give more importance to this type of activity in which added value is created. Management must be aware of the fact that if these activites were not realized, there would not be production and naturally their effects to the business.

The activities in group B must be considered technically. These types of activies are needed to be reduced, or more precisely used in the most appropriate way. Especially, if the rotations in the production process and transition activities among the parties were done different from the essential one, production time would get longer and thus, the production parties would have more costs because of the more use of input. In this activity group suitability must be based on (Surendra et al., 2006, p. 16).

In grop C, the activities which do not create added value but essential for the completion of the production. The activities in this group are classified as managerial activities. The complete removal of these activities cause process operability to end, in other words, production to halt. The ways to decrease this kind of activities must be searched. The business management, must especially focus on the optimization in these kinds of operation. For instance, the advantages which enable automobile spare parts produced in to parties to be produces in a single party in month. The activities in group D are the ones which must be removed completely. They are those which are not essential for the process, do not create added value for the product, cause an increase in the costs, extend the production and delivery time, decrease the customer satisfaction level. If the business management aims to decrease the costs, it must not give credence to activities in group D and take some steps to prevent these activities (education, specialization, equipmant support etc.).

6   PERFORMANCE

The aim of the process improvement works fort he businesses to obtain more output with the same amount of input comparing top re-improvement or the use of fewer input to reach the same amount of Both of these would only be possible by deacreasing or removing the activities not creating added value in the process.

Enterprise in Turbulent Environment

Revenues 5%-23%		Inventory 20%-52%
Blue-Collar Productivity 5%-25%		Inviseble Inventory 20%-60%
White-Collar Productivity 20%-110%	Total Cycle Time 30%-70% reduction	Depreciation 10%-32%
Time-to-Market 20%-70%		Scrap 20%-82%
Return on Assets 20%-110%		Delivery Lead Times 30%-70%
Figure 3: Business Perfomance Improvement by Total Cycle Time Reduction Programme
(Thomas, 1990; Towill, 2001, p. 14)

We know that process improvement works are realized to improve the performance of the business The aim is to reduce the costs under the main titles, enhance the quality and speed. As a result of the process improvement projects, an increase in the incomes, efficiency, efficient use of the assets and in time delivery to rthe customer, on the other hand a decrease in the inventory, cost of keeping inventory, losses, mistakes and the costs emerges. The results (Towill, 2001, pp. 14–15) of the total cycle time reduction programme are shown in figure 3. As a result of the process improvement, a decrease in the cost and an increase in sales of the business. Thus, the profit of the business and accordingly its value increases.

Enterprise in Turbulent Environment

Table 3: Process Improvement's Effects On Firms Performance

	Before	After	Differrence
Demand amount	200.000	200.000	0,00%
Total Fixed Cost	900.000	900.000	0,00%
Total Variable Cost	1.800.000	1.800.000	0,00%
Wastage_%	**10%**	**3,00%**	**70,00%**
Proces improvement's effects on sales quantity			
Salable product amount	180.000	194.000	7,78%
Defect amount	20.000	6.000	70,00%
Proces improvement's effects on variable cost			
Unit varibale cost_by demand	9,00	9,00	0,00%
Unit varibale cost_by salable	10,00	9,28	7,22%
Defect's effects on unit varible cost	1,00	0,28	72,16%
Proces improvement's effects on fixed cost			
Unit fixed cost_by demand	4,50	4,50	0,00%
Unit fixed cost_by salable	5,00	4,64	7,22%
Defect's effects on unit fixed cost	0,50	0,14	72,16%
Proces improvement's effects on unit profit			
Price	17,00	17,00	0,00%
Unit profit_by deman prouduct's cost	3,50	3,50	0,00%
Unit profit_by salable prouduct's cost	2,00	3,08	54,12%
Defect's effects on unit profit	1,50	0,42	72,16%
Proces improvement's effects on total profit			
Total profit by demand unit	700.000	700.000	0,00%
Total profit by salable unit	360.000	598.000	66,11%
Total wastage effect's on total profit	340.000	102.000	70,00%
Total Assets	29.000	29.000	0,00%
Total capital	14.000	14.000	0,00%
Proces improvement's effects on business perfomance			
Sales	3.060.000	3.298.000	7,78%
Total Profit	360.000	598.000	66,11%
Break Even Point_unit	128.571	116.555	9,35%
Break Even Point_Sales	2.185.714	1.981.442	9,35%
Sales Profitabilty	11,76%	18,13%	54,12%
Return on assets	105,52	113,72	7,78%

After the process improvement practises, the performance of the business (Kaygusuz, 2010, pp. 45–53) is examined in terms of the variables as sales, cost, profit and return on assets. As a result of the process improvement the loss rate of the decreased from 10% to %3 and this improement effects' on business performance is shown in table 3.

As shown in table 3, after process improvement, firm's wastage rate, decreased 10% to 3%. This improvement's results can be showed by using this different performance indicators. After process improvement, sales increased 7,78%, unit cost, decreased 7,72%. As a result of these, total profit increased 66,11, break even point decreased 9,35%, sales profitability increased 54,12%. At last, return on assets, increased 7,78%.

7   CONCLUSION

Process improvement is an ongoing journey. You may stop at some stations or have a break. But you must go on and don't come back. Todays' competitive environment, growing customer expectations and reduction in prices are the most important factors for business' wealth. There are two options for business: leave or continue. To be competitive, business must improve their process. But not only production, every process in the business. With process improvement, business continue to live on the profit area. Wherever you look, a weel-down business process improvement projects give the competitive power to business.

AN OVERVIEW OF INSTITUTIONAL DEVELOPMENT AS A DETERMINANT OF FDI ATTRACTIVENESS IN THE SOUTHEASTERN EUROPE

Ines Kersan-Skabic

Juraj Dobrila University of Pula, Department of Economics and Tourism »Dr. Mijo Mirkovic«, Croatia
ikersan@unipu.hr

ABSTRACT

In the situation of the scarce domestic capital and investments, foreign direct investments (FDI) are needed to push the domestic economy and employment. They are usually seen as a solution to boost economic growth, but their effects on the domestic economy depend on the type of FDI and sectors where they go. The aim of this paper is to research institutional environment in the SEE countries: effectiveness of government, rule of law, protection of property rights, etc. The indicators about doing business, transition progress and governance are included in the analysis. Indicators of institutional development point many weaknesses in the SEE region: relatively high perception of corruption, poor development of institutions in terms of competitiveness, poor credit rating, poor efficiency of government, the rule of law, political stability. According to the analyzed parameters it can be concluded that the highest level of per capita FDI attracted Montenegro and Croatia, where it should be noted that the institutional arrangements in Montenegro becames more convenient for foreign investors in comparison to Croatia. Romania and Bulgaria as a member of the European Union recorded a number of deficiencies in the institutional development, that means that the EU membership was not solved their internal institutional weaknesses. At the same time it is also a lesson for other countries in the region that the issues of institutional arrangements is an internal matter and the accession to the EU (and the EU membership) can only help in building institutions, but the country remains responsible for the efficiency of their performances.

Keywords: FDI, Institutional development, SEE region

1 INTRODUCTION

In the situation of the scarce domestic capital and investments, foreign direct investments (FDI) are needed to push the domestic economy and employment. They are usually seen as a solution to boost economic growth, but their effects on the domestic economy depend on the type of FDI and sectors where they go. There are different implications of FDI on the export and import depending on its motives: horizontal FDI replaces (reduce) trade: instead of exports, companies begin production in a foreign country and thus have less trading costs (Horstmann and Markusen, 1992). The vertical FDI impact on the division of production in less intensive segments that use different factors of production - each segment is located in the country that is abundant in the required factor (Helpman, 1984). Since these parts should be connected, they affect the growth of trade. FDI may help to achieve modernization, industrial upgrading and improve productivity by importing foreign technologies, diffusing knowledge and Western best practices. The developing countries are often trying to attract more FDI with its own economic policies and incentives expecting their positive implication on the domestic economy.

There is a lot of analysis of the attractiveness of a particular country or a group of similar countries (Markusen, 1998; Markusen and Venables, 1998). Location determinants are very

broad concepts and they includes traditional factors such as natural resurces availability (prices, infrastructure), the size of the market (living standard, wages, production costs), macroeconomic environment (inflation, unemployment, interest rates, GDP growth rates) and institutional factors (property rights, FDI incentives, bilateral trade/investment agreements, taxes, etc).

In the case of developing countries the institutional framework is inevitable as a guarantee of market functioning. Institutional weaknesses, frequent changes in laws and inefficiency (slowness) of public administration may affect weak inflow or absence of FDI inflows. Inclusion of institutions in terms of FDI inflows is particularly important for emerging markets and developing countries, because developed countries have a strong institutional framework conducive to business development and market forces. The reliability and safety of institutions has emerged in the economic literature, in the first place as a catalyst for growth (Rodrik and Subramanian, 2003; Edison, 2003; Rodrik, 2004) and as an inward- FDI attractor mainly in transition economies (Pournarakis and Varsakelis, 2004; Bevan et al., 2004).

The countries of South and East Europe have been passed through the process of transition with liberalisation and privatisation where the foreign capital has played very important role. All the SEE countries were not equally successful in attracting foreign capital and their position depends on specific location characteristics of every particular country. Western Balkan states were faced with disintegration processes and lack of mutual cooperation till the 2000s. Because of this they lay behind in the amount of FDI inflows in comparison with CEE countries. The SEE countries have started to build their bilateral and regional cooperation (trade agreements) that have arise in CEFTA (Central European Free Trade Area), but despite this trade integration improvement, they are still lagging behind the CEE countries in the amount of FDI inflows. For example in the period 1993 till 2011 in the group of CEE countries Estonia has received 10 507 euros, Czech Republic 7418 euro and Hungary 5962 euro per inhabitant, while in the region of SEE countries Montenegro and Croatia have got the largest amount of FDI per inhabitant.

The region of SEE countries is not as large as CEE market (total population), so the market size cannot be the strongest influenced factor on FDI inflows. There can be the wage level, the infrastructure development, but also institutional framework which may be the reason for unsatisfactory amount of inward FDI.

New institutional economics extends economics with a social and legals norms that influence on the market functioning in the neoclassical framework. It is not opposite of the economics and it does not criticized economics; the idea is to include the efficiency of institutions in the analysis of market economies. It includes a variety of indicators such as: property rights, governance efficiency, social norm and capital, human assets, asymmetric information, strategic behaviour, bounded rationality, opportunism, adverse selection, moral hazard, contractual safeguards, surrounding uncertainty, monitoring costs, incentives to collude, hierarchical structures, bargaining strength, etc. Institutions may not be only considered as preconditions to FDI, they have been built in the process of transition; there is interaction between foreign investors and institutions in the host countries. Institutions, i.e. legal, political and administrative systems tend to be the internationally immobile framework whose costs determine in international attractiveness of a location.

A nation's institutional environment is the set of political, economic, social and legal conventions that establish the foundational basis for production and exchange (Oxley, 1999; Sobel, 2002).

The goal of this paper is to investigate the role of institutions in the attracting FDI inflows in the SEE region and to determine the relation among the institutional factors and the level of FDI inflows and stock. The paper is organized in 4 chapters. We follow with the literature review, third chapter is focused on research (methodology and results), and forth part is conclusion.

2   LITERATURE REVIEW

There are a lot of determinants that influence on country's abilities to attract foreign capital depending on the development level of a particular country. In the case of developing countries the most important factors are market size, production costs, factors availabilities and institutional framework regarding market functioning (property rights, administration, establishment of new firms, stimulations measures etc.). The significance of institutional factors are lower when we observe and analyse the FDI flows among developed countries because that countries already have institutional framework which is "invisible" regarding to long-term market oriented economies.

Dunning (1992) introduced an eclectic paradigm, known as the OLI paradigm pointing out three important elements that must be present in order to motivate the investors to invest in a particular country: ownership, location and internalization advantages. Among the location determinants we can point out the market size as one of the most significant variable in explanation FDI inflows in Central and East European (CEE) countries and this is also result of their integration in the EU.

The Dunning's location advantages include: the supply side (labour skills and costs, corporate taxation), the demand side (market size and growth) and the political and social infrastructure. Since that the initial Dunning's eclectic paradigm has not specifically included institutional factors, it was most focused on economic factors, Dunning (2006) pointed out that it is important to incorporate institutional factors in an extension of the model. It is further suggested that institutions affect all three components of the paradigm (Dunning and Lundan, 2008). During the 1990s privatization was a strong factor for receiving foreign capital (Bevan et al., 2004).

The focus in this paper will be on the determinants of FDI that influence on the investor´s decission about the location of investments. Institutional factors belong in the location characteristics of host countries and although they are important for building confidence and foreign investment, the analysis of other factors (market size, growth rates of GDP, labor costs, etc.) prevail in research of localization determinants.

What should be analyzed within the functioning of institutions? Whether only formal institutions and administrative actions or should we approached to institutions in a way to engage the informal elements that influence on the behavior and the non-cash operating results (Schmieding, 1993). Grogan and Moers (2001) consider institutions in terms of the degree of property rights, the effective application of law and regulation, and the degree of corruption. Such a definition may be covered by subjective data measuring the quality of institutions.

Enterprise in Turbulent Environment

Recent situation in the SEE region have highlighted the importance of an enabling institutional environment in reaping the maximum benefits from FDI inflows. In the last decades there are analysis of institutional importance in attracting and efficiency of foreign capital (Acemoglu and Johnson, 2005; IMF, 2003). It is difficult to approach to the institutions on the right way and to include all that belongs under that term. Daude and Stein (2007) found that poor institutions can act like a tax and therefore are a cost to FDI. Poor institutional quality can also increase the uncertainty associated with all types of investment, including FDI. Aizenman and Spiegel (2006) find that institutional efficiency is robustly correlated with the ratio of FDI to total domestic investment. Globerman and Shapiro (2002) find that the returns to good governance are greater for developing/transition economies as compared to others.

Rodrik and Subramanian (2003) distinguish four types of institutions: market creating institutions that protect property rights and make contracts fair and reliable; market regulating institutions that help to regulate market externalities, imperfect and asymmetric information or economic scales in sectors like transportation, telecommunication or environment; market stabilizing institutions that reduce macroeconomic instabilities (inflation, currency rate, balanced budget, fiscal rules) and prevent major crises and market legitimizing institutions that support social protection and manage social conflict. Kogut and Spicer (2002), and Stiglitz (1999) think that the establishment of new institutions is important as more conventional macroeconomic policy objectives. Kaufmann, Kraay and Mastruzzi (2004) include: political stability, government effectiveness, regulatory quality, rule of law and control of corruption, while La Porta, Lopez-de-Silanes, Shleifer and Vishny (1999) include property rights index, business regulation index, corruption and bureaucratic delays.

Bénassy-Quéré et al. (2007) investigate the quality of institutions in home and host countries and found that institutional distance tends to reduce bilateral FDI flows. Bureaucracy, corruption, information, banking sector and legal institutions are important determinants of inward FDI but there is no general result applies to outward FDI.

Brunetti et al. (1997) has connected the differences in the degree of predictability of the institutional framework with the FDI inflows in countries in transition. The significant degree the differences in FDI across economies in transition could be explain with the expectation of (un)stable institutional framework.

Bissoon (2012) found that FDI inflows are significantly related to the quality of institutions. Besides macroeconomic stability, a good regulatory framework and political stability would have a positive impact on the FDI inflows of the 45 developing countries in the African, Latin American and Asian region.

Fabry and Zeghni (2006) has investigates the role of institutions in attracting FDI inflows in 11 post communist European economies (among others they have included also Croatia, Romania and Bulgaria). They created an analytical framework to understand the link between transition, institutions and FDI. The results of the empirical test confirm their expectation that FDI is sensitive to specific and local institutional arrangements.

Enterprise in Turbulent Environment

3 RESEARCH

3.1 Methodology

The question is how the measure institutional development. There are several institutions that assess the institutional development.

European Bank for Reconstruction and Development publicize the Transition Report where it follow up a large scale of indicators to assess the country's improvements in large scale privatization, small scale privatization, trade liberalization, price liberalization, competition policy, restructuring economies and the infrastructure development (roads, railways, telecommunication, water supply etc.). The scores are from 1 to 4+ and are based on an assessment of the size of the challenges in two components: market structure and market-supporting institutions and policies. They measure the transition gap (deviation from efficiency market structure). The score 1 to 2 means that there are a large transition gap, and score 4 or 4+ means that this gap is negligible (EBRD, 2012).

The Worldwide Governance Index consists of six dimensions: voice and accountability; political stability and absence of violence; government effectiveness; regulatory quality; rule of law and control of corruption. Political stability reflects perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including politically-motivated violence and terrorism. Government effectiveness reflects perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies. Regulator quality reflects perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development. Rule of law Reflects perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence. Control of corruption reflects perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests. The data are estimation of governance (ranges from approximately -2.5 (weak) to 2.5 (strong) governance performance) (World Bank, 2012b).

The Transparency International measures the level of corruption in public sector and assess Corruption Perception Index (CPI) starting from 1995. In the last report it was included 183 contries. It is a composite index, a combination of polls, drawing on corruption-related data collected by a variety of reputable institutions. The CPI reflects the views of observers from around the world, including experts living and working in the countries/territories evaluated. A scale of 0 – 10 is applyed to measure the perception of corruption, where 0 means that a country is perceived as highly corrupt and 10 means that a country is perceived as very clean.

The World Bank researches the enterprise environment and creates the Doing Business index which provides objective measures of business regulations for local firms in 185 economies and selected cities at the subnational level. It includes 10 areas of business regulation, such as starting a business, resolving insolvency and trading across borders (World Bank, 2012b).

The World Economic Forum is one a key institutions that observe countries competitiveness. Competitiveness is a very compex and includes twelve groups of determinants such as

Enterprise in Turbulent Environment

infrastructure, primary education, secondary school enrolment, efficiency of (goods and labour) markets, innovation, etc. The institutional develpment is the first determinant and it belongs to basic reqirements. It is determined by the legal and administrative framework within which individuals, firms, and governments interact to generate wealth. The importance of institutions is growing in the crisis situation and in the process of recovery, but also institutional development is more important in developing and emerging economies (WEF, 2012).

UNCTAD published FDI Attraction, Potential and Contribution Index from 2002 in the World Investment Report. The Inward FDI Attraction Index ranks countries by the FDI they receive in absolute terms and relative to their economic size. It is the average of a country's rankings in FDI inflows and in FDI inflows as a share of GDP (UNCTAD, 2012).

3.2   Results

According to these international organizations below are presented and analyzed selected indicators of the institutional environment in the SEE countries. Given the different methodologies, and the number of countries taken in the analysis, there are limitations in mutual comparisons of the results, but we can track the changes that have occurred over time.

The FIAS (2007) survey about attractiveness of SEE region conclude that the best performers are Croatia, Romania and Bulgaria and that the other countires are lagging behind because of a lack in business environment stability, infrastructure reliability and a low perspective to became the EU member states. It was the situation five years ago and furher data will show if the situation is changed and what are the causes of changes.

Table 1: FDI inflows, FDI inward stock and FDI per capita in the SEE region (UNCTAD, 2012)

Countries	FDI inflows in millions of dollars						FDI inward stock	FDI stock per capita	FDI in % of GDP
	2006	2007	2008	2009	2010	2011	2011	2011	2011
Albania	324	659	974	996	1051	1031	4701	1460	36
B&H	555	1819	1002	251	230	435	6719	1748	37
Bulgaria	7805	12389	9855	3385	1601	1864	47653	6469	89
Croatia	3468	4997	6180	3355	394	1494	30883	6963	49
Macedonia	433	693	586	201	211	422	4728	2295	44
Montenegro	622	934	960	1527	760	58	5803	9360	128
Romania	11367	9921	13909	4844	2940	2670	70328	3693	37
Serbia	4256	3439	2955	1959	1329	2709	22872	3142	53

From Table 1 we can point out that the Romania and Bulgaria have collected the largest amount of inward FDI stock while Montenegro and Croatia have the highest level of FDI stock per capita (which is better measure than absolute terms) and Montenegro has the highest degree of FDI intensity.

Table 2: FDI institutional environment in SEE countries (World Bank, 2012a; EBRD, 2012; TI, 2012; WEF, 2012; UNCTAD, 2012)

	Standard & Poor	Profit tax rate in %	GCI-Institutions Rank	FDI Attraction Index (rank)		Doing Business World Bank (Rank)	Corruption perception index (scores)	
	February 2012	2012	2012-13	2005	2011	2013	2005	2011
Albania	B+ stable	10	84	108	40	85	2.4	3.1
B&H	B negative	10	85	75	150	126	2.9	3.2
Bulgaria	BBB stable	10	108	6	45	66	4.0	3.3
Croatia*	BB+ stable	20	98	45	84	84	3.4	4.0
Macedonia	BB stable	10	78	...	...	23	2.7	3.9
Montenegro	BB negative	9	44	56	20	51	2.8	4.0
Romania	BB+ stable	16	116	10	88	72	3.0	3.6
Serbia	BB stable	10	130	37	50	86	2.8	3.3

*Legend: BBB- or higher is OK; BB+ or below („junk" bonds)- very speculative grade. * Data for Croatia are for December 14, 2012.*

Corruption perception index: A country/territory's score indicates the perceived level of public sector corruption there on a scale of 0 - 10, where 0 means that a country is perceived as highly corrupt and 10 means that a country is perceived as very clean. Global Competitiveness Index is calculated for 142 countries in 2012–2013.

Tables 2 and 3 provide institutional determinants of SEE region. There aren some common characteristics for SEE countries: all countries (except Bulgaria) have very speculative credit rating, all countries have low level of CPI that means that perception of corruption is relatively high, they also have achieved very bad institutional rank accordig to the Global Competitiveness Index (GCI). There are also differences among countries: Croatia has the highest level of profit tax rate and it is twice higher than the level of most of the SEE countries (which has rate of 10%). Total tax rate (as % of profit) is the highest in Romania, Albania and in Croatia and all countries except Croatia has reduced (significantly) the tax burden in the period frm 2005 to 2013. Montenegro has achieved the best rank in the GCI-Institutions, FDI Attraction Index, it has the lowest profit tax rate and it has the highest FDI intensity.

Starting a business is the easiest in Macedonia and Albania and registering property in Serbia and Bulgaria (the difference in time period for registering the property among the Croatia and Serbia is 10 times). Croatia has a relative disadvantage in the strenght of investors protection where it takes the scores 4 and it is the worst position among the SEE countries. Regarding Worldwide governance indicators the rule of law and control of corruption have a negative sign for all countries for the period 1996-2011 and Albania, Bosnia and Herzegovina and Serbia have a negative average values for all indicators that means their performance are weak. The best scores have Bulgaria and Croatia in the areas of government effectiveness, political stability and regulatory quality.

Table 3: Some Doing Business indicators for SEE countries and Global Governance Indicators (World Bank, 2012a; World Bank, 2012b)

	Starting a business (days)		Registering property (days)		Strenght of investors protection (0-10)		Total tax rate (% of profit)		Worldwide governance indicators (average 1996-2011)				
	2005	2013	2005	2013	2005	2013	2005	2013	Government effectiveness	Rule of law	Political stability	Regulatory quality	Control of corruption
Albania	41	4	42	33	2.7	7.3	58.2	38.7	-0.50	-0.79	-0.35	-0.09	-0.74
B&H	12	12	331	25	5.0	5.0	43.2	24.1	-0.80	-0.49	-0.52	-0.37	-0.33
Bulgaria	32	18	19	15	6.0	6.0	46.0	28.7	0.01	-0.18	0.27	0.49	-0.2
Croatia	29	9	956	104	4.0	4.0	32.5	32.8	0.43	-0.04	0.42	0.35	-0.07
Macedonia	48	2	74	40	5.0	7.3	21.6	9.4	-0.30	-0.43	-0.71	0.01	-0.45
Montenegro	...	10	...	71	6.3	6.3	31.6	22.3	0.03	-0.09	0.48	-0,13	-0.21
Romania	28	10	77	26	5.7	6.0	57.2	44.2	-0.30	-0.1	0.19	0.32	-0.28
Serbia	56	12	186	11	5.3	5.3	35.8	34.0	-0.40	-0.78	-0.81	-0.46	-0.55

4 CONCLUSION

Institutional development is an important determinant of attracting foreign investment in developing countries, particularly in countries in transition. The SEE region can be attractive for foreign investors because of its location advantages, and only partly because of the size of the market. Monitoring of FDI flows reveals that the SEE countries have received significantly less FDI than CEE countries which could be partly justified by their subsequent involvement in international financial flows, while simultaneously CEE countries become full members of the EU, which gave a further positive impetus to foreign investment inflows. Analysis of institutional development is very complex and there are several international organizations that monitor various aspects of the institutional environment using a different methodology (statistics, surveys of businesses).

Indicators of institutional development point many weaknesses in the SEE region: relatively high perception of corruption, poor development of institutions in terms of competitiveness, poor credit rating, poor efficiency of government, the rule of law, political stability. It can not be singled out no country for which we could say that it is satisfactory institutionally regulated, but it is interesting to note the differences in the institutional system of the countries where we can follow weaknesses in Croatia in segments: registering property, strength protection of investors, overall tax rate (and profit rate) and the FDI attraction index, while in Montenegro: the lowest corporate tax rate in the region, the best ranking in the GCI-Institutions, the best position towards FDI attraction index (with a weak rule of law, regulatory quality and control of corruption). According to the analyzed parameters it can be concluded that the highest level of per capita FDI attracted Montenegro and Croatia, where it should be noted that the institutional arrangements in Montenegro becames more convenient for foreign investors in comparison to Croatia.

It is interesting that Romania and Bulgaria as a member of the European Union recorded a number of deficiencies in the institutional development: the worst ranking (among SEE countries) in the GCI Institutions, worsening of FDI attraction index, low rank according to the Doing Business indicators and still relatively high perception of corruption. It means that the EU membership was not solved their internal institutional weaknesses. At the same time it is also a lesson for other countries in the region that the issues of institutional arrangements is an internal matter and the accession to the EU (and the EU membership) can only help in building institutions and the country remains responsible for the efficiency of their performances.

Enterprise in Turbulent Environment

EVALUATING THE IMPACT OF SELECTED MEASURES OF HUMAN RESOURCE MANAGEMENT

Natasa Keuc
BDC-TIM, d. o. o., Slovenia
natasa.keuc@gmail.com

Peter Ostrez
BDC-TIM, d. o. o., Slovenia
peter.ostrez@gmail.com

ABSTRACT
Human resource management is a very difficult task. It is difficult to introduce new things that employees are not ready, they do not want or can not handle. Customizing is our main task, but our experience shows that in practice this is not so. As the director of a small company I have since 2010 gradually introduced new instruments in the research environment BDC - Tim d.o.o. The results of internal surveys have been very satisfactory, but the situation after the introduction of instruments and changing working environment is analyzed and assessed zero. Therefore, the aim of the study was to assess the impact of the effects introduced instruments of human resource management and determine acceptance of the new proposals. The survey was conducted on a sample of employees in the BDC - Tim d.o.o. the questionnaire and group interviews. Analysis of the results showed that the employees are very satisfied with the introduction of standing instruments of human resource management, they do not agree with the introduction of design skills and implementation of annual interviews.

Keywords: Organizational climate, Organizational culture, Organizational philosophy

1 INTRODUCTION
Companies in today's fast-growing market are increasingly choosing systematic development of human resources, which is also the purpose of human resource development practice in our following research environment. Our focus is primarily on the education and training of employees, motivation, career building and awareness of their own ability and also on the responsibility to use their knowledge and activity to contribute to the success of our company. If we, as firm, want to have favorable business results, it is not enough to invest in a technology of the company, but there are also investments needed in human resources. Being aware of that this is precisely what we do in our private sector.

Human resource management is a special field of management in which human resources are optimized in a way to adjust goals and needs of the company and employees (Azman, 1993, p. 39).

DeSimone and Harris (1994, p. 96) define human resource management as an efficient use of employees to achieve goals of the organization. They divide functions of human resources management into:
- primary - recruiting and selection of cadre, salaries and benefits, cadre planning, relations between employees and development of human resource;
- secondary - the establishment of organizational goals, forming of the research informing system, forming work activities.

Enterprise in Turbulent Environment

Human Resource Management (HRM - Human Resources Management) is an organizational function which deals with issues related to people such as compensation, hiring, success management, organization, development, safety, wellness, advantages, employee motivation, communication with management and staff training (McNamara, 2005, p. 1).

For a more detailed explanation of given situation we want to process, here are some facts and information: Until 2009 BDC - Tim d.o.o. was stationed in the old tenement house and included five employees. In 2009 we decided to do an internal investigation to study the degree of employee satisfaction related to organizational climate.

The results showed satisfaction with organizational climate of our organization (score 3−4; maximum possible score was 5), satisfaction with salary (score 3), dissatisfaction with working premises and offices (score 2); dissatisfaction with informal gatherings (picnics, trips, social events) (score 2−3).

In 2010, based on the internal research mentioned above, we decided to move to a new and bigger location. Within 6 months we also realized some short-term and long-term goals and used the instruments of human resource management; we renovated offices and working premises and ergonomically adapted them to a given work, set up a regular daily meetings (informal), mandatory weekly team meetings, monthly planning activities, organized a trip with employees and their families, organized a visit from Santa Claus for the children of employees and provide gifts, increased base salary and ensure extra stimulation and motivation by adding an additional payment based on the sale (sales commission).

The central problem in this paper is the evaluation of the effects of initiated instruments. The purpose is also to evaluate the introduction of instruments which are already initiated in human resource management. For yet unrealized instruments we wanted to determine whether employees were willing to accept them.

The goal of the paper is to determine which instruments introduced to staff met with a positive response and which not, as this could be a cue for subsequent treatment of company management in relationship with employees and organizational climate.

It is wrong to think the financial stimulation is the only or the most important instrument for increasing employee loyalty to the company and also to improve productivity.

Systems of motivation and rewards have been studied by numerous authors; Warr (in Robertson, Smith and Cooper, 1994, p. 23) interviewed employees in the UK. It was discovered more than half of men and women would be employed despite assured financial provision. Non-financial reward of the salespeople in Japan was discovered to be the leading reward (Takahashi, 2006, p. 17; Watanabe, 2000, p. 58). In the European Union Gibbson and Waldman (1999, p. 81) and Ward with his co-workers (1992, p. 17) studied the employee motivation and reward. Their main goal was to discover which management methods have the most impact on employees and what has the most positive effect on them.

Based on the problem in this paper we are setting the following hypotheses: R. H. 1: We assume the introduced instruments of human resources management were understood as a progress of the organization.

R. H. 2: Employees will fully accept suggestions for new instruments for managing human resources.
- ✓ R. H. 2. 1: clearness and introduction of competency model,
- ✓ R. H. 2. 2: Annual interviews,
- ✓ R. H. 2. 3: agreeing with strategy, vision and goals of the organization.

2 METHODOLOGY

Searching answers to the questions we examined primary and secondary data sources. In the theoretical part we used the deductive research approach. We used content analysis method, synthesis method and compilation method. Reading relevant literature, we searched for topics that could be connected to the problem discussed.

Empirical part is based on exploring relationship between employees and stated executed measures. The study included the population of all employees of our company and was conducted in September 2012, hereinafter referred to as "study 2012".

In the study 2012 we used: individual and group interviews with employees, questionnaire method, which contained a total of 10 questions, content analysis method, records of written reactions of employees ...

Obtained data were statistically analyzed using Excel, SPSS.

3 RESULTS

3.1 We assume the introduced instruments of human resources management were understood as a progress of the organization

*Chart 1: The result of tests of the population in terms of satisfaction with the arrangements in place (survey 2012)*

X axis: building of the organization, working premises, regular team meetings, monthly meetings, informal gatherings, informal trips, Santa Caluse visit, salary increase, work stimulation, sales commission

From top to botom: completely unsatisfied, unsatisfied, partly satisfied, satisfied, highly satisfied

Enterprise in Turbulent Environment

Respondents evaluated the building of the organization positively, 100% responded they were highly satisfied with the new building. According to the results new ergonomically designed work premises also gave 100% satisfaction and functional utility. The main emphasis of ergonomically designed working premises is on well-being of employees and preventing locomotor system disorders, which we cannot afford in private sector. 54.05% of the respondents were also highly satisfied with team and regular monthly meetings, the rest of them, 45.95%, were satisfied with them. I introduced regular team meetings and monthly meetings as soon as our organization moved to a new location, because I am aware of the fact the climate and culture are formed in the everyday contacts. If this is not fulfilled, the identification with the organization and its values decreases.

100% of respondents were highly satisfied with the informal meetings outside of company time, parties and Santa Claus visits, which I organized in 2010 for the first time. It included great gifts for all the children of employees and also animation with well-known entertainers. With the increase of the basic salary, work stimulation and motivation and adding sales commission more than half of the respondents, 54.05%, were satisfied. According to the results of the research we can reach the conclusion employees are mainly united about non material stimulation, while in terms of material stimulation (mainly financial reward) opinions seem to be divided. More than half of the participants positively welcomed this measures, but not entirely as other measures.

3.2 Employees will fully accept suggestions for new instruments for managing human resources

3.2.1 Clearness and introduction of competency model

Competencies are the ability to use knowledge, employee's abilities and skills to successfully complete tasks and duties, as defined in systematization of job positions. They serve as a basis for level of knowledge and skills standardization, that employee needs to have for a particular job position.

Table 1: Agreeing with the introduction of competency model (study 2012)

Statements	1 – completely disagree	2 – disagree	3 – partly agree	4 – agree	5 – completely agree	Everage value
I agree with the introduction of competency model	100 (37 %)	0	0	0	0	1

Table 2: Understanding the competency model (study 2012)

Statetments	1 – I do not understand at all	2 – I do not understand	3 – I partly understand	4 – I understand	5 – I completely understand	Average value
Presented competency model, its importance and role for the employee, as well as for the organization	0	0	9 (24,32 %)	11 (29,73 %)	17 (45, 95%)	4,22

Respondents state in 45.95% they understood the presented competency model completely, 32.43% understood it and 24.32% partially understood the model. Respondents do not agree with the introduction of competency model. We found reasons for the disagreement by performing a group interview.

The responses were:
- they do not care what we do, but everyone knows their job and tasks, so the competency model would remain only on paper due to this particular research.

3.2.2   Agreeing with performing annual interviews

Regular annual interviews bring many benefits and advantages for leadership and employees of the organization. Based on annual interviews employees can build and develop their personal, professional and work career, cooperating with company management. They can also express their opinions, positive or negative, and give suggestions.

Table 3: Agreeing with introduction and implementation of annual interviews (study 2012)

Statements	1 – I completely dissagree	2 – I do not agree	3 – I partly agree	4 – I agree	5 – I completely agree	Average value
Introduction and implementation of annual interviews		16 (43,24 %)	9 (24,32 %)	11 (29,73 %)	1 (2,70 %)	2,91

Table 3 shows respondents on average agree with the introduction of annual interviews, however, 43.24 % of them do not agree with the introduction of annual interviews disagree.

3.2.3   Agreeing with strategy, vision and goals of the organization

Culture and climate affect on realization of the strategy and achieving goals of the organization. The efficiency of organization or company in strategy realization and achieving its goals is a function of the involvement of employees in the realization and their participation. We are aware the cultural preconditions for effective realization of the organization strategy are fulfilled only in an organization, where the relationship between employees and managers are good and where the involvement of employees in decision making is high.

Table 4: Agreeing with strategy, vision and goals of the organization (study 2012)

Statements	1 – I completely dissagree	2 – I do not agree	3 – I partly agree	4 – I agree	5 – I completely agree	Average value
Strategy BDC - Tim d. o. o.	0	0	0	0	37 (100 %)	5
Vizion BDC - Tim d. o. o.	0	0	0	0	37 (100 %)	5
Goals BDC - Tim d. o. o.	0	0	0	0	37 (100 %)	5

The results presented in Table 4 clearly show employees completely agreed with the strategy, vision and goals of the organization. From this we can conclude employees are well aware of the strategy, vision and goals of the organization and can somehow relate to. They also had no comments on what could be added or excluded. Opinions were, and I quote, that it is all O. K., well-done and wisely written.

4   CONCLUSION

Unfortunately, there is still a common belief the financial measure is what needs the most attention in relationship with employees.

Most organizations in Slovenia include financial rewarding in their management systems. With this investigation we can confirm the potential advantages of the different systems of financial rewards on the basis of theory and empirical research cited by the working report of the European Commission (Commission Staff Working Paper: Financial Participation of Employees and the European Union):
-   greater involvement of employees based on better sense of affiliation to the company and also greater motivation to improve business results; thereby productivity increases and social tension decreases;
-   greater employee loyalty, which is highly aspired especially by high-tech companies;

Introduction of financial participation in companies is an effective tool which can help to (adapted from European Foundation for Improvement of Living and Working Conditions, 2004, p. 2):
-   motivate and reward employees for their contribution to the greater success of the company;
-   bring company goals closer to employees and help them understand what leads to higher efficiency of business;

- maintain key employees and/or employees who gained their specialized knowledge and experiences during the employment in the present company (a lot of time, effort and money was invested in their knowledge and experiences);
- attract highly skilled workforce;
- reduce marginal expenses of labor;
- strengthen team spirit.

Based on the assumption investing only in technology is really not enough, but you have to invest especially in human resources, it is very important to establish which way to invest and which measure is important for our employees.

The aim of this study was to evaluate the impact of implemented instruments of human resource management in the BDC - Tim d.o.o. organization. The research we performed showed satisfaction with established instruments of human resource management.

It is wrong to think only high salary is the measure which will make employees to use all their knowledge and energy for the benefit of the organization. The most important for employees are informal meetings outside the official time, parties, picnics, trips and gifts for their family. Based on the results of this research we can reach to the conclusion employees are mainly united about non material stimulation, while in terms of material stimulation (mainly financial reward) opinions seem to be divided.

According to the results, it would make sense to upgrade the study to the degree to find out why employees disagree with some organization measures and which measures are those. The answer may lie in lack of understanding and ignorance of those measures, or perhaps elsewhere.

We must not forget limitations of this research, which was done in this specific organization and therefore should not be generalized, as there can be differences in salary, stimulation, working environment, co-workers, and can vary from case to case.

A big advantage of this research is the fact we got answers which are specific to this organization and if we put the results of the study into practice, we can expect desired results. Because of that this study could perhaps be a great guidance for all leaders, especially in the private sector, where they are free to do their own research. Leaders in private sector can put some energy and especially finances to where they can actually expect the greatest results.

CONTINUAL EDUCATION OF EMPLOYEES – PREREQUISITE FOR SUCCESSFUL COMPANY

Silvana Koleva
Ss.Ciril and Methodius University in Skopje, Faculty of Economy Skopje, Republic of Macedonia
silvana@eccf.ukim.edu.mk

ABSTRACT
During the educational process, potential candidates and employers can't have all the practical knowledge and skills which the companies demand in their working. In these conditions the need of constant education of the employees is more than necessary.The training is a very expensive process which demands a lot time and money. Depending on the complexness of the working tasks, every company makes its own decision, if and what training the employees need. With the training of the employees, the quality of the work increases and the working results in the company are getting bigger. Following the employees characteristics, the manager team can easily make communication and also it can see the training needed for certain workplaces which is important for the realization of the business goals, the goals of certain people and the company goals in general. The technical and technological development in nowadays conditions, the globalization of the market and the struggle with the opponents, makes the training process and the upgrading of the employees, most valuable for the companies. Improving the working capacities of the employees we can gain improvement of the company characteristics as well.

Keywords: Companies, Employees, Specialization, Training

1 INTRODUCTION

Recources are the the key strategical factor in the internal soroundings in each company. Beside material, financial, informational, the human resources are also important piece in the staff potential in one company.

The qualifications needed of the staff employed, their knolidge and reliability to answer to a certain asignement, represents the post that leeds to success in one company.
Successful companies are those which admit the importance of their own employees and help them in any way to develop their potential with what they would bring the company up to a higher level.

There are big differences between capacities, experience and the caracter of employees, which shows that a constant education is needed, depending on individual capabilities that every employee poses.

Training and education of employees depending on the needs of the work place, could be achieved inside the company, outside through organising work meetings, seminars, conferences, symposiums and other formes.

The lenght and intensity of the trainings, mostly depends on the need, complexity of the work asignements and the finacial opportunity of the company as well.
Beside employees, the managers also have the need of a constant education, because, the true and real direction comes directly from them.

Enterprise in Turbulent Environment

With constant training the company gets well trained employees and good and successful managers as well, who can respond to any work tasks in any time, and who also bring success to the company.

2 THE NEED OF EDUCATION AND TRAINING OF THE EMPLOYEES

In developed countries , companies consider training in the line of most important functions of the management with human resources.

Knowledge, sklls, behaviour are conected to attitudes of one person towards work tasks as well as people with who enters in intepersonal relations to fulfil the asignement.

Training of the employees in one company is nedeed to achieve new knowledge, and positions in the future. This also spreds and increases the potencials and prepares for future work chalanges.

Training and education of employees also have their own specific content and each one of them can improve the results of the company, if the programes for that purpose are successfuly achieved.

The need of training and education is more neccessary in modern conditions of existance of a company.

3 A PROGRAM FOR THE EMPLOYEES TRAINING PROCESS

Constant education of employees in companies in the 21st century, when science and technologie are on a very high level, became one of the most important factors for human resource developement.

Estimating needs of training of employees as relevant and on schedule , it's neccessary, the human resources sector to have a program in advance just for training and education.
Preparing the annual program of nedeed training and education of employees, all the company units have to be included and to participate as well.

The base in preparing and developing the annual plan in one company should be the sectors' plans made by managers of the work units.

The managers from the sector units cooperate in organizing, preparing, giving positive or negative opinion for certain parts of the program, and they also participate in making decisions for or against this program to be accepted or rejected.

Training is a complex function which demands quality achievment of all activities.

The training program represents legal-institutional frame for quaity, constant, coordinated, effective, and efficiant trainings of the employees in the company.

The training program and improvement of employees has more important steps for successful achievement of the activities which in practice we see as related and they can be realized in the same time.

Enterprise in Turbulent Environment

3.1 Identifying the needs for training and improvement

The need for training should be diagnozed with analysis of the company results and the needs in future.

It is neccessary to identify in which mesure the company fulfils its goals and assignements and is this training process a big facotr for achieving better results in the company working. These training needs are always actual when there is a difference between the existing and needed level of knowledge of the employees of the company.

Outworking these differences between existing and needed knowledge, skills and behaviour,it can be achieved with a proper system of training wich can also give an answer to all the questions related to the knowledge needed and the people who should participate in it.

To respond to all this it is neccessary to make a detaled analysis of the needs in the company, the work places and the employees as well.

Every company should have its own strategy to identify the skills and knowledge neccessary which employees should have for every work place, so the working results would grow and become better.

Making a program wich will adjusted to their education and uears of work in the current workplace is absolutely neccessary.

Identifying the needs for training beside analysis of the workplaces and their professionality, it is also neccessary to make a detail analysis of the worker as a person (executor of a certain task).

This analysis would give the answer of the question, how the person fulfils the work given and the tasks as well, and to discover which knowledge , skills and capacities should be gained during the training process.

3.2 Training goals

Basic goal of each training is to point the knowledge and skills needed as well as the creative capacity of every person included in some specific work task.

Developpement and improving of knowledge and skills represent enlargementof working and creative capacityof each person.

One of the goals of constant trainings of the employees is the opportunity to trnasform the potential of every executor in certain working action.

3.3 Methods, organizing and achiievement of training

One very improtant factor for implementation of the emplloyees trainings, is in fact which method will be accepted in a specific case of an emplyee, for a groupe of employees as well as for whole company.

Method which are used in the employees training can't be categoricly detected as training methods, but mostly they are methods used in person developpement and are identified as training methods for improvement of employees.

Enterprise in Turbulent Environment

Bigger problem choosing between different trainning methods represents the decision which method would be proper in certain situation.

There is a big variety in methods wich are reachable for training on every level.

Some methods are older, but they are shown good and are still in practise. The technical and technological developpement, as well as the developpment of computer scinece make implamentation of some trainings more important, efficiant, and mora economical from traditional methods of training.

Between more important methods of training, developemet and improving of employees there were:
- introduction of working principals
- teaching
- counciling
- rotation on the workplace
- practical training on the workplace
- work education
- courses outside
- seminars
- computer programs
- video presentations
- conferences
- technical training, etc.

The realizaton of training methods for the employees, can be organized and performed in different ways depending on the size of the company, the number of employees, the period of employement, the place where the training takes place etc.

a) **Depending on the number of employees that should be included we can deffer: individual and training in groups**

With the individual training an individual could be trained and he can also gain a specific knowledge for executing a specific task which demands special qualifications and skills.

The individual training is usually performed in smaller companies with a small number of employees.

Depending on the complexity of the company work and the working assignements as well, the individual trainning can be performed inside the company with hlep from the colegues with a bigger work experience, and outside the company in case of a specific training for a specific task.

The training in groups provides teaching more peopple in the same time who work same or similar jobs in one company.

It doesn't matter if this training will be exploring, working in production or selling, every individual should give his own contribution and oppinion about the Basic and additional or special training.

b)   Depending on the knowledge acquired in certain area we can deffer:

With basic training employees gain basic knowledge about the work, needed for normal executing and starting the work tasks.

With the additional training employees spred their knowledge gained with the basic training. Depending on the workplace and the job they execute, additional improving of employees are performed trough specific seminars, symposiums, conferences, training in work teams inside and outside the company.

These trainings are neccessary for accountants whose work is submitted to law changes and procedures, teachers trainings, trainings in medicine, trainings in informatical technologie, etc.

c)   Depending on the time period we differ: Training before strarting the work process, training after accepting the work and functional training which lasts until the end of the work years

For some workplaces it is neccessary the future employee to posess certain qualifications, with what he can provide his own workplace. In fact these training are neccessary for specific workplaces which demand certain and specific skills and knowledge.

Training after accepting the job can include a larger spectar of trainings which employees need.

The need of this kind of training is identified with the start and introduction of certain work task. The manager of the sector in the company is the person who should point the need of additional training of employees.

In these cases managers who do have this kind of role, exchange their own knowledge and experience, and specify the needs for additional training of each employee.

The functional training during the work years is introduced to increase constant knowledge for improving capability and skills of employees.

This type of training should be introduced for certain work tasks where a specific experience is neccessary.

These type of trainings are usually introduced by experienced trainers.

d)   Depending on the place we can differ: training on the workplace and training out of the workplace

One of the most used trainings represents the one on the workplace itself. Some researches show that 90% of the trainings are on the workplace itself where the employees directly do their part of the working process.

Altough, these kind of trainings are used by a larger number of the companies, in the same time they are shown as very poor in practice. Failures are mostly about unsufficient training environment, a lack of good trainers, undefined criteria for implementation, etc.

Enterprise in Turbulent Environment

The only good thing for the company is the small expence for introduction of these trainings, and less absence of the employees which also implies double savings.

The trainings outside the company means learning trough practical courses, classic teaching, computer simulation, etc.

Implementation of trainings outside includes experts from different areas.
A big number of companies include candidates on specific courses at specific universities. Basicly these candidates are getting prepared for future managers or technical experts.

The advantage of the training outsidethe workplace is that the employees are out od the possible stress which the working process can cause on them, and in that way they couldn't be able to pay attention to the training process itself.

The negative side of all this is the great financial expence needed for implementation.

If we pay attention on getting quality and well trained staff, finaces shouldn't be any kind of obstacle in the realization of the trainings, because the knowledge gained will be introduced in the working process, and the success of the company will reach a very high level.

Simply by creating successful and quality employees a successful company could be created as well.

4   EVALUATION OF THE TRAINING EFFECTS

Organizing and projecting trainings means specifying activities included in the training itself, duration of the training and determination the exact activities that will be performed in the training.

A very important element in the introduction of the training is choosing the most efficient methods which on the other hand depends on the available means for that purpose, the number of participants, etc.

Avoiding or neglecting each element needed for implementation of the employees training which also means irrational spending of resources and low efficiency of the training introduced.

One the steps necessary for organizing and introducing the full training program is efficiency grade for implementation.

The employees' result grade should be obtained regularly

The main purpose is to appoint the good and the bad sides of every employee.

Summing up the effects of the training, the benefit for the company and the individual can be easily recognized.

Training as any other function should be evaluated so it effects can be easily seen.

The effects represent in a way the level how much the learning and improving programs influence on the employees workplace, their success, as well as the benefits of the training and development.

There are more accesses in evaluating trainings. The Kirkpatrick access is mostly implemented. He formed a four criteria model of evaluation of training.
- A grade for reactions of participants in trainings according to the content of the training itself
- A grade for the knowledge obtained in the training program implemented with the help of tests before and after the training program.

With this criterion the knowledge of the employees not involved in the program could be compared with the one of the individuals included in the training.
- A grade for the changes in the behavior of participants in the training if we know that these trainings often do cause changes in behavior to some individuals.
- A grade for the results gained which should influence the productivity, increasing quality of products, reducing expense and work absence, as well as returning the trainings investments.

This means that the benefits of the trained employees should be bigger than the expenses invested in their learning.

The benefits include higher income, increased productivity, increasing quality of the work and bigger satisfaction from the work as well.

A large number of authors dedicate special attention to the mark of valorization –the income of means inserted*

The result of the effect or the mark for the training results is most difficult to prepare. The heaviness sustains in analysis of the many marks which express results of the participants in the training.

Many exploring in the European countries show that the training programs different combinations of the methods presented should be used.

The purpose of this mark is to appoint if the means used and spent, give a certain income and how high this profit is.

In the company working where buyers' role is highest goal, successful employees are the most important capital ever.

5   CONCLUSION

"You are as good in the work as the people you have chosen to work for your company". To keep the level of successful working and constant increasing and improving, beside other conditions and activities, a special attention must be paid to trainings and improving of the employees.

For obtaining constant quality work the employees must have a constant training and improving.

Without appropriate training, knowledge and skills, employees fall into work, and they are even inefficient in the working process because training is only one of the factors which influence efficiency in executing the work tasks.

Training employees should be realized on a very high level of dedication, thoroughness and professionalism as well.

On a company level, training prepares employees for taking more complex work, with what, a possibility to change the work results could be provided.

Training and improving of employees represents a frame which is focused on organization skills, development of the employee through education, with what, long term needs of the company, individual goals in the career and the value of employees, could be provided.

Training is a very expensive process which demands time and money for realization. Bringing decisions, preparing good programs for the training process, and upgrading the skills and employees attitudes on every possible level, increase the efficiency in the company, and bring back the interests. This represents the only way to get the company to the top of success.

ANALYSIS OF THE FUNCTIONING OF CLUSTERS IN POLAND[1]

Ewa Kraska

Jan Kochanowski University in Kielce, Faculty of Management and Administration, Institute of Economy and Administration, Poland
University of Lodz, Faculty of Economics and Sociology, Institute of Spatial Economy, Poland
ekraska@ujk.edu.pl

ABSTRACT
The cluster concept has gained special significance after the publication of the works of M. Porter "The Competitive Advantage of Nations"(1990). But the most popular definition of industrial cluster was formed eight years later, when he wrote that clusters are:"geographic concentrations of interconnected companies, specialized suppliers, service providers, firms in related industries, and associated institutions (e.g. universities, standards agencies, trade associations) in a particular field that compete but also cooperate"(Porter, 1998, p. 197). A cluster as a regionally focused form of economic activity generates positive effects for business and the region. Global researchers suggest that clusters help to increase the innovation and competitiveness of the country in which they are located. Since the 90s clusters have become an increasingly important element of economic development and innovation strategy of the European Union and its Member States. In years 2007–2013, clusters are expected to one of the objectives of support for EU regional policy. EU funds destined for cluster initiatives will help to take concrete actions by entrepreneurs interested in the cluster activity. Poland has recently joined the countries interested in popularizing the idea of clusters. Some specialized cluster studies have been carried out in Poland identifying clusters. This article gives an overview on policy support, formation and the functioning of clusters in Poland.

Keywords: Cluster, Cluster policy, Initiatives, Poland

1   INTRODUCTION
The ability to compete in the national market and the flexibility of enterprises are becoming increasingly important in the face of the world economy. One way to strengthen the competitive position of companies is by exploitation of synergies resulting from the cooperation between enterprises in clusters.

Since 2000 there has been increased interest in Poland and cluster structures associated with such situations as:
- finding new solutions to improve the innovativeness of enterprises,
- preparations for Poland to join the European Union,
- development of information technology,
- Polish participation in the activities of various international organizations,
- striving enterprises to improve upon their competitiveness and increase innovation.

Poland ranks low is terms of competitiveness and innovation among international rankings. In the report Innovation Union Scoreboard 2011[2], Poland had been placed for "moderate

---

innovative countries – catching up economies" (European Innovation Scoreboard 2011, p. 27), because our ranked performance indicators which have been taken into account in this study had below average. The average Summary Innovation Index for UE-27 countries was 0.533 but for Poland economy it was 0.304 in 2010 (chart 1).

The report said that in Poland we are relatively strong human resources, finances and support, firm investments. But level is still low in: innovative small and medium-sized enterprises, cooperation among businesses, level of entrepreneurship, and the amount of funding provided for research and development. Expenditures on research and development activity in Poland in 2010 were at the level of 0.68% of gross domestic products, but the average EU-27 counties level at was 2.01% of gross domestic products. On the other hand at the same time gross domestic products according to purchasing power parity per capita in PPS (current prices) was at 15300 €, but the average among the 27 countries EU was at 24 400 € (Statistical Yearbook of the Republic of Poland, 2011, p. 749−752).
Chart 1: Convergence in innovation performance in EU-27 (www.proinno-europe.eu/metrics)

Poland ranked 39th among 139 countries in the Global Competitiveness Report 2010–2011, which was drawn up by the World Economic Forum. This is a good result when compared against the world at large, but not outstanding among European countries. From 2003 on, we had successively moved up and prooven our position. The following European country scored higher competitive positions than Poland: Sweden (2th), Germany (5th), Finland (7th), Netherlands (8th), Denmark (9th), United Kingdom (12th), France (15th), Austria (18th), Belgium (19th), Luxemburg (20th), Ireland (29th), Estonia (33th), Czech Republic (36th) (The Global Competitiveness Report 2010–2011, p. 25). The report emphasized the poor technical infrastructure in Poland, the low degree of cooperation between the public and private sectors

---

[2] The level of innovation based on Summary Innovation Index, which is calculated as a weighted average of 29 indicators of partial to the EU-27 countries and Croatia, Turkey, Iceland, Norway, Switzerland, the U.S. and Japan.

as well as of research and development, and business environment institution quality (chart 2). The authors suggest that Poland should now focus its efforts on creating conditions for the development of entrepreneurship and innovation. Therefore the development of an appropriate policy taking into account the cluster is of special importance. Policies conducive to the development of clusters and, - enterprises can help improve the innovative and competitive position of the Polish economy within EU countries and worldwide.
Chart 2: Relative performance of Poland with other countries (based on The Global Competitiveness Report 2010–2011, 2010)

2   HOW WE SUPPORT CLUSTERS IN POLAND?

In Poland there are neither separate policies based on specific clusters nor overall cluster policies in effect. Clusters are part of regional innovation policies and economic policy. Projects involving clusters appeared sporadically between the years 1994–1999. However, in during the 2000–2006 period, projects supporting cluster initiatives were as follows: Action 2.6 Integrated Regional Operational Programme, Measure 2.3. Sectoral Operational Programme Human Resources Development, Measure 1.3. and 1.4 Sectoral Operational Programme Improvement of the Competitiveness of Enterprises. These activities accounted for only 5.4% of Community measures identified in the Community Support. It is during this period when projects, typically financed to the development of human resources for the modern economy and innovative enterprises. Organizations related to the promotion of cluster development in Poland are now: the Ministry of Economy, Ministry of Regional Development and Ministry of Science and Higher Education and the Polish Agency for Enterprise Development. The interest in support of cluster structures and their development increased in for years 2007–2013. The need to support the cluster was included in the nationwide operational programs and regional operational programs of individual Polish voivodships. The document "Strategy for increasing the innovativeness of the Polish economy in 2007–2013", emphasizes the importance of a cluster in a supportive role for enterprises to

improve upon their innovation. In the National Regional Development Strategy for 2007–2013 emphasis is placed on promoting cooperative ties among enterprises, popularizing the knowledge of the clustering, deepening of cooperation among public and private sectors and business environment (Poland National Strategic Reference Framework (NSRF) for 2007–2013, 2006, p. 37). It should be noted that those documents contain only general information on cluster, their problems and possible solution. The Poland NSRF for purposes directly related to support clusters allocated approximately 116 million euro (104.3 million in the Operational Programme Innovative Economy, and 11.8 million Operational Programme Development of Eastern Poland).

For the years 2007–2013 the following sources of financing for emerging cluster initiatives and development of existing clusters are available in Poland (www.biznesklaster.pl):
- Operational Programme Innovative Economy, Measure 5.1 "Supporting cooperative relations on a supra-regional importance." It supports initiatives that lead to cooperation and strengthening the links between economic and scientific organizations representing at least two regions.
- Operational Programme Human Capital, , Measure 2.1 "Development of modern economy" (Sub-measure 2.1.1 "Development of human capital in enterprises", Sub-measure 2.1.2 "Partnership for increasing adaptability", Measure 2.1.3, "System support for increased adaptability of workers and enterprises
- Operational Programme Development of Eastern Poland (this program is dedicated for five regions: Lubelskie, Podlaskie, Podkarpackie, Świętokrzyskie, Warmińsko-mazurskie), Measure 1.4 "Promotion and Cooperation", component "Cooperation" - co-financing projects related to building networks, including those related to the identification and development of clusters;
- Regional Operational Programmes
- Seventh Framework Programme, which is the EU's financial instrument supporting research and development, encompassing almost all scientific disciplines.

Different approaches to support clusters are being applied at the Polish regional level. Some Polish regions (Świętokrzyskie, Mazowieckie, Wielkopolskie, Warmińsko-mazurskie) directly point to the possibility of supporting formal clusters of structured funds (within the Regional Operational Programmes), and extracts for this purpose a separate action. Other regions (Podkarpackie, Podlaskie, Lubelskie, Małopolskie, Łódzkie, Dolnośląskie, Śląskie, Opolskie, Lubuskie, Kujawsko-pomorskie, Pomorskie) connect clusters of activities that support other efforts to promote entrepreneurship, business environment and build relationships between businesses sharing the sphere research and development. In the case of one region does not explicitly mentioned the possibility of supporting cluster initiatives and cluster. Pomorskie region alone has developed and implemented the "Regional Cluster Support Program for 2009–2015". This program aims to support three types of clusters (key, sub-regional/local and embryonic/network technology). Two other polish regions (Dolnośląskie, Wielkopolskie) - launched a official program to support clusters based on relatively small internal resources. We see that only some regions leaders are aware of the benefits of the development of cluster structures, and therefore offer them support. Some regions have participated or currently participate as partners in international projects Regionet, CluStart "Boosting innovation through new cluster concepts in support of emerging issues and Cross-Sectoral themes". Projects are aimed at increasing the knowledge and expertise in support of clusters, both among local governments, and regional institutions for regional development. Those projects also served to develop international cooperation among

clusters of the region (Directions and assumptions of Polish cluster policy until 2020..., 2012, pp. 26–27).

Despite the various cluster support programs there is a need to form a national policy of cluster development, taking into account regional differences during the process of their formation. Equally important activities were carried out to promote the idea of clustering within each region. A impediment to the development of clusters in Poland are the regulations that should facilitate cooperation between public and private sectors. Financial aid from EU funds is just one of many elements to support a cluster. Mutual trust between companies and a desire to start a business cooperation are also essential factor. The Public Opinion Research Centre shows the level of public confidence in Poland to be low. Their research from March 2010 shows that 96% of Poles trust family, friends (90%), relatives (87%), colleagues (84%), and - to a lesser extent - neighbors (74%), and the parish pastor (69%). 46% of respondents did not trust strangers (The Public Opinion Research, 2010). Low public confidence affects the quality of cooperation between enterprises within clusters.

3   FORMATION AND FUNCTIONING CLUSTERS IN POLAND

Operation of enterprises in the clusters is a new form of spatial organization of production processes in Poland. In the 90's the first study of regional innovation systems, which concerned industry associations with science was carried out. In 2002, the Institute for Market Economics in Poland was the first to conduct a study identifying the presence of clusters in the economy. Similarly, by 2007 the Polish Agency for Enterprise Development had identified a cluster structure. Studies of clusters in Poland have been conducted for a relatively a short time. So there has been no comprehensive study of clusters, apart from a few fragmented studies of clusters in Poland. Some information on the number of identified clusters in Poland can be found in the *European Cluster Observatory* (www.clusterobservatory.eu). According The Observatory there are 246 clusters in Poland. More detailed information about clusters in Poland is provided by a report „Cluster benchmarking in Poland", which was prepared by Polish Agency for Enterprise Development (PAED) in 2010. The authors showed that between the years 1997 and 2009 in Poland there were 178 cluster initiatives. However 47 of them were selected to take part in this research, because only those have been classified as a cluster and it was possible to establish contact with them (Cluster benchmarking in Poland, 2010). A high concentration of specialized business in an area or related industries does not necessarily imply that there is cooperation between enterprises, which is the basis of the cluster. I can vouch that the report of PAED illustrates in a good way the reality of creating and functioning of the Polish clusters.

The best known example of a high technology cluster in Poland is The Aviation Valley Association. It was created in 2003, as a non-profit organization, to provide a means of rapid development and growth of the aerospace industry in southeastern Poland. This historic decision was made by a group of leading aeronautic producers, suppliers and businessmen. Significant funding for the Association has been provided by Pratt & Whitney, a world leader in the design, manufacture and service of aircraft engines, space propulsion systems and industrial gas turbines. Now it represents 90 companies within the region, with several others in the process of applying for membership (www.dolinalotnicza.pl). Other known clusters in Poland are: The Tarnow Industrial Cluster Plastic Valley, Ceramic Tiles in Opoczno, Amber in the Gdansk, Automotive Parts Manufacturers' Association and Organic Food Valley.

In Poland 47% of the studied clusters were established in 2007, which is related to the availability of European programs aimed at promoting clusters, described earlier. 36 % of clusters were established as a result of undertaken activities (Cluster benchmarking…, 2010, p. 31).

The main creators of the clusters were entrepreneurs themselves who saw the benefits of cooperation. Clusters were also formed through the initiatives of businesses supporting institutions as well as research and development sectors. These clusters have 1886 members. 78% of members of clusters is business, 8% of business supporting institutions (for example: industry associations, chambers of commerce, Centre for Innovation and Transfer of Technology, non-profit consulting institutions and agencies for ownership transformations or restructuring agencies), 8% of research and development sectors, 6% of other members (which include local government units).
Chart 3: Members of clusters (Cluster benchmarking in Poland: survey report in 2010, 2010, p. 31)

Chart 4 presents the size of enterprise which are part of the clusters surveyed. 44% of clusters in Poland consist of microenterprises, which employ up to 9 people. Clusters in Poland are a good way of developing small and medium enterprises. One cluster in this group consists of microenterprises; others clusters consist of different-sized enterprises.
Enterprise in Turbulent Environment

Chart 4: Structure of business in clusters (Cluster benchmarking in Poland: survey report in 2010, 2010, p. 31)

43% of cluster initiatives participating in the benchmarking operates on an association and 11% of signed consortium agreements. Other clusters operate in the form of: joint-stock companies, companies with limited liability, foundations, agreements, associations partnership agreements, contracts of cooperation and economic chambers.

32% of clusters function in highly innovative industries such as computer science and aviation. 40% of the clusters represent intermediate level of development industries (hospitality and tourism). Clusters in Poland have limited financial resources to carry out their tasks. Two years prior to the research, 43% of respondents did not have any outside financial resources. 28% of clusters had a budget of under 500 thousand PLN. 24% of clusters have more than one million PLN for development of the cluster. Clusters have problems with financing their projects from their own resources alone. The studied clusters initially gained from EU 65,5 million PLN worth of funds and they carried out 62 projects. These projects focused on financing infrastructure, including construction and manufacturing lines. 63% of clusters allocated less than 10% of their budget on research and development. 28% didn't conduct any on research and development at all. Two clusters spent an average of 80% of their budget on research which did not result in the form of patent protection. One cluster, despite having 20% of the budget appropriated, developed five innovative solutions, and received a patent for them (Cluster benchmarking..., 2010, p. 46).

Members of the cluster share with each other some forms of cooperation (see chart 3). Almost all clusters (47 clusters) have their own website, where we can find contact details and information about the members of the cluster. One cluster has no website, because it has no money for its upkeep. 98% of clusters conduct joint activities in the field of advertising. 10% of clusters are not organized nor participate in any fairs or exhibition. 58% of clusters organized social events for members once or several times a year. Such events enable their members to seek opportunities cooperation to in an informal way. 56% of clusters see the need to cope for cooperation with public authorities in order to consolidate their position in the market (Cluster benchmarking..., 2010, pp. 82–89). Cluster activities are mainly aimed at local government where the clusters operate.

Enterprise in Turbulent Environment
Chart 5: Types of activities undertaken by the studied clusters
(http://www.pi.gov.pl/eng/chapter_86525.asp)

53% of the cluster conducts one single form of education for members of its cluster. They create activities such as workshops, visits to foreign clusters and conferences. Clusters are interested in raising the level of expertise among their members. The analysis shows that the clusters that have received external funds applied several measures to increase the level of knowledge.

42% of clusters share a database, which usually contains contact details of their members and partners. 11% of clusters recognized that such a database is important. 40% of clusters have communication frameworks, where they have discussion forums and groups. Only 17% of clusters share work on new products and services. 35% of clusters are considering such a cooperation. 14% of clusters share distribution channels. Flow of information and diffusion of innovation is limited. It is notable that the transfer of knowledge and innovation make operating business in clusters highly innovative.

The total employment in companies of all clusters in Poland is around 284 000 people (Cluster benchmarking ..., 2010, p. 124) which accounts for 1.6% of employees in the economy. By comparison, the proportion of employees in clusters distinguished by the ECO is about 15.5%, whereas the average for the European Union (EU-27) is 20.7% (Directions and assumptions of Polish cluster policy until 2020, 2012, p. 18). It can be concluded that cluster have a limited influence on the labor market in Poland.

The clusters comprise of approximately 42 entities, which on the average employ about 5,800 employees. In clusters involved in highly innovative research contracts with the industry, an average of 20 employees are involved. Clusters tend to employ highly qualified professionals (averaging 50% of employees) (Cluster benchmarking..., 2010, pp. 56–57).

4   CONCLUSION

In Poland there no specialized tools for developing a policies based on clusters. It is therefore necessary to develop suitable policies to support a cluster model which takes into account the evolvering conditions. A cluster is a difficult tool to stimulate growth, as it requires the formation of human capital at a high level. Local governments should in the right way support the development of human capital and seek to incur level of trust in society which will improve the cooperation between enterprises.

It is also important to create the proper conditions for clusters, whence not enough aid is distributed to entrepreneurs interested in this form of business organization, if there is adequate infrastructure and legal basis. In addition, cooperation between research centers and the private sector should be strengthened because a competitive and innovative economy is the "cooperating" economy.

Clusters in Poland are a relatively recent phenomenon compared to the traditions of European clusters and Silicon Valley. Clusters which have participated in the study are in the early stages of development. At this stage, clusters need promotion, financial and legal support and business consulting. Clusters have some difficulties with financing the activities using solely their internally funds. Projects and activities are used by clusters which have received external funding.

Members are unwillingly to cooperate with each other. They do not exchange the information about their technology for fear of competitive advantage - this is a result of low levels of trust in Poland. Low level of cooperation between members of clusters as well as low of funding for research and development are the cause of lead to a low level of innovation and technology exchange among clusters.

Enterprise in Turbulent Environment

POWER GENERATION COMPANIES' PERFORMANCE IN LIBERALIZED ELECTRICITY MARKET: CROSS-COUNTRY ANALYSIS

Ekaterina Meltenisova

Institute of Economics and Industrial Engineering Siberian Branch of Russian Academy of Science, Russia
emeltenisova@gmail.com

ABSTRACT

After recent restructuring process of Russian power sector responsibility for financing investment in power generation was shifted away from generally state-owned monopolies to private investors. Investors faced with plenty risks in the liberalized market and to find out whether they should risk their money investors analyze the company's performance. So for making effective investment it's necessary to define what factors (economic, social, regional and industry factors or company's financial indicators) influence on companies' performance. Russian electricity market is on the early stage of liberalization so it's interesting to regard what factors influence on companies' performance on the relatively liberalized electricity market and to find some "lessons" for Russian one. Comparison with foreign experience allows to find out whether significant factors of companies' performance depends on the stage of market liberalization. In research we consider US electricity market as it's liberalized and the restructuring process of power sector in both countries passed on relatively same scenario. For defining key factors of companies' performance in Russia and USA panel data analysis was used. As an indicator of company's performance Tobin's q was chosen, eight American power companies and twenty Russian generation companies were regarded. Economic, social, regional factors with financial indicators were included in research. All data were calculated for period since 2006 to 2010. As a result we found that regional factor (such as GRP growth rate) and financial indicators (such as return on return on equity, liquidity ratio and others) are significant both for Russian and US power companies' performance. For US ones renewable energy projects and dividend per share also play an important role for company's performance. Also we find that the significant factors of generation companies' performance doesn't depend on level of market liberalization.

Keywords: Company's performance, Panel data analysis

1 INTRODUCTION

This paper explores the relation between Russian generation companies' performance and economic, social, regional factors and financial indicators. Tobin's q, as the ratio of the firm's market value to the book value of its assets was chosen as an indicator of companies' performance (Tobin, 1969, pp. 15–19). After restructuring process of Russian electricity market responsibility for financing investment in power generation was shifted away from generally state-owned monopolies to private investors. New owners of Russian generation companies have to find financial resources and to invest them for building new capacities for providing sustainable future development of their company and the sector in the whole. So new owners has to attract external financial resources or use company's equity for financing investment projects. Today it's quite important to accumulate enough financial funds (both external and internal ones) for realizing generation companies' investment programs (Gitelman et al., 2011, pp. 34–40).

For evaluating risks of investing company's performance is supposed to take into consideration. Company's managers also take into account company's performance during investment decision making process (Brown et al., 2006, pp. 45–56). So from one hand company's performance could be regarded as a signal for investors about the profitability of investment process and from another hand represents the ability of Russian generation companies to provide sustainable development in the future due to investment program's realization. If company doesn't want to face with the lack of financial resource it's important to maintain high level of its performance. For managing company's performance it's necessary to define what factors and what ones don't influence on it. It will help to work out a system of company management for increasing generation companies' performance.

Russian electricity market is on the early stage of liberalization so it's interesting to regard what factors influence on companies' performance on the relatively liberalized electricity market and to find some "lessons" for Russian one. Comparison with foreign experience allows to find out whether significant factors of companies' performance depends on the stage of market liberalization. USA was chosen for three main reasons. First of all the restructuring process in Russian electricity sector was made on relatively the same with US electricity market scenario. Secondary USA like Russia has federal structure its electricity markets includes different states like different regions in Russia. And the last but not the least in USA there is highly competitive electricity market with effective and transparent rules.

Finally we find that Russian generation companies' performance doesn't depend on industry indicators (such as electricity generation in the region, electricity consumption and tariffs growth rate in the region). It predominantly depends on financial indicators of Russian generation companies, such as assets return ratio, quick liquidity ratio. Comparison Russian and US generation companies demonstrates that there are similarities in significant factors of companies' performance for both countries. It testifies that significant factors of companies' performance doesn't depend on the stage of market liberalization.

Since the restructuring process began interest to research of Russian electricity sector became to grow. Some researchers analyze main aspects of new company's management (Gitelman et al., 2002, 2006) others try to analyze and evaluate the investment opportunities of new electricity companies (Esipenko, 2012; Mikhailov, 2004). Among foreign researchers it's needles to mention Pitman R. with his attempt to explore the structure of new wholesale generation companies on the early stage of their forming (Pitman, 2006). However the aspect of determining key factors of company's performance for making some management recommendations isn't researched enough.

This article contains some results of Russian and US energy companies' research making for last 7 years.

2   RESTRUCTURING OF RUSSIAN ELECTRICITY SECTOR

2.1   General scheme of restructuring process
In the beginning of XXI century it became obviously that for stable future development of the Russian electricity sector it's necessary to find a plenty amount of financial resources for building new capacities to meet growing demand. For this goal the structure of sector was drastically changed.

Reorganization was aimed at increasing efficiency of power plants operating, creating conditions for Electric Power Industry development on the basis of stimulation of investment activity and finally providing consumers with sustainable and regular power supply.

Sector's structure was changed: natural monopoly functions (such as dispatching and power transmission) and potentially competitive ones (production and supply, service and repair works) were separated. So in power sector new structures responsible for separate activity types were created instead of former vertically integrated companies which exercised all the above mentioned functions (Gitelman et al., 2002, pp. 51–57).

Generation, sales and repair companies became private, and all natural monopoly spheres remained under government control. So the conditions for competitive electric power market are supposed to be created. It means that market prices became unregulated by the State and are formed on demand and supply basis. Under these conditions new players compete trying to reduce their costs.

As concerns generation companies they were divided into two main groups: wholesale generation companies (WGC) and territorial generation companies (TGCs). Each WGC comprised power plants, situated in different regions of the Russian Federation, to prevent possible monopoly power. So WGCs became the largest wholesale market competitors. Territorial generation companies (TGCs) contain power plants not within WGCs and located in several neighbouring regions.
Figure 1: Power Sector Structure in 2000 (http://www.rao-ees.ru/en/reforming)

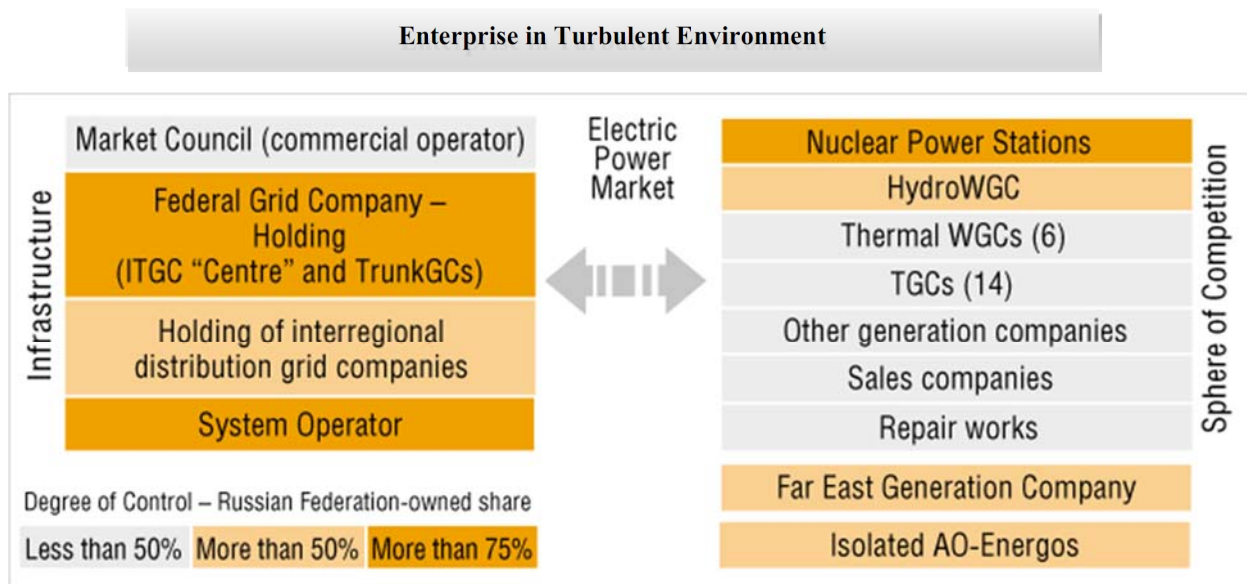
Enterprise in Turbulent Environment


Figure 2: Power sector structure today (http://www.rao-ees.ru/en/reforming)

2.2 Investments into Russian generation sector

Since the beginning of restructuring process almost all generation companies have strategic investors nowadays. Such foreign energy holdings as E.ON, Enel, Fortum bought shares of Russian generation companies. Despite on it Russian electricity sector till 2030 need 9,8 trillion rubles for realizing all investment projects (Gitelman et al., 2009, pp. 34–41). These financial resources are planned to be taken both from company's equity (new owners' money) and external funds. The last one will play the smaller role that the first one as the change of main strategic investors in the field isn't expected to be in the nearest future. Nevertheless both for investors and for company's owners it's important to be sure in successful investing in company's assets. For this purpose they take into consideration the generation companies' performance.

Companies' performance testifies the ability of company to invest in its assets effectively. From one hand it reflects the ability of company to accumulate financial resources (as external and internal ones) and to invest them effectively (to choose project correctly and to make a plan of its realization). On the modern stage Russian electricity market development the problem is not to attract funds in the industry for sustainable future development but to define the effectiveness companies' investment made with both external and internal financial resources. In other words, it is important to understand whether Russian generation companies able to make planned investment plans just in time, how effectively they are able to finance their current production and future investment?

3 METODOLOGY OF ANALYSIS

3.1 Factors of companies' performance

For taking effective measures for managing generation companies' performance first it's necessary to answer the question what factors influence on it and what once don't. Moreover a lot of factors may influence on the performance of the company (and on generation company as well), such as social and economic ones, regional and industry indicators, financial factors. Consequently approximately 20 factors were included into analysis trying to define what ones influence on company's performance and what ones don't (Table 1).

Effectiveness of investment depends on financial indicators of the company. So it's necessary to take into account different aspects of company's financial performance, such as ability of company to pay its debts, the amount of external financial resources, assets' management effectiveness. If company doesn't have enough funds or couldn't manage it effectively it will probably invest successfully in its assets.

For generation companies it's also important to take into account regional factors as their success could depend on region where companies' capacities are located or where they supply product. And for sure the effectiveness of investment depends on economic and social situation in the regions and in the whole country as well. That's why a complex of factors was regarded in analysis of company's performance.

All these factors were hand calculated for Russian and for US generation companies. Exceptions were made for dividend per share, P/E ratio and share of capacities using renewable energy. First and the second ones weren't calculated as during period of analysis Russian generation companies issued shares and consequently regarding these indicators is useless. In Russia there is less than 0,2% of renewable energy generation so including share of capacities using renewable energy in regression is supposed to be also useless.

Table 1: Factors that may influence on generation companies' performance

№	Group of factors	Factors
1.	Factors of company's financial performance	**-ratios of turnover** (equity turnover, assets turnover) **-ratios of capital structure** (leverage, Equty to Debt ratio); **- liquidity ratios** (current ratio, quick and absolute ratios); **-profitability ratios** (return on assets, return on equity, return on tangible assets); - **dividend per share;** - **P/E ratio.**
2	Economic and social factors	-growth rate of gross regional product (GRP); -rate of unemployment; -price index.
3.	Electricity sector's factors	-electricity production; -electricity consumption; -tariff rate; -share of gas generation; -share of renewable energy's generation.

In USA we analyze eight main players: AEP, ConEdison, PGE, Duke, Georgia, Northeast Utilities, SCE, Southern Company. They provide with electricity more than 9 million people and all together have more than 60% of the whole market in USA (BMI report, 2009, pp.23-24). In Russia we analyze all generation companies (except RusHydro that include hydro generation and remains under government control). So we include 14 TGCs and 6 WGCs for analysis of Russian electricity market.

3.2   Indicator of energy company's performance

For defining key factors we use the Panel data analysis made with STATA8. To implement panel data analysis it's necessary to define the dependent variable.

To define the indicator of energy companies' performance first it's important to understand what we understand under this definition. As it was already mentioned companies' performance demonstrates the ability of company to accumulate financial resources (as external and internal ones) and to invest them effectively in successful projects. Investment to energy company's assets is object of analysis so it's necessary to evaluate how effectively company "creates" its assets. Finally we chose Tobin's q as an indicator of companies' investments in assets and as an indicator of companies' performance.

After Tobin first introduced the concept of "q" defined as the ratio of the market and replacement value of the firm's assets (Tobin, 1969, pp. 15–19) it's became widely used, as firm's investment opportunities set (Lang et al., 1995, pp. 137–154), the extent of agency problems (Opler et al., 1993, pp. 51–59), and the overall quality of the firm's management team (Lang et al., 1989, pp. 181–192). Tobin's q also is often regarded as statistic that might serve as a proxy for the firm's value from an investor's perspective (Badrinath, 1994, pp. 109–131).

Tobin's q is typically estimated using one of two competing approaches (Wolfe, 2003, pp. 155–159). The first uses an extensive set of financial statement information as a starting point for estimating both market and replacement values. These data are then adjusted for factors that are likely to cause systematic divergences between market and accounting value (Perfect et al., 1994, pp. 313–341).

In contrast, the second approach (henceforth to as the simple approach) uses a comparatively small set of financial statement data with minimal adjustment (Chung et al., 1994, pp. 70–74). In this research "simple" one was used and Tobin's q was calculated as follows (Chung et al., 1994, pp.70–74):

$$q_{cp} = \frac{mve + ps + ltd + cl - ca}{ta} \tag{1}$$

MVE – value of companies' common stocks;
PS – liquidation value of preferred stocks;
LTDEBT – book value of companies' long-term debt;
CL – book value of company's current liabilities;
CA – book value of company's current assets;
TA – book value of total assets.

All indicators and Tobin's q were calculated annually since 2006 to 2010 for energy companies in USA, and quarterly since the third quarter of 2006 till the third quarter of 2011. We include dummy variables in regression and find that different analysis periods don't influence on company's performance.

4   RESULTS

4.1   Factors of Russian and US energy companies' performance
Based on statistical tests made with STATA8 the model with fixed individual effects for Russian generation companies was chosen. As a result for Russian generation companies we determine four significant factors of company's performance (table 2).

Enterprise in Turbulent Environment

Table 2: Significant factors of company's performance

Significant factors	Statistics
Debt to Equity ratio	-2,56 z-Value = - 3,415
Quick liquidity ratio	0,18 z-Value = 2,635
Return of equity	0,707 z-Value = 3,98
GDP growth rate	4,50 z-Value = 2,98

So as we could conclude from Table 2 that for maintaining company's performance it's necessary to control company's debt and its ability to service its debt in the short-time period. We also find that increase in growth rate of gross regional product increases Tobin's q and consequently increases the company's performance of generation companies.

The increase of return on equity on 1% increases Russian generation companies' performance on 0,7%. Return on equity ratio demonstrates how money a business makes for its investors who therefore pay considerable attention to it. So if company uses and manages its assets effectively it will increase the performance of Russian generation companies.

Companies' equity plays an important role in Russian generation companies' performance. Both Debt to Equity and Return on Equity ratios are significant. In our opinion it could be explained as it identifies the ordinary shareholder's investment in a company. Industrial factors such as electricity production and generation, tariffs rate aren't significant for energy company's performance in Russia.

The most significant factors is GDP growth rate. It complicates the management process as company couldn't influence on it and should only try to forecast it and to take it into consideration. Company could control and manage other significant factors that allow to manage its performance.

4.2   Factors of company's performance for generation companies in USA
The same analysis with same repressors (Table 1) and Tobin's q (equation 1) was made for energy companies in USA to define significant factors of their performance and to compare results with Russian ones that allows to conclude whether key factors of companies performance depends on the level of electricity market liberalization.

Finally we find that five factors influences on American generation companies' performance.

Table 3: Significant factors of US energy companies' performance

Significant factors	Statistics
Quick liquidity ratio	0,102 z-Value = 3,45
Return of equity	0,174 z-Value = 2,76
Dividend per share	0,009 z-Value = 4,98
Growth rate of GRP	0,151 z-Value= 5,69
Capacity on using renewable energy	0,098 z-Value = 2,63

Like for Russian generation companies quick liquidity ratio, return on equity and growth rate of gross regional product demonstrate their significance for US energy companies' performance. Like for Russian companies the most significant factor for US energy companies' performance is growth rate of gross regional product. When gross regional product increases it means that the demand on electricity is growing. Consequently energy companies who sell electricity in this region are supposed to be financially successful and are able to accumulate more money for investment in the future.

Significance of quick liquidity rate, like for Russian companies, means that for making effective investment it's necessary not to have problems with paying existing debts in short-time period. If return on assets increases it means that company manage its equity better and consequently testifies that company will be able also to invest more effectively.

The significance of capacity on renewable energy could be explained with growing importance of using renewable energy instead of coal and gas. Almost all US companies that were included in analysis have special centers for making researches and implementing results in this sphere. Moreover in USA there are a lot of special incentives for energy companies that deal with such projects.

Dividend per share wasn't calculated for Russian companies as during period of analysis they issue shares so "per share" statistics are supposed to be useless. For US energy companies dividend per share is significant and it could be explained as dividends are paid after all taxes and revenue deductions. So the higher dividend per share is the more profitable company is supposed to be and consequently the higher is her possibility to invest effectively in its assets.

If we compare Table 2 and Table 3 we could observe that there are three similar significant factors: quick liquidity ratio, return on equity and growth rate of gross regional product. It means that there are some similarities in factors of companies' performance on electricity market both in USA and in Russia despite on different level of electricity market liberalization.

5   CONCLUSION
We determine what factors influence on generation companies' performance in Russia. Based on panel data analysis made with STATA8 we find that to increase companies' performance it's necessary to take into consideration financial indicators and growth rate of gross regional

product. The growth rate of gross regional product is the most significant factor of company's performance. Industrial factors don't influence on energy companies' performance in Russia.

If company wants to increase its performance it's necessary to take into account its debt how it could pay for it and how effectively it uses its assets and equity. In our opinion such conclusions could be explained with the sector's features. Electricity power sector is a capital intensive and under conditions of electricity market and non-transparent of its main mechanisms' operation, attracting debts could decline the companies' performance. Summarizing all of these facts we could conclude that Russian generation companies could control and manage its company's performance via influencing (on financial indicators) or predicting (gross regional product growth rate) significant factors. It's important as it allows from one hand to attract necessary amount of financial resources, accumulate funds and from another hand to invent in company's assets effectively.

Analyzing US energy companies we found that growth rate of GRP, dividend per share, capacity on renewable energy, quick liquidity ratio, return on equity influence on energy company's performance. The most significant factor as for Russian generation companies is GRP's growth rate. Cross-country analysis allows not only to determine significant factors of energy companies' performance in the U.S. but also to compare the results with ones for Russian generation companies.

We find three similar significant factors of company's performance as for Russian and U.S. energy companies: growth rate of GRP, quick liquidity ratio and return on equity. It means that the list of significant factors of company's performance doesn't depend on the level of liberalization of electricity market. The similarity of significant factors in Russia and USA may also testify that in Russia relatively competitive electricity market was created.

Nevertheless there are some aspects that should be taken into consideration with Russian generation companies. There are some aspects in experience of US energy companies that could be useful for Russian companies in the future as US electricity market is highly competitive today and the sector's restructuring process passed on the relatively the same scenario. First of all it's necessary to pay attention to renewable energy projects. There is a growing interest to this sphere because of growing concerns about environment and unpredictable gas and oil prices. And the last but not the least it's important to control and manage dividend per share ratio in future.

The significance of debt to equity for Russian companies and non-significance for US ones testifies that on Russian electricity market risk plays more important role than on US one.

CULTURAL DIMENSIONS AND MOTIVATIONAL TECHNIQUES AS BASIC PREREQUISITES FOR HUMAN CAPITAL MANAGEMENT

Adelina Milanova

Bulgarian Academy of Sciences, Economic Research Institute, Bulgaria
nalidea@yahoo.com

ABSTRACT

The main purpose of the paper is to present a conceptual link between cultural dimensions and the role of motivation and motivational techniques within a corporate environment. The main focus of this study is the human capital of an organization as a set of specific features and characteristics. In the context of the thesis, there is inserted as appropriate tool the study and the identification of the meaning of human capital and its manifestation within the business unit as well as to present concepts about the relationship with cultural organizational dimensions and motivational techniques as a function of different views on motivation. Motivational techniques in a society without an adequate level of business maturity are rather a practical extrapolation of theoretical postulates, without a great opportunity for their optimization. The introduction of a new approach to identification and handling of human capital requires consideration of knowledge as an economic resource and develop a clear concept of strategic management of knowledge, which is demonstrated by the mobilization of intellectual resources of the organization, of abilities and attitudes for a good diagnosis of the business unit. Optimizing knowledge and skills through education and training outside the company or through experience gained in it is essential to optimize and increase human capital in business structure. So, should we consider human capital and the knowledge as economic resources? Regarding the nature of the relationship between organizational culture within its matrix and motivation like a process, several incentive techniques could be obtained, through specific analysis of motivational activity of the company and by assessing the business – maturity. Then, should we be able to answer the question whether rational motivational techniques might affect the cultural dimensions of the organizational culture in business unit, given that corporate culture is an indisputable factor for construction and image identification of any economic structure.

Keywords: Business maturity, Cultural dimensions, Human capital, Knowledge, Motivation

1   INTRODUCTION

Should we be able to present a conceptual link between cultural dimensions and the role of motivation and motivational techniques within a corporate environment – that is the main purpose of the paper.

In the context of the thesis, there is inserted as appropriate tool the study and the identification of the meaning of human capital and its manifestation within the business unit as well as to present concepts about the relationship with cultural organizational dimensions and motivational techniques as a function of different views on motivation. Motivational techniques in a society without an adequate level of business maturity are rather a practical extrapolation of theoretical postulates, without a great opportunity for their optimization.

The introduction of a new approach to identification and handling of human capital requires consideration of knowledge as an economic resource and develop a clear concept of strategic management of knowledge, which is demonstrated by the mobilization of intellectual

resources of the organization, of abilities and attitudes for a good diagnosis of the business unit. Optimizing knowledge and skills through education and training outside the company or through experience gained in it, is essential to optimize and increase human capital in business structure. So, should we consider human capital and the knowledge as economic resources.

Regarding the nature of the relationship between organizational culture within its matrix and motivation like a process, several incentive techniques could be obtained, through specific analysis of motivational activity of the company and by assessing the business – maturity. Then, we should be able to answer the question whether rational motivational techniques might affect the cultural dimensions of the organizational culture in business unit, given that corporate culture is an indisputable factor for construction and image identification of any economic structure.

2   HUMAN CAPITAL WITHIN THE BUSINESS STRUCTURE

The main focus of this study is the human capital of an organization perceived as a set of specific features and characteristics, embodied in its employees (knowledge, skills, abilities, health, motivation) that have a value and a source of future income for the worker, meaning the owner of the human capital as well as for the organization which, under certain conditions is using that capital (Krull, 2008).

In this sense, the main actors, interested in the development of the human capital in the business unit are either the employee (or worker in general) and the company itself.

Human capital of the company level is a significant part of the organization's intellectual capital and greatly affects the appearance of other components. The role of its management consists in striving to increase the participation of intangible factors in the proposed goods and the overall market value of the organization. Managers, acting in their best diagnosticians, should be open for using new approaches to the human capital in the company, based on the development and the operationalization of various strategies.

Ultimately, this capital has a value and is a factor of efficiency and profitability for the structure itself as well as for its employees.

Optimizing knowledge and skills through education and training outside the company or through experience gained in, it is essential to perfect and to increase human capital in the business structure.

As seems appropriate, should we develop a model that links the operational management of the processes of production and the use of knowledge, people, communication networks and technologies, the specific corporate culture with the strategy for the knowledge management. This algorithm requires precision in the formulation of strategy in terms of modes of its implementation and of course, in terms of coherence with the strategic management of the company.

The more employees are familiar with the strategy of the company and the more are involved in it, the higher are the chances that employees make the most of their efforts that ultimately lead to improved efficiency and financial performance (Hristov, 2009).

Enterprise in Turbulent Environment

There are different systems to monitor business processes in real time. One of successful approaches that will observe more informative, is the system of Balanced Scorecard. The initial impetus for the formation of the concept of Balanced Scorecard for effectiveness is given by studying the experience of the company Analog Devices, which under the leadership of its Vice President Arthur Schneiderman implement corporate systems of indicators (Corporate Scorecard). The maps in addition to traditional financial metrics used indicators of customer service, quality products, length of production cycle, development of new products and more. Gradually modified versions of the Balanced Scorecard began to be used in areas outside the business - social activities, education and local government activities of non governmental organizations and others. The main purpose of the Balanced Scorecard is to mobilize the organization in a new strategic direction, but as an instrument to measure - to present the characteristics of all relevant factors that determine the success of the company.

When in the early 90s, Robert Kaplan and David Norton /R. Kaplan & David Norton/develop an approach, called "The Balanced Scorecard for effectiveness", large companies are hopeful that real options are created for optimizing strategic management, as it includes and knowledge management. In a balanced system of objectives and indicators derived from the vision and strategy of the company in the process of governance, it should show exactly where the focus on specific business unit is.

According to Kaplan and Norton, vision as a focus of the future state occupy the highest field in the map. Especially important is the vision to be shared at all levels, which inevitably refers to the organizational culture, respectively its relationship with specific knowledge management. The conceptual idea leads to the development of strategy or several strategies as spelled out by individual perspectives. In general terms these perspectives are: finance, customers, internal business processes and learning and development. Directly towards these perspectives strategic objectives are set, which are in strict causality with the overall vision.

The next levels are critical success factors and key performance indicators. Indicators and complied values, desirable to be achieved, provide management capabilities for monitoring activities. At the lowest level in the structure of the Balanced Scorecard is the action plan, which is a set of strategic initiatives and concrete actions and steps by which to achieve strategic objectives.

Knowledge management aims to increase overall performance. Managers focus on partial or complete change of corporate culture, which is principally a difficult process. To comply and obey of its most important resource like the knowledge, it is necessary to introduce new organizational practices that gives to the corporate culture flexibility and adaptability.

Management of business processes includes the life cycle of a process - from design and modeling through implementation, monitoring, optimization and improvement. It is closely linked with the strategic goals of the organization in designing and implementing process architectures, establishing a system of "quantitative measurement of processes" and linking them to organizational goals. As regards the management of processes in a company great thing about *Business activity monitoring* can be used to achieve better effectiveness and efficiency of current operations and to ensure long-term success.

At first glance, the specifics of this type of approach are associated mainly with large companies. But, eliminating certain specifics of the scale, many of the techniques might prove

Enterprise in Turbulent Environment

relevant to any company that could potentially have vision about the knowledge as a key economic resource.

In this sense, the perception of human capital as the most valuable asset of the company is based on the belief that it will lead to economic benefits for the employer. An important point is the belief that the process of transformation of human resources in human capital will have an evolutionary character will use best practices and successful management of human resources. The creation and development of human capital is an essential concept of human capital management in the realization of the personal function of contemporary and future organizations. This is only the beginning of the process of forming a new model of personnel management, which will replace the ordinary administration. The roles of the organization and employees in establishing and developing the human capital of the organization are other (Krull, 2008). The role of the company is to make the initial human capital, and later to develop through training a certain organizational culture and motivation system, also thanks to its corresponding standard physical conditions and medical care. The role of employees in the development of human capital is also very important and with a great diversity: active participation in learning inside and outside the company, implementation of learning, striving for balance between work and family life, caring for their physical and mental condition, etc.

The introduction of a new approach to identification and handling of human capital requires consideration of knowledge as an economic resource and develop a clear concept of strategic management of knowledge, which is demonstrated by the mobilization of intellectual resources, by the organization of abilities, as well as by the good diagnosis of the attitudes of business unit.

Knowledge management as a strategy for management of companies is directly related to the cultural parameters in a specific plan can be identified as determinants of innovation culture. It is imperative to implement recent recommendations for creating a new format for generating innovative attitudes.

What, however, show the results of recent research (Milanova, 2012):
- The Bulgarian companies demonstrate low degree of development of a culture of applying new knowledge, which affects principally on supply and demand of knowledge.
- The management of the knowledge is directly related to and conditioned by the organizational culture. Strategy for knowledge management is linked to the business - strategy of the company, which in turn is a function of business maturity. Business maturity of the Bulgarian companies does not correspond sufficiently with the necessary determinants for generating innovative attitude and good organizational practices.
- Just as the organizational culture in Bulgaria is heavily dependent on national economic genotype /national cultural matrix/, innovation culture, attitudes and demand of knowledge, can hardly claim yet to be directly related to specific organizational cultures and practices.
- Innovative policies and claims to fully institutionalize the concept of knowledge economy meet a kind of "wall" in undertaking specific activities and promoting advanced practices related to the innovativeness. This can only mean that there is the perception of cultural dimensions as a fundamental capital.

- Data for the Bulgarian economy made an urgent reconsideration of the prerequisites and conditions for the development of organizational culture in the new format. Otherwise, poor picture of the parameters associated with the manifestation of knowledge would become a barrier to the expectations of good modern economy.

These findings logically lead to another aspect of the research - to what extent and under what circumstances an employee, gaining experience, thanks to the work in the company, increasing their individual human capital and value of the labor market would want, or would not want to leave the company with its own funds.

This complex issue is in fact an expression of the development of attitudes and motivation respectively motivational techniques within the company. The main problem here is how it can be argued that the relationship between organizational cultural dimensions and different motivational techniques coupled corporate strategies is reciprocal and therefore, how rational motivational techniques can affect the overall organizational culture of the economic structure.

3 MOTIVATIONAL TECHNIQUES AND CULTURAL DIMENSIONS

3.1 The case of Bulgaria

There are many theories of motivation and spelled out specific motivational techniques, most of which are complementary (Anguelov, 2000; Sotirova and Davidkov, 2005, etc.). We should not present them in a summary form, neither share what they accept or reject. Rather, should we proceed to an informal synergy to answer the problem raised.

As known, the key feature in the theory of Herzberg is the difference between satisfaction and motivation of people at work (Herzberg, 2012). The scope of employment conditions is put in place to help to overcome the frustration of the work. They created human satisfaction in a short time. Herzberg underlines them as factors - stabilizers. In the course of work, there are factors that create job satisfaction and labor. The definition of Herzberg for them is as factors - motivators. In Herzberg's theory, however, there is insufficient difference between motivation and satisfaction. According to him, satisfaction can be regarded as a synonym for motivating people at work. Essentially, it revealed two causal effect relationships:
- Things people like in life, make them work harder and better and vice versa
- Things they dislike, determine the deterioration of employment performance and logically it is imperative to be removed.

For the most part, motivation theories focus on the chain: performance - satisfaction - reward (Theory of expectations theory of the restraining effects, etc). In this context, different management mechanisms are elaborated with principally different effects.

Considerable milestones in work motivation are satisfying sense of justice and understanding of organizational role (Sotirova and Davidkov, 2005). The development of motivational strategy requires in-depth analyzes of situations and applying of a set of techniques, adequate or consistent with the performers and situations. Managers must constantly learn not only the needs of its employees, and their desires to apply adequate techniques:
- Forming achievable, realistic goals for workers in the labor process in order to raise expectations that an impact produced results.

- Using money as a reward and incentive, although they are not the only incentive that people need.
- Awards and recognition of achievements. The awards are considered positive when they are earned.
- Granting of responsibility. Responsibility is a kind of challenge because it is associated with status, with delegation of rights etc.
- Enriching and expanding capacity. Bring to professional maturation of the contractor, shall be provided different challenges and opportunities for self-expression and growth.
- The increase is a strong motivator for those who enjoy working in organizations providing such an opportunity. It involves a new job, training, new skills, high level of professionalism.
- Training. Programs for continuous training and development motivate people to broaden their knowledge and skills.
- Job security - ensuring relatively stable employment, secure salary, various insurance packages, and changes in contracts for extending them.
- Establish an effective system of feedback - development of options for evaluation in the direction of staff: qualifications, achievements - recognition of human resources - a system that promptly alerts and offers references for causes of performance deviations.
- Team Building. They attract participants, make them enthusiastic and motivate them
- Development of empathy and identification with the organization. People are motivated when they believe in the mission of the organization.
- Create opportunities to facilitate operations, automation, computerization and the intellectualization of labor management.
- Ensuring synergies and contacts (formal and informal) of human potential in the organization.
- Job satisfaction. It is achieved when the work was done well; the contractors are informed of this by setting clear and achievable objectives.

The result is an amalgam of specific theoretical assumptions, and operational programs. Observations suggest that in these cases seems particularly relevant to identify the source of these specific manifestations, which actually means and determines the integration of socio-anthropological and motivational parameters in human capital management.

As mentioned in previous papers, the status of corporate cultures in Bulgaria is generally characterized by the following specific organizational parameters (Milanova, 2004, 2008, 2012):
- There was a tendency to bureaucratic structure.
- Predominant orientation process rather than outcome orientation.
- Although there is little difference in percentages is folksy predominant type of organization to work, as individuals derive their allegiance to a greater degree of organization and tend to identify with her than with the type of work.
- The organization is perceived in a much greater extent as a closed organization.
- Control of the organization is more liberal.
- Taking into account certain relativity, more organizations are defined as organizations from practical type / paramount importance in the market /organizations rather than by type of legal / for paramount importance of rules and their implementation/.

Enterprise in Turbulent Environment

According to its organizational culture, the unit /organization/ can be defined as a process-oriented or results-oriented, which, as deduced dimensions specifically related to organizational culture, is the first to demonstrate a link with the values, i.e. the national cultural model (Hofstede, 2001; Milanova, 2008). In Bulgaria 60% define their organization primarily as a process-oriented. This is typical for the stressed cultures with high uncertainty avoidance as the orientation process involves avoiding risk, well-known, predictable and repetitive work situations while the orientation of the results suggests comfort in unfamiliar situations prone to challenges and risks. In this dimension must be taken into account the industry, suggesting a lower or higher dose of conservatism.

In identifying the organization as a staff-oriented or oriented to the work, the percentage is almost equal, in favor of the second option. This dimension is considered to be unrelated to the value system, but rather reflects the current situation /whether at some point the organization is pressed for work, whether for this reason it "looks" and is interested only in itself/ or in the philosophy of the founders. The Bulgarian business environment, however, this dimension is mostly a problem area of the national cultural model and this is related to the attitude: collectivism - individualism.

The type of organization is determined and compared to the feeling of belonging to its own members. These types, as mentioned, are the folksy and the professional ones. In the folksy type organization is interested in family and social background of its members, but also takes account of their competence and looks at their future. While, about the professional type the privacy is seen as sacrosanct, and the only thing that matters, is the professional competence. This dimension is also seen as somewhat linked with values. Bulgarian companies in more than 50% are directed to the first type. This finding is entirely understandable, given the relationship with collectivist dimension, but there is also an impact by anxiety and the avoidance of uncertainty too.

The issue relating to control is to be implemented in a company is associated with the structure and behavior in-house environment. Strict, formal control requires rigorous, dignified behavior, respect for the agreement or arrangement with more accurate price. When talking in this case the behavior of dignity is mainly connected with the internal causality. Fully in line with this logic, about 70% indicated that their organizations' control is liberal.

Table 1 (Author)

Cultural dimensions / Motivational techniques	Orientation towards the process	Orientation towards the work	Folksy organization	Liberal control
Money as a reward and incentive	strong	strong	strong	strong
Awards and recognition of achievement	medium	strong	strong	medium
Responsibility as a challenge	weak	medium	medium	medium
Enriching and expanding the job – professional performer maturation& job satisfaction	medium	medium	medium	medium
Promotion	medium	medium	medium	medium
Training	weak	medium	medium	medium
Job security	strong	strong	strong	strong
Effective feedback system	weak	weak	weak	weak
Teambuilding; contacts intensification in the organization	weak	medium	medium	weak
Empathy and identification with the organization	weak	weak	weak	weak

Often in academic and popular discussion questions are asked about the famous deficit and modern at the same time adequate corporate culture here. In our opinion, the problem boils down to lack of maturity of the kind (Milanova, 2008): institutional environment, coupled with the current political processes; market environment; culture of the human factor.

4 CONCLUSION

Problems that remain current to the Bulgarian companies are related to basic postulates and findings, because organizational cultures are too dependent on national economic genotype.

Motivational techniques are rather a practical extrapolation of theoretical postulates, without an opportunity for their optimization, due to inadequate level of business maturity in our society as a whole.

There are entities in which this problem is successfully overcome, and there are trends to be gradual and in other business units. In this sense, our belief is that we need to mobilize the best and adequate economic, sociological, and business - anthropological mechanisms to make dynamic transformation processes by which the image of economic structures would become modern and authoritative.

Knowledge is not imposed as a key economic resource yet and therefore innovation culture is not up to par. Ultimately, the relationship between organizational cultural dimensions and motivational techniques could not be defined as reciprocal as well as actually it is not possible that rational motivational techniques influence qualitatively corporate culture.

ABSTRACT
Predictive inferences (predictive distributions, prediction and tolerance limits) for future outcomes on the basis of the past and present knowledge represent a fundamental problem of statistics, arising in many contexts and producing varied solutions. In this paper,, new-sample prediction based on a previous sample (i.e., when for predicting the future outcomes in a new sample there are available the observed data only from a previous sample), within-sample prediction based on the early data from a current experiment (i.e., when for predicting the future outcomes in a sample there are available the early data only from that sample), and new-within-sample prediction based on both the early data from that sample and the data from a previous sample (i.e., when for predicting the future outcomes in a new sample there are available both the early data from that sample and the data from a previous sample) are considered. It is assumed that only the functional form of the underlying distributions is specified, but some or all of its parameters are unspecified. In such cases ancillary statistics and pivotal quantities, whose distribution does not depend on the unknown parameters, are used. In order to construct predictive inferences for future outcomes, the invariant embedding technique representing the exact pivotal-based method is proposed. Furthermore, this technique can be used for optimization of inventory management problems. An illustrative example is given.

Keywords: Future outcomes, Inventory management, Predictive inferences

1 INTRODUCTION

Prediction of future outcomes based on the past and current data is the most prevalent form of statistical inference. Predictive inferences for future outcomes are widely used in risk management, finance, insurance, economics, hydrology, material sciences, telecommunications, and many other industries. Practical problems often require the computation of predictive distributions, prediction and tolerance limits for future values of random quantities. Consider the following examples: 1) A consumer purchasing a refrigerator would like to have a lower limit for the failure time of the unit to be purchased (with less interest in distribution of the population of units purchased by other consumers); 2) Financial managers in manufacturing companies need upper prediction limits on future warranty costs. A large number of problems in inventory management, production planning and scheduling,

location, transportation, finance, and engineering design require that decisions be made in the presence of uncertainty. Most of the inventory management literature assumes that demand distributions are specified explicitly. However, in many practical situations, the true demand distributions are not known, and the only information available may be a time-series of historic demand data. When the demand distribution is unknown, one may either use a parametric approach (where it is assumed that the demand distribution belongs to a parametric family of distributions) or a non-parametric approach (where no assumption regarding the parametric form of the unknown demand distribution is made). Under the parametric approach, one may choose to estimate the unknown parameters or choose a prior distribution for the unknown parameters and apply the Bayesian approach to incorporating the demand data available. Scarf (1959) and Karlin (1960) consider a Bayesian framework for the unknown demand distribution. Specifically, assuming that the demand distribution belongs to the family of exponential distributions, the demand process is characterized by the prior distribution on the unknown parameter. Further extension of this approach is presented in (Azoury, 1985). Parameter estimation is considered in (Conrad, 1976). Liyanage and Shanthikumar (2005) propose the concept of operational statistics and apply it to a single period newsvendor inventory control problem. In this paper we consider the case, where it is known that the demand distribution function belongs to a parametric family of distribution functions. However, unlike in the Bayesian approach, we do not assume any prior knowledge on the parameter values. Conceptually, it is useful to distinguish between "new-sample" prediction, "within-sample" prediction, and "new-within-sample" prediction. For new-sample prediction, data from a past sample are used to make predictions of future outcomes from the same process or population. For within-sample prediction, the problem is to predict future outcomes in a sample or process based on early data from that sample or process. For new-within-sample prediction, the problem is to predict future outcomes in a sample or process based on early data from that sample or process as well as on a past sample data from the same process or population. Various solutions have been proposed for the prediction problem, that is, the problem of making inferences on a random sample $\{Y_j; j = 1, \ldots, m\}$ given independent observations $\{X_i; i=1, \ldots, n\}$ drawn from the same distribution. The Y_j's and the X_i's are commonly featured as "future outcomes" and "past outcomes" respectively. Inferences usually bear on some reduction Z of the Y_j's − possibly a minimal sufficient statistic − and consist of either prediction intervals or likelihood or predictive distribution for Z, depending on different authors. Kaminsky and Nelson (1998) discussed point and interval prediction of order statistics. Best linear unbiased predictors based on location-scale family of distributions are reviewed. Prediction intervals based on such predictors as well as those based on pivotals are studied. A brief discussion of Bayesian prediction is also given. Predictive distributions are found in the Bayesian framework (see Aitchison and Sculthorpe, 1965). Lawless (1982) applied the conditional method, which was first suggested by Fisher (1934) and promoted further by a number of others (Nechval et al., 2003; Murthy et al., 2004), to different problems relating to the Weibull and extreme value distributions. In practice the proposed methods have limited applications and it is the purpose of this paper to obtain predictive inferences concerning Z via the simple invariant embedding technique (Nechval, Nechval and Vasermanis, 2003; Nechval, Berzins, Purgailis and Nechval, 2008; Nechval and Nechval, Purgailis, 2011; Nechval, Purgailis, Nechval and Strelchonok, 2012; Nechval, Purgailis, Cikste, Berzins and Nechval, 2010). The obtained results are given below.

2   PREDICTIVE INFERENCES FOR FUTURE OUTCOMES

Let us assume that the random variable X follows the exponential distribution with the probability density function

$$f_\sigma(x) = \sigma^{-1}\exp(-x/\sigma), \quad \sigma > 0, \tag{1}$$

and the cumulative distribution function

$$F_\sigma(x) = 1 - \exp(-x/\sigma), \tag{2}$$

where σ is the scale parameter ($\sigma > 0$).

2.1 New-sample prediction

Theorem 1. Let $X_1 \le ... \le X_k$ be the first k ordered observations from the previous sample of size n from the exponential distribution (1) and Y_r be the rth order statistic in a set of m future ordered observations $Y_1 \le ... \le Y_m$ also from the distribution (1). Then the probability distribution function of the ancillary statistic Y_r/S_k is given by

$$\Pr\left\{\frac{Y_r}{S_k} \le \eta\right\} = \sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \frac{1}{[1+(i+m-j)\eta]^k}, \tag{3}$$

where $S_k = \sum_{i=1}^{k} X_i + (n-k)X_k$.

Proof. The joint density of $X_1 \le ... \le X_k$ is given by

$$f_\sigma(x_1,...,x_k) = \frac{n!}{(n-k)!}\prod_{i=1}^{k}\frac{1}{\sigma}\exp\left(-\frac{x_i}{\sigma}\right)\exp\left(-(n-k)\frac{x_k}{\sigma}\right). \tag{4}$$

It is known that

$$S_k = \sum_{i=1}^{k} X_i + (n-k)X_k \tag{5}$$

is the sufficient statistic for σ. Then

$$V_k = S_k/\sigma \tag{6}$$

is the pivotal quantity, the probability density function of which is given by

$$f(v_k) = \frac{1}{\Gamma(k)}v_k^{k-1}\exp(-v_k), \quad v_k \ge 0. \tag{7}$$

Using the invariant embedding technique (Nechval, Nechval and Vasermanis, 2003; Nechval, Berzins, Purgailis and Nechval, 2008; Nechval and Nechval, Purgailis, 2011; Nechval, Purgailis, Nechval and Strelchonok, 2012; Nechval, Purgailis, Cikste, Berzins and Nechval, 2010), we reduce

$$\Pr\{Y_r \le y_r\} = \sum_{j=r}^{m}\binom{m}{j}[F_\sigma(y_r)]^j[1-F_\sigma(y_r)]^{m-j} = \sum_{j=r}^{m}\binom{m}{j}\left[1-\exp\left(-\frac{y_r}{\sigma}\right)\right]^j\left[\exp\left(-\frac{y_r}{\sigma}\right)\right]^{m-j} \tag{8}$$

Enterprise in Turbulent Environment

to

$$\Pr\left\{\frac{Y_r}{S_k} \leq \eta \mid v_k\right\} = \sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \exp\left(-(i+m-j)\eta\, v_k\right), \tag{9}$$

where

$$\eta = y_r / s_k. \tag{10}$$

It follows from (9) that

$$\Pr\left\{\frac{Y_r}{S_k} \leq \eta\right\} = E\left\{\sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \exp\left(-(i+m-j)\eta\, V_k\right)\right\} \tag{11}$$

$$= \int_{0}^{\infty}\sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \exp\left(-(i+m-j)\eta\, v_k\right)f(v_k)dv_k = \sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \frac{1}{[1+(i+m-j)\eta]^k}. \tag{12}$$

This ends the proof.

Corollary 1.1. A lower one-sided new-sample α prediction limit h on the rth order statistic Y_r in a set of m future ordered observations $Y_1 \leq \ldots \leq Y_m$ is given by

$$h = \eta\, S_k, \tag{13}$$

where η satisfies the equation

$$\sum_{j=r}^{m}\binom{m}{j}\sum_{i=0}^{j}\binom{j}{i}(-1)^i \frac{1}{[1+(i+m-j)\eta]^k} = \alpha. \tag{14}$$

(Observe that an upper one-sided $1-\alpha$ prediction limit h may be obtained from a lower one-sided α prediction limit by replacing α by $1-\alpha$.)

2.2 Within-sample prediction

Theorem 2. Let $Y_1 \leq \ldots \leq Y_l$ be the first l ordered observations (order statistics) in a sample of size m from a continuous distribution with some probability density function $f_\theta(x)$ and distribution function $F_\theta(x)$, where θ is a parameter (in general, vector). Then the joint probability density function of $Y_1 \leq \ldots \leq Y_l$ and the rth order statistics Y_r $(1 \leq l < r \leq m)$ is given by

$$g_\theta(y_1, \ldots, y_l, y_r) = g_\theta(y_1, \ldots, y_l)g_\theta(y_r \mid y_l), \tag{15}$$

where

$$g_\theta(y_1, \ldots, y_l) = \frac{m!}{(m-l)!}\prod_{i=1}^{l}f_\theta(y_i)[1-F_\theta(y_l)]^{m-l}, \tag{16}$$

Enterprise in Turbulent Environment

$$g_\theta(y_r \mid y_l) = \frac{(m-l)!}{(r-l-1)!(m-r)!} \left[\frac{F_\theta(y_r)-F_\theta(y_l)}{1-F_\theta(y_l)}\right]^{r-l-1} \left[1-\frac{F_\theta(y_r)-F_\theta(y_l)}{1-F_\theta(y_l)}\right]^{m-r} \frac{f_\theta(y_r)}{1-F_\theta(y_l)}$$

$$= \frac{(m-l)!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1}\binom{r-l-1}{j}(-1)^j \left[\frac{1-F_\theta(y_r)}{1-F_\theta(y_l)}\right]^{m-r+j} \frac{f_\theta(y_r)}{1-F_\theta(y_l)} \quad (17)$$

represents the conditional probability density function of Y_r given $Y_l = y_l$.

Proof. The joint density of $Y_1 \le ... \le Y_l$ and Y_r is given by

$$g_\theta(y_1,...,y_l,y_r) = \frac{m!}{(r-l-1)!(m-r)!} \prod_{i=1}^{l} f_\theta(y_i) [F_\theta(y_r)-F_\theta(y_l)]^{r-l-1} f_\theta(y_r)[1-F_\theta(y_r)]^{m-r}$$

$$= g_\theta(y_1,...,y_l)g_\theta(y_r \mid y_l). \quad (18)$$

It follows from (18) that

$$g_\theta(y_r \mid y_1,...,y_l) = g_\theta(y_1,...,y_l,y_r)/g_\theta(y_1,...,y_l) = g_\theta(y_r \mid y_l), \quad (19)$$

i.e., the conditional distribution of Y_r, given $Y_i = y_i$ for all $i = 1,…, l$, is the same as the conditional distribution of Y_r, given only $Y_l = y_l$, which is given by (17).This ends the proof. □

Corollary 2.1. The conditional probability distribution function of Y_r given $Y_l = y_l$ is

$$P_\theta\{Y_r \le y_r \mid Y_l = y_l\} = 1 - \frac{(m-l)!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1}\binom{r-l-1}{j}\frac{(-1)^j}{m-r+1+j}\left[\frac{1-F_\theta(y_r)}{1-F_\theta(y_l)}\right]^{m-r+1+j} \quad (20)$$

Corollary 2.2. Let $Y_1 \le ... \le Y_l$ be the first l order statistics in a sample of size m from the exponential distribution (1). Then the conditional probability distribution function of Y_r given $Y_l = y_l$ is

$$P_\theta\{Y_r \le y_r \mid Y_l = y_l\} = 1 - \frac{(m-l)!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1}\binom{r-l-1}{j}\frac{(-1)^j}{m-r+1+j}\left[\exp\left(-\frac{y_r-y_l}{\sigma}\right)\right]^{m-r+1+j}. \quad (21)$$

Theorem 3. Let $Y_1 \le ... \le Y_l$ be the first l ordered observations (order statistics) in a sample of size m from the exponential distribution (1), where the parameter σ is unknown. Then the probability distribution function of the ancillary statistic Y_r/Y_l is given by

$$\Pr\left\{\frac{Y_r}{Y_l} \le \frac{y_r}{y_l}\right\} = 1 - \frac{m!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1}\binom{r-l-1}{j}\frac{(-1)^j}{m-r+1+j}\left(\prod_{i=0}^{l-1}\left[\left(\frac{y_r}{y_l}-1\right)(m-r+1+j)+m-l+1+i\right]\right)^{-1} \quad (22)$$

Proof. We reduce (20) to

$$\Pr\{Y_r \le y_r \mid Y_l = y_l\} = 1 - \frac{(m-l)!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left[\exp\left(-\frac{y_l}{\sigma}\left(\frac{y_r}{y_l}-1\right)\right) \right]^{m-r+1+j}, \quad (23)$$

where Y_r / Y_l is the ancillary statistic whose distribution does not depend on the parameter σ, Y_l / σ is the pivotal quantity. Using the probability density function of Y_l / σ, we eliminate the unknown parameter σ from the problem as

$$\Pr\left\{\frac{Y_r}{Y_l} \le \frac{y_r}{y_l}\right\} = \int_0^\infty \Pr\{Y_r \le y_r \mid Y_l = y_l\} g(y_l / \sigma) dy_l / \sigma$$

$$= 1 - \frac{m!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left(\prod_{i=0}^{l-1} \left[\left(\frac{y_r}{y_l}-1\right)(m-r+1+j)+m-l+1+i\right] \right)^{-1}, \quad (24)$$

where

$$g(y_l / \sigma) = \frac{m!}{(l-1)!(m-l)!} \left[1-\exp\left(-\frac{y_l}{\sigma}\right)\right]^{l-1} \exp\left(-\frac{y_l}{\sigma}(m-l)\right) \exp\left(-\frac{y_l}{\sigma}\right)$$

$$= \frac{m!}{(l-1)!(m-l)!} \sum_{i=0}^{l-1} \binom{l-1}{i} (-1)^i \exp\left(-\frac{y_l}{\sigma}(m-l+1+i)\right), \quad (y_l / \sigma) \in (0, \infty), \quad (25)$$

represents the probability density function of the pivotal quantity Y_l / σ. This ends the proof. ☐

Corollary 3.1. A lower one-sided within-sample α prediction limit h on the rth order statistic Y_r in a set of m future ordered observations $Y_1 \le \dots \le Y_m$ is given by

$$h = \eta \, Y_l, \quad (26)$$

where η satisfies the equation

$$1 - \frac{m!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left(\prod_{i=0}^{l-1} [(\eta-1)(m-r+1+j)+m-l+1+i] \right)^{-1} = \alpha. \quad (27)$$

Theorem 4. Let $Y_1 \le \dots \le Y_l$ be the first l ordered observations (order statistics) in a sample of size m from the exponential distribution (1), where the parameter σ is unknown. Then the probability distribution function of the ancillary statistic $(Y_r - Y_l)/S_l$ is given by

$$\Pr\left\{\frac{Y_r - Y_l}{S_l} \le \frac{y_r - y_l}{s_l}\right\} = 1 - \frac{1}{\mathrm{B}(r-l,(m-r+1))} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left[1+(m-r+1+j)\frac{y_r - y_l}{s_l}\right]^{-l} \quad (28)$$

where

$$S_l = \sum_{i=1}^{l} X_i + (m-l)Y_l \tag{29}$$

is the sufficient statistic for σ.

Proof. Using the technique of invariant embedding (Nechval, Nechval and Vasermanis, 2003; Nechval, Berzins, Purgailis and Nechval, 2008; Nechval and Nechval, Purgailis, 2011; Nechval, Purgailis, Nechval and Strelchonok, 2012; Nechval, Purgailis, Cikste, Berzins and Nechval, 2010), we reduce (20) to

$$\Pr\{Y_r \le y_r \mid Y_l = y_l\} = 1 - \frac{(m-l)!}{(r-l-1)!(m-r)!} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left[\exp\left(-\frac{s_l}{\sigma}\frac{y_r - y_l}{s_l}\right) \right]^{m-r+1+j}. \tag{30}$$

where $(Y_r - Y_l)/S_l$ is the ancillary statistic whose distribution does not depend on the parameter σ, S_l/σ is the pivotal quantity. Since the probability density function of S_l/σ is known, we eliminate the unknown parameter σ from the problem as

$$\Pr\left\{ \frac{Y_r - Y_l}{S_l} \le \frac{y_r - y_l}{s_l} \right\} = \int_0^\infty \Pr\{Y_r \le y_r \mid Y_l = y_l\} g(s_l/\sigma) ds_k /\sigma$$

$$= 1 - \frac{1}{B(r-l, m-r+1)} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left[1 + (m-r+1+j)\frac{y_r - y_l}{s_l} \right]^{-l}, \tag{31}$$

where

$$f(s_l/\sigma) = (\Gamma(l))^{-1} (s_l/\sigma)^{l-1} \exp(-s_l/\sigma), \quad (s_l/\sigma) \ge 0. \tag{32}$$

This ends the proof. □

Corollary 4.1. A lower one-sided within-sample α prediction limit h on the rth order statistic Y_r in a set of m future ordered observations $Y_1 \le \ldots \le Y_m$ is given by

$$h = Y_l + \eta\, S_l, \tag{33}$$

where η satisfies the equation

$$1 - \frac{1}{B(r-l, m-r+1)} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j} \left[1 + (m-r+1+j)\eta \right]^{-l} = \alpha. \tag{34}$$

2.3 New-within-sample prediction

Theorem 5. Let $X_1 \le \ldots \le X_k$ be the first k ordered observations from a previous sample of size n from the exponential distribution (1) and $Y_1 \le \ldots \le Y_l$ be the first l ordered early observations from a new sample of size m also from the distribution (1), where the parameter σ is

unknown. Then the probability distribution function of the ancillary statistic $(Y_r - Y_l)/(S_k + S_l)$ is given by

$$\Pr\left\{\frac{Y_r - Y_l}{S_k + S_l} \leq \frac{y_r - y_l}{s_k + s_l}\right\} = 1 - \frac{1}{B(r-l,(m-r+1))} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j}$$

$$\times \left[1 + (m-r+1+j)\frac{y_r - y_l}{s_k + s_l}\right]^{-(k+l)}. \tag{35}$$

Proof. For the proof we refer to Theorems 1 and 4. □

Corollary 5.1. A lower one-sided within-sample α prediction limit h on the rth order statistic Y_r in a set of m future ordered observations $Y_1 \leq \ldots \leq Y_m$ is given by

$$h = Y_l + \eta \, (S_k + S_l), \tag{36}$$

where η satisfies the equation

$$1 - \frac{1}{B(r-l,m-r+1)} \sum_{j=0}^{r-l-1} \binom{r-l-1}{j} \frac{(-1)^j}{m-r+1+j}\left[1 + (m-r+1+j)\eta\right]^{-(k+l)} = \alpha. \tag{37}$$

3 INVENTORY MANAGEMENT PROBLEM AND PREDICTIVE INFERENCE

In this section, we consider a single-period newsvendor model. Single-period stocking decisions often occur in practice; these require the decision maker to choose the stocking level of an item for which demand exists for only a single period. Several factors affect this decision: the distribution of demand, the cost and price of the item, the salvage value of the item, and the loss of customer goodwill due to stockouts. The newsvendor model addresses this problem and develops a formula for what is usually called the 'critical-fractile'. The optimum order quantity is calculated using the critical-fractile of the distribution of the demand for the period. Underlying the mathematical simplicity of the critical-fractile formula is a powerful and intuitively appealing insight for the determination of the order quantity. The order quantity depends only on the optimum balance between two types of costs. The first is the cost per unit associated with the unavailability of stock to meet the manifest demand (i.e., underage cost). The second is the unit cost associated with excess inventory at the end of the period for which there is no demand (i.e., overage cost). Following Hadley and Whitin (1963), we review the single-period newsvendor model and provide a broader interpretation to the structure of its solution. The notation, we use for the newsvendor model, is given below.

Y	Random variable for single-period demand
$f_\theta(y)$	Probability density function of single-period demand
$F_\theta(y)$	Probability distribution function of single-period demand
θ	Parameter (in general, vector)
c_1	Unit selling price
c	Unit procurement cost, which is independent of the procured amount
g	Unit salvage value for unsold items remaining at the end of the period
c_2	Unit stockout penalty cost (over and above any lost profit)
u	Variable representing the order quantity

Enterprise in Turbulent Environment

u^* Optimal order quantity

$Q(u)$ Expected profit as a function of the order quantity

c_o Unit overage cost

c_u Unit underage cost

Different versions of the problem may equivalently consider expected opportunity cost minimization or expected profit maximization. We examine the latter and write the expected profit as

$$Q(u) = c_1 \int_0^u y f_\theta(y)dy + c_1 u \int_u^\infty f_\theta(y)dy - cu + g \int_0^u (u-y)f_\theta(y)dy - c_2 \int_u^\infty (y-u)f_\theta(y)dy. \quad (38)$$

Assuming that $c_1 + c_2 > g$ (which is generally true in most situations), we can show that the expected profit function $Q(u)$ is concave. We, therefore, set the first derivative equal to zero to find a maximizing solution. The value of u that maximizes (38) is the one that satisfies

$$F_\theta(u^*) = (c_1 - c + c_2)/(c_1 - g + c_2). \quad (39)$$

Clearly the lost contribution margin $(c_1 - c)$ plus the stockout penalty (c_2) represents the 'underage cost'. Similarly the item cost (c) minus the salvage value (g) represents the 'overage cost'. If we refer to the underage cost as c_u and the overage cost as c_o, we may rewrite (39) as

$$F_\theta(u^*) = c_u /(c_u + c_o). \quad (40)$$

We should choose the order quantity u^* such that the cumulative distribution function (cdf) of u^* equals the ratio of the underage cost to the sum of the underage and overage costs. A relatively high underage cost results in a higher order quantity, whereas a relatively high overage cost leads to a lower order quantity, as one would expect. If the single-period demand Y follows the exponential distribution (1) then

$$Q(u) = \sigma \left[(c_1 - g) - (c-g)\frac{u}{\sigma} - (c_1 - g + c_2)\exp\left(-\frac{u}{\sigma}\right) \right], \quad (41)$$

$$u^* = \sigma \ln\left(1 + \frac{c_1 - c + c_2}{c - g} \right), \quad (42)$$

and

$$Q(u^*) = \sigma \left[c_1 - c - (c-g)\ln\left(1 + \frac{c_1 - c + c_2}{c - g} \right) \right]. \quad (43)$$

Parametric uncertainty. Consider the case when the parameter σ is unknown. Let $X_1 \le \dots \le X_n$ be the past observations (order statistics) of single-period demands from the exponential distribution (1). Then

$$S = \sum_{i=1}^n X_i, \quad (44)$$

is a sufficient statistic for σ, S is distributed with

$$g_\sigma(s) = [\Gamma(n)\sigma^n]^{-1}s^{n-1}\exp(-s/\sigma) \quad (s > 0), \tag{45}$$

To find the best invariant decision rule u^{BI}, we use the invariant embedding technique (Nechval, Nechval and Vasermanis, 2003; Nechval, Berzins, Purgailis and Nechval, 2008; Nechval and Nechval, Purgailis, 2011; Nechval, Purgailis, Nechval and Strelchonok, 2012; Nechval, Purgailis, Cikste, Berzins and Nechval, 2010) to transform (41) to the form, which is depended only on the pivotal quantity $V = S/\sigma$ and the ancillary factor $\eta = u/S$. In statistics, a pivotal quantity or pivot is a function of observations and unobservable parameters whose probability distribution does not depend on unknown parameters. Note that a pivotal quantity need not be a statistic—the function and its value can depend on parameters of the model, but its distribution must not. If it is a statistic, then it is known as an ancillary statistic.

Transformation of $Q(u)$ is given by

$$Q(\eta \mid v) = \sigma\big[(c_1 - g) - (c - g)\eta v - (c_1 - g + c_2)\exp(-\eta v)\big]. \tag{46}$$

We find the expected profit for the statistical decision $u = \eta S$ as

$$E\{Q(\eta)\} = \int_0^\infty Q(\eta \mid v)g(v)dv = \sigma\big[(c_1 - g) - (c - g)\eta n - (c_1 - g + c_2)(\eta + 1)^{-n}\big], \tag{47}$$

where

$$g(v) = [\Gamma(n)]^{-1}v^{n-1}\exp(-v) \quad (v > 0). \tag{48}$$

The value of η that maximizes (47) is given by

$$\eta^* = \big[1 + (c_1 - c + c_2)/(c - g)\big]^{1/(n+1)} - 1. \tag{49}$$

Thus,

$$u^{\mathrm{BI}} = \eta^* S = \Big[\big[1 + (c_1 - c + c_2)/(c - g)\big]^{1/(n+1)} - 1\Big]S. \tag{50}$$

Comparison of decision rules. For comparison, consider the maximum likelihood decision rule that may be obtained from (42) as

$$u^{\mathrm{ML}} = \hat{\sigma}\ln\big[1 + (c_1 - c + c_2)/(c - g)\big] = \eta^{\mathrm{ML}}S, \tag{51}$$

where $\hat{\sigma} = S/n$ is the maximum likelihood estimator of σ,

$$\eta^{\mathrm{ML}} = \ln\big[1 + (c_1 - c + c_2)/(c - g)\big]^{1/n}. \tag{52}$$

Since u^{BI} and u^{ML} belong to the same class

$$\mathbf{C} = \{u : u = \eta S\}, \tag{53}$$

it follows from the above that u^{ML} is inadmissible in relation to u^{BI}. If, say, $c = 2$, $c_1 = 490$, $c_2 = 2$, $g = 1$ (in terms of money), and $n = 1$, we have that

$$\text{rel.eff.}_{E\{Q(\eta)\}}\{u^{ML}, u^{BI}, \sigma\} = E\{Q(\eta^{ML})\} \big/ E\{Q(\eta^*)\}$$

$$= \frac{(c_1 - g) - (c - g)\eta^{ML} n - (c_1 - g + c_2)\dfrac{1}{(\eta^{ML} + 1)^n}}{(c_1 - g) - (c - g)\eta^* n - (c_1 - g + c_2)\dfrac{1}{(\eta^* + 1)^n}} = 0.93. \tag{54}$$

Thus, in this case, the use of u^{BI} leads to a growth in the expected profit of about 7 % as compared with u^{ML}. The absolute expected profit will be proportional to σ and may be considerable.

Predictive inference. It will be noted that the predictive probability density function of the single-period demand Y, which is compatible with (38), is given by

$$f(y \mid s) = \frac{n+1}{s}\left(1 + \frac{y}{s}\right)^{-(n+2)} \quad (y > 0). \tag{55}$$

Using (55), the predictive profit is determined as

$$Q^{(p)}(u \mid s) = c_1 \int_0^u y f(y \mid s) dy + c_1 u \int_u^\infty f(y \mid s) dy - cu + g \int_0^u (u - y) f(y \mid s) dy - c_2 \int_u^\infty (y - u) f(y \mid s) dy$$

$$= \frac{s}{n}\left[(c_1 - g) - (c - g)\frac{u}{s} n - (c_1 - g + c_2)\left(\frac{u}{s} + 1\right)^{-n}\right], \tag{56}$$

which can be reduced to

$$Q^{(p)}(\eta \mid s) = \frac{s}{n}\left[(c_1 - g) - (c - g)\eta n - (c_1 - g + c_2)\frac{1}{(\eta + 1)^n}\right]. \tag{57}$$

It follows from (57) that

$$E_\sigma\{Q^{(p)}(\eta \mid s)\} = \int_0^\infty Q^{(p)}(\eta \mid s) g_\sigma(s) ds = \sigma\left[(c_1 - g) - (c - g)\eta n - (c_1 - g + c_2)(\eta + 1)^{-n}\right] = E\{Q(\eta)\}. \tag{58}$$

Thus, u^{BI} can be found immediately from (56) as

$$u^{BI} = \arg \max_u Q^{(p)}(u \mid s). \tag{59}$$

4 CONCLUSION

The technique proposed in this paper represents a simple and computationally attractive statistical method based on the constructive use of the invariance principle in mathematical statistics. The main advantage of this technique consists in that it allows one to eliminate unknown parameters from the problem and to use the previous and current data of observations for obtaining predictive inferences as completely as possible. We have illustrated the technique for the exponential distribution. Applications to other log-location-scale distributions could follow directly.

A HEURISTIC MODEL TO AID THE WESTERN BUSINESS PEOPLE WORKING IN CULTURALLY DIFFERENT SOCIETIES TO ADJUST TO THE ENVIRONMENT

Mehryar Nooriafshar
University of Southern Queensland, Australia
mehryar@usq.edu.au

Conor Vibert
Acadia University Nova Scotia, Canada
conor.vibert@acadiau.ca

ABSTRACT
This paper is based on an ongoing research project that investigates the factors that contribute to successful assimilation by Western professionals in different countries. The investigation which has utilised data collected from different case studies related to Japan and Hong Kong. Each case study deals with issues and challenges facing Western expatriates residing in these countries for the purposes of business. As part of this work, the researchers have developed, presented tested a heuristic model for quantifying and predicting a Challenge Index for Western expatriates in Japan and Hong Kong. The index can be used to determine the level of difficulty for living and working in these countries; or comparing a given situation with others. The findings indicate that an attempt to familiarise oneself with the basics of the local language (eg Japanese) and recognition and acceptance of certain attitude differences would certainly contribute to a successful adaption.

Keywords: Business, Expatriate, Heuristic, Model

1   INTRODUCTION

The main objective of this paper is to identify and present effective means of adopting suitable approaches and adjusting attitudes for the purpose of work in Japan and Hong Kong. The investigation is based on different case studies chosen from a large database of interviews in various countries and settings. The selected interviews for the analysis were the most appropriate cases related to Japan and Hong Kong. These cases are detailed and structured interviews with professionals, from a number of different countries, who reside and work in Japan or Hong Kong. These professionals have had experience in various fields and are presidents, directors, consultants, teachers or business owners. Hence, their experiential knowledge about the challenges and how to effectively overcome the issues are quite valuable. The interviews are extracted from the Acadia Multi-Media Case Management System (AMCMS). The entire system comprises 340 case interviews related to various fields in several countries.

The interviews have been analysed carefully and commonalities, in terms of challenges, have been identified to form the basis for building a heuristic model. The heuristic model can aid in predicting the Challenge Index for a prospective Westerner wishing to work and reside in Japan or Hong Kong. This model can also be utilised for the purposes of monitoring one's difficulty levels in a manner which allows performing what-if analysis or comparison with other similar scenarios.

Enterprise in Turbulent Environment

A number of research articles that inform this study are reviewed and the methodology used to collect and analyse the data sample is outlined.   A series of predictions are then presented based on insight from articles and the video interviews. The following sections of this paper demonstrate how the research was conducted, data was collected and the model was built.

2   NOTABLE LITERATURE

Differences between national cultures is a topic of interest to many. Popular among researchers are models that seek to explain and describe these differences. Two frameworks in particular inform this study. One of these was created by Dutch researcher Geert Hofstede and published in numerous studies over time (Hofstede, 1980; Hofstede, 1993). He classified countries based on the survey data collected in early 1970s' from over 100,000 IBM employees located in 72 countries. Initially 40 countries were classified. Further analysis of the data allowed three regions and ten other countries to be classified according to four dimensions of culture that he labeled uncertainty avoidance, masculinity, power distance and individualism. Research conducted a few years later uncovered a fifth dimension that was termed long term orientation.

This last dimension refers the acceptance by a culture of a long term and traditional view of time. Tolerance for ambiguity refers to the uncertainty avoidance dimension. The extent to which stereotypical male and female characteristics are found in a culture was capture by the masculinity dimension. The degree to which inequality is accepted in a society was termed power distance. Finally, whether the interests of the individual or the group take precedence is referred to as individualism.

Originating with the ideas of sociologist, Talcott Parsons, a fellow Dutchman Franz Trompenaars (1994) used survey data from 28 countries to categorize national cultures according to five bipolar dimensions. He used questions that posed different dilemmas of everyday life. Achievement as opposed to ascription refers to whether status is given or whether we need to prove ourselves. Specific as opposed to diffuse refers to whether we handle ourselves in predetermined ways or whether our relationships are contextual and changing. Neutral versus emotional refers to whether individuals display or hide emotions. Universalism as the opposite of particularism is concerned with whether rules or relationships take precedence. Finally, similar to Hofstede's model, individualism versus collectivism explores whether the needs of the individual or the group is dominant in a society.

These two models or frameworks of national culture differences are well known and have been popularised in many management textbooks. They also prove useful for explaining some of the experiences of the Canadian expatriates in Hong Kong.

3   DATA COLLECTION METHODOLOGY

The research sites of this study were Japan and Hong Kong. Opportunistic search was used to identify interview candidates who were residing and working in Japan and Hong Kong. These business people were engaged in both manufacturing and service industries. Prospective interviewees were contacted two months prior to the interview by e-mail to obtain their consent, arrange an interview date and location and pass on the survey instruction. Interviews lasted approximately 40 minutes. Typically 20 minutes were needed to set up equipment and 20 minutes were needed to take down the film set and depart. Interviewees were filmed from the chest up. The interviewer is not seen or heard in the interview.

The video interviews are hosted on the Acadia Multimedia Case Management System (AMCMS) which is a web-based, password protected, scalable platform designed for higher education business students and the corporate training market.

The video interviews form part of the Acadia International Executive Insight Series (AIEIS) collection.   At the time undertaking this research project, it hosted over 340 interviews and almost 7000 video clips.

4   DISCUSSION
This section provides a few examples of selected interviews and discussions.

Although Japan is regarded as one of the main democracies of the world, one must remember that it is a society in which people are ranked according to their social status or position at work. Hence, a totally different kind of relationships between people should be expected. As pointed out by Hofstede (1980), the fact that not all individuals in societies are equal expresses the attitude of the culture towards these inequalities amongst us. Hofstede (1993) also suggests that Japan is a hierarchical society. The hierarchical feature of the Japanese society does not imply inequity. Japan is a free country with its strong beliefs in their traditions and religions of mainly Buddhism and Shintoism. With regard to their traditional beliefs, one may refer to the Bushido concept which contains egalitarian principles that have allowed wealth to trickle down to the vast majority in Japanese society (Fujimura, 2011). The traditional religions have also had similar effects on the Japanese attitude in terms of equity and equality of human beings in their society. According to Taka et al. (1994): "In the case of Buddhism, every living creature is said to have an equal Buddha- hood, a Buddhahood which is very similar with the idea of numen and micro- cosm."

One must accept the fact that unlike Australia and Canada, Japan is not regarded as a universalist, rule based society but it is classed as a particularist society. For further reading refer to Trompenaars (1994).

It should be noted that often language and culture are interrelated as one influences the other. Culture's roots are deeply established in the years of tradition and history.

Insight from the interviews suggested that a lack of knowledge of the Japanese language can create a solitary situation for the Westerner who is trying to become part of the society.

While the culture of Hong Kong differs from the West one should remember that to a large extent, these differences do not pose a problem. Hong Kong can be labeled as multi-cultural rather than a uni-cultural society. According to Chan Kwok (2011), Hong Kong is an ideal place to witness how different forms of cultural hybridity are produced, promoted and consumed. Hence, Western attitudes are not foreign to the people of Hong Kong. A reasonably balanced combination of Eastern and Western cultures exist in Hong Kong. As noted by Yiu-wai Chu (2011), the "blend of East and West'' cliché́ was something that has been welcomed by the Hong authorities.

5   A HEURISTIC MODEL
The data analysis and evaluation of the selected cases led to the identification of a set of issues, themes and topics which in turn were grouped into a set of common challenges. For

Enterprise in Turbulent Environment

instance, in the case of Japan, the groups covered challenges such as learning basic conversational Japanese, attitudes of the Japanese people both at work and in social situations, commonly practised ways of handling long hours spent at work and on public transportation, and differences in dealing with formal situation. These challenges were then titled as Language, Culture, Transportation, Work Ethics and Red Tape. The cases were observed carefully again and the issues raised were recorded under each category.

For the purposes of Japan, the possible problems or challenges have been classified under five main categories. The rationale for this grouping is based on the frequency of issue topics mentioned in the interviews. The following is the main topics raised and discussed by the interviewees:
1). Language
2). Culture
3). Work Ethics
4). Transportation
5). Red Tape

It should be noted that the emphasis placed on each category and the frequency of its occurrence in the interviews was noted during the observation. As a result, the categories for the issues were ranked according to their importance. Language has the highest weighting and the Red Tape issue ranks number five.

These factors can be regarded as independent variables of our heuristic model and the Challenge Index will depend on these variables:

$$CI = \text{Function of } \{ L, C, WE, T, RT \}$$

Where: L = Language; C = Culture; WE = Work Ethics; T = Transportation; RT = Red Tape

In which, the independent variables in the model are assumed to have an additive effect on each other. The Challenge Index can be worked out by inserting a difficulty level as a percentage against each category. Guidelines on these percentages are provided for the user.

It should be noted that this model, as suggested above, provides a figure as a guide which can be used for comparison purposes with other expatriates. It can also provide an opportunity for performing what-if analyses. Hence, the user of the model can relax a factor, increase or decrease its percentage and then determine some guiding figures. If the person in question, for instance, decides that they have made some progress with the language and their difficulty for it deserves a lower percentage then they may choose a smaller percentage for a new CI calculation.

6 CONCLUSION

This paper has demonstrated how a heuristic model, based on facts and theory, can help a Western Business person living and working in a culturally different country. The model has the potential to be used for comparative or what-if analysis by someone who wishes to monitor and adjust the challenges and difficulties facing them in a different situation. For instance, an expatriate working in Japan would be able to compare his or her own difficulty for different conditions; or compare the calculated index with other fellow expatriates. Hence, they would be in a more informed position with regard to making the necessary adjustments.

It should be emphasized that the model is not intended to be an exact or optimisation based model but instead, a guide in the form of a heuristic model. It is envisaged to extend the developed model and apply it to other culturally non western countries too.

It is recommended to carry out further testing with additional data to improve the heuristic model. Hence, future research projects related to the future enhancement of this model are planned.

GILT GROUPE: DESPERATELY SEEKING A NEW BUSINESS MODEL HOW DISCOUNT LUXURY SITES STRUGGLE IN THE ECONOMIC RECOVERY ERA[1]

Nikolai Ostapenko
University of the District of Columbia, Washington, USA
nostapenko@udc.edu

ABSTRACT
Gilt Groupe is a favorite website for luxury bargain hunters spending their lunch breaks with style. The company, founded in 2007, already has a well-established reputation and is expected to generate close to $1 billion in annual sales by the end of 2012. Its online platform uses the "flash sales" method, offering limited-time availability of high fashion, travel, home décor, and culinary bargains to its members. Membership, originally by invitation only, is now open to all. The idea of moving "sample sales" online was first realized on a European website, Vente-Privee.com, which now has more than 13 million customers. Following Gilt's introduction in the United States, flash sales skyrocketed and led to the launching of many new sites, which have proved popular both with consumers seeking impressive discounts on uber-luxury goods, and with exclusive brands wanting to unload their unsold stock quickly.

Keywords: *Branding, Discount sales, Distribution, Luxury products, Online retail*

1   INTRODUCTION

Gilt is an interesting case study of a successful, trend-setting player in the ever-challenging fashion industry. After its foundation, the company experienced a meteoric rise in online sales and even approached a possible public offering within its first five years. Yet, as the economy slowly began returning to normal and luxury overstock was less available, Gilt's business model seemed to become more vulnerable than sustainable. That, in combination with the intense influx of competitors, has led Gilt to try a variety of new ideas and new marketing strategies, seeking to build on its strong brand recognition and influx of investor money to expand and grow successfully. This research examines the state of the discount luxury market in the U.S. economy and analyzes Gilt's marketing and operations strategies in this lucrative yet complicated market segment.

2   OVERVIEW OF THE DISCOUNT LUXURY INDUSTRY

2.1   Discount Luxury Market and Gilt's Major Competitors

Gilt Groupe operates in an extremely competitive market where aggressive competitors fight for the same pool of customers and the same luxury good overstocks from the world's desirable brands. Despite Gilt's pioneering market entrance as the first "flash-sample reseller" on the web platform in the United States, relatively low market entry barriers allowed other sites to quickly get into the game and follow Gilt closely in terms of market size and revenue. The ease with which a website can be set up, without the major overhead costs of luxury brick-and-mortar stores, opened the gates to a flood of competitors. The biggest barriers to entry are the lack of available luxury inventory, which affected Gilt as well not long ago, and

---

[1] Wesley Graf, my former Georgetown University student, contributed to the material and research presented above.

the desire of the most desirable brands to work only with carefully selected and well-established discount websites. The consequences of these barriers are evident in Gilt's business strategy, as the company constantly tries to innovate by rapidly expanding and enhancing its online offerings and mobile platforms. There are countless competitors emulating Gilt's business model, but we will focus on three major ones.

Because Gilt was the first site of its kind in the United States, its revenue, as demonstrated in Chart 1, has increased rapidly, staying consistently ahead of its competitors. After one year of operation, Gilt earned about $24 million in revenue. Three years later, that number exploded to $605 million, with many analysts believing it will surpass $1 billion in 2012 (http://www.ft.com/intl/cms/s/0/124b3b68-1386-11e1-9562-00144feabdc0.html#axzz1g9fpbXlD). Currently, with more than 5 million members, Gilt leads the domestic competition in terms of membership charts as well. Starting with luxury clothing for women, its business has expanded into many other categories, and currently includes men's and children's branded apparel, home and artisan products, fine food and wine, and appealing travel deals.

Chart 1: Financial Times, http://www.ft.com/intl/cms/s/0/124b3b68-1386-11e1-9562

Internationally, *Vente-Privee.com* was the first company to get into the discount luxury segment online, as early as2001. The company is the only competitor that exceeds Gilt in terms of all major financial indicators. Its membership base of over 13 million customers is almost three times larger than Gilt's. However, the site currently operates only in Spain, Germany, Italy, Austria, the United Kingdom, and Belgium, and thus has not been competing directly for U.S. customers. Potential still exists, owing to close relationships with more than 850 luxury European brands that allow the company to access highly regarded inventory and top-of-the-line products (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/).

RueLaLa (www.ruelala.com) is an American site launched in mid-2008. It has around 450 million members and makes an estimated $300 million in revenue by focusing almost exclusively on women's luxury clothing, with occasional offerings of home accessories and men's goods (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/). The company followed Gilt closely in terms of granting "members-only" access, garnered much media attention at a time when the press was focusing on Gilt, and quickly started to share Gilt's reputation and customer base.

Ideeli, another significant competitor, started in 2007, shortly after Gilt came onto the scene. The company has around 4 million members and revenue hovering around $200 million (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/).

Ideeli was one of the original competitors to succumb to the high pressure of the online luxury marketplace. The market rule suggests that when more competitors fight for the same inventory, luxury companies experience a decline in overstock and are less interested in reducing the wholesale price. It has become much more difficult to deliver the high end of luxury to consumers at a big discount. The CEO of Ideeli, Paul Hurley, began to move away from top luxury brands, on the theory that "with high-end retail, there's only so much inventory to work with. Scarcity is part of the high-end fashion brands' strategy" (http://www.reuters.com/article/2011/10/17/us-flashsales-idUSTRE79G41X20111017). The company now sells luxury items from the lower end, where the inventory is more readily available and the potential customer base is much larger, albeit less affluent.

2.2   The Threat from New Market Entrants

Luckily for Gilt Groupe, the discount luxury market is becoming more difficult to enter with success. Oversaturation of the market led to customer fatigue regarding any new market opportunity, and to a feeling among consumers that they already have enough choices, perhaps even too many, as our survey among young professionals in the Washington, D.C., area suggested. Additionally, strengthening in true luxury sales and abundant demand for overstocked items caused a decline in the inventory available for purchase by new entrants (http://www.reuters.com/article/2011/10/17/us-flashsales-idUSTRE79G41X20111017). The only significant player worth mentioning in this regard is Vente-Privee.com, the European founder of the flash-sales business model. This company's vast market experience and tight relationships with some of the world's most prestigious brands have helped it sustain popularity as it circumvents the scarcity issue. Recently it partnered with American Express, hoping to leverage the latter's 42 million customers for an early influx of American Express card holders (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/).

2.3   Threat of Market Substitutes

Substitutes in the discount luxury market come from two main sources. One such source is sites such as Fab.com, which are starting to gain popularity. Fab.com, a flash site similar to Gilt, has become popular because of its highly specialized and preselected unique items that customers could not readily find elsewhere. The site rarely sells clothing items and focuses mainly on high-end non-apparel designs such as visual art, gadgets, and lighting fixtures. It can be considered a substitute because it shows a trend among online consumers to move away from the Gilt business model, which offers a vast array of products that were available in luxury department stores a year ago. The attraction is to a highly curated service that creates the illusion of purchasing something worth buying from a source offering unique designs, rather than just products that used to be available at full price.

Enterprise in Turbulent Environment

Chart 2: Wall Street Journal

This new format works and, as suggested in Chart 2, more and more consumers are flocking to sites like Fab.com or Woot.com, another site offering one specific unique item a day that typically sells out in just in a few hours, rather than to Gilt, Ideeli, and similar competitors (http://online.wsj.com/article/SB10000872396390444097904577535323312754532.html?mod=googlenews_wsj#). Gilt's unique visits went up 24% from the year before to slightly above 1 million, the highest increase among industry competitors. Fab.com, by contrast, increased its unique visits from 129,000 to 2 million: a 16.56% boost. Obviously a shift is under way, in terms of what kind of "flash sale" site consumers want to spend their time and money on.

The other substitute comes from the full-price luxury market. As the global economy slowly recovers, the luxury goods market is experiencing robust growth. LVMH, owner of Louis Vuitton and other posh brands, recorded net profits up 28 percent in 2011 over 2010, which already was a strong year (http://view.koreaherald.com/kh/view.php?ud=20120730000733&cpv=0). PPR, owner of Gucci and Yves Saint Laurent, saw a sales increase of 17%. Jumps in luxury sales across the board reflect an influx of customer spending in designer boutiques and department stores such as Neiman Marcus, Saks Fifth Avenue, Nordstrom, and Bloomingdale's, as well as on their transactional websites. Additionally, Net-a-Porter.com, the most prestigious online seller of full-price luxury goods, has been seeing huge increases in its net profits and importance in the industry (http://view.koreaherald.com/kh/view.php?ud=20120730000733&cpv=0). As consumers are earning more money again, they are willing to step away from discount sites such as Gilt, where they had a chance to buy—and fast—a limited supply of not-quite-flashy and possibly ill-fitting merchandise, to full luxury retailers where they can get what they want on their own terms. One of Gilt's core strategies, the "flash sales" model, certainly offers business advantages but forces consumers to respond immediately, and buy before the item is gone forever. With more money in hand, many consumers are more likely to forego this "competitive shopping" opportunity and make more meaningful, thoughtful, and "experiential" purchases at full price in luxury stores.

2.4 Bargaining Power of Customers

Customers can exert pressure on Gilt, given the availability of a vast number of competitors offering similar products in a similar format. A customer who is unhappy with Gilt can simply switch to another reseller such as RueLaLa, Vente-Privee, or the hundreds of others that have emerged since the rise of Gilt. As Gilt struggles to offer the 70% discounts of its early days

and increasingly shifts to discounts of 40-50%, consumers are likely to desert and switch to other competitors or substitutes, such as department or specialized stores that offer them exactly what they are looking for. Given the free membership at Gilt and other competitors, switching costs the consumer nothing. Because most customers are highly price-sensitive, they were willing to endure the downsides of Gilt (last season's designs, rushed and competitive shopping) when they were getting impressive discounts, but as discounts lessen and consumers have more discretionary money, they can exercise more power over the company in the marketplace.

2.5   Bargaining Power of Suppliers

One of the biggest problems facing Gilt is the power of its suppliers. The founders admit that when starting the site, their greatest difficulty was persuading luxury brands to let them sell goods online at a huge discount (http://online.wsj.com/article/SB10001424052748703792704575366842447271892.html).   If that was difficult during the recession, it has become even more so as the luxury market strengthens. In Gilt's initial phase, as the recession began to hit luxury brands hard, overstock inventories sometimes ballooned by a factor of ten, to a level totally unfamiliar to these companies (http://www.reuters.com/article/2011/10/17/us-flashsales-idUSTRE79G41X20111 017). That led to a situation where Gilt faced "adequate supply, great pricing, and brands willing to talk to them," according to Steven Dennis, founder of Sageberry Consulting, which researches online retail markets (http://www.reuters.com/article/2011/10/17/us-flashsales-idUSTRE79G41X20111017). Times have changed, however. Companies have learned to scale down production to avoid such extreme inventory excesses (http://www.businessoffashion.com/2011/12/the-rise-stumble-and-future-of-gilt-groupes-busi ness-model.html). The merchandise stocks that they currently have and are willing to sell also have many potential buyers, as opposed to just Gilt. That has driven wholesale prices up, and Gilt, which averaged 70% discounts in the beginning, now offers average discounts of 40-50%, with suppliers no longer forced to settle for rock-bottom pricing (http://www.reuters.com/article/2011/10/17/us-flashsales-idUSTRE79G41X20111017).   Even more distressing, suppliers of top luxury brands no longer feel the need to sell to Gilt or other web platforms at all, and that has caused the online selection of brands to suffer. Years ago Gilt was selling brands like Zac Posen and Gucci for women at a discount.

A quick look at the site now shows that many of the brands are ones that most consumers would not readily recognize. The combination of an influx of competitors and a dwindling supply of luxury overstock has allowed suppliers, once grateful price takers, to become price setters (http://www.businessoffashion.com/2011/12/the-rise-stumble-and-future-of-gilt-grou pes-business-model.html). As the economy grows even stronger, luxury brands will want to rebuild their sense of exclusivity by discontinuing, not reselling, their goods. For instance, Lela Rose, a sought-after fashion designer with dresses priced between $1,000 and $10,000, used to sell her products on Gilt. However, she succinctly expressed suppliers' worries by suggesting, "[Consumers] might be saying, 'That's what I bought when I had no money,' and now they're used to paying the sale price" (http://www.businessoffashion.com/2011/12/the-rise-stumble-and-future-of-gilt-grou pes-business-model.html). But now luxury brands do not worry about customers' willingness to pay full price when they have more money in their pockets.

Enterprise in Turbulent Environment

3 MARKETING STRATEGIES OF GILT

3.1 Product Strategy

As already stated, Gilt Groupe is an online retail service that brings members discounted luxury goods in a "flash sale" style of shopping experience. Gilt announces upcoming sales via urgent email to all members, and begins selling at noon each weekday, with all merchandise 70% off the retail price.

Figure 1: Presented by using logos from Gilt's sites

Most sales last for 36 hours, but merchandise often sells out sooner, given the limited quantity and the high demand. In fact, over 50% of revenue comes within one hour of the start of the sale (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/). This sense of urgency is a huge part of what makes Gilt so successful, and it is a key part of the product and promotion strategies. Consumers get on the site and recognize that they have a very limited amount of time to get products at steep discounts before they are gone. Thus they are much more likely to make impulse purchases, and they lack the luxury of time to weigh their options. Initially, Gilt started these flash sales only for women's clothing and only for a small membership base: originally, 15,000 members personally invited by Gilt's founders, Alexis Maybank and Alexandra W. Wilson (http://online.wsj.com/article/SB10001424052748703792704575366842447271892.html). As the business grew, however, Gilt's product changed to include many more services, as well as unrestricted membership. These changes began around the time of the launch of Gilt Man site, the same business model selling men's clothing and accessories. Figure 1 shows Gilt's current full range of product lines. Obviously the brand has expanded far beyond women's clothing, and now offers a variety of products at a range of discounts. All the sites have a very luxurious visual appearance, featuring black backgrounds and highly styled professional photos. They also are curated to suggest that customers are getting a selection of only the best products, and Gilt's latest endeavor, Park and Bond, has largely separated itself from the Gilt brand name altogether.

3.2 Price Strategy

Gilt's pricing is one of the most important factors in the rise of the brand image. Gilt Groupe's

"bread and butter," Gilt.com, offers women's, men's, and children's clothing, as well as home decor and gifts, at between 50 and 70% off retail prices. Additionally, selling to Gilt gives sellers an opportunity for a quick influx of cash, always welcomed by many smaller brands and frequently helpful to almost all brands in the depths of the recession. Gilt typically buys the product at 50% off wholesale price. As retailers typically markup clothing from the price they have paid, the wholesale price equals half of the retail price. By purchasing at half the wholesale price, Gilt can double the price it pays and still sell at 50% off the retail price. When purchasing extra-large orders, Gilt can get goods even lower, at less than 50% of the wholesale price, and thus can offer discounts in the 70% range (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/).

Some of their other product lines offer smaller or no discounts: Park and Bond offers no discounts, Jetsetter offers some full-price travel packages, and Gilt Taste offers limited discounts, if any. They justify these full prices by offering very exclusive selections of goods, to give members the additional benefit of seeing only the crème de la crème of men's clothing, travel experience, and artisan food and wines, respectively.

3.3   Place Strategy

Gilt has always excelled in the "place" arena. Its storefront is completely online and therefore open 24/7 to customers. Its website is a case study in exuberant elegance and sophistication. The site is divided into different categories by tabs at the top, allowing members to look only at the sales relevant to them. Most men, for example, have no need to see the newest women's sales, and upon login are immediately directed to the Gilt Man dedicated section. The photography is extremely professional, and the cover photos for the sales look more like the ads in glossy magazines than the photos typically found on a retailer's website, whether discount or full-price.

Additionally, Gilt put a strong early effort into developing dedicated mobile applications so that consumers can shop on the fly. Given the urgency of the flash sales, which start promptly at 12 p.m., the mobile app allows customers who may not have computer access at the moment to quickly get on their iPhones, iPads, Blackberries, or Androids and rapidly browse the site. As seen in Chart 1, up to 30% of Gilt's revenues come from purchases via mobile apps. Even more extraordinary, Gilt sees up to 50% of its revenues coming from the apps on holiday weekends, such as July 4th, when consumers are traveling or on the beach and do not necessarily have access to computers (http://bits.blogs.nytimes.com/2012/06/29/gilt-groupe-mobile/). Gilt also innovates constantly in the mobile arena. A new version of the app will allow customers to upload photos of themselves and then "try on" items like sunglasses (http://bits.blogs.nytimes.com/2012/06/29/gilt-groupe-mobile/). While that may sound gimmicky, it gets consumers excited to get on the app and try it, and, of course, more customers lead to more sales.

One weakness worth mentioning is the occasional problem of the website's functionality. When there is a highly publicized and desirable sale, as when the site offered Christian Louboutin or vintage Hermès bags, the site crashes or is extremely slow. Given the limited quantities and the first-come-first-served nature of flash sales, this can be problematic for customers who are set on a product but find that it has sold out by the time the page loads. With the exception of this infrequent problem, Gilt's accessibility is one of its greatest strengths.

3.4   Promotion Strategy

Gilt's promotion has been widely talked about in the media because its marketing has stayed "under the radar," without any advertising campaigns or commercials. Additionally, the company's intense focus on gaining a desirable membership base helped spread the word to affluent customers and helped reassure luxury brands that Gilt was protecting their exclusivity. Once the site had funding and was up and running, the founders sent out invitations to 15,000 of their colleagues from the Harvard Business School, friends from their undergraduate-degree universities, and fashion industry gurus from whom they gained retail and   business   experience (http://online.wsj.com/article/SB10001424052748703792704575366842447271892.html).

Chart 3: Forbes

They targeted this market because these people were exactly the demographic they hoped to reach: wealthy, educated, and young, like the founders themselves. From there, the only way to gain membership was by referral from an existing member, who got a $25 gift certificate for inviting friends. It was an ingenious way to gain members, as all the new members were connected with the initial group of highly desirable customers. The strategy paid off in spades. As seen in Chart 3, membership skyrocketed, with more than 75% of subscribers referred to the website by members (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/). Now, with over 5 million members, Giltworks with the exact demographics that it initially desired. Customers are young, rich, and educated; 65% are younger than 35; 67% have an income in excess of$150,000; and 87% have bachelor's degrees (http://www.forbes.com/sites/matthewcarroll/2012/01/05/the-rise-of-gilt-groupe-part-3/4/). The founders were also wise to make themselves the "face" of the company. They are good-looking, young, and smart, and they felt that including personal notes in all packages and emailing members to offer personal selections would make their company more relatable. As they said in their book, "We knew that increasing our visibility would help us personalize and build trust in the brand. Gilt wouldn't be a faceless corporate behemoth like most online retailers. Instead, it would have a friendly human face, despite being a brand most customers interact with only via their computers" (Maybank and Wilkinson, 2012).

Guilt owners also went on a "tour" of sorts by holding upscale events whenever they traveled to a new place, and hosting private dinners for Gilt's most loyal customers, as well as bloggers, journalists, and tastemakers. They followed up by sending handwritten notes to those whom they had met and, as a result, they were featured in countless media pieces across the country (Maybank and Wilkinson, 2012). Their marketing strategy was a smart way to grow both the company and its aura of brand exclusivity. By deciding to offer membership to a limited group at first, they were able to avoid overwhelming the site and to grow slowly and

consistently, while building a base of loyal customers.

4   CONCLUSION

Gilt has many challenges in the years ahead, as well as many undiscovered opportunities. For one thing, the business of flash sales, with its dwindling suppliers, is responsible for only 35–50% of Gilt's total business today. Now designers are being asked to make inventory especially for Gilt, goods never available in stores, using the designer's own extra fabrics and supplies. This opens up for Gilt a whole new market that nobody else has been thinking about (Thau). Thus the company can offer new, exclusive goods while still ensuring a great online discount.

Gilt should also continue to expand its full-price brands. Park and Bond has had great success in selling high-priced men's clothing, and such an opportunity also exists for women's apparel. Gilt's competitor Net-a-Porter has become an icon, creating a market for luxury women's online retailing that did not exist before. With only one other major player in the high-end luxury brands, Gilt can tap its resource of vendors and brand relationships in that market.

Gilt's services, already top-notch, can be translated into quality media editorial content on fashion, which gives full-price customers added value and reason to shop. Park and Bond has already teamed up with men's magazine *GQ* to offer "Editor's Selections" and editorial content, which immediately gives Park and Bond a share in *GQ*'s excellent reputation for men's style. Gilt Taste has partnered with *Gourmet Magazine* for a similar reason and hired Ruth Reichl, one of the country's most respected food critics, to provide editorial content and recommendations for the foods they sell. That gives consumers confidence, and gives Gilt Taste brand equity by relating it to such a respected fashion magazine (http://techcrunch.com/2011/05/18/gilt-taste-a-pricey-online-marketplace-for-artisan-foods/).

Continuing to build connections with great magazines and brands will help spread the word about Gilt, and it will give consumers the added benefit of top-quality publicity when shopping for Gilt brands.

Gilt also has global opportunities that it is just beginning to explore. If it is successful, the growth potential overseas is obviously enormous, so it is crucial that the company expand carefully and thoughtfully. Gilt is offering free international shipping and returns for a limited time to entice new customers in many countries to try its products. The company is working diligently to master the intricacies of international shipping, going as far as to call it "step number one in going global," so that it can understand the international market (http://www.ft.com/intl/cms/s/0/124b3b68-1386-11e1-9562-00144feabdc0.html#axzz1g9fpbXlD). It must look into partnerships abroad, so that it can work with successful businesses, possibly acquire the companies of possible competitors, and instantly become a large presence abroad.

Finally and less obviously, Gilt needs to leverage its immense customer research tools. The company has been collecting customer data since its inception. It looks at everything from age and gender to the types of products customers buy and how to customize the email message each user gets daily so that it displays only the sales most relevant to the user in question (http://www.businessoffashion.com/2011/12/the-rise-stumble-and-future-of-gilt-groupes-business-model.html). If it shares this information with its vendors and partners, it will be able to

leverage this data into a significant cash flow as well as to revitalize the relationships with some of the luxury vendors that no longer work with the company (http://www.ft.com/intl/cms/s/0/124b3b68-1386-11e1-9562-00144feabdc0.html#axzz1g9fpbXlD).

The company obviously has been extremely successful by searching for opportunities everywhere and seizing them. As the market changes, the company has enough drive, intelligence, money, and prospects to adapt successfully to the new economic situation and continue to run an innovative fashion business model on a global scale.

THE INFLUENCE OF BUSINESS PROCESSES ON ORGANISATIONAL BEHAVIOUR: AN ILLUSTRATION OF THE CROATIAN HOTEL INDUSTRY

ABSTRACT

Organisations look for new ideas and sources of competitive advantage, and in the ever more significant service sector it is particularly important to ensure organisational behaviour. This research is an attempt to examine the impact of business processes on organisational behaviour. The purpose of this study is to determine the hospitality leaders' attitudes toward the evaluation of well-defined business processes as a precondition for good organisational behaviour. In addition, the results showed that the canonical correlation analysis of the relationship between groups of the business process and organisational behaviour variables is significant, as well as that well defined business processes are the strength of organisational behaviour.

Keywords: Business processes, Hotel industry, Management, Organisational behaviour

1   INTRODUCTION

Assuming that competition in the past, the present and the future is not competition between products or services, but competition between the skills of process thinking of employees who created processes, who created products and/or services, or those who generated cash flow and accumulated company assets (Vujica Herzog, 2007, p. 5811), we reveal the importance of viewing business processes as a basis for competitive advantage. On the other hand, certain processes and behaviours give life to organisations (Ivanchevich, Konopaske and Matteson, 2011) and thereby influence organisational behaviour. In this respect, the studies of the consulting company Gartner between 2005 and 2009 identified the business process improvement as the number one priority of top management (Reiter et al., 2010, p. 3). Whereas today authors (Krainc and Miočić, 2006; Thompson and Martin, 2010; Buble et al., 2010) consider business processes to be the backbone of modern organisations.

In order to achieve the best operating practices, it is necessary to understand which activities and methods actually produce the desired outputs (in terms of increasing competencies and real changes in the way we work) (Kujansivu and Lönnqvist, 2008). Rummler and Brache (1990) suggest the organisation of activities in such a way that the organisational activities are linked by coordination mechanisms: mutual adjustment, direct supervision and standardisation. In this respect, standardisation makes a substantial contribution, because it plans and implements standards and procedures that govern work performance with an aim to standardise behaviour, standardise outputs, standardise skills and norms (Wagner and Hollenbeck, 2010, pp. 238–241). Apart from the above, it is important to note that the basic

mechanisms of coordination are in the continuum, that is to say, when standardisation is achieved the process does not stop but returns to the beginning to repeated mutual adjustment due to, for instance, new circumstances.

The role of the system in organisational behaviour, in the present circumstances, is to manage individuals and groups in organisations to achieve maximum effect, but also to describe, understand and manage flexible but formal organisational structures. In systems, particular attention is paid to the analysis of how the nature of work and differently designed organisations influence the activities of human resource management as well as those of directing organisational behaviour. The concept itself is related to employees' perception of the goals and their clarity, group membership, level of cooperation, autonomy, etc. In other words, managing organisational behaviour means understanding: (1) individuals in the organisation, (2) group and organisational processes, and (3) intergroup relations in the organisational context. However, if the process workflow cannot be implemented in a structure which supports and enables the achievement of outputs, primarily user-oriented ones, work does not make sense, in other words, by mapping work with people, job roles must cover everything - from the causes of events to the output intended for the users/stakeholders as well as all the sequences in-between (Burlton, 2001, p. 61). Aytulun and Guner (2008) consider an organisation to be a network of processes whose interaction achieves a defined purpose, and its advantage is focused on customer satisfaction, improving speed and efficiency, rapid adaptation to the environment, reducing boundaries between departments, seeing all the activities, increasing participation of employees and reducing costs, that is, influencing the elements of organisational behaviour.

The service sector as a whole has grown in importance over the past decade. However, from the management perspective, all efforts are put to achieve higher levels of employee service delivery performance, because of the impacts on service quality, customer satisfaction, as well as on the financial performance of organisations. The research was focused on examining the influence of business processes on organisational behaviour. The purpose was to determine the attitudes of the hospitality leaders in the Croatian hotel industry towards the evaluation of well-defined business processes as a precondition for good organisational behaviour. The purpose of the research is primarily set with regard to the today's management's concern over achieving suitable organisational context, all this in order to achieve willing organisational behaviour, in other words, to: *improve employee productivity, ensure job satisfaction, reduce fluctuation, reduce absenteeism, improve willing organisational behaviour, that is, minimise deviant organisational behaviour.* The main hypothesis was that: well defined key business processes positively affect the desired organisational behaviour.

2 LITERATURE REVIEW

2.1 Business processes

The problem area of business processes has become all the more important as business circumstances have become more complex since mere adjustment to the environment has become a challenge for organisations. By moderating levels and links, companies use the process management techniques to strengthen and create valuable hard-to-copy relationships as well as the complementarity between processes (Benner, 2009, p. 474). Under the influence of the environment, organisations are constantly reminded of the need to understand their own business processes, management boards demand - process analysis, certification agencies require - process analysis, competition compels us to – analyse business processes etc.

(Graham, 2004). In other words, appreciating defined business processes (Management Centre Europe, 2010, p. 4) has become a part of company's culture, however, it can also become a major obstacle to change. Why? Every company at any stage of its development by analysing and modifying business processes ensures the achievement of strategic orientation – e.g. increased productivity, cost minimisation, reduction of social consequences, reduction of environmental emissions and the like. Most successful companies achieve this through more effective and innovative business processes which reduce costs, increase efficiency and ensure the quality of the product, ensure job satisfaction, lower fluctuation and absenteeism. In other words, by improving business processes they ensure proper use of companies' resources. A major shift in the process approach occurs, because instead of the functional approach and job descriptions, the process approach focuses on organisational role. In this way a job position is not described through tasks but through process activities. The process approach itself requires the construction of business processes that take place in the organisation. In this way, the organisation becomes more compact and more resistant to changes in the market and is able to respond quickly to market demands, as well as to optimise its business activity. Furthermore, it becomes obvious that almost everything is a process and that business processes have a key role in the economic survival of organisations (Harrington, 1991). The overall characteristics of processes are that they include change; they develop through time; they are composed of a group of events; they are mostly only identified through internal complexity that exists in a given time; they may be owned and depend on the environment, in other words, usual procedures may evolve over time. The first step in defining the processes themselves is to understand where a process begins and ends. A process begins with a "trigger" that causes the activity which is carried out by a person or a group of persons (team, department, etc.), and ends when it develops into another process, passes onto another person or group. An interesting feature about the process approach is that almost always one person plays two roles - the user and the process performer. Rummler, Ramias and Rummler (2010) also noted that documenting processes is not necessary because it takes too much time, extensive materials are not read and written materials cannot be updated, etc. However, they do believe that processes should be defined or captured in the actual performance and designed according to a particular need, which means they should be documented with a purpose, and the purpose should form the document and dictate the requirements in terms of usefulness (Rummler, Ramias and Rummler, 2010, p. 14). And in an organisation, as a natural model, this means describing processes. Business processes in companies are usually less focused on tasks (Nilsson, Tolis and Nellborn, 1999) and more on people. Process orientation contributes to clarifying the roles of employees and encouraging their involvement in improving work performance. Moreover, the process theory (Buchanan and Huczynski, 2010, p. 22) is an approach to explain organisational behaviour based on narratives which show how many factors, combining and interacting over time in a particular context, are likely to produce the outcomes of interest (Buchanan and Huczynski, 2010, p. 22). In addition, as one of the core topics in organisational behaviour, Robbins, Judge and Campbell (2010, p. 8) include business processes alongside motivation, leader behaviour and power, interpersonal communication, group structure, learning, attitude development and perception, change processes, conflict, work design and work stress.

2.2   Organisational behaviour
According to Wagner and Hollenbeck (2010, p. 5) one of three important considerations is that organisational behaviour assesses the 'behaviour' of groups and organisations per se. Nevertheless, there are events that occur in organisations that cannot be explained in terms of individual behaviour. Such events must be examined in terms of group or organisational

processes. Accordingly, the individual, the group, the organisation and the environment collectively influence behaviour in organisations (Mullins, 2010, p. 6). Organisational behaviour focuses on *improving productivity, reducing absenteeism and fluctuation, as well as reducing deviant behaviour, but also on encouraging organisational citizenship behaviour and job satisfaction* (Robbins, Judge and Campbell, 2010, p. 26). Organisations are trying to find a measure of structural support that would ensure streamlined and desired organisational behaviour. In the philosophy of organisational behaviour we could apply the idea that, in some way, the organisation and the management have to ensure that everyone in the organisation is a winner, that people focus on the key elements of their work and understand their contribution to the overall success of the organisation. Organisational behaviour as an area of management is the result of interaction and interdependence between the variables of formal organisation and the human factor variables (Mittal and Kumar, 2001). The variables of formal organisation are composed of three basic interdependent and interactive elements: structure, process and technology, while the human factor variables consist of: biological and psychological structure, physiological processes and personality (Mittal and Kumar, 2001), both groups of variables depend on organisational dynamics, conflict, changes and adaptation. The reasons for managing organisational behaviour primarily lie in the realisation of strategies and organisational goals and achieving organisational success. One of the answers is to set organisation's business processes as the foundation of organisation's system: teamwork, cross-functionality that will ensure the importance of each employee, encouraging corporate citizenship behaviour, i.e. helping new employees, etc. The objective (Bartlett and Ghoshal, 1997) is to develop and maximise the collaboration between individuals in the system (processes) in order to develop additional value to the company. The mere awareness of the process ensures the removal of barriers between organisational units and individuals. Mullins (2010, p. 9) suggests an integrative model of organisational behaviour that includes: organisational mechanisms, group mechanisms, individual characteristics, individual mechanisms and individual output. In other words, one way to bring about a change in the management of organisational behaviour is to ensure a managed organisational context through the organisation's business processes.

Regardless of what the organisation does, especially in the service sector, employees help achieve the envisaged business processes because business performance has its "undefined side" - certain organisational behaviour. Between the simple (repetitive procedures) and complex (unpredictable activities) there is always room for designing and improving the domain of the process that will help improve certain conditions, the level of good practice, cause and effect relationships, etc. The process areas at management levels are: *concern for people in the organisation, communication and coordination, performance management, training and development, compensation and work environment that contributes to the desired organisational behaviour*. The recent trends in the design of work are: self-creating work, employees are allowed to create their work in accordance with organisational goals, which means they are free to innovate their work, etc., however, this is rarely applied in practice; self-organizing teams, the manager does not allocate tasks to individuals but to a group, and they decide themselves how the work will be done, this allows greater autonomy (this is also rarely applied in practice, with some difficulty in the performance), flexibility in work performance, possibility of modifying amounts, product range, product specification (possibility of upgrading and expanding capacities, possibility of redeploying equipment). Roberts (2010) states that the process improvement efforts designed to ensure speed cannot achieve the expected results in the organisation if people go slowly, so that the present

performance is focused on human-based processes, especially due to the complexity of the performance and the awareness of the situation as well as the response to the environment.

Human behaviour can be analysed as a process of "continuous, independent sequence of actions" and understanding this process is necessary in order for the organisations to understand what changes the structure needs (Mullins, 2010, p. 62). Becoming familiar with the events that initiate processes and focusing on the people can be provided by managing organisational behaviour in the future. The nature of management requires from individuals and groups to be familiar with the processes, tasks and responsibilities and the organisation itself, as well as the management of the dynamics of organisational behaviour. According to Clark (2005, p. 318), performance management basically indicates the framework for organisation's human resources that directs, supervises, motivates and redefines organisational behaviour, for Brumback (1998, p. 265) performance means both behaviour and results, because behaviours represent an important output of the organisation (referenced by Torrington, Hall, Taylor and Atkinson, 2009, p. 101). By merging business processes (which come from the prescriptive approach) and people (who deal more easily with and support the emergent approach) we develop a need to analyse the interdependence of these two poles and bring them closer in order to achieve the desired organisational results, that is, the organisational behaviour which will ensure long-term sustainability.

3   FINDINGS

3.1   Research methodology

Fundamental theoretical hypothesis was empirically explored on a sample taken from the selected branch of activity - hotel industry (H 551) in the Republic of Croatia, according to the National Classification of Activity. The database register of business entities of the Croatian Chamber of Economy (CCE) and Business Information Centre (Homepage) were used in collecting the relevant data on companies in the industry for the year 2010. The field study was conducted by using a dynamic system of web based questionnaires with the questionnaire domain that was forwarded in an e-mail inviting the recipients to fulfil the questionnaires in October 2011. The sample includes 70 most successful companies that contribute to the creation of added value, assuming they really contemplate organisational improvement and seek to improve structural elements. Out of 70 companies from the sample, 58 responded to our research, however, only 28 companies provided all the required information.The questionnaire "The impact of business processes on organisational behaviour" was developed as a research instrument. The questionnaire examined quantitative variables in addition to qualitative questions that were taken in their original form to clarify the considerations about the research problem. The examinees from the strategic level of management were asked to express their level of agreement with a particular statement on a one-to-seven Likert scale ranging from Strongly disagree (1 - *not at all*) to Strongly agree (7 - *to a large extent*).

In this paper, we use descriptive statistics and Canonical Correlation Analysis to understand better the complexity of the working environment phenomenon. The analyses were made by using the statistical data analysis software Statistica, version 7.0 and SPSS for Windows, version 15.

3.2 Research implications

The oldest company was founded in 1935, and the youngest in 2011, and the range of ages is wide because of the consolidation of changes in the Croatian hotel industry that has taken place in recent years. 37% of the companies find themselves market leaders, 14.6% find themselves market challengers, and 48.1% of the companies consider themselves to be market followers. During the season the companies employ up to 2500 people, and the average number of employees is 300. The examinees in 66.7% of cases were male, and 33.3% female. Most examinees, 85.2%, are responsible for multiple functional areas, 44.4% belong to top management (44.4%) and 55.6% to medium level management. The most frequently applied quality management system is ISO9002 (64.7%), benchmarking (47.1%), total quality management (41.2%). 17.6% of the companies use business process reengineering. The observed companies (N = 58) in 58.8% of cases provide a large number of completely different services, and the organisational structure in 51% of cases is function-based, while only four companies, that is 7.8%, have a process-based organisational structure. Considering the fact that more than 50% of the companies retain the function-based organisational structure, it should be pointed out that such a structure often results in fragmentation, given that in order to prevent fragmentation and achieve the desired level of cooperation and collaboration between organisational units, companies must complement their function-based organisational structures, and sometimes this means creating process parts that combine strategically important activities that were previously performed in separate functional units. Moreover, this is supported by the fact that 52.9% of the examinees believe that the organisational structure is only partially adequate; indicating the importance of the structural components with regard to company's performance. The examinees also believe that the activities of the company are most significantly influenced by time dependence (34.7%), and the degree of activities that must be completed in order for another activity to begin, followed by the dependence on employee approach (28.6%), which precisely describes and focuses on our research problem: business processes.

The hypothesis testing was carried out on the basis of the selected characteristic parameters for groups of variables: business processes and organisational behaviour.

Enterprise in Turbulent Environment

Table1: Canonical analysis summary

		Canonical Analysis Summary Canonical R: ,99409 Chi2(121)=169,61 p= ,00241	
		Left Set	*Right Set*
No. of variables		*11*	*11*
Variance extracted		*100,00%*	*100,00%*
Total redundancy		*66,4127%*	*52,5509%*
Variables:	*1*	*PP17_3*	*OP40_1*
	2	*PP18_1*	*OP40_2*
	3	*PP18_2*	*OP40_3*
	4	*PP18_3*	*OP41_4*
	5	*PP18_4*	*OP41_6*
	6	*PP18_5*	*OP42_4*
	7	*PP18_6*	*OP42_5*
	8	*PP18_7*	*OP43_1*
	9	*PP18_8*	*OP44_3*
	10	*PP18_9*	*OP45_1*
	11	*PP18_10*	*OP45_9*

The dependence testing showed a statistically significant coefficient for the basic sets of the selected variables (predictors - business processes and criterion - organisational behaviour) and a high canonical correlation coefficient (Rc = 0.99409) with the significance level of 99% (p < 0.01) and a 100% explained variance in both sets of variables: predictor and criterion. Furthermore, eigenvalues as the characteristic values of the matrix show that the strength of relationship between pairs of variates is extremely high (0.9) in the first three canonical factors. The canonical correlation coefficient indicates that 99.4% of the variance is shown between the first pair of canonical factors, the coefficient of determination (R^2) shows that the variance of the first group of the criterion variables can be explained by the predictor variables with approximately 98.82%, the remaining 1.18% in the common variability explanation can be attributed to other characteristics which are not considered in this study. Lambda Prime, a test of the significance of the correlation coefficients, which confirms the significance of certain canonical factors in the variables tested, is very high (Lambda Prime = 0.00001) in the first pair of the canonical factors with a 99% level of statistical significance.

The highest correlation of the correlation coefficients of the predictor variables (r=0.95) is shown by the variables *support business processes are defined in the company (PP18_5)* and *management business processes are defined in the company (PP18_3)*. And the other significant correlation is shown by the variables that *key processes* (PP18_4) and *supporting business processes* (PP18_5) (r=0.90) are defined in the company. The highest correlation of predictor and criterion variables (r=0.757167) show variables *business processes ensure job satisfaction* (OP41_6) and *support business processes are defined in the company* (PP18_5). The canonical weights of business processes in a positive sense (2.94) show that the unique contribution of the variable *support business processes are defined in the company (PP18_5)* is the most significant and reaches its maximum in the canonical factor 8 *(Root 8),* whereas the canonical weights of organisational behaviour show that, in a positive sense (1.03), the

most significant unique contribution is that of the variable *organisational objectives are achieved based on the lowest costs* (OP40_3), which reaches its maximum in the canonical factor 1 *(Root 1)*.

The factor structure of predictors (business processes) and criterion (organisational behaviour) reveals that the variable *support business processes are defined in the company (PP18_5)* has the most significant correlation (0.81) with third canonical variate (canonical factor). In this table, the factor structure of the criterion variable *employees look for opportunities for new work due to the organisational culture of companies (OP42_5)* (0.77) has the most significant relationship with the eighth canonical variate (canonical factor). Based on the values shown, we can conclude that the canonical correlation of the relationship of the group of selected variables of business processes and organisational behaviour is high (Rc=0.99409, R^2=0.988209, p <0.01) and we accept the hypothesis that well-defined business processes positively affect the desired organisational behaviour.

4   CONCLUSION

The paper points out the impact the defined organisational processes have on organisational behaviour. In other words, process orientation ensures the freedom of action of the people in the organisation by encouraging people to "own their work", to be team players and to motivate people to get involved in resolving problems, to provide voluntary assistance (organisational citizenship behaviour), and to reflect on their work and tasks, bring ideas, make decisions, suggest the right initiatives. Furthermore, it is important for companies that the structural dimension, with varying interpretations of individuals performing the processes, ensures equal organisational behaviour. However, the new process approach to business has not yet been fully understood. Although the companies defined their core business processes, the combination of integrated processes and fragmented organisations created a form of cognitive dissonance, with horizontal processes pulling people in one direction and traditional vertical management systems pulling them in another. Thus, our research findings indicate that business processes are still an insufficiently understood concept, that the creation of self-managed work teams, which require extra effort, special training and education, has been neglected. Although the most significant feature of teamwork is that of providing support to business processes (M=5.71, SD=1.13), teamwork indeed has a direct impact on work productivity and job satisfaction that represent the essential elements of organisational behaviour, however, the other elements belong to the domain of the *neutral action areas*: organisational citizenship behaviour, absenteeism, fluctuation and deviant behaviour in the workplace. Therefore, the practice of business processes possibly influencing other variables of organisational behaviour should be adopted in the future.

HEALTH AS A PART OF HUMAN CAPITAL

Velma Pijalovic
School of Economics and Business, Bosnia and Herzegovina

ABSTRACT
Human capital consists of healthy, well educated, skillful, innovative and creative people who contribute to creation of new values. Therefore human capital incorporates the health-related aspects of a person per definition. Health has a direct impact on human capital, but also it has interaction with education. Although the influence of health and education on effectiveness and economic growth is hard to separate, most of the authors when making analyses, take into account only the influence of the human capital in the whole. In this paper, we will analyze thoroughly mutual influences of health and education, and its influence on worker's productivity. Despite the fact that there is a great number of books, articles and researches, that deal with education as a component of human capital, small number of works analyze health as its second most important component. The main goal of this work is to show the importance of health as a component of human capital. Health presents the main individual and social value, and there is nothing above it. Health of a person reflects in biological, psychological and social sphere and its interaction. How much will human capital contribute to successful business of a company and also to the economic growth depends on all three health components. Population health dramatically improved in the last century. Therefore for example, indicator of life expectancy at birth in the USA increased from 42.5 in 1890 to 79.0, according to the latest data of World Health Organization. Mortality due to cardiovascular diseases also decreased. Alongside the improvement of health indicators, health expenditure increased measured with percentage of GDP and dollars per capita. In the final part of the work, on the example of selected European countries, we analyze relation between health indicators, life styles and health expenditure to amount of real GDP.

Keywords: Education, Health, Human capital

1 INTRODUCTION

Different historical periods, different socio-cultural environments and different scientific disciplines have formed numerous concepts to define health. The most frequently used definition of health is the one from the preamble to the World Health Organization Constitution of 1948, which says that health is "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (Richards, 2003). In the first empirical paper in health economics, Fuchs V. states: "Good health is one of man's most precious assets." (Fuch, 1972, p. 3) Most of the scientific discussions within social sciences most often view health as a prerequisite of function. Thus, social sciences deal with the functional-structural dimension of health, or rather its role as a prerequisite for achieving an individual's social status. Philosophical considerations, on the other hand, view health as one of the prerequisites to achieve a happy, hedonistic life, or a life in which the soul is in harmony with itself; however, here health is not viewed as an ultimate goal. The concept of health is probably most difficult to incorporate into economic sciences. Specifically, one could say that for economic sciences health is a matter of choice at individual level and at community level. This choice includes the ways in which limited resources are allocated between investments in the health sector and other sectors and between different alternatives within the health sector. This concept, or rather the study of health economics, is based on a definition of economics which, as is well known, is a social science that deals with defining

ways in which limited resources are allocated to meet potentially limitless needs (Vilogorac, 2001, p. 9). The next concept that can serve to analyze health is the concept that treats health as a public good. Specifically, considering the fact that health care occupies a very important place in public policy creation and also considering the fact that, regardless of the health care system in place, there is no state without some form of national health insurance, we can conclude that today the issue of individual health may be treated as a public good. This is particularly evident in public health care, which has to deal with the issue of externalities. Health, or rather health services, is also an important export product. It is estimated today that annual earnings in health tourism are about 60 billion dollars, while realistic projections indicate this figure will grow in the coming years to 100 billion dollars (Barić, 2011, p 13). However, when discussing health as an export product, it is important to note that this concept does not include only the notion of health tourism that encompasses professional and controlled use of healing sea, spa and air capacities. Specifically, in the last few years, clinics around the world have been offering standard health services at secondary and tertiary levels to patients coming from abroad. The last, but not least important concept that treats health is the analysis of health as one of the principal components of human capital.

2 HEALTH AS CAPITAL

The economic theory understands capital to be factors that have the following three qualities:(i) durability, (ii) transferability and (iii) the existence of a trade-off. Health may be viewed as a durable good because healthy organs remain healthy for an extended period of time and lead to extended lifespans. Return on health is transferable in the sense that better health makes it possible to earn better wages in the market. Investing in health entails different forms of sacrifice, such as: changes in diet, spending time and money to treat diseases, etc., and we can therefore conclude that health has the three qualities required to treat is as capital (Fimpel, 2007, p. 8). The concept of "investing in people" was introduced in the economic theory in the late 1950s, and the first discussion in which health is treated as capital is found in an article published in The Journal of Political Economy in 1962, in which S.J. Mushkin views health as an important investment. In the paper, Mushkin analyzes similarities and differences between education and health care. Both education and health care increase "productivity" of an individual, with the individual being viewed as a consumer as well as a producer. Both education and health are in part consumable goods and in part investments, and both are treated as implicit components of the standard of living, or in Mushkin's words: "when a man does not have sufficient vitality to function normally, consumption of other goods loses in importance, and without education the distinctive quality of the human being is lost" (Mushkin, 1962; referenced by Fimpel, 2007, p. 7). Apart from these similarities between health and education, there are also some differences: (i) while investments in education increase the quality of workforce, investments in health increase the number of able-bodied persons and individuals' capacity for work; (ii) while health care programs seek to prevent diseases that occur due to a "hostile" environment, education seeks to detect and encourage natural talents that are developing in this environment; (iii) while in education there are two alternatives - to invest or not to invest, in health the issue is to make a choice between investing and submitting to the effects of the Darwin's law according to which the fittest survive, which is not an acceptable option in the modern society. A specific feature of health and education is that both are, on the one hand, the result of production processes and, on the other hand, they represent an input in the production process.In the context of what was said previously, it is important to stress that health represents one of the principal determinants of human capital.

3   HEALTH AS A PART OF HUMAN CAPITAL

The concept of human capital was developed in the early 1960s when the US economist and Nobel laureate Theodore W. Schultz analyzed the cost of education as an educational investment (Bogdanović, 2008, p. 46). In addition to health and education, later on human capital came to include all human qualities that an individual's and organization's labor efficiency depend on, including: physical health, physical and mental abilities, motivation for work and development, and skills and competencies. Although there are many different views regarding the definition and content of human capital, human capital in general has at least two principal components: (i) collective human capital, and (ii) individual human capital. The principal elements of collective human capital are the national culture and social institutions, organizational climate and culture of each legal entity, and social (team) harmony/cohesion. On the other hand, individual capital includes: intellectual, health, emotional, moral, social, aesthetic and altruistic capital (Bogdanović, 2008, pp. 51–54). Accordingly, by its very definition, human capital also includes the health of employees. Because the impact of health and education on efficiency and economic growth is difficult to isolate, most of the authors in their analyses take into account only the impact of human capital as a whole. However, between education, health and productivity, there are many interdependencies that need to be analyzed.

The relationship between health and education is an interdisciplinary question that is treated as part of the study of public health, sociology, health economics, etc., with each discipline treating this correlation in a different way. Within human capital, education can have an impact on health in two ways: it may increase the efficiency of individual production of health or it may lead to a more health-oriented production (Albert and Davia, 2010, p. 163). In addition, an improvement in productive efficiency from investments in education increases the return on life-saving investments in health (Todaro and Stephen, 2006, p. 349). Education also plays a very important role in preventive action because an increase in the level of education results in not only medical staff but also patients having more knowledge about methods for preventing disease. Sala-i-Martin, for instance, states that children of better educated mothers in developing countries are significantly more likely to survive than children of mothers who are illiterate (Sala-i-Martin, 2006, p. 97). Higher education increases the rate of return on health, because longer life expectancy means an increase in income generated during one's lifetime, while an early death would, for each individual and for society, make investment in education less cost-effective. The most recent research framework pays special attention to employment as an important transmission mechanism: educated persons are more likely to find a job, which has better effects on health than unemployment (Albert and Davia, 2010, p. 165). On the other hand, health also has a major impact on education. Increased health care capacities can increase return on investments in education because health is an important factor of school attendance. Among the ways health has an impact on education, Todaro and Stephen note that healthier children perform better at school. (Todaro and Stephen, 2006, p. 350). The next way health has an impact on education concerns the incentive to invest in education. Specifically, the expected return on education is higher among persons who are healthy and are less likely to fall ill, and companies are motivated to invest more in employee education. The sameapplies to an individual. In case of a short life expectancy, the discounted present value of income from an individual's life is lower, and therefore the usefulness of education and training is relatively low, and individuals are not motivated to invest in education. If the rate of child mortality is high, parents face a sort of a trade-off, known in theory as the Beckerian qualitative-quantitative trade-off associated with children, where parents choose quantity sacrificing the quality of their

children's life. In addition to these interactions between health and education, it is important to note that both health and education affect productivity and, ultimately, the overall economic development of a country. Sala-i-Martin states that poor health is the cause and consequence of poverty. He calls this phenomenon the "poverty trap". Specifically, unhealthy persons have less productive bodies in terms of strength and height, and on the other hand such persons cannot concentrate properly and therefore have smaller brain capacity (Sala-i-Martin, 2006, p. 100). It is possible to find numerous examples in support of the argument that health increases worker productivity. For example, the British entrepreneur and social reformer Robert Owen (1771–1858) introduced new rules and mechanisms to increase worker productivity in his cotton factory in New Lanark, Scotland. Owen was a member of a Board of Health which dealt with improving health and treating people living in industrialized cities, and he was trying to implement the Board's conclusions in his own factory. To increase productivity, he introduced strict hygiene standards and taught workers and their children the importance of cleanliness. Owen established a hygiene inspection team, the "bug hunters," who made regular visits to workers' homes. In addition, the workers in his factory worked fewer hours per day than those in other cotton factories. As a result of these activities, Owen cited an increase in productivity and profits (Fimpel, 2007, p. 14). Papers published by Schultz in 1999 and 2000 and papers published by Bloom three years later also showed that, at macro level, there is a positive correlation between health and productivity of workers (Chawla, 2007). On the other hand, education also has an impact on productivity. Specifically, less educated persons are less responsible and less independent, cannot perform demanding jobs and are therefore less productive. They are often less mobile and flexible in terms of dealing with new challenges. The last interdependence we will be dealing with here is the dependence of health and education on productivity. Specifically, higher productivity leads to higher and more efficient production, which in turn gives the worker more time that he or she can invest in health and education. In addition, higher labor efficiency also means that the education and health sectors work more efficiently, and based on this the level of education and health of the population will ultimately be at a higher level.

4   CORRELATION BETWEEN HEALTH INDICATORS, LIFE STYLES AND HEALTH EXPENDITURE AND THE AMOUNT OF GDP

How much the health of population will contribute to improved performance of companies and ultimately economic development depends on the development of all three principal components of health - biological, psychological and social - and their interaction. Here we do not think only of the health care industry that aims to prevent health conditions (although it is important), but also of prevention and a healthy life style that will result in a healthier and, by consequence, more productive population.

Numerous studies conducted over the past twenty-odd years have shown that between health and economic growth and development there is mutual causality. In 1996, Barro conducted a study to isolate the most important factors that determine economic growth in a country. Overall health status of the population as measured by the logarithm of life expectancy at birth (LEB) showed a significant positive effect on growth. The coefficient he obtained, all other things being equal, implies that an increase in life expectancy by forty percent (from 50 to 70 years of age) results in an increase in the growth rate by 1.4% per annum. A similar result is obtained if we take as the indicators of health of the population child mortality rate, adult mortality rate or life expectancy at age 5. It is very important to note here that health also shows a significant impact on economic growth if we include the impact of education and GDP into the regression (Barro, 1996, p. 14).

Enterprise in Turbulent Environment

A study by Barghava 2001 showed a positive impact of health on economic growth in developing countries, while the impact in developed countries was negative. On the otherhand,in countrieswithhigh standards in health care andeducation, investments in health are not less important because the longer life expectancy increases the incentive to invest in human capital and individuals replace today's consumption with investments in health and education because this will ultimately lead to higher returns and higher future consumption (Fimpel, 2007, p. 17).

Doppelhofer, Miller and Sala-i-Martin (2004) included in their regression analysis more than twenty factors that may have an impact on economic growth. Their analysis has shown that health is the most important component of human capital in terms of impact on economic growth. They took as health indicators life expectancy at birth, malaria prevalence and the share of tropical regions in the total area of the country (Doppelhofer, Miller and Sala-i-Martin, 2004, p. 826).

Several studies conducted in different periods have shown that there is a measurable, positive and significant correlation between life expectancy and economic growth. For instance, the indicator of life expectancy at birth in the US increased from 42.5 years of age estimated in 1890 to 79 years of age as indicated bythe most recent data of the World Health Organization. Weil (2005) used data on average age, height and average life expectancy of males to study the impact of health on economic growth and he found that there was an impact of health on economic growth, but this impact was significantly lower than in other estimates. In addition to this obvious relationship, a World Bank study also showed a strong correlation between aggregate indicators of population health and the amount of per-capita income. As an example of this correlation, we can take the number of child deaths before age five. Overall, in 2002 there were 120 deaths per 1000 children in low-income countries, 37 deaths in middle-income countries, while in high-income countries there were 7 deaths per 1000 children. In addition to increasing workers' productivity, population health has an impact on economic development through an increase in the number of able-bodied population and through a reduction in direct and indirect costs of treatment. It is also possible to measure economic effects of different diseases. For instance, McDonald and Roberts concluded that a 1% increase in HIV prevalence in Africa results in a 1% reduction in per capita income (McDonald and Roberts, 2006, p. 241).

4.1 Analysis of the impact of indicators of population health, life styles and health expenditure on the level of GDP in selected European countries

As shown previously in this paper, the impact of health as a principal component of human capital on the level GDP can be measured in a number of ways. In this section of the paper we will show the impact of the level of health expenditure and the indicators of population health (we will use data on on life expectancy and mortality from cardiovascular disease) and life styles (alcohol consumption) on the level of GDP in European countries. For ease of analysis, we have divided the European countries into four groups. The first two groups are the EU15 countries (France, Germany, Italy, Belgium, the Netherlands, Luxembourg, United Kingdom, Denmark, Ireland, Greece, Spain, Portugal, Finland, Austria and Sweden) and EU12 (Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovakia, Slovenia, Malta, Cyprus, Romania and Bulgaria), while the third group includes Croatia, Montenegro, Iceland, Turkey and Serbia, which are called EU candidate countries in this paper. Because Bosnia and Herzegovina does not have the status of a candidate country, we have included Serbia in the

analysis, which is also a potential candidate for EU membership. Health care expenditure trends have been analyzed for the three groups of countries and for Bosnia and Herzegovina.

Chart 1 shows the trend of GDP per capita expressed in PPP$. As expected, the EU15 countries have the highest values of real GDP per capita, followed by new member states and finally candidate countries. Bosnia and Herzegovina has the lowest value of GDP. These differences among the groups of countries are more or less the same over the years.
Chart 1: GDP per capita PPP$, groups of countries

One of the indicators of population health is life expectancy at age 65. As shown in Chart 2, the highest values for this indicator were recorded in the oldest EU member states and the lowest in the new EU member states. Improved health of the population is also indicated by a reduction in mortality rates from cardiovascular disease. Chart 3 presents mortality from cardiovascular disease. This chart shows that the highest number of deaths from cardiovascular disease per 100,000 population is in the new EU member states and the lowest number is in the old EU member states. The mortality rates decrease in all four groups, while the differences remain more or less stable.
Chart 2: Life expectancy at age 65, groups of countries

Enterprise in Turbulent Environment

CV DISEASE
Chart 3: Mortality from cardiovascular disease

Another factor that affects health characteristics of a population, affecting thereby economic development, is life style. We can see in Chart 4 that the highest alcohol consumption for all years is in the EU15 countries, and the lowest in EU candidate countries. However, at the end of the defined period, these differences disappear.
Chart 4: Alcohol consumption in liters

Health expenditure rises along with the improvement of population health. Chart 5 shows the trend of health expenditure per capita in selected countries. Of all the listed countries, health expenditure per capita is highest in the EU15 countries. After showing trends in the observed variables, we will now show the correlation between these variables and the level of GDP per capita. Chart 6 displays a positive correlation between life expectancy at age 65 and the level of GDP per capita. On the other hand, in Chart 7 we can see a negative correlation between mortality rates from cardiovascular disease and the GDP per capita. If we look at the variable of alcohol consumption per capita, we can conclude that there is no unambiguous trend of correlation between this variable and the level of GDP (see Chart 8). On the other hand, we can notice a positive correlation between the level of health expenditure per capita and the level of GDP per capita (Chart 9).

Chart 7: Correlation between mortality from cardiovascular disease and GDP p.c
Chart 8: Correlation between alcohol consumption and GDP
Chart 9: Correlation between health expenditure per capita and GDP per capita

5 CONCLUSION

Health can be defined in various ways within economic sciences. In addition to being treated as a public good and being held as one of man's most precious assets, investment in health also has all the qualities necessary to treat it as capital. In this respect, it is important to note that, along with education, health is considered a vital component of human capital, with a series of similarities and differences as well as interdependencies between education and health. Numerous studies conducted over the past twenty-odd years have shown that between health and economic growth and development there is mutual causality. Having reviewed some previous studies in this paper, we have used as an example selected European countries to show trends in the growth of GDP per capita and selected variables associated with population health, life styles and amounts of health expenditure per capita. As expected, we have concluded that the highest GDP per capita was in the old EU member states. Population health improved in parallel with GDP growth, such that there was an increase in life expectancy at age 65 and a reduction in the number of deaths from cardiovascular disease. Improvement in health indicators is accompanied by a growth in health expenditure. After analyzing trends in these variables, in this paper we also analyzed the correlation between the variables and the level of GDP. With respect to life style and its impact on the level of GDP, by using alcohol consumption as a variable we have not managed to show a clear correlation between these two. On the other hand, we have proved the existence of a positive correlation between life expectancy at age 65 and GDP per capita, and between health expenditure per

capita and GDP per capita. In this paper we have also shown that a reduction in the number of deaths from cardiovascular disease is correlated with the growth of GDP per capita, whereby we have confirmed that improvement of health, as an important component of human capital, leads to an increase in GDP per capita.

ABSTRACT
This paper focuses on the adjustment of marketing strategies of Croatian ICT (Information and Communication Technologies) distributors in the process of accession to the European Union. This process has brought about doubts and fear of the unknown. Moreover, the attitudes and opinions in the society are greatly polarised. This paper researches the impact of the deregulation process and the simplification of business processes of foreign ICT distribution companies in the Republic of Croatia. National ICT distributors have planned marketing strategies, which need to be implemented due to the forthcoming changes and with the aim of increasing or maintaining their competitive position. Every company must find its own path in the newly formed circumstances, recognise advantages and emphasize them. The correct perception of the complexity of marketing, the comprehension of the marketing mix elements and their interrelationship can help increase competitiveness of national ICT distributors. This paper also comprises a short overview of the theoretical framework of marketing strategies and puts the topic in context. For the purpose of this paper an online survey is carried out and a questionnaire is sent to 230 electronic addresses. The segment of the observed sector comprises 521 companies (according to International Data Corporation, market research and analysis firm specialized in information technology, telecommunications and consumer technology), and 51 companies take part in the survey, which accounts for 9.79% of the overall target segment of the sector. It should be noted that the total of 521 companies includes foreign companies as well, i.e. companies with capital of foreign origin but they have not been included in the final sample of 51 companies. Research and analysis of data obtained through the survey point towards certain conclusions about business practices of ICT distribution companies, the problems they encounter, their strengths, advantages and ways of adjusting the marketing mix elements as the main guidelines of the adjusted marketing strategies. It is believed that the market and distribution channels are threatened by the increase of foreign competition and market deregulation in the Republic of Croatia.

Keywords: Distributive retail, European Union, ICT, Marketing strategy

1 INTRODUCTION

The process of accession to the European Union has brought about doubts and fear of the unknown while the attitudes as well as the relationships are greatly polarized. The aim of this paper is to research the impact of the deregulation process and the simplification of doing

business of foreign ICT distribution companies in the Republic of Croatia. As a consequence of deregulation and the opening of the market a large number of foreign companies will set up their operations in Croatia. Market expansion and competition will have beneficial effects for the consumers. A large number of companies in the classical retail business, i.e. businesses that add the smallest value to the product will find themselves in the most difficult position. The main problem is whether these companies will manage to stay competitive on the open European market and to what extent they will have to adapt their marketing strategies.

Croatian national ICT distributers possess certain advantages and strengths such as distribution skills, marketing and managerial knowledge of large domestic distributors (IDC, 2011). A large advantage is the knowledge of local and regional markets, customs, threats and specifics of distribution channels. The new act on the obligatory payment within 60 days (NN 125/11) should make doing business in Croatia easier for all companies. There are certain doubts about the implementation of the law, which is a general issue when it comes to the Croatian legislation. The general impression is that there is a somewhat weaker negotiating position in relation to foreign distributors caused by a relatively small size of most local distributors and the market itself. In the past years a trend of mergers and takeovers has been noticed but there has been a large number of companies prepared to be taken over due to unfavourable market conditions. Croatia, despite its excellent geographical position, has not managed to attract a larger number of foreign companies as a foothold for further expansion. A justifiable argument could be that Croatia is a relatively small market and as such is not particularly interesting, however a common market tends to merge spontaneously and it is inevitable that the European Union market will assimilate the Croatian market.

2   DEVELOPING MARKETING STRATEGIES

Marketing strategies are defined as long-term sales and profit goals and the marketing mix strategy over time (Kotler and Keller, 2008).

Out of the five competitive concepts of marketing management, nowadays less used are the concepts of production, product and sales and more attention is devoted to the integrated marketing concept and the concept of holistic marketing. This conceptual evolution is the consequence of hyper-production and hyper-competition where the main need for the product can be satisfied quickly and from many sources.

Marketing strategy is an opportunity for all stakeholders to realize long-term marketing goals on the target market as well as opportunities for their realization with the provision of necessary recourses (Allenby, 2006). The formula "segmentation, targeting, positioning (STP)" is the essence of strategic marketing (Kotler, 2008). Segmentation is important in order to determine the targeted market segment and to adjust the elements of the marketing mix depending on preferences. Based on the customer preferences and the adjustments of the marketing mix, the product is positioned to satisfy the perception of the segmented consumer. Segmentation is an extremely important step in the optimal allocation of resources to the target consumers in order to achieve good product positioning and choice. Positioning is done based on competitive advantages important to the segmented market and it can be achieved by the company (Previšić, 2004). After determining the value, the organizations are ready to deliver it to the market by determining specific product characteristics, price and distribution. The message about value is sent through promotion, i.e. communication mix and thus positioning the product as it is shown in Figure 1.

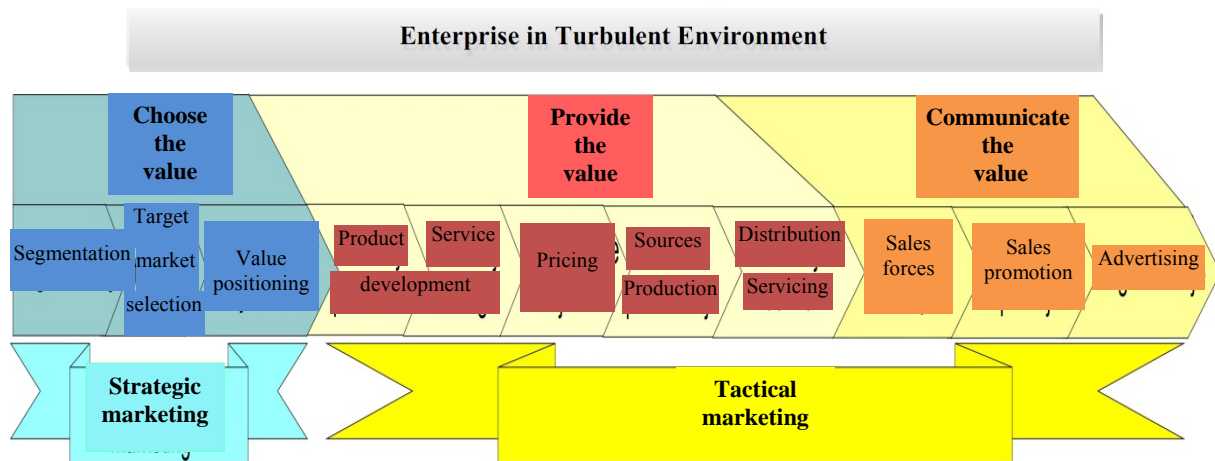
Enterprise in Turbulent Environment


Figure 1: Value creation and delivery sequence (Kotler and Keller, 2008, p. 36)

For instance, when introducing new products marketing strategies are developed in three parts. The first part describes the size, structure and behaviour of the target market, positioning and the desired goals regarding sales, market share and profit over the course of the first few years. The second part of the plan drafts the planned price, distribution strategy and marketing budget for the first year. The third part of the plan deals with long-term sales and profit goals and the marketing mix strategy over a period of time. The marketing strategy, or its adjustment to the changeable market conditions, is of the key importance for the existing products, their survival on the market and their development.

3 DESCRIPTION, OVERVIEW AND INTERPRETATION OF RESEARCH RESULTS

3.1 Description of the conducted research
Research of marketing strategies of Croatian ICT distributers in accession process to the EU has been carried out in the experimental part of this work.

A survey method of research for collecting the necessary data was chosen after setting the objectives and hypotheses of research.

The survey was carried out in June 2012. A questionnaire was sent by email to 230 email addresses from a server on which the survey was posted. The observed sector segment comprised 521 subjects (IDC, 2011) while 51 responded to the questionnaire, which accounts for 9.79% of the total targeted sector segment. It is important to point out that the total number of 521 subjects included foreign companies, i.e. foreign capital as well. After checking 51 surveyed companies in the *poslovna.hr* database it was established that all of them were of domestic ownership and capital. The research results have shown several interesting cognitions while the surveyed companies are all established businesses, 58.8% of which have been in business between 11 and 20 years. The research has shown that the largest number of companies, 49% of them, employ up to 5 people, and the companies that have been present on the market from 11 to 20 years employ the largest number of people.

3.2 Overview and interpretation of research results
Companies participating in the survey had five possible answers to the question how familiar and well informed they are about the alignment of the Croatian legislation with the legislation of the EU. As can be seen in the graph in Chart 1, ten companies responded that they have not focused on the change in the legal environment and they are not familiar with it, which

accounts for 19.6% of the surveyed companies. Only two companies are regularly and informed in detail, which is an extremely small number regarding the possible impact. It can be concluded that the companies, according their own estimate, are not informed. 35% of the surveyed companies are informed occasionally and according to the need, which is the same number as the only superficially informed companies.

How well informed are you about the alignment of the Croatian legislation with the legislation of the EU?

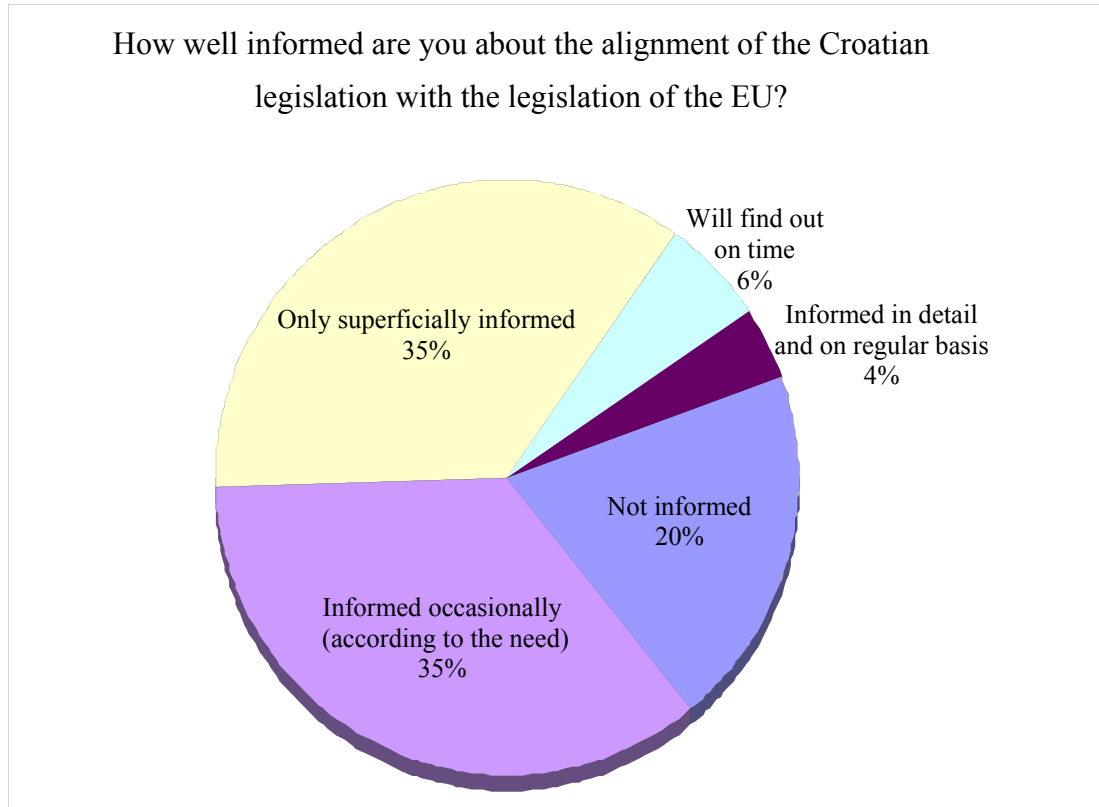
- Will find out on time 6%
- Informed in detail and on regular basis 4%
- Not informed 20%
- Informed occasionally (according to the need) 35%
- Only superficially informed 35%


Chart 1: Knowledge of legislation alignment process

Taking the future and the necessary investments into consideration in order to retain or increase their competitiveness in the EU, domestic ICT distributors will have to invest in all the elements of the marketing mix (Chart 2). The companies plan to make the largest investments in products, i.e. services in order to stay competitive. 39.2% of companies plan an aggressive promotion approach, 37.3% believe they will have to invest in price competitiveness. Investments in distributive channels are planned by 23.5% of the surveyed companies.

Enterprise in Turbulent Environment

In order to increase or retain competitiveness in the EU
your company will invest most in…
Chart 2: Marketing mix investment plan

According to the core activity retailing, provision of services and wholesaling consider investing in products/services to be the priority (Chart 3). Companies with distribution as their core activity believe that the priority investments are in distribution channels, which means investing in retaining present customers but opening new channels as well. Retail companies that focus on the end user consider investing in promotional activities a bigger priority than investing in price competitiveness. The smallest number, four companies, see investing in distribution channels as a priority in order to retain competitive position.

Enterprise in Turbulent Environment

Activity	Distribution	Retail	Provision of services	Wholesale
■ Promotion	0	13	5	2
■ Product/service	2	17	11	5
□ Price competitiveness	2	10	5	2
■ Distribution channels	3	4	2	3
Chart 3: Future investment plan according to the core activity

According to distribution channels the companies believe they will mostly need to invest in product/service (Chart 4). The exception are companies whose primary channels are large retail chains. Such companies believe that investing in price competitiveness is their priority. Companies whose primary distribution channels are specialized chains will be equally investing in product/service, promotional activities and their distribution channels and somewhat less in price competitiveness.

Distribution channel	B2B	e-retail	Own retail	Less specialized channels	Specialized channels	Large retail
Distribution channels	7	7	7	8	4	4
Price competitiveness	3	9	15	8	3	5
Product/service	9	14	27	11	4	4
Promotion	4	7	18	9	4	4
Chart 4: Future investment plan according to distribution channels

Previously stated is clearly shown in Chart 4, according to the distribution channels.

4 CONCLUSION

Croatian ICT distributors are faced with the environment marked by a high degree of dynamics and instabilities as the consequence of various external conditions of doing business and over which the companies have practically no influence. Therefore, it is necessary for the companies to adjust to these changes and market turbulences with the aim of not only surviving but ensuring a successful future development as well.

Through the research and analysis of data obtained from the survey certain conclusions can be drawn about the ways ICT distribution companies do business, the problems they encounter, their strengths, advantages etc. The surveyed companies think that the market and distributive channels are threatened by the growing foreign competition and deregulation on the Croatian market.

In the accession process to the EU and the growing competition, the price competition is increasing and consequently, the need to invest in promotion is perceived as a necessity.

The companies are aware of the situation that the prices and profit margins are being brought down while at the same time there is a growing need to invest in promotion and all the elements of the communication mix and therefore, the need of redefining marketing strategies.

Marketing strategies and the relations between the basic elements of the marketing mix in the analysed process and the present position of the Croatian national ICT distributors form the

basis for staying competitive and their survival on the market. Only a proactive holistic approach to marketing and the elements of the mix can ensure competitiveness. There isn't a unique solution and every company has to find their own approach in the newly formed circumstances – recognize the advantages and strengths and put them to good use.

THE EFFECTIVENESS OF THAILAND'S SEVEN GREENS INITIATIVE ON TOURISM: A CASE STUDY OF NAN PROVINCE

Rossawan Ponluksanapimol
The University of Tokyo, Japan
rossawan@gmail.com

ABSTRACT

This research examines tourism in Nan Province of Thailand under the framework of the Seven Greens initiative launched by Tourism Authority of Thailand, of which the objectives are to prepare Nan as a tourist destination without adversely affecting the area. The aim of this research is to evaluate the effectiveness of this initiative and review the status of green tourism in Nan, a living ancient city rich in tourism resources, but not yet a well-known tourist destination. The hypotheses were that the government's program is not impactful enough in persuading tourism stakeholders to reduce their activities' impact on the environment and that there is a lack of awareness and knowledge among tourism providers and tourists. The research relied on data collected from published materials, publications of the Thai government, the site visit, surveys and interviews with relevant stakeholders. One main finding was that Nan has yet to reach its optimum sustainability level, based on the standards of the "Seven Greens" concept, which requires behavioral implications and operational participation. The results have shown involvement among tourism service providers, the local government and the local community to be inadequate and unbalanced. Moreover, the findings made an important contribution in four areas yet to reach the required level and needing to be improved, namely, infrastructure, legal framework, human resources, and people's contributive actions. It is evident that despite the people's awareness and determination, the message of the "Seven Greens" and the government's advisories were not conveyed as effectively and were not as impactful as could have been the case. Efforts to strengthen community and personal awareness and persuade more people to adopt these concepts are still needed to enhance sustainability and to set an excellent role model for other cities in the world.

Keywords: Ecotourism, Nan, Nan tourism, Seven Greens, Sustainable Tourism, Thailand Tourism, Tourism, Tourism development

1 INTRODUCTION

Modern tourism have traditionally aimed at meeting tourists' desires to experience different natural attractions, man-made attractions and cultural exploration. Such activities traditionally exert considerable pressure on the natural and cultural resources, which must therefore be maintained and protected against decay. While tourist activities have contributed to the urbanization of many natural areas and the development of many indigenous societies in the country, this has recently been seen as a threat since many of those natural areas are being harmed far beyond repair and the cultures are being altered if not already decayed. Thailand is considered among the world's top tourism destinations, due to the rich nature it has to offer to global tourists. The tourism industry in Thailand creates a major income resource for the nation and also attracts development in other fields such as transportation, trade, and other businesses. At the same time, the Thai public and the government have been increasingly aware in recent years of the adverse impact of tourism on their cultures and natural resources. Accordingly, many initiatives sponsored by the government and private advocates are currently active to support the enhancement and development of green tourism in Thailand. In

2008, the Tourism Authority of Thailand (TAT) launched the "Thai Tourism against Global Warming" Environment Conservation Declaration Project to alert the relevant parties more closely to environmental issues. Under the Environmental Conservation Declaration, the Seven Greens concept has been determined as a guideline for a conservation effort and greenhouse gas reduction for all relevant parties.

2 THE SEVEN GREENS INITIATIVE BY TOURISM AUTHORITY OF THAILAND

The Seven Greens initiative is an example of the efforts made by the Thai government to enhance sustainability in tourism and is described by the figure below:

Figure 1: Poster about the Seven Greens Initiative
(Tourism Authority of Thailand, 2011)[1]

The Seven Greens concept was developed around tourism elements in 2009 and has behavioral implications and an operational framework or guidelines towards environment preservation and greenhouse gas reduction for different parties in different sectors as follows:

1) Green Heart
Those involved in every sector of the tourism industry must have appropriate attitudes, feelings, thoughts, perception and awareness concerning the value of the environment. They should also act to preserve and restore the environment as well as reducing greenhouse gases with proper knowledge, understanding and methods.

---

[1] English translation of the motto at the centre of the poster: "Enjoy Traveling, Care for the Environment".

Enterprise in Turbulent Environment

2) Green Logistics
The means of journeying and taking public transportation services for tourism from tourists' homes to tourist attractions must be either energy-saving or involve the usage of alternative energy to reduce greenhouse gases and preserve the environment.

3) Green Attractions/Destinations
Tourist attractions must be managed according to the sustainable development policy framework and implementation, and must have clearly committed to environmental preservation as well as reducing greenhouse gases with appropriate means.

4) Green Communities
Community tourist attractions must have integrated tourism management sustainably in both urban and rural areas. They must include implementation that focuses on environmental conservation, particularly the preservation of communities' unique culture and ways of life.

5) Green Activities
Tourism activities are in line and in harmony with the value of tourist destinations' resources and environment. They are entertaining or fun, while also giving tourists the opportunity to learn new experiences in a way that minimizes any adverse impact on natural resources and the environment.

6) Green Service
The servicing styles of tourism service providers impress tourists with consistent quality together with a determination to preserve the environment and reduce greenhouse gases in their services.

7) Green Plus
Individuals, groups and organizations agree to cooperate in contributing their physical energy, ideas, and funds to conserve and restore tourist attractions' environments, or in mitigating the threat of global warming.

According to TAT, the Seven Greens initiative call for the active participation and support of all tourism stakeholders in order to maintain the balance between tourism promotion and environmental protection to ensure long-term sustainability.

3   TOURISM IN NAN PROVINCE
Nan is one of the two pilot projects for the Seven Greens initiative, Samui Green Island Project and Nan Province Project. There is growing interest in Nan as it is regarded as an ancient but a living city (under its motto "Nan, Living Old Town") and is rich in natural and cultural resources. It is also considered a very safe tourist destination and is very well suited as a tourist destination for tourists from all places. Based on an interview with Nan Tourist Police in August 2012, the crime rate for tourists as of then stood at 0%.

Enterprise in Turbulent Environment

Figure 2: Nan Tourist Map (Tourism Authority of Thailand, 2011)

Nan covers an area of 11,472.072 square kilometres and is located 668 kilometres from the capital city of Bangkok. It is a town with an abundance and mixture of cultures from the high mountain ranges to the plain. It was as ancient as the Sukhothai Kingdom and was under the continuous ruling of 64 kings. The northern and eastern boundaries are shared with Lao People's Democratic Republic.

There are numerous tourist attractions in Nan, including temples, caves, national parks, mountains, villages, waterfalls, natural formations, fairs, festivals and the famous boat race. Despite its richness in tourism resources, the city is not yet a well-developed tourist destination. As a result, provincial authorities and its local people are working to ensure that appropriate measures and controls are put in place to protect the province from the negative effects caused by growing tourism activities. Despite these efforts, some are still unwilling to see more tourists in the city as they are concerned about these impacts and possible management failure by the local government.

A tourist survey conducted by Nan Statistics Bureau between December 2010 and September 2011 showed that 79.0% wanted to return to Nan the following year, 19.2% intended to return soon, and 1.8% said they would not return. The reasons were dissatisfaction with services such as restaurants and cafes that exploited the holiday season, while other negative factors included insufficient hotel services, hotel conditions that differed from those specified at the time of booking, and insufficient public toilets for ladies in the national parks.

Based on the survey, the number of tourists on a monthly average from December 2010 to September 2011 was 57,920, of which 99% were Thais and 1% was foreigners. The numbers each month have been fluctuating, partly due to political unrest throughout the year as well as a major flood in Nan in June 2011. Subsequently, the number of tourists rose again and is expected to peak every December, the holiday season. Regardless of the externalities, it can be observed that the number of tourists is generally low in non-winter seasons, which indicates that the city is reliant on seasonality and that tourism in this city has yet to reach its optimum sustainability.

Table 1: The number of tourists in Nan by month between December 2010 and September 2011 (Nan Statistics Bureau, 2011)

Month and Year	All Tourists Total	Thais	Foreigners
December 2010	143,618	142,187	1,431
January 2011	86,670	85,942	728
February 2011	56,116	55,361	755
March 2011	32,799	32,578	221
April 2011	71,986	71,645	341
May 2011	24,288	24,174	114
June 2011	13,653	13,516	137
July 2011	18,399	18,282	116
August 2011	35,328	34,619	708
September 2011	96,349	95,258	1,091
Total	**579,206**	**573,563**	**5,642**

4 THE EFFECTIVENESS OF THE SEVEN GREENS INITIATIVE IN NAN PROVINCE

In May 2011, the author conducted a survey in Nan, in which a total of 46 individuals and 31 tourism service providers participated.

20% of the individual respondents went to Nan because they saw the advertisement of TAT's Seven Greens. The remaining 80% had been recommended by their friends or received information about Nan from the newspaper or magazines. This figure indicates that few tourists have traveled to Nan under the influence of the Seven Greens project.

4.1 Marketing Effectiveness of the Seven Greens Initiative

When the individual respondents were asked if they had heard of the "Seven Greens" initiative, 52% answered "No", while 35% said "Yes". It is also interesting to note that although Nan is being promoted as a tourist destination under the Seven Greens concept, 90% of its local respondents had not heard of the initiative. This data suggests that the Seven Greens concept has not been effectively conveyed to tourists and the local community. Conversely, 52% of the tourism service providers had heard of it, which suggests that the marketing campaigns were more geared toward the service providers. When the respondents were asked if they were aware of the importance of protecting the environment while traveling in Nan more than 90% of both individuals and business respondents responded in the affirmative, which suggests high awareness among tourism stakeholders, regardless of the 7 Greens initiative. However, when the tourism service providers were asked whether they

were conducting their business according to the initiative or not, 57% said "Yes", 39% did not know, and 4% said "No". It implies that regular assessment measuring the effectiveness and feasibility of the launched initiative may not have been performed, since 39% of tourism providers were not aware of whether or not they were conducting their businesses in line with the scheme, while 21% did not consider it effective or feasible. The reasons are listed as follows:

1) High costs associated with such initiatives,
2) Tourists' demand for luxury required during tours,
3) No clear governmental guidelines on how to comply with the Seven Greens initiative.

Table 2: The percentage of respondents answering to four questions related to the Seven Greens initiative (Ponluksanapimol, 2011)

Questions	Tourism Service Providers			Individual Respondents (tourists and local people)			Remarks
	Yes	No	Don't know	Yes	No	No answer	
Have you heard of the 7-Greens initiative?	52%	48%	-	35%	52%	13%	90% of local people said "No"
Are you aware of the importance of protecting the environment while conducting tourism activities in Nan?	94%	0%	-	91%	-	4%	6% of tourism service providers and 5% of individual respondents were neutral.
Are you conducting your business according to the initiative?	57%	4%	39%				
Is the 7-Greens initiative easy to comply with ?	46%	21%	32%				

This clearly demonstrates the need for increased awareness among individuals on the importance of the Seven Greens elements. Additionally, it reflects the lack of governmental planning and support via relevant legal frameworks. Ensuring such legal framework will help facilitate implementation and force businesses to incorporate sustainability into their business models rather than viewing it as an additional cost.

Enterprise in Turbulent Environment

4.2   Awareness of Environmental Protection

When the respondents were asked if they were aware of the importance of protecting the environment while traveling in Nan, more than 90% of both individuals and business respondents responded in the affirmative, which suggests high awareness among tourism stakeholders, regardless of the Seven Greens initiative.

4.3   Performance of Each Seven Greens Element

The overall performance of the Seven Greens initiative in Nan is measured based on the responses from the questionnaire. Note that tourists and local people were not evaluated on "Green Community", "Green Attractions" and "Green Service".
Chart 1: Overall performance of Seven Greens by individual respondents and tourism service providers (Ponluksanapimol, 2011)

It is revealed here that the least successful "Greens" for individual people were Green Logistics and Green Plus while tourism service providers found it difficult to meet the expectations of the Green Logistics, Green Community, and Green Service initiatives.

It is therefore clear that additional support for Green Logistics, efforts to encourage the provision of Green Services and to improve community awareness of the importance of sustainability are necessary in order for Nan to grow into a fully sustainable tourist destination.

In Chart 1 and 2, a score out of 100 was given to each respondent on each relevant "Seven Greens" aspect based on their responses. The average was then taken to form an analysis and is illustrated in the charts below.

Enterprise in Turbulent Environment

Behavior Score (%)	Overall	Locals	All Tourists	Eco-tourists	Temple-tourists	Other-tourists
■ Green Heart	96.0	100.0	94.9	100.0	93.8	95.4
▢ Green Activity	86.9	80.0	89.1	100.0	78.6	84.6
■ Green Logistics	31.3	22.2	33.9	37.5	41.7	26.0
■ Green Plus	28.3	27.0	28.8	26.5	27.1	29.0

Chart 2: Overall performance of each Seven Greens element taken from individual respondents (Ponluksanapimol, 2011)

In Chart 2, note that Green Community, Green Attractions, and Green Service are excluded from this analysis as individual respondents could not be measured for the same. Chart 2 suggests that overall, most tourists and local people have a Green Heart and are engaging in Green Activities. However, Green Logistics and Green Plus are the two aspects that are often ignored and for which improvement and added support are therefore required. Another point is that the average score for Green Plus was the lowest among eco-tourists compared with other types of tourists. This indicates that eco-tourists are not contributing so sufficiently as expected to the environment and communities that they visit and that a Green Plus concept should be emphasized to tourists in the ecotourism areas.

The next analysis was performed by analyzing the answers of respondents who were tourism service providers. A score out of 100 was given to each respondent on each relevant "Seven Greens" aspect based on their answers. The average was then taken to form an analysis as illustrated in Chart 3.

Enterprise in Turbulent Environment

|	Overall	Tour Operators	Temples	Shops	Restaurants	Hotels
■ Green Heart	98.4	100.0	100.0	100.0	95.8	100.0
■ Green Activity	50.0	50.0	0.0	0.0	0.0	0.0
■ Green Attraction	48.0	0.0	48.0	0.0	0.0	0.0
■ Green Plus	45.5	68.8	25.0	40.6	47.5	12.5
■ Green Service	43.1	87.5	0.0	37.3	48.7	21.5
▫ Green Community	41.1	68.8	25	40.6	39.6	8.3
■ Green Logistics	18.7	33.3	28.9	10.7	20.0	8.3
Chart 3: Overall performance of each Seven Greens element taken from tourism service providers (Ponluksanapimol, 2011)

Chart 3 suggests that for tourism service providers, Green Logistics, Green Service, and Green Community are the top 3 aspects requiring improvement.

Tour operators still encourage their customers to use planes and chartered vans as a means of transportation to and within Nan. One reason is that there are no railways to Nan and no convenient public transport for tourists, hence the need for governmental support in creating a more effective logistics system. This contradicts with the idea of Green Logistics and Green Service.

In terms of Green Community, tourism service providers are not seen to be taking the lead in extending the concept of sustainability to the local community. Local tourism service providers should contribute to leveraging the community's capability in sustaining Nan's tourism and participate in sharing information with the local community. They should also contribute to the environment by using a more energy efficient logistics and devise new services that are friendlier to the environment and community in order to add value to the latter.

It is also interesting to note here that the tourist attraction operators who responded to the questionnaire were unaware of the Seven Greens concept whereas all tour operating companies knew about it. More effective marketing and training strategies must be implemented so that all the relevant providers are well informed.

5 CONCLUSION
It is apparent that although the tourists and residents of Nan are aware of and determined to save energy to conserve the environment and sustain Nan's tourism, the message of the "Seven Greens" and the government's advisories were not conveyed as effectively as could have been the case. Efforts to strengthen community and personal awareness and persuade more people to adopt these concepts are still needed. Despite the research results showing the genuine interest of the Thai government in promoting green tourism among tourists, the local

community and tourism service providers in Nan Province, its initiative was not very effective. Infrastructure, legal framework, human resources, and personal contributions are the four areas with room for improvement in Nan.

Furthermore, individuals, groups and organizations must agree to contribute their physical energy and contribute more ideas and investment to conserve Nan more actively and efficiently. The emphasis on knowledge and implementation among local people and tourists must be enhanced in order to encourage concrete actions and physical contributions to sustain tourism. Currently, although individuals are well aware of the significance of sustainability, they lack sufficient governmental support or social guidelines to fully turn these intangible concepts into action and incorporate them into their daily lifestyles.

The key is to ensure a policy to promote and manage sustainable tourism is further reinforced. The following were identified as obstacles to the development of sustainable tourism in Nan Province:

1) The lack of an effective mechanism for monitoring and implementing sustainable tourism
2) The lack of an adequate legal framework to support the implementation of sustainable tourism
3) The lack of investment in infrastructure projects that can reduce environmental impacts associated with tourism-related activities (for example, transportation infrastructure)
4) The lack of contributive actions from different parties on elements of sustainable tourism and how each of them contributes to the overall performance of sustainable tourism
5) The government must also include domestic tourism in its plans rather than focusing on supporting foreign tourists. This will promote implementation and behavioral awareness among Thai people, which can be expanded to other Thai provinces.
6) The lack of human resources in tourist areas, including hotels and attractions.

It is believed that tourism in Nan still has positive outlook if these problems are addressed and if all stakeholders take part more actively. Nan could become a model city for sustainable tourism. To achieve that, a more extensive research is being conducted and more samples are being collected to grasp a better understanding of the tourism situation in Nan.

THE PROSPECTS OF INTERNATIONAL ACQUISITIONS IN CAR INDUSTRY DURING THE GLOBAL ECONOMIC CRISIS - THE CASE OF GEELY VOLVO

Branko Rakita
University of Belgrade, Faculty of Economics, Serbia
brakita@sbb.rs

Dusan Markovic

dusanm@ekof.bg.ac.rs

ABSTRACT

Significant technological, social and economic changes on the global level marked the beginning of the 21st century. Growing importance of Chinese economy stands out as one of the most important among these changes. Accelerated economic development of China was first based on FDI inflow and the export of low-cost less technology intensive products. However, a gradual alternation to Chinese economic policy and the growth of outward FDI followed by a global breakthrough of some Chinese companies operating in technology intensive industries (Huawei, Lenovo, Mindrey, Haier etc.) has been marked in the past few years. Further economic development of China will to a large depend on the positioning of Chinese car manufacturers. In this paper the stress will be put on high technology intensity in car industry, on its global character, high concentration within the industry and on market saturation in developed countries due to global economic crises. Basic characteristics of automotive industry and its development will be considered regarding prolonged economic crisis. Current local character of Chinese car manufacturers and its going global prospects will be observed. In order to become global players Chinese car manufacturers could implement the acquisition strategy of some key competitor from developed countries. Chinese car companies aimed at relatively small targets in the previous period because they were inexperienced in acquisitions and restructuring management and tended to decrease risks. The last and the most important is the acquisition of Swedish Volvo by Chinese Geely. These are the companies significantly differing in the level of technology, corporate and national culture, brand perception and geographic orientation of business operations. Potential risks that follow these differences as well as potential synergetic effects, supposing that the acquisition process is properly managed, will be considered in the paper.

Keywords: Acquisitions, Auto industry, China, Synergy

1 INTRODUCTION

The globalization process, having been intensified over the last two decades, has had profound impact on the international business environment. One of the most important results of this process is the integration of national economies into global economy. According to some research Chinese economy was the fastest globalized national economy between 1975 and 2000 (Dreher, 2006, pp. 1091−1110). Deregulation of Chinese economy and integration into global economy set the bases for its strong economic growth. Despite the poor starting point, China has become the second world economy for only two decades. China GDP has shot up in the past two decades and was multiplied more than eleven times. Likewise, GDP per capita was multiplied 9.5 times. Some researchers believe that without structural reforms and stimulation of domestic demand China will very soon hit the peak of its economic

growth. Global economic crises and falling demand for Chinese products in their main export markets (i.e. European Union) support these ideas. The World Bank's latest research expects Chinese economy to cool off, but in spite of the slowdown it forecasts strong GDP growth rates, compared with developed economies (World Bank, 2012, p. 81).

China's development in the last two decades has been based on strong FDI[1] inflow, which rose from USD 4 billion to USD 185 billion. Big MNCs[2], usually from developed economies, have used its subsidiaries in China as export-platform FDIs. Strong presence of export-oriented MNCs and deregulation of economic policy have allowed Chinese companies go global. The first wave of the internalization comprised work intensive industries. Nevertheless, in the past few years a number of Chinese companies performing in high technology industries have become global competitors (Lenovo, Huawei, Haier, ZTC, Mindray etc). These companies are still exception rather than the rule, and it seems clear that more players from China will enter the global field in the years to come.

Due to large R&D investments and high market saturation in the global auto industry market, new entrants cannot easily penetrate it. Today's Chinese car industry is not globally competitive, though some companies strive to internationalize their business operations. Several Chinese car companies made international acquisitions to achieve this goal. The last and the most important has been the acquisition of Swedish *Volvo* by Chinese *Geely*. This acquisition is estimated to be very risky due to its size, investor's lack of experience in acquisition management, and the differences between national and corporate culture of the investor and the target.

This paper consists of three parts. The first part offers theoretical explanation of horizontal acquisitions. The motives behind the acquisitions of enterprises operating in the same industry will be examined. The second part of the paper gives a review of the present situation in auto industry and its future prospects. The focus will be on the market position and the future role of Chinese car manufacturers. The third part of this paper offers the analysis of the motives behind *Geely*'s acquisition of *Volvo*, potential benefits and risks involved in it.

2 THE ROLE OF CROSS BORDER ACQUISITIONS IN CONTEMPORARY BUSINESS ENVIRONMENT

Before the global economic crisis international acquisitions recorded constant, though unsteady growth. In this period both the number and the value of international acquisitions increased. In 2007 the value of international acquisitions was more than USD 1,000 billion and they reached the historic peak, while in the next two years they suffered a sudden downturn, and in 2009 their value was USD 250 billion. In 2010 and 2011 an appreciable growth of international acquisitions was recorded, though its value accounted for something more than the half of its historic peak (UNCTAD, 2012, pp. 177−180). The dynamics of international acquisitions varied from industry to industry. Its dynamics in car industry did not entirely correspond to global economic trends.

---

[1] Foreign Direct Investments

[2] Multinational Companies

Table 1: The value of international acquisitions in car industry in million USD (UNCTAD, 2012, p. 185)

	Value of transactions	*Number of transactions*
2005	8.524	78
2006	7.475	84
2007	3.099	86
2008	11.608	95
2009	8.753	74
2010	7.488	84
2011	5.370	87

According to Table 1 international acquisitions in car industry reached its peak exactly in the crisis period. These relatively unexpected trends regarding the global economic trends must be observed through the comparison between pre-crisis and post-crisis structure of the industry. This is to say that a considerably high market concentration in auto industry before the crisis did not leave much room for further acquisitions. Some car manufacturers were, however, severely hit by the crisis and had to seek restructuring through bankruptcy, while the others had to divest some of its operations. Car companies that successfully survived the first wave of the crisis (*Volkswagen and Fiat*) and companies from emerging markets (*Geely*) seized the opportunity stemming from the competitors' unfavorable position and took over some or all of their operations. In the last two decades, in the Fifth Wave mergers and acquisitions, the number of horizontal acquisitions has rapidly increased. In this period companies tended to utilize the positive economic trends in the West as well as deregulation of world economy (Gaughan, 2007, p. 59). The Fifth Wave acquisitions are to a large the consequence of the MNCs' strategies of focusing on the cornerstone of competitive advantage and divest from highly diversified business operations. This applies to car industry too.

In business economics acquisitions have been analyzed from different aspects with the aim of identifying the motives behind them, effects they produce, the causes of success or failure, and how to advance the acquisition process itself. In spite of extensive theoretical and practical researches into this field failure rate of acquisitions remains high. Most analyses show that more than 50% of acquisitions fail and the often quoted research carried out by KPMG shows that on average 53% of acquisitions is value destroying, 30% have no effects on value, and only 13% of acquisitions create value (Kelly, Cook and Spitzer, 1998, p. 2). The most recent research in this field shows that the success rate of acquisitions is much higher if investors from emerging markets acquire targets from developed markets. This is because intangible resources possessed by companies from developed markets complement country specific advantage of emerging markets multinationals (Gubi, Aulaks, Ray, Sarkar and Chittoor, 2009, pp. 397–418).Considering the high failure rate of acquisitions it is necessary to classify them according to their goals: (1) acquisitions by which companies try to advance its business performance without changing the business model (2) acquisitions by which companies try to reinvent their business model (Christensen, Alton, Rising and Waldeck, 2011, pp. 49−57). Through the first type of acquisitions companies try to maintain their strategic position and it is more frequent than the second one. Investors often have high expectations about these acquisitions and the premiums paid for them can be very high. On the other hand, less frequently the goal behind acquisition is to reinvent the existing business model and to create a new strategic position. Acquisitions of targets from developed markets

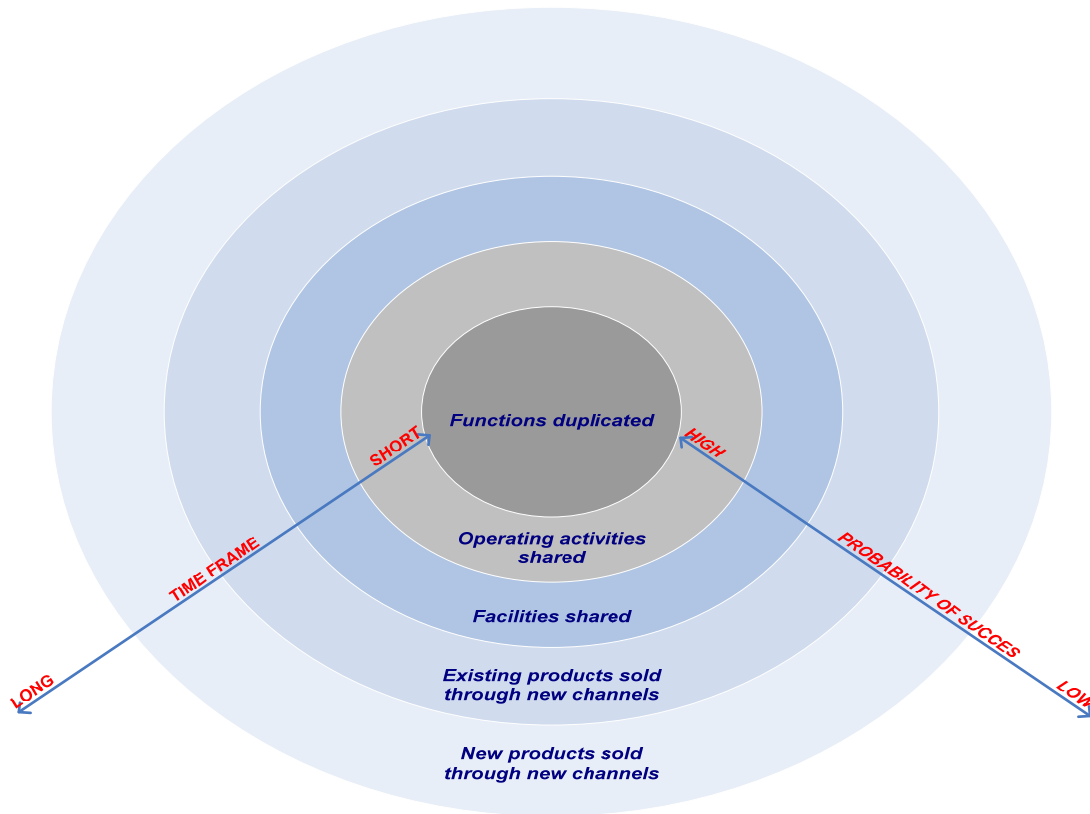
by investors from emerging markets fall under the second type of acquisitions. The motive behind all acquisitions is to achieve synergy. Synergy can be achieved via operational and financial synergy. The effects of operational synergy through acquisition will not be produced equally fast and do not have equal prospects of success (Cullinan, Le Roux and Weddigen, 2004, pp. 97−104). Figure 1 shows operational synergy map that can be represented in the form of concentric circles.


Figure 1: Operational synergy map (Cullinan, Le Roux and Weddigen, 2004, pp. 97–104)

During Due Dilligence process, but also in post-acquisition period, cost reduction is investor's top priority. There are several reasons for this. Cost reductions can be quiet easily identified and quantified, and most often they can be easily achieved in short term. Rapidly achieved considerable cost reduction contributes to so called "early victories". "Early victories" must be promoted among the stakeholders, especially among the investors and creditors (Habeck, Kroger and Tram, 2000, p. 68). Cost reductions especially gain in importance in consolidated industries such as car industry. The main characteristic of consolidated industries is overcapacity. One of the first measures investors in these industries take after acquisition is elimination of surplus capacities. Investors thus eliminate fixed costs, and consequently decrease pressure on prices and increase profit margins (Sudarsanam, 2003, p. 106). This is a one-time cost reduction. These measures concern both production and nonproduction employees and entire production facilities. Acquisitions in car industry often include these measures, primarily closing production facilities in countries with expensive labor force. Elimination of overcapacity is closely related to economy of scale. Economy of scale can be achieved in almost any area starting from R&D, production, distribution channels and advertising. It gains in importance in industries with high fixed costs, such as car industry.

Enterprise in Turbulent Environment

Building competitive advantage only through economies of scale is a high-risk strategy in the world of hypercompetition and constant technology innovations.

Apart from economies of scale, economies of scope can contribute to cost reduction too. Economy of scope is the use of available resources not only in current business operations but also in similar business operations. In auto industry economy of scope can be achieved through usage of a flexible production line. Economy of scope is, however, expected to be the most effective in R&D. Considering that 88% of innovations do not achieve expected investment return, and a large number of them are soon after its implementation successfully imitated by competition, companies tend to apply their innovations in production of as many products as possible. *Honda,* for example, applied internal combustion engine innovations in production of motorcycles, automobiles, but also loan mowers and artificial grass cleaners (Ireland, Hoskisson and Hit, 2009, p. 188). Acquisitions offer new opportunities to achieve economy of scope, though it is quiet hard to identify and quantify them.

In addition to cost reduction, the motive behind many horizontal acquisitions is revenue above the simple sum of investor and target's revenues. In Due Dilligence investors pay little regard to revenue increase opportunities. Revenue-based synergy can be achieved through complementary products, reputation spillover, usage of the existing channels for new products, development of new products and distribution channels etc. Revenue-based operational synergy involves considerable risks, and it can be achieved in the long run (see Figure 1). Revenue-based operational synergy through acquisitions within consolidated industries is extremely hard to achieve. Many companies, therefore, must seek growth opportunities in geographic segments with low market saturation.

Another motive behind horizontal acquisitions can be financial synergy, which contributes to lower cost of capital. If there is not a high level of correlation between the cash flow of investor and target, creditors can perceive the acquisition as an instrument of financial risk management. Possibilities of cash flow diversification are fairly limited because car industry is globalized and the manufacturers face hypercompetition. Cost of capital can, however, be lowered via acquisitions of companies that generate the majority of its cash flow in different markets or by different segments. Case study presented below proves this statement.

Investors sometimes make acquisitions to reinvent their business models. By this investors try to set a new long-term growth basis, and thus advance its competitive position (Christensen, Alton, Rising and Waldeck, 2011, pp. 49−57). These acquisitions are made if investors lack capacities to keep up with technology innovations or beat off severe competition. When investors estimate that the present production portfolio or market portfolio cannot provide for long-term growth, acquisition of a company possessing the lacking resources is necessary. This can mean penetration into new geographic markets, new market segments or launch of an entirely new product. This radical change of the existing business model made through acquisition involves considerable risks. Identification of the resources essential for business model reinvention, that is to say identification of target, is of crucial importance. Integration process, which usually requires changes both in target and investor's organization structure, must be carefully planned and implemented. Evaluation of target via quantification of the effects acquisition brings about is quiet challenging. *Geely's* acquisition of *Volvo* is a typical example of an acquisition made to reinvent investor's business model.

3   THE DEVELOPMENT OF GLOBAL AUTO INDUSTRY AND THE PROSPECTS OF CHINESE COMPANIES

Car manufacturers have been severely affected by the global economic crises, although not equally in all markets. The biggest drop in production happened in the USA. The production of all vehicles down fell from 10,780 thousand in 2007 to 5,709 thousand units in 2009 (OICA, 2012). The falling demand and overcapacity in the industry created huge problems for the "Big three" from Detroit. In June 2009 General Motors filed for bankruptcy protection and the USA government acquired 60% of its shares. In the same year Chrysler filed for bankruptcy protection and after several investments in it, Fiat gradually became major shareholder of the company in July 2011. Ford evaded the bankruptcy but had to restructure business operations and sell some brands and affiliates. The crises very soon overflowed to the other side of the Atlantic and hit European markets. The production of vehicles in Europe dropped from 22,856 thousand in 2007 to 17,009 thousand units in 2009 (OICA, 2012). European new passenger car registration fell by 7.8% to 14,713 thousand units in 2008, recording the sharpest decline since 1993 (ACEA, 2009). The negative trend continued in 2009 and new passenger car registration dropped by 1.6% comparing to previous years, despite significant financial support by governments. The sharp decrease in demand puts a lot of pressure on the companies to sell off business units and lay off workforce.

The crisis has affected the emerging auto markets as well, though to a lesser extent than it struck car manufacturers from developed countries. Car industry experts forecast that the sale in both developing and developed countries will equalize and reach the level of 35 million units. Growing demand in emerging markets has attracted significant investments made by both developed and domestic companies. This increased the production, especially in China. Despite the crises car production increased from 8,886 thousand units in 2007 up to 18,419 thousand units in 2011, which brought China to the very top of the list of global auto producers (OICA, 2012). China owes the lion share of its car production to foreign subsidiaries, although domestic companies have made huge steps forward.

Today's new business environment created global expansion opportunities for Chinese car companies. Overcapacity in the industry, financial problems of some important competitors and global focus on clean energy work in Chinese manufacturers' favor. If China's companies manage to exploit these trends, they will be able to go global and challenge the industry leaders. Consolidation on domestic and global markets is relevant to China's auto industry. The fact that there are about 150 domestic car companies in China made central and regional governments put soft pressure on the companies to consolidate their operations. Consequently, there were two China-China acquisitions on the list of top 10 deals – vehicle manufacturers in 2011, worth more than USD 4.8 billion (PriceWaterHouseCoopers, 2012, p. 14). Car industry overcapacity on the global market is the consequence of falling demand in developed markets and huge improper investments in the pre-crisis period. In the KPMG survey some 41.5% of respondents consider the USA to be overbuilt market, even though the USA manufacturers have reduced capacity in the last four years by more than 1 million vehicles. Respondents believe that overcapacity of German and Japanese markets is between 11% and 20% (KPMG, 2012, p.46). The overcapacity is a precondition for the wave of China's cross border acquisitions in the industry. By acquiring the assets of a distressed but well known international manufacturer, China's auto companies are hoping to significantly accelerate their development and market penetrations (Russo, Tse, Ke and Peng, 2009). The structure of global auto industry in the future will depend on the technology innovation in construction of hybrid or electric cars and their commercialization. The development of green

vehicles and consumers' favorable response to them is important to every country, but most of all to China. Significant progress in this field will help China decrease its dependence on foreign oil, with wobbly prices, and reduce pollution and greenhouse emissions, as some of the main obstacles to its medium term strong growth. According to China's five year plan production of green vehicles is going to be a strategic industry which will receive over USD 15 billion of investments in a bid to have one million cars on the road by 2015. The significant part of the investment will be in the rapid development of necessary infrastructure, more than 2,000 charging stations and 40,000 charging poles (KPMG, 2012, p. 14). However, the first results of the initiative are disappointing (Krieger, Rathke and Wang, 2012). Analyses of the above mentioned determinants give four possible scenarios of China's auto industry development until 2020 (see Figure 2).

		NO	YES
China's car producers develop significant scale advantages in clean techs	**Yes**	**The clean tech advantage** Market share: *3%-6%* Profit pool: *USD 1 − 3 billion*	**A Perfect storm** Market share: *7%-15%* Profit pool: *USD 4 − 8 billion*

China's car producers acquire one or more major developed markets car companies

Figure 2: Scenarios of China's car industry development (Barbosa, Hattingh and Kloss, 2010)

The panelists in McKinsey survey saw 40% of likelihood that China's car companies will not grasp green car production or acquire any major car companies in the current decade. This implies that China's car companies will play a marginal role on the global market. On the other side is the scenario in which China's car companies aggressively enter developed markets, through one or more significant acquisitions and clean technology advantage. The panelists in the survey gave it 10 to 15% chance that this scenario will be realized during the current decade (Barbosa, Hattingh and Kloss 2010). The future position of Chinese car industry will to a large depend on duration of global crises, its impact on China's economy and restructuring activities of key players in the industry.

4 VALUE CREATION THROUGH INTERNATIONAL ACQUISITIONS – CASE OF GEELY – VOLVO ACQUISITION

During the last decade Chinese car companies have achieved a strong growth. However, the level of internationalization of these companies is rather low because they use their own capacities or create joint ventures with leading MNCs to serve primarily the growing domestic market. Chinese government created incentives to accelerate consolidation of car industry and to help at least one car manufacturer from China become one of the top ten car manufacturers. These companies will not be able to achieve greater penetration into the global market via internal development, due to severe competition in the industry and lack of intangible resources (brand, technology etc.). As it was mentioned earlier the solution to this

problem could be acquisition of targets that possess the lacking resources but are facing financial problems due to global economic crisis. In the last few years there have been made some attempts at acquisitions of car companies from developed countries but they were not fully successful or failed. *Geely – Volvo* acquisition worth USD 1,8 billion has been the most serious attempt at global positioning made by a Chinese car company. *Geely* is contractually obliged not to outsource company headquarters from Sweden, not to cancel production capacities in Sweden and not to lay off acquired employees.

Enormous differences between the investor and target are the peculiarity of this acquisition. *Geely* was a local Chinese company manufacturing cheap and poor quality vehicles. Total sale in the year of acquisition accounted for 400 thousand cars, and marked 29% growth in sales compared with the year before the acquisition was made (OICA, 2012). The net profit generated in the year of acquisition accounted for around USD 200 million, that is to say the net profit increased by USD 12 million compared with the year before the acquisition was made. These impressive results are primarily due to growing demand in domestic market, but also to business rationalization measures. On the other hand, *Volvo* is a global company producing high class and mid class cars. The company has built a worldwide reputation as a manufacturer of safe and high quality vehicles. In 2009, due to the global economic crisis, *Volvo*'s sale dropped by 30% and the company suffered more than USD 650 million net loss (Wang, 2011, p. 28). Since *Volvo* was part of *Ford's* group, these extremely poor results made *Ford* disinvest from *Volvo*.

Because there are considerable differences between these two companies' competitive position, corporate and national culture, organizational structure and the strategic approach they take, it will be a great challenge to implement the acquisition and achieve synergy. According to the acquisition plan the companies will continue operating separately due to considerably different product lines, consumer segments and brands. This strategy is aimed at: (1) growth in sale of *Volvo* vehicles in Chinese market (2) reduction in operational costs (3) internationalization of *Geely's* operations and growth in *Volvo's* global sale. This is the type of acquisition which is made to radically change business model used by investor.

Because *Volvo* produces luxury cars the production itself involves high fixed costs. The largest proportion of *Volvo's* fixed costs is comprised of R&D costs and wages, due to rather restrictive labor laws in Sweden. To overcome this problem it is necessary to increase production and sale, meaning to achieve economies of scale. The goal set in the acquisition plan is to reach the production of 600 thousand *Volvo* vehicles by 2015, and around 800 thousand vehicles by 2020 (Volvo, 2012a). This goal can be achieved only through increased sales in emerging markets, primarily in Chinese market. The strategic goal is to sell more than 200 thousand *Volvo* vehicles in China by 2020. To reach this goal *Volvo* has already invested in two assembly plants and one engine plant (Volvo, 2012b). The positive results were soon achieved. In 2010 *Volvo* sold 31 thousand vehicles and increased sales by 50% compared with 2009 (Volvo, 2010). Sales growth continued in 2011 when the sales in Chinese market amounted to more than 47 thousand vehicles, and China became one of the three markets of utmost importance to *Volvo*. In the first half of 2012 *Volvo's* sales in Chinese market recorded almost negligible growth. Growth in sales will to a large depend on application of *Geely's* local knowledge, development of local dealer network and on whether *Volvo* is included in government car procurement list, dominated by *Audi* and *Mercedes*, since government car procurement accounts for about 8% of national car sales (*Wang*, 2011, p. 44). European brand

enjoying good reputation that have recently acquired local dimension, which is of special importance to ethnocentric consumers, is especially useful for further expansion.

Quiet high costs considerably eroding profit margins have been one of the main problems *Volvo* faced with in the previous period. *Volvo*'s assembly and production plants being built in China, whose capacities are beyond the expected sales in China's market, will significantly contribute to cost reduction. This will reduce labor force costs but also transportation costs involved in export to other countries in East and Southeast Asia. Additionally, already developed *Geely's* distribution network in China will reduce the costs of developing a new one. This strategy also involves establishment of R&D centre in China. The motive behind R&D outsourcing is cost reduction through cheaper highly qualified workers. In 2009 more than 2/3 of goods and services were sourced from Sweden, France and Belgium (countries with high costs of production) and there was no local sourcing. Employment of local suppliers that are experienced in cooperation with multinationals and meet quality standards can reduce costs. According to *Volvo's* China market entry strategy in a locally produced *Volvo* car around 60% to 80% will be sourced from China. Local sourcing will to a large depend on *Geely's* network of suppliers. The China market entry strategy is based on exploitation of location specific advantage combined with high safety standards and recognizable brand (Rugman, 2009, pp. 42−63). Apart from operational synergy, financial synergy is expected to be achieved through this acquisition. Because *Geely* and *Volvo* serve different consumer segments and markets there is a low correlation between their cash flows, which has positive effects on cost of capital (Zhou and Zhang, 2011, pp. 5−15).

Finally, the major goal behind the acquisition is internationalization of *Geely's* business operations. Safety standards were a big obstacle for *Geely's* penetration into the Triad markets (Zhou and Zhang, 2011, pp. 5−15). Because car industry is technology intensive, considerable investments are necessary. Internally generated technology innovations would soon prove insufficient for a more aggressively internationalization of *Geely's* operations. Through this acquisition *Geely* acquired the right to exploit technology innovations in safety, and technology innovations in highly efficient engines developed by *Ford* and *Volvo*. Due to this, the model Emgrand EC7 has received four star ratings out of maximum five, which was a precondition for *Geely's* expansion to European market (Wautom, 2012).

Although this represents a huge step forward, further success of the company will to a large depend on its capacity to develop and commercialize its own technology innovations. This can be achieved only through investments in R&D, and engagement of lacking experts. Lack of global experience and undeveloped channels of distribution can be a big obstacle to international expansion. *Volvo* management can actively participate in the development of organizational structure most suitable to *Geely's* global expansion, and *Volvo's* experience and network of contacts in developed markets will contribute to establishment of distribution channels. The biggest challenge facing *Geely* is development of its own brand. In the domestic market *Geely* brand has the reputation of being cheap and of poor quality and it is quiet unknown in global market. Improvements in the quality of products through acquisition of *Volvo*'s technology innovations can improve the reputation *Geely* has. Brand development must be focused on "value for money" consumer segments because this segment has been neglected due to KIA and Hyundai's shift to segments with higher purchasing power. Because this brand is fairly unknown in the global market it is possible to introduce it in developed markets as innovative, safe and affordable. To achieve international success it is highly

important to promote *Geely* brand without any reference to *Volvo* brand, otherwise, *Volvo*'s reputation might be damaged.

Due to different national and corporate cultures, *Geely* decided to give *Volvo* great managerial autonomy. *Volvo's* top management was retained, and the company is run by the board of directors comprised of local managers and only one director from China. By not integrating *Volvo* into its business system *Geely* maybe did not fully exploit cost reduction opportunities, however, through this strategy it avoided making mistakes common to international acquisitions (Prashant, Singh and Raman, 2009, pp. 119−115). The first analysis of abnormal returns of each company's stocks during the announcement period shows that the value was not created through acquisition (Chandera and Windjojo, 2012, pp. 129−143). The fact that at the end of 2012 The China Development Bank granted *Volvo* EUR 922 million loan through *Geely's* mediation, for the purpose of paying off its matured liabilities and with the maturity of 8 years supports this statement. Before making final conclusions about the success of this acquisition it should be pointed out that investors from emerging markets are often confused about short-term goals, hence the impression that no value is created through acquisition. However, acquisitions based on clear vision and long-term orientation will certainly create value in its last instance (Kumar, 2009, pp. 2–9).

5 CONSLUSION

Global economic crisis created favorable conditions for more intensive acquisitions in car industry. In the previous period there were several acquisitions of small low performing car companies from developed countries by investors from Chine. The last and the most significant due to value of transaction and high brand awareness was *Geely – Volvo* acquisition. Chinese investors try to reinvent their business models and improve competitive position through acquisitions of companies from developed countries. Future competitiveness of Chinese car manufacturers will depend on their capacities to grasp production of electric cars or perhaps on acquisition of another big car company from developed countries.

Geely – Volvo acquisition will show whether Chinese car companies have capacities to manage international acquisitions. Investor's lack of experience in international acquisition management, financial position of the target and differences between investor and target's national and corporate culture significantly increase the risks involved in this strategy. Revitalization of the target via economies of scale achieved through increased sales is one of the two main tasks *Geely* has taken on. This can be accomplished only through penetration into emerging markets. The first step towards this goal is establishment of two assembly plants and one engine plant in China that will serve both domestic and neighboring markets. *Geely's* local contacts and investments will allow *Volvo* penetrate local distribution channels. The second task *Geely* has taken on is to grasp technology innovations in safety in car industry considering that *Geely* vehicles failed crash tests, which are a precondition for expansion to European market. *Geely* increased its safety standards through application of the acquired technology innovations and in 2012 NCAP model received four star ratings out of maximum five in the crash test. Through advancements in quality and design of its products *Geely* should gradually build up and position its brand as "value for money".

To decrease the risks involved in integration of target *Volvo* has been given a great managerial autonomy. Potential disagreements that may arise from different corporate culture have been thus evaded and a great stimulus to the acquired management came from it. Finally, by not integrating these two brands management prevented a spillover of *Geely* brand poor

reputation to *Volvo* brand. The analysis shows that there was no short-term value creation through this acquisition. However, this acquisition should not be regarded as unsuccessful because the goal behind it is not to achieve short-term financial effects but to radically change *Geely's* business model in the long run.

ABSTRACT
The research and development policy (R&D policy) plays a central role in innovation policy since it consists of public sector measures that initialize and promote innovation. When designing policies in other areas (education, employment, fiscal, tax policy, etc.) the mutual interactions with R&D policy should be considered. The article first discusses the theoretical reasoning for public sector intervention in R&D processes. In general, the existence of market and system failures is used as a justification for government intervention. The government should intervene with adequate measures and only in an extent that is needed to overcome the failures. At the same time, the government should avoid overreacting and prevent giving state aid that distorts competition in the market. This study examines the level and structure of R&D policy resources and expenditures in EU member states and in countries that are closely linked to EU. Thus, the evaluation of the role of the R&D policy in innovation system is given. However, it has to be considered that different countries (small and large, developed and undeveloped, with open and closed economies) have different innovation policy goals and measures to achieve them. In addition, the R&D policy is designed in even wider institutional conditions. All of these qualitative aspects have to be considered when interpreting the results of quantitative comparative analysis of countries' R&D policies. The aim of the articles is to assess the international position of Estonian R&D policy in the aspects of resources and expenditures among EU member states and other closely linked countries in order to create the basis for an international comparative analysis of Estonian R&D policy. In order to achieve the aim, the following research tasks are posed and resolved:

- *on the basis of research literature, the necessity, essence, measures and anticipated outcomes of R&D policy are explained;*
- *on the basis of empirical analysis, the assessment on the international position of Estonian R&D policy implementation among EU member states and other closely linked countries is given.*

The data used in the empirical analysis (32 countries in years 2004, 2006 and 2008) is gathered from Eurostat database (including Community Innovation Surveys) and the component analysis is conducted. The results allow to design Estonian R&D policy measures that are based on acknowledged theoretical viewpoints and international experience.

Keywords: Innovation policy measures, Market failures, R&D policy, System failures

---

Enterprise in Turbulent Environment

1 INTRODUCTION

The central role in innovation policy development is executed by research and development policy (R&D policy), which represents the major complex of public sector measures to initiate and promote innovation. The objective of the current study is to assess the international position of Estonia among EU member states and countries closely associated with EU in respect of R&D policy implementation from resource supply and cost aspect. In order to achieve the objective, the following research tasks were set and fulfilled:

- through scientific literature the necessity amd nature of R&D policy were identified;
- through empirical analysis an assessment was given to the international position of Estonia in implementing R&D policy among EU member states and countries closely associated with EU.

The results of the research help to design Estonian R&D policy development measures, also taking into account theoretical approaches and international experience.

2 THEORETICAL BACKGROUND OF RESEARCH AND DEVELOPMENT POLICY

2.1 Elimination of market failures

Already for decades attention has been focused on an aspect that R&D outcomes have more the nature of public than private good (Nelson, 1959; Arrow, 1962). To large extent, their consumption has no rivalry – the invention or innovation can be used in parallel and the utility can be acquired by endless amount of consumers without changing the nature of the innovation or invention (see Romer, 1990; Grossman and Helpman, 1991; Aghion and Howitt, 1992). Still, there is market competition in R&D activity – the utility of innovation or invention for the first marketer remarkably decreases after it is being applied by competitors. From the viewpoint of the first user of invention or innovation, it raises an important problem of excluding unentitled persons (competitors) from the consumption of R&D work (the protection of intellectual property). As the protection of intellectual property is often so difficult and expensive, the economic rationality of its application should be considered. Therefore, the necessity of R&D policy is derived from the fact that due to the absence of competitive rivalry in consumption, it is not a pure private good and firms cannot afford excluding unentitled persons from the consumption of R&D work. The application of exclusion principles demands intervention of the public sector, as the owners of inventions (innovations) cannot cope with it for themselves. Still, the public sector intervention for excluding market competition because of the practical absence of rivalry in the consumption of the R&D results in most cases cannot be justified.

It should be checked whether public sector R&D subsidies really stimulate private firms to increase R&D costs (supplement them) or replace (substitute) them (Leyden and Link, 1991; Lach, 2002). Public sector R&D costs increase total social R&D costs when public sector support influences the private sector to provide R&D funds to projects that without the support would not be profitable (Klette et al., 2000; Wallsten, 2000; Jaffe, 2002; Tokila et al., 2008). A threat that public sector support will substitute private sector R&D costs emerges inevitably in cases where the private sector has necessary resources but they are more expensive than those offered by the public sector (Jaffe, 2002; Blanes and Busom, 2004).

2.2 Eliminating system failures

System failures restraining R&D work and the usage of its results can be classified as follows

(Arnold, 2004): *capability failures* – the incapability of research institutions to act derived from bad management, lack of competence, weak study capabilities and other deficiencies; *failures in institutions* – the stiffness of the activities of organizations (universities, research institutes, patent offices, etc.) and thus the incapability to adjust to environmental changes; *network failures* – problems in the relationships of innovation system parties, which are characterized by the shortage of relations or their insufficient quality, the incapability to apply new knowledge and tangling in morally aged technology; *framework failures* – deficiencies in legal institutions, intellectual property protection, health and safety requirements and other background conditions, including social values; *policy failures* (Tsipouri et al., 2008) – deficiencies in the government related to R&D policy development, coordination with other policies and the assessment of policy outcomes, etc.

In order to overcome system failures reducing R&D work efficiency, the public sector must develop an evaluation system for research institutions, systematically direct research institutions to fulfil tasks important for economics, create networks to spread new knowledge and implement counselling programs, but also improve regulatory mechanisms that are important to develop R&D work. Still, it should be taken into account that public sector intervention should be in accordance with the nature and impact of the system failure, the efficiency of resources used should be maximum and regulations should not reduce private sector's initiative and responsibilities necessary for the research work. When considering the rationality of public sector intervention, different public sector failures (the instability of political decision process, the increase of bureaucracy, decision makers' irresponsibility for the results, the possibility of corruption, etc.) must be considered.

The diversity of R&D work means that when designing R&D policy, all institutions and organisations should be directed to cooperate to achieve common objective. This means, creating an institutional environment favouring interactions between organizations. Institutions are defined as the collection of habits, norms, routines, practices, rules or laws that regulates relationships and interactions between individuals, groups and organizations (Edquist and Johnson, 2000). The importance of institutions in guaranteeing the development of innovation is also emphasized by Klun and Slabe-Erker (2009).

3   INTERNATIONAL COMPARATIVE ANALYSIS OF RESEARCH AND DEVELOPMENT POLICY IMPLEMENTATION

3.1   Data and variables used in analysis

In total 32 countries are used in the analysis (27 EU member states, Croatia, Turkey, Iceland, Norway and Switzerland). The statistical data used is from Eurostat on-line database and Community Innovation Survey (CIS) studies. In the current study, data from three years is applied in order to follow the dynamics of different policy aspects. All variables in analysis have been taken from years 2004, 2006 and 2008. Given years have been chosen because for those years all the variables have values available. Several variables come from the CIS study, which is conducted every two years and data from year 2008 is the newest available.

Many theoretical approaches and empirical research (European Commission, 2003; Falk, 2004; OECD, 2005, 2007; Koch et al., 2007; Manjón, 2010) have brought out several variables that describe public sector R&D policy and which can be used to assess the level and structure of R&D policy in different countries. In the current study, the following variables will be used to comparatively assess public sector R&D activities in EU member

states and countries closely associated with EU (see tables 1 and 2). Analysing different variables separately would give fragmented results. In the current analysis, data describing public sector R&D activities are considered as a whole complex taking into account the interconnections of variables.

One of the goals of the R&D policy is to develop R&D activities carried out by the public sector. This aspect is described by first set of variables (see table 1). First four variables describe R&D activities carried out in the public sector. For those variables it must be accounted that not all R&D expenditure in government and higher education sector are financed by the public sector – some of the funding is provided by the business and non-profit sectors, but also from the external sources (mainly EU institutions). Therefore, it is important for each country to bring out those variables that describe R&D expenditure funded by the government sector of that country (variables 5-6). Variable 7 describes government budget – more specifically its share in R&D financing. It is important to note that government budget includes some specific funds acquired from EU institutions, namely EU structural funds that support R&D activities. Last two variables in the table 1 describe the share of public sector R&D personnel in total employment, which describes the supply of work force in public sector R&D activities.

Table 1: Variables describing public sector R&D activities (compiled by the authors)

No	Abbreviation	Variable description
1	GOVgdp	Government sector R&D expenditure (% of GDP)
2	GOVshr	Share of government sector R&D expenditure (% of total R&D expenditure)
3	HESgdp	Higher education sector R&D expenditure (% of GDP)
4	HESshr	Share of higher education sector R&D expenditure (% of total R&D expenditure)
5	GOVtoGOV	Government sector R&D financing from the government sector budget (% of GDP)
6	GOVtoHES	Higher education sector R&D financing from the government sector budget (% of GDP)
7	GBAORD	Share of government budget appropriations or outlays on R&D in government sector total costs (%)
8	empGOV	Share of government sector R&D personnel in total employment (% according to data converted to full time equivalents)
9	empHES	Share of higher education sector R&D personnel from total employment (% according to data converted to full time equivalents)

The second important area of R&D policy is supporting business sector R&D activities. Variables describing public sector support to private sector R&D activities are given in table 2. In different studies, six business sector R&D financing indicators have been used. First two measure the level of government sector financial support to business sector R&D activities. The following four variables are based on the CIS study. Variables 3-6 describe the share of innovative enterprises that received public financial support for innovation activities. The support may be obtained from different levels of government (local or regional authorities, central governments and EU institutions).

Table 2: Variables describing public sector support to business sector R&D activities (compiled by the authors)

No	Abbreviation	Variable description
1	GOVto BESgdp	Business sector R&D financing from the government sector budget (% of GDP)
2	GOVto BESshr	Share of government sector financing in business sector total R&D expenditure (%)
3	funPUB	Share of innovative enterprises that received any public funding (% of total innovative enterprises)
4	funLOC	Share of innovative enterprises that received funding from local or regional authorities (% of total innovative enterprises)
5	funGMT	Share of innovative enterprises that received funding from central government (% of total innovative enterprises)
6	funEU	Share of innovative enterprises that received funding from EU (% of total innovative enterprises)

3.2   The results of empirical analysis

Table 3 shows the statistical parameters of variables describing public sector R&D activities and the level and structure of the public support for private sector R&D activities. The table indicates that the values of variables vary remarkably through EU member states and countries associated with EU, both in absolute (the difference between minimum and maximum levels) and relative terms (the relationship of standard deviation to mean).

Table 3: Statistical characteristics of variables describing public sector R&D activities and the level and structure of the public support for private sector R&D activities[2]

Variable	Mean	Standard deviation	Minimum value	Maximum value	Value in Estonia	Estonian difference from mean (in standard deviations)
GOVgdp	0.20	0.11	0.01	0.68	0.14	-0.54
GOVshr	17.74	12.51	0.74	67.01	12.72	-0.40

---

[2] Values have been calculated as the mean of three years (2004, 2006, 2008).

Enterprise in Turbulent Environment

Estonian position in public sector R&D activities and in the level and structure of the public support for private sector R&D activities can be seen on chart 1. On the chart, the difference in minimum and maximum values (in standard deviations) and Estonian mean value for each indicator is given. The chart shows that the position of Estonia is the best for the variable *HESshr* (share of higher education sector R&D expenditure in total R&D expenditure) and the worst for the variable *funPUB* (share of innovative enterprises that received any public funding).

Chart 1 indicates that according to variables describing higher education sector R&D financing, the share of higher education sector R&D personnel and government budget appropriations or outlays on R&D Estonia holds a higher position than the average of EU countries. For the rest of the variables describing public sector R&D activities and the level and structure of the public support for private sector R&D activities, Estonia has lower values than the EU average. Therefore, in Estonia the financing of government sector R&D activities, the share of government sector R&D personnel and the public funding for business sector R&D are lower than the average of EU. In Estonia, the main contribution of innovation promotion is expected from the higher education sector and public support for private sector R&D is seen to be rational on a lower level than the EU average.

Chart 1: Estonian position among variables describing public sector R&D activities and the level and structure of the public support for private sector R&D activities

Subsequently, component analysis is conducted with the variables describing public sector R&D activities and the level and structure of the public support for private sector R&D activities. The results of component analysis (table 4) show the structure of public sector activities promoting and supporting innovation. Component analysis is based on the correlations in the set of variables.

The component analysis covering the indicators describing public sector R&D policy brought out five independent synthetic complex indicators (components) describing the internal structure of the variables. As the result of component analysis the number of variables describing public sector R&D policy decreased by two thirds (i.e. from 15 to 5), but less than half of the information (variation) included in initial variables was lost (82.9% of the variance of initial variables is explained).

Explaining the nature of synthetic components and giving adequate names for the new indicators is a complicated task. In the current study, the method applied by Karu and Reiljan (1983) is used to explain the economic nature of components as synthetic new variables.

With the first component K1 three variables, that describe higher education sector R&D funding and the share of higher education sector R&D personnel in total employment, are closely connected. In addition, variables that describe government budget appropriations or outlays on R&D and the share of government sector R&D expenditure in total R&D expenditure are strongly connected with the given component. In case of the last variable a reciprocal association exists that explains the crowding out effect of higher education sector R&D funding by government sector R&D funding. The nature of the first component is described with the name "Level of higher education sector R&D financing", whereas the level

of funding also affects the possibility of employing R&D personnel.

With the second component K2 three variables, that describe government sector R&D financing and the share of government R&D personnel in total employment, are strongly associated. With the given component, variables *GOVshr* (the share of government sector R&D expenditure in total R&D expenditure) and *HESshr* (the share of higher education sector R&D expenditure in total R&D expenditure) are weakly associated. The association with the variable *HESshr* is negative, which indicates the substitution of government sector R&D financing by higher education sector R&D financing. This component is characterized by the name "Level of government sector R&D financing".

The third component K3 includes two initial variables that explain the share of innovative enterprises that received funding from the public sector (more specifically from the central government). The nature of the third component is described by name "Share of central government in financing R&D activities of firms".

With the fourth component K4, three variables are strongly associated that describe the level and share of government sector financing in business sector R&D and the share of innovative enterprises that received funding from local or regional authorities. The nature of given component is in the best way explained by the name "Level of business sector R&D financing by public sector".

The fifth component K5 is composed of only one indicator – the share of innovative enterprises that received funding from EU among all innovative firms. That is why this component is explained by the name "Share of EU in financing R&D activities of firms".

Component scores describe each country in the analysis. As each country is represented in the sample with data from three years, there are three component scores for every country. In order to compare countries, they are characterized with the mean of three component scores. Component scores indicate that the structure of public sector R&D policy remarkably varies through countries – countries emphasize different R&D policy areas. To assess the international position of Estonia, a chart illustrating the results is used (see chart 2).

On chart 2 Estonian average positions among the analysed countries are shown using five complex indicators (components) that explain public sector R&D policy in a way that the difference from the mean value and the distance from the extreme values can be seen. When in general Estonia is below the average level of R&D policy implementation, Estonian activities can still be considered balanced – in the case of three components the difference from the average level is smaller than the distance from the extreme values.

Enterprise in Turbulent Environment
Chart 2: Estonian position among analysed countries using the five components describing public sector R&D policy

According to the component K1 (the level of higher education sector R&D financing), Estonian average component score is higher (by 0.54 standard deviations) than the average of analysed countries and Estonia is situated in the first third among all countries (on the 9th position). Thus, the public sector finances higher education sector R&D on higher level than the European average. This indicates that in Estonia many expectations are set on universities as promoters of R&D. In the case of small open country, it should be considered reasonable as new knowledge should mainly be transferred to specialists through the learning process and this is mostly done by the academics involved in R&D activities. In the case of the first component, the most similar country to Estonia is the Netherlands. The highest component values are in Finland (1.7) and Sweden (1.6), the lowest (negative) values in Romania (-1.9) and Bulgaria (-1.8).

In the case of component K2 (the level of government sector R&D financing), Estonia is by 0.62 standard errors lower than the average of analysed countries and situates on the 24th position. This means that the government sector with its research and scientific personnel does not create remarkable support potential for the business sector and neither is a supportive cooperation partner. In order to find out whether setting such objective would be reasonable at all, it is necessary to study the impact of government sector R&D activities on the business sector. The comparison with other countries offers a few standpoints in this respect. In the case of K2, Estonia is similar to Greece and Denmark. The highest values are in small countries Iceland and Bulgaria (3.1 and 1.6) and the lowest in Malta (-1.6) and Turkey (-1.3). The value of the component K3 (the share of central government in financing R&D activities of firms) is -0.96 in Estonia and it situates on the 28th position in the list of countries – only in four countries the component scores are smaller. The financing of business sector projects by the central government demands enough competence to create long-term innovation policy

Enterprise in Turbulent Environment

strategies on government level, but also capability to set and solve very specific development tasks to eliminate market and system failures. Profound research is needed to find out the presence of such competence and capabilities in Estonia. Thus, the modesty of Estonia in this R&D field can be considered natural. According to the third component, the similar countries to Estonia are Iceland and Slovakia. The central government supports R&D processes the most in Norway and Cyprus (component scores 2.6 and 2.1), the least in Romania (-1.2), Latvia (-1.0) and Bulgaria (-1.0).

According to the component K4 (the level of business sector R&D financing by public sector), Estonia is situated on remarkably lower level than the average (component score -0.94) and is analogically to the previous component on the 28th position. The low level in that policy field is derived from the fact that Estonia has no regional government level and the local government generally does not have resources and competence to support R&D activities. According to the fourth component, Portugal and Turkey are the most similar countries to Estonia. The highest component scores are in Austria (2.1) and Romania (1.9). The lowest level is in Lithuania (-1.5) and Croatia (-1.1).

Estonian component score for the component K5 (the share of EU in financing R&D activities of firms) is -0.47 and it is situated on the 23rd position among analysed countries. In the given field some deficiencies of Estonian R&D policy must be admitted – namely, the public sector is not able to help the business sector in applying and implementing EU support. According to this component, Estonia is most similar to Bulgaria and Ireland. In this policy field, the best results are in Greece (3.2) and Poland (2.2). The lowest levels are in Luxembourg (-1.5), Turkey (-1.3) and Croatia (-1.1).

When viewing all five innovation policy components together it is revealed that among all analysed countries the best results are in Finland – all five component scores have positive values. The worst results are in Malta – all five components have negative component scores. Estonia is with one over average and four below average values situated on the negative side, but in order to give a specific assessment, more elaborate analysis is needed.

As component analysis includes data from three years, it is also possible to view the dynamics of component scores. On chart 3 the value of Estonian component scores for each year have been given.

Enterprise in Turbulent Environment
Chart 3: Component scores describing Estonian public sector R&D policy in 2004, 2006 and 2008

Chart 3 shows that for all five components Estonian component scores have grown in time, which means that the position in comparison to the average level of analysed countries has risen. Although in 2006 there was a small decrease in the position (the decrease of component score) of two components (K3, K5), Estonia has considerably moved towards the average of EU countries in the respect of R&D policy implementation. The largest increase has occurred in the value of the fourth component (the level of business sector R&D financing by public sector) and the modest is the growth of the third component (the share of central government in financing R&D activities of firms).

4   SUMMARY

Designing national R&D policy is a difficult task from the aspects of making a choice among the variety of instruments, as well as the several-folded nature of the impact that different instruments create. There are large discrepancies in both R&D policy theoretical and empirical approaches. The current study systematised available theoretical approaches, analysed problems brought out in empirical studies and gave an assessment to the international position of Estonian R&D policy implementation based on the empirical analysis of the dataset of EU member states and countries closely associated with EU.

The reason for public sector R&D policy implementation is to eliminate the market and system failures restraining R&D progress. Market failures are mostly derived from the aspect that from the viewpoint of rivalry, the results of R&D have principally public good nature and the exclusion from the usage of those results is often unpractical. The positive externality of R&D must be taken into account, because the private demand is inevitably lower than the social rational level and with R&D policy measures the demand must be brought to the social utility level. Information constraints do not enable firms to risk with long-term R&D investments and public sector must fulfil the investment gap threatening state development.

Due to the system failure, the cooperation between different parties of national innovation

system does not function smoothly or some institutions and organisations do not fulfil their tasks efficiently. The creation of formal institutions and cooperation organizations promoting R&D development is the immediate responsibility of the public sector. Innovation policy determines the tasks of the R&D policy in promoting innovation in a country and reciprocal connections with the supportive components of the innovation policy (education policy, cooperation development policy and business environment policy).

Still, the intervention by the public sector needs careful analytical justification, as incompetent intervention can distort market processes and shape a R&D policy with irrational scope or structure.

Empirical analysis showed that according to most indicators, that describe public sector R&D activities and the level and structure of the public support for private sector R&D activities, Estonia is below the average level among the countries analysed. Component analysis brought out five dimensions of public sector R&D policy:
- K1 – the level of higher education sector R&D financing;
- K2 – the level of government sector R&D financing;
- K3 – the share of central government in financing R&D activities of firms;
- K4 – the level of business sector R&D financing by public sector;
- K5 – the share of EU in financing R&D activities of firms.

Only in the case of K1 (the level of higher education sector R&D financing) Estonian level is higher than the average of analysed countries, whereas according to other R&D policy components Estonia is below the average level. This is a somewhat expected result, as in the case of a small open country external sources are considered important for obtaining innovative knowledge.

Although the position of Estonia according to most components describing public sector R&D policy is relatively modest, an important progress has occurred during the four year period (2004–2008) and Estonia has become remarkably closer to the average level of EU member states and countries closely associated with EU. After the CIS data is published for year 2010, the impact of world economic and financial crisis on Estonian public sector R&D policy can be analysed.

INSURANCE COMPANIES' SOLVENCY CHALLENGES IN SMALL TRANSITIONAL COUNTRIES

ABSTRACT
Solvency measurement is definitely one of the most sensitive actuarial tasks of an insurance company. Its specific importance does not change if we discuss life, health, non-life or pension insurance. Also, in each of the previously mentioned insurance types, solvency is one of the most relevant indicators. In insurance companies, solvency is being determined by different indicators which depend on the solvency regime that is being applied to a specific economy. Also, different approaches are used in USA, Switzerland and the European Union. This paper is focused on the EU regime being applied in small transition countries. The comparison with other relevant systems will be provided as well. It took some time for the current EU Solvency I regime to be appropriately adopted by all countries required to implement the system. Initially, the implementation of Solvency I was a challenging issue, but it is history now for most developed countries. Unfortunately, we cannot say the same for the transition countries. As a logical consequence of the financial sector transition over the last decades, the European Union financial authorities were trying to define a new, better solvency assessment system to be adopted in most of the Union countries. That procedure officially started in 2006 and is still pending. All EU members will be obliged to implement the system, at least its standard part. All more sophisticated measures are left for the countries' insurance companies and/or supervisors to decide on whether to implement them or not. When discussing the developing countries, that are knocking on the EU door, the insurance directives implementation possibilities is one of very important questions. Given the importance of small countries' stabilization and association procedures, the financial sector is one of its key elements. When it comes to insurance, solvency measurement is currently the most challenging part of it. Challenges are many and the most demanding ones pertain to the lack of data, inappropriate knowledge and continuous education. Also, the supervisors are not aware of their importance in the whole process. The survey concluded between actuaries in insurance companies has also identified some other important issues which are to be elaborated in the further course of the paper. The paper aims at making a clearer comparison between the relevant solvency regimes and the measures. In addition, the key challenges of the implementation of the EU regime in the small transition countries, considering the small countries characteristics and the solvency measurement complexity, will also be elaborated.

Keywords: *Actuarial science, Solvency, SOLVENCY I, SOLVENCY II, Transitional countries*

1 INTRODUCTION

In the middle of the last century, solvency was given more serious consideration for the first time. The first specific proposals were sublimated into the first three generations of the Life Insurance Directives (effective until 2002 –Solvency 0). In 2002, the approach became slightly innovated, however, no radical changes (Solvency I) were introduced. At the

beginning of the new century, it was found that the previous approach to the solvency treatment was outdated and that, as the global experiences dictated, it was necessary to develop a new approach (which, at the time, already existed in USA, Japan, Switzerland). The new approach made a radical step forward from the scope of financial elements (which, under certain circumstances add to the value of the solvency margin) to the risk-based approach (where the solvency margin results from an individual risk assessment to which the insurer has been exposed.

Therefore, the path of the solvency assessment for life insurances will be presented in the further course of the paper. The starting point is the assessment based on simple parameters, factors and formula which used to be applied to the accountancy data (after adjustments of the amounts communicated for reinsurance). Specifically, with regard to life insurances, the base depended on who bore the risk of investments. The survey and a critical review will be finished applying a new, risk-sensitive approach to measuring the insurer's financial stability. Such a radical change is aimed at securing a better protection of insurers and their funds, wherein the supervisor will dispose of better tools, techniques and methods for the assessment of the insurer's credit worthiness.

Regardless of technical changes of the method for determining the solvency margin, all of the foregoing approaches have several features in common (IAIS Sun-Committee on Solvency and Actuarial Issues, 2000; referenced by ChandraShekhar, Kumar and Warrier, 2008, p. 2):
- any approach implies "a minimum solvency requirement" or "a required minimum margin" – this being a minimum amount of surplus of the insurer's assets over his liabilities;
- apart from the minimum amounts, the insurer maintains the amount of the "available solvency margin" as well, which is primarily used for the financial statements to the regulatory institutions and which constitutes the amount of free capital and, as an absolute value, it must be the amount greater than the required minimum solvency margin;
- any approach defines the control level, which is the minimum permissible amount of assets where there is no intervention by the regulatory institution;
- solvency testing also implies any approach, implicitly or explicitly, and testing of amounts and their harmonisation with the principles set down is understood.

The European Union (European Economic Community at that time) first Directives were published in the '70-ies of the last century. The first Directive regulated life insurance and was publicised on 5 March 1979, while the first Directive which regulated non-life insurance was publicised earlier, that is, on 24 July 1973. These two Directives were the first steps towards the establishment of the EEC single insurance market. Among other things, the text of the Directive also included specific determinants the companies had to satisfy to be considered solvent. Such requirements were based on the 1961 work authored by C. Campagne. One of the more significant issues which also caused disputes among the EEC member states related to whether the insurance companies should be allowed to deal with both life and non-life insurance (in other words, was the establishment of composite companies permitted). Such debates caused a gap of almost 6 years between these two first directives regulating the solvency issues concerning life and non-life insurance. Three directives were produced for the respective areas of life and non-life insurance each.

During the implementation of the life insurance third Directive, the Council of the European Communities looked into the possibility of revising the technical provisions and the assessment of adequacy of solvency margin. Considering that the previous Directives were aimed at unifying the rules, thus making a step forward towards a single insurance market, a decision was made for any further correction, in the context of the rules, to be made so that the currently effective rules are not radically changed. Radical changes should be thoroughly examined, harmonised with all levels and then applied. The basic corrections relative to the previous regime pertained to specifying the quality of the available solvency amount and solvency margin required for unit-linked products.

These contemplations were the introduction into the development of a new model of the insurer's solvency assessment - Solvency I system, which is the assessment system applicable even nowadays.

2   SOLVENCY I

In cooperation with the Commission of the European Communities, the Council of the EEC decided to produce a report on the current situation of solvency and offer recommendations for possible changes. The report was supposed to be presented to the Insurance Committee within three years as of the date of implementation of the previous rules (in the Life Insurance Directive, specifically Article 26 which regulates the solvency margin issue). During 1994 (almost two years after the implementation of the Life Insurance Third Directive), the Insurance Committee raised and issue of revising the methods and techniques for the assessment of an insurer's solvency. A conclusion was made for the top level insurance supervisors to be involved in rendering the new rules. Such initiative resulted in the establishment of a Working Group which was led by Helmut Müller, German supervision representative. In 1997, the Working Group presented to the Insurance Committee a report titled the Müller's Report.

In general, the activities on revising the assessment of the adequacy of technical provisions and solvency margins were at that time split to two parts. One part of the Commission worked on the Solvency I processes – which implied revision of the current determinants in accordance with the recommendations in the 1997 Müller's Report. The other part of the Commission worked on the development of a brand new approach to the solvency assessment - Solvency II.

Analyses that followed the Müller's Report and covered the period from 1997 to 2001, included many associations of insurers, actuaries and supervisors. A conclusion was rendered that the current solvency assessment system was adequate, but for a short period of time. Considering the risk escalation, a reservation was attached to the claim that the solvency assessment system would be adequate in several years. Even at that period of time some countries developed or were engaged in developing a risk based (thus being risk-sensitive) system for assessment of insurer solvency. Such considerations opened a path for the development of some new ideas to be articulated in the Solvency II Directive at a later point in time. Until that time, a new Directive proposal, that is, a Proposal for a Directive of the European Parliament and of the Council amending Council Directive 79/267/EEC as regards the solvency margin requirements for life insurance undertakings, was produced in 2000.

Two years later, on 5 March 2002, the European Parliament adopted new Directives on solvency of insurer's life and non-life insurance. The life insurance Directive was titled the

Directive 2002/12/EEC of the European Parliament and of the Council amending Council Directive 79/267/EEC as regards the solvency margin requirements for life assurance undertakings. After several months, on 5 November 2002, this Directive was replaced by a new one titled the Directive 2002/83/EEC of the European Parliament and of the Council concerning life assurance.

In late 2000, the first 2002/12/EEC Directive was replaced by a 2002/83/EEC Directive which was effective at the time of writing this document as well. The 2002/83/EEC Directive is more comprehensive, with its eight parts and 74 Articles. It regulates the following areas:
1. Definitions and scope (Articles 1 through 3);
2. The taking-up of the business of life assurance (Articles 4 through 9);
3. Conditions governing the business of assurance:
    3.1. Principles and methods of financial supervision (Article 10 through 19);
    3.2. Rules relating to technical provisions and their representation (Articles 20 through 26);
    3.3. Rules relating to the solvency margin and to the guarantee fund (Articles 27 through 31);
    3.4. Contract law and conditions of assurance (Articles 32 through 36);
    3.5. Assurance undertakings in difficulty or in an irregular situation (Articles 37 through 39);
4. Provisions relating to right of establishment and freedom to provide services (Articles 40 through 50);
5. Rules applicable to agencies or branches established within the Community and belonging to undertakings whose Head Offices are outside the Community (Articles 51 through 57);
6. Rules applicable to subsidiaries of parent undertakings governed by the laws of a third country (Articles 58 and 59);
7. Transitional and other provisions (Articles 60 and 61);
8. Final provisions (Articles 62 through 74).

Considering the basic subject of this paper, Title 3 (Chapters 2 and 3) is in our focus. The referenced parts of the Directive address the technical provisions, the solvency margin and guarantee fund.

Technical provisions in life insurance under the Directive 2002/83/EEC have thoroughly been explained in Articles 20 through 26.

Every insurance company is required to establish sufficient technical provisions. In case of life insurance, this primarily refers to mathematical provisions. Other possible forms of technical provisions (transferrable premium) are usually presented within mathematical provisions. The amount of the technical provisions should be calculated in compliance with several basic determinants.

Calculation of mathematical provisions should be made by applying prudent actuarial prospective calculation methods. In the process, all future liabilities of the insurer (established based on the signed insurance contracts, wherein every individual contract should be studied analytically) should be taken into account. Apart from the liabilities established in a manner that the payments of the insured sums are in the focus, all guaranteed profits, surrender values, bonuses and expenses of the insurer should make a basis for calculation of the amount

of the provisions. Although the application of the prospective method is recommended, using the retrospective methods is also allowed in the following two cases: if the prospective method cannot be applied due to the specific nature of the contract, and if the retrospective method does not result in lower technical provisions than the prospective method. Prudent validation methods do not imply the determination of the best assessment. The methods for the assessment of technical provisions should be adequately selected and reliable, but only for themselves. These methods must follow those of the same features (in the context of the assets safety) by which the assets to be used for covering the technical provisions are validated. The assessment of the technical provisions or, more accurately, mathematical provisions must be calculated separately for every contract and by using the individual methods. The Directive also allows that the group methods may be used but only when the verification shows that the group methods lead to the approximately same results as those obtained when using individual calculation methods. Naturally, it is recommendable in both cases that additional provisions should be created for the unpredictable risks. Where the surrender value of a contract is guaranteed (under the conditions defined in compliance with the tariff and the insurance conditions), the amount of the mathematical provisions for the contract at any time shall be at least as great as the value guaranteed at that time.

Another important determinant pertains to the **method for interest rate determination**. Interest rate should be selected very carefully. Interest rate is a part of the actuarial tables which, along with the statistically balanced probability of mortality, numbers of alive and dead persons, expected and average lifespan, make a basis for the risk quantification. The rules for selection of interest rate which, for the purpose of the actuarial tables, is transformed into the discount rate, are defined by the respective national supervisors of all member states. Evaluating the amount and features of interest rate, the national supervisor should take into account the following elements. It is necessary that the supervisor identifies for all contracts one or several rates to which the actuaries of the insurance companies should adhere. If the life insurance contracts imply certain interest rate guarantees, the regulator should identify a single national economy rate provided that it is not more than 60 % of the rate on bond issues by the government of that national economy. In addition, when the assets are not valued at their purchase price, the supervisor may stipulate that one or more maximum rates may be calculated taking into account the yield on the corresponding assets currently held, minus a prudential margin. The amount of rate is established at the adequate level (which is a maximum allowed rate of interest), but it does not imply that the insurance companies are bound to use a maximum rate. The insurance companies may decide not to comply with the provisions determining the interest rates as stated, but only in some cases. The deviation is allowed in the case of the unit-link contracts (the contracts directly linked to the investment results, wherein the insurer bears the investment risks), single-premium contracts (for a period of up to eight years) and without-profits contracts, that is, annuity contracts with no surrender value. Under no circumstances may the rate of interest used be higher than the yield on assets. If, during the insurance company business the yield is deducted, the insurer company should cover the costs from its own reserves. The interest rate chosen should be transparent.

Statistical elements of **valuation and allowed expense loading** should be selected carefully, taking into account the type of contract, duration, administrative fees and the anticipated acquisition costs.

For the contracts which imply the **participation in profit,** the method of calculation for technical provisions should take into account, either implicitly or explicitly, future bonuses (in a manner consistent with the other assumptions and expected distribution of profit).

All **expense loading elements** should be determined carefully and presented either implicitly or explicitly. It is necessary that the expenses defined to be an integral part of the tariff be consistent with the insurer's anticipated expenses.

The methods selected for calculation of technical provisions should be consistent for many years. Changes of the calculation bases and methods applied are not permitted.

The insurance companies should pay due attention to data transparency. To this end, bases and methods used for calculation of mathematical provisions and provisions for bonus should be available to the public.

Tariffs created for the insurer's new products should be defined under the reasonable actuarial assumptions at the level enabling that the insurer's liabilities may be satisfied and the adequate technical provisions created at all times.

Technical provisions must be covered by the insurer's assets. The assets must be selected so that they suit the type of the product (which constitutes a mathematical provision) and provide security, refund and marketability of the investment. The Directive clearly specifies the categories of assets which may cover the technical provisions: investments, loans and others. Each category has several sub-categories (Directive of the European Parliament and of the Council concerning life assurance, 2002/83/EEC, 2002). The categories of assets are rather generally defined. As usual, the EU Directives leave to the member states to develop a detailed list of assets which may be used for covering the technical provisions. In general, all assets which were decided to be used for covering the technical provisions should be validated under the net principle and assessed in a prudent manner. Loans may be used as cover, but only if secured. If there are derived financial instruments in the market, which may contribute to certain risk reduction, they may be used for covering the technical provisions. Financial instruments which are not subject of trade at the organised markets, may also be used for the foregoing purposes, but only if their solvency is at a high level. If the insurer has debtors, these loans may be used as security but only when all possible claims of the debtor against the insurers are deducted from those amounts. Deferred acquisition costs may be accepted as the instrument for covering the technical provisions, but not beyond the amount of the rate applied to the calculation of mathematical provisions.

The investment rules are set down in percentage for some parts of technical provisions. Certain percentages may not be exceeded (except in special cases and with a written consent by a supervisor).

Apart from quantitative restrictions, the invested assets must satisfy some other additional conditions which comply with the basic characteristics of life insurance as business, the nature of the assets being invested and the market characteristics.

Like in the previous Directives (first three Directives about life insurance within the Solvency 0 system) a distinction has been made between the available solvency margin – ASM and the

required solvency margin – RSM. Furthermore, it also foresees that the insurer maintains the guarantee fund.

Apart from the amounts of the available solvency margin and the required solvency margin, the solvency ratio is a standard indicator of the insurer's financial quality. The solvency ratio will be calculated by using the following formula:

$$SMR = \frac{TSM}{\frac{1}{2} \cdot TR} \cdot 100 \qquad (1)$$

wherein
SMR - solvency margin ratio (expressed in %)
TSM - total solvency margin
TR - total risk
This control indicator is most frequently used by supervisors in their assessments of the insurers. The formula used in all countries and systems has the same logic, however, various types of risks are taken into account. The example of the solvency ratio calculation by the Japanese supervisors is presented below.

Depending on the result of the previously defined solvency ratio, the Japanese Regulator has developed an action scale. Legal minimum of solvency ratio is 200%. If the value is ≥200%, no steps whatsoever will be taken.

Table 1: Solvency Margin Ratio and action thresholds (Topics in Life Insurance Industry, 2010)

Category	SMR	Actions
Not categorised	$SMR \geq 200\%$	No actions to be taken
Category 1	$100\% \leq SMR < 200\%$	Development of a business promotional plan
Category 2[1]	$0\% \leq SMR < 100\%$	a. Development and implementation of a plan to secure solvency b. Banned or restricted payment of dividends c. Banned or restricted payment of bonuses to the policy holders d. Changed premium calculation method for new contracts e. Banned or restricted payment of bonuses to managers
Category 3[2]	$SMR < 0\%$	Partial or total business suspension for a temporary period of time

The prescribed method has been amended and it should be stated that, from the perspective of the Directive Solvency I, the total amount of risks may be calculated by using these methods (Stochastic measure referring to Solvency II) or determining measures.

---

[1] If the value of net assets of the insurer in this category is negative, the insurer shall be placed under category 3.

[2] If the value of net assets is positive, regardless of SMR<0%, the insurer may be placed under category 2.

3   SOLVENCY II

One of the first documents that highlighted urgent need for changes of the current system was the one referring to the principles of assessment of capital adequacy and solvency, titled the Principles on Capital Adequacy produced by the International Association of Insurance Supervisors - IAIS in 2002.

The IAIS document contains the following 14 principles required for the capital adequacy assessment:

- Principle 1: Technical provisions – have to be adequate, reliable, objective and allow comparison across insurers;
- Principle 2: Other liabilities – Adequate provisions must be made for all other liabilities insofar as they are not included in the technical provisions;
- Principle 3: Assets – Assets have to be appropriate, sufficiently realisable and objectively valued; it is quite certain that there is a need to create provisions to allow for concentration risk, credit risk, market risk, liquidity risk and liquidation risk;
- Principle 4: Matching – Capital adequacy and solvency regimes have to address the matching of assets with liabilities. The capital adequacy and solvency regimes should address the risk of loss arising from mismatches in the currency, timing of cash flows and amount of cash flows, of the assets and the liabilities of the insurer adjusted to take account of off-balance sheet exposures;
- Principle 5: Absorption of losses – Capital requirements are needed to absorb losses that can occur from technical and other risks; risk of error, reinsurance risk, operating expenses risk, special technical risks (liquidation risk and the risk of excessive or uncoordinated growth), operational, market, organisational and conglomerate risks, and investment risks (depreciation, liquidity, interest rate);
- Principle 6: Sensitivity to risk – Capital adequacy and solvency regimes have to be sensitive to risk – which implies valuation of liabilities (including technical provisions), requirements on assets (including requirements for valuation of assets), definition of appropriate forms of assets (capital in particular) and determination of required solvency margin;
- Principle 7: Control level – a control level is required;
- Principle 8: Minimum capital – a minimum level of capital has to be specified;
- Principle 9: Definition of capital – capital adequacy and solvency regimes have to define the suitable form of capital;
- Principle 10: Risk management – capital adequacy and solvency regimes have to be supplemented by risk management systems; these risk management systems have to be comprehensive and cover all risks to which the insurer is exposed; the required solvency margin has to be considered the last resort in case of considerable losses and undermined financial stability of the insurer;
- Principle 11: Allowance for reinsurance – reinsurance policy should consider the effectiveness of the risk transfer;
- Principle 12: Disclosure – The capital adequacy and solvency regime should be supported by appropriate disclosure;
- Principle 13: Solvency assessment – Insurance supervisory authorities have to undertake solvency assessment;
- Principle14: Double gearing – in case of membership in a group, capital adequacy and solvency regimes should be adequately implemented.

In the context of implementation of the Lamfalussy approach, an important step forward has been made towards harmonisation of the EU processes.

It has been inferred that the system on which Solvency II is based has been taken over from the banking business operation which is envisaged by Basel II system and which consists of three pillars.

Pillar I covers quantitative requirements, i.e. the rules for calculation of certain values (primarily technical reserves and investments). According to the principle of caution, insurer's capital requirements are followed up through three categories: aimed capital, necessary amount of capital and absolute minimum capital.

Pillar II pertains to the supervision process and sets out clearly defined internal control and risk management rules.

Pillar III sets out market discipline, in particular transparency requirements and accounting rules harmonization.

Phase 1 Solvency II was a phase devoted to extensive research and scientific work. The objective of Phase 1 was to collect as many opinions of the EU relevant authorities in the field of insurance as possible in order to provide a sound basis for setting up a new system. The search for possible solutions partly continued in the second phase, while the roadmap for the new directive has been presented at the Insurance Committee session held in June 2004. With the introduction of the new idea, the Insurance Committee sought assistance and advice from EIOPA, more specifically in April and December 2004 and in the spring 2005, when the updated version of the Directive was presented.

The conclusions and recommendations can be directly linked with the structure and the three pillars of Solvency II. The Pillar I recommendations apply to two levels of capital requirements, as follows:
- solvency capital requirement – SCR – the amount that should reflect the level of the economic capital with which the insurer can settle its obligations without disturbance and with the minimum loss occurrence likelihood. This level should identify most of the risks to which the insurer is exposed and should be the basic instrument for the supervision process. The new system, except for standard formulas, will make it possible for insurers to develop internal models for the SCR calculation.
- minimum capital requirement – MCR – or security margin that should be created so as to constitute the main signal for necessary supervision. The MCR should be calculated by applying simple and objective methods, considering that in case of the supervisor's intervention, where the insurer does not conduct business properly, the case may end up before the court, so the calculation method should be kept simple and comparable in different jurisdictions.

In addition to capital requirements, Pillar I also covers technical reserves treatment and defining of the level of intervention.

The Pillar II recommendations were just the elaboration of the previously mentioned idea. Specifically, with a sound quantitative background, the national economy should have a sound supervision system. A proposal has been made to harmonize certain supervision

procedure components, such as: internal control principles, risk management, finance management, harmonization of assets and liabilities and re-insurance criteria development. All risks that are not quantified in Pillar I are taken into account and assessed in Pillar II. A proposal has been made to set the on-site minimum control criteria, define the supervisors' authorities and responsibilities and require transparency of the activities.

The Pillar III recommendations pertain to data transparency and publication. It has been inferred that it is necessary to develop a uniform reporting system.

The SCR constitutes the level of capital required to ensure that the insurer will be able to operate its business without disruption and with minimizing the loss occurrence likelihood. The directive implies that the prospective calculation quantifies a risk-sensitive amount at the level which shall be adequate information to the supervisors on the potential need for their intervention. Considering that the primary objective of the directive development and implementation is harmonization of directives, this type of regulation should be harmonized in member states with their local regulations.

In addition to the SCR Directive, Solvency II also stipulates the calculation of another capital requirement – risk margin. The best assessment of the insurer's liabilities is used for the SCR calculation. The approach developed on the cost of capital is used for the calculation of risk margin. The approach based on the cost of capital is recommended by the Directive and it takes the future SCR value as the basis for calculation.

The best estimate of the insurer's liabilities shall be calculated gross from amounts recoverable from re-insurance (without deduction of the liabilities to re-insurers), while the cost of capital with risk margin is calculated after deducing liabilities for re-insurance (i.e. net re-insurance). The risk margin is calculated for all types of insurance (as specified by the Directive), and only for the types where hedging, as alternative to some risks, is not possible (in most instances, this is the case with life insurance).

According to the Solvency II provisions, MCR is the amount of the capital which constitutes the lower capital threshold of which the insurer disposes. If the amount of the available capital approximates the calculated MCR or drops below that value, this is an alarming sign to the supervisor to intervene.

The MCR calculation is based on technical reserves and risk-free sums (not on the risk as is the case with SCR), but the risk-margin is not taken into account.

Table 2: Factor values for specific types of insurance (CEA, Insurers of Europe, 2006)

The table below sets out the general main differences between the two systems:

	Solvency II	Solvency I
Valuation of assets	Market consistent value	Market/accounting value
Valuation of liabilities	Market consistent value	Methods are not harmonized, but the security margin falls within technical reserves
Available capital	Holistic balance sheet approach	Partly in use
Diversification	In use	Not in use
Risk mitigation	In use	Partly in use
Solvency control levels	SCR and MCR	One level determined by the supervisor
Insurer groups	Recognized	Partly recognized
Calibration	On economic basis with the use of market and historical information and experiences	Subjective and usually does not correspond to specific traits of the insurer

4 SOLVENCY IN BOSNIA AND HERZEGOVINA

Current legislation which defines solvency assessment of insurance companies in Bosnia and Herzegovina is drafted on the level of Entities.

Solvency in the Federation of BiH is defined under a by-law – Rulebook on the Elements and Control of the Solvency Margin[3], issued by the Insurance Supervision Agency of the Federation of BiH. In addition to the Rule Book which defines the issue of solvency in FBiH, calculation of mathematical reserve is also defined as an essential element, which is a step before calculation of solvency margin. Calculation of mathematical reserve is also explained in another Agency's by-law - Criteria for Mathematical Reserve of Life Insurances and Other Insurance Types that Are Subject to Calculation of Mathematical Reserve (published together with the previously mentioned Rule Book).

In the Republika Srpska, the same matters are defined under the Rulebook on the Elements and Control of the Solvency Margin of the Insurance Companies in the Republic of Srpska[4]. In 2012, the RS started to prepare new by-laws - Draft Rule Book on the Elements and Control of the Solvency Margin and Draft Rule Book on the Calculation of Capital and Capital Adequacy of Insurance Companies.

Everything said and explained before pertains to the model of solvency assessment currently applied in Bosnia and Herzegovina. We have earlier mentioned the laws and by-laws which provide a legal framework for such calculation and explained it by giving an example of an existing insurance company. Also, we have given an example of life insurance calculation pattern. Specific details about the Insurance Company have not been provided, since the information contained in the calculation of the mathematical reserve and solvency margin are considered to be a business secret.

Solvency margin assessed in this way corresponds to the Solvency I concept. One of the input elements used in the calculation is the mathematical reserve (its gross and net amounts).

---

[3] The Rule Book was published in the Official Gazette of the Federation of Bosnia and Herzegovina No. 80/06.

[4] The Rule Book was published in the Official Gazette of the Republika Srpska, No. 101/07.

Mathematical reserve, *per se,* is the value of compound interest of the investment portion of the premium and directly includes only a population death risk (when pure life insurance policies are concerned). Where calculation involves joined health insurance policies, morbidity tables are also taken into account, which means that a disease risk is included. A new concept, Solvency II, requires broadening the scope of risks which are included in the calculation. It is considered that the mere quantification of a death risk is not sufficient to secure the amount of capital which would ensure company's solvency. Therefore, the scope of risks has been broadened so that the calculation now includes: Contract risks: risk taken under the life insurance contract, biometric risk, buy-out risk, policy expiry risk, costs risk, Market risks: risk of discrepancy between assets and liabilities, Credit risks: concentration and reinsurance risk, Operational risks.

The life insurance module that is in the focus of this text involves the following risk sub-groups:
Contract amendments, Mortality, Longevity, Disability, Contract expiry (revision), Expenses, Catastrophes.

Insurance sector in Bosnia and Herzegovina has shown slight increase in the recent years, despite the overall crisis. Life insurance markets, as a part of industry which is in the focus of this text, show a growth trend, however, since the basis is relatively low, the growth rate is still considerably lower than it could be expected at a developing market. Reasons for such a slow development could be found in many areas of life, but it would be sufficient to mention low domestic purchasing power, absence of insurance tradition and culture, lack of awareness of the need for insurance and benefits thereof, and the lack of confidence in industry.

Notwithstanding the perception of the public, insurance sector actively follows European standards in some segments. Earlier in the document, we attempted to outline the European standard and the possibilities and limitations of its application to the Bosnia and Herzegovina market. In a string of different rules that Europe imposes to the insurance business, the focus is on the Solvency II directive, which defines regulations, methods and techniques in calculating solvency margin and insurer's capital adequacy (preceded by a series of pre-calculations).

In addition to assessing the possibility to apply the explained models, which remained theoretical in absence of appropriate information that could be used to properly test the mentioned models, a small-scale insurance market research was conducted with the aim to show how the industry sees the new system. Questions were posed to the actuaries who are lead experts in their companies and thus best suited to give answers and their opinions about these issues.

Based on the answers provided by actuaries of ten Companies in Bosnia and Herzegovina, it can be concluded that companies are only partly aware of all challenges they will have to face in the process of adaptation and implementation of the new system. It is also clear that all companies still do not see Solvency II as a close future, so that they take a relatively serious approach to resolving this problem. On top of that, the regulatory authorities in both entities in Bosnia and Herzegovina currently do not provide much support. The regulatory authorities have not yet devised either plans or guidelines which would help insurance companies to adapt to the new system and better prepare for new solutions. Companies are aware of the problems resulting from absence of information and insufficient knowledge and competence

in this area. This is not such a big problem for companies with mixed (international) ownership, because in both situations they will rely on their mother companies in the European Union who had to solve those problems earlier. Domestically owned insurance companies will encounter more problems with the data, given that neither the Federation of BiH nor the Republika Srpska have adequate data bases. Moreover, the knowledge and skills needed to master new solutions will have to be found by engaging external consultants.

One of the major limitations in application of internal models (integral ones or only certain modules) is the size of the market. It can be hardly expected that a market this small with disorganized statistics, as is the BiH market, would provide any realistic opportunity to assess the impact of some of the risks on the market, specifically those risks considered as relevant by insurance companies. In addition to sophisticated knowledge and skills that are necessary for devising an internal model, insurance company must possess highly precise and detailed information.

We can conclude by noting that insurance companies in BiH will have to apply the new system, but obviously that will not happen in the close future. Here lies the reason why insurance companies and regulatory authorities still do not attribute much attention to the issues relevant to Solvency II.

Implementation of the new system will be possible once all interested parties take real action in furtherance of this goal, when they start finding adequate solutions, draft documents and work towards the implementation. Until then, we will be left to discussing limitations only.

5   CONCLUSION
According to the existing legislation in Bosnia and Herzegovina, solvency assessment system is based on Solvency I assessment system. Current system does not incorporate all the mentioned risks, nor does it foresee a sophisticated quantification. Nevertheless, the Bosnia and Herzegovina market will be inevitably affected by those developments.

There is no doubt that Bosnia and Herzegovina will have to adapt to EU processes in the future, in this case, those are directives for insurance sector. Undeniably, harmonization with Solvency II is ahead, but it will take a lot of effort.

The research showed that insurance companies in Bosnia and Herzegovina do not possess a systematic body of information and knowledge of the new system. It follows from the provided answers that a lot of things have been done *ad hoc*, lacking a thorough, scientific and expert approach. Companies partly have preliminary documents (first level documents) that can be used for preparatory activities, but they by no means can be taken as a serious road map for the future. Companies in Bosnia and Herzegovina have to develop their own strategies of introducing Solvency II, in accordance with their own vision. In the questionnaire, insurance companies referred to the strategies devised by their big mother companies, however, they could be used as guidelines, but not as a final solution for insurance companies whose business is in BiH. When assessing possibilities and limitations of the implementation, local companies should assess all external and internal factors which directly and/or indirectly affect the possibility of implementation (primarily limitations and obligations defined by law, characteristics and particularities of the market, availability of information, staff qualification). There is no analysis conducted by official authorities about the degree of incompatibility between current solutions and new requirements,

notwithstanding that such a document would provide good guidelines to insurance companies. Should regulatory authorities express a clear interest, companies would certainly notice it and take a more active approach. Current behavior of regulatory authorities undeniably leaves insurance companies with the impression that the new system does not bring vital changes in the calculation segment (which is completely wrong). On the other hand, the majority of companies are aware that additional training of employees is necessary. At the initiative of regulatory authorities, the forthcoming period should be used to raise awareness of the role and importance of the new assessment system. This process is unavoidable, so that it would be vitally important to start its implementation promptly and without any delay since insurance companies and regulatory authorities would have more time to make necessary adjustments, which are prerequisite to arriving to better final solutions.

With regard to the technical aspect of the new solutions, it can be concluded that insurance companies think about the new concept, but very little has been done in its implementation. Companies are mainly aware of the problems associated with the new system, but actuaries are those who know most about the implementation and details thereof. The fact is that actuaries bear most of the responsibility in this respect, but they also possess the most specific knowledge needed to implement this system. It should be noted at the same time that actuaries are not the only persons in companies who are interested in this business activity. It would be impossible to properly implement this new system without personnel from other departments like insurance security, accounting, risk management and company management (who should show understanding and give support to future work).

The forms that are used in the standard model by insurance companies in BiH to quantify risk do not show the data necessary for such risks quantifications. The only available information can be taken from the last 1991 census in BiH. Considering all demographic changes which took place from 1992 to 1995 and afterwards, one can be sure that currently available information does not provide a valid basis for risk quantification. In absence of such information, risk is approximately quantified on the basis of old mortality tables (1980–1982) or international companies use tables of the countries in which their mother company is registered (mother companies from the EU). Therefore, there is hardly any official information about, for instance, the number of ill or deceased people per certain sample categories, about the reasons for termination of insurance contracts, costs ... However, from the exclusively scientific point of view, such data cannot be taken as adequate since the life style, habits, health status and other relevant mortality and/or morbidity factors of the population in, for instance, Austria and Bosnia and Herzegovina, certainly are not the same. Without adjustments, such tables would show a somewhat underestimated premium, resulting in underestimated reserves. Insurance companies resort to adjustments through an interest rate which is included in mortality tables, while solvency margin is calculated on the basis of mathematical reserve (the only risk included here is a death risk). On top of these problems, insurance companies in Bosnia and Herzegovina do not have adequate (or they have very modest) internal data bases which can be taken as the basis to quantify other risks (contract expiry, disasters, costs and so on). The model itself anticipates that companies have internal indicators, however, insurance companies in BiH do not have them.

In the context of applying the standard model, insurance companies in Bosnia and Herzegovina will undoubtedly encounter serious problems when they attempt to apply the life insurance module. The only risk that can be precisely mathematically assessed is the death and longevity risk, but the validity of information at local market remains questionable. Other

Enterprise in Turbulent Environment

risks could be quantified provided that employees are properly trained and that there is appropriate IT support, but there is still a pressing problem of (currently) unavailable necessary and relevant information.

Once initial problems of implementation are overcome, the new model would surely bring numerous advantages to insurance companies in BiH, in particular in the context of security and adequacy of resources necessary to the company. The implementation of the new model would enable insurance companies to appear at the European market without any fear. On the other hand, it is clear that not all insurance companies from the Bosnia and Herzegovina market would continue their business operation. New demands for capital would certainly considerably surpass the current ones. Present assessments do not require the assessment or quantification of any of the relevant risks arising from the contract itself: contract expiry risk, costs or contract amendments. The only risks assessed now are those directly linked to the offered policy, which certainly is the crucial risk, but definitely not the only one.

Insurance companies in BiH do not have large portfolios and years long experience that could be used to prepare adequate data bases. Another important limitation associated with the implementation of new solutions is presently under-educated staff and lack of funds in insurance companies.

Once directly applied, the standard model will increase capital demands in insurance companies, on top of that, the companies will be able to apply internally developed solutions. In short-term, internal development of the model is a demanding investment, but it brings many advantages in mid and long term. Internal model gives insurance companies the opportunity to calibrate the standard formula to the needs of the company which creates the model. Company can conclude at a certain point that their life insurance portfolio is extremely exposed to risks, for instance risks of contract termination resulting from buy-out of policies. Through internal modeling, this risk weight can be increased, while weight of other risks, ranking low at that moment, can be decreased. Therefore, internal modeling results in a more precise determining of capital demand than it is the case in the conservative approach taken in the standard model. Once applied, the internal model should result in a lower level of capital demand in insurance companies.

When thinking about the consequences of such result, it can be simply concluded that all insurance companies tend to have as many available funds as possible, but not at the expense of unjustified decrease of reservations and exposure to risk. Internal model resolves these issues, keeps the precisely required level of capital and releases a maximum possible amount of disposable capital.

Taking into account currently available resources, insurance companies expect problems in the implementation of internal models (possibilities to develop internal models should primarily be considered, or if not the whole model, than at least internal modules for some risks). Problems are also anticipated in the sophisticated assessment of credit and market risks (in non-life SCR, that is one of the key components).

The market survey and research performed for the needs of this document showed that companies predominantly tend to apply the standard model and do not like to experiment with internal modeling. It can be logically expected that markets this small fear to implement so complex calculations because they lack not only relevant data, but also know-how and

information. From the scientific point of view, development of internal model would be a logical and reasonable step, but the fact is that it would be hard to implement. Internal modeling would give insurance company the opportunity to obtain a perfectly clear picture of the exposure of its capital to different types of risks. In practice, this implies that capital demand would most probably be assessed lower than it would be when classic standard formula is applied. From the expert point of view, the standard formula requires a lot of efforts, investments and additional funds for internal model development. Notwithstanding its positive effects in the long run, company managements would not welcome those new developments.

Through the implementation of the new model of assessment (standard model), insurance companies in Bosnia and Herzegovina would increase the security level of their funds and capital demands. Organized companies would not encounter major problems in the process. On the other hand, companies whose reservations are not determined on the quality basis or in accordance with the fundamental scientific and professional principles (and in accordance with the law), would hardly be able to satisfy such requirements. As a result, the application of the new model should, among other things, help to put insurance market in order.

ABSTRACT
A list of key competencies of the graduate has been defined by the Council of Europe Symposium on "Key competences for Europe". Since this list of competencies is provisionary, every country and a higher education establishment supplements and elaborates it in accordance with their preferences and requirements. The problem is that the ambiguity of this list leads to controversial approaches to monitoring maturity of graduates-bachelors' skills. There is no single standard mechanism of forming and monitoring key competencies. Our research is devoted to finding a solution to this problem. An algorithm of conducting research was developed by the authors and described below. This article describes the results of the first four stages of the study. It is supposed to write a series of articles devoted to this issue as the stages of the research algorithm move forward.

Keywords: *Competence, Dublin descriptors, Key competence, Monitoring maturity of competences, Personal and professional managerial qualities*

1 INTRODUCTION

Using the term "competence" in modern literature is closely connected with the process of refocusing Russian education from the "knowledge-" to the "competence-targeted" approach, which is pre-requisite for modernization and bringing the results in line with the international standards.

Competency is a set of competences, the availability of knowledge and experience necessary for effective activity in a given subject area. Thus, it may be noted that competence is a set of skills, while competency is a set of competences.

Analyzing articles on this issue, we also noted the category of "competency" as a category. The terms "competency" and "competence", as commonly used synonyms, should be distinguished:

Competence includes a set of interrelated abilities (knowledge skills, ways of activity), defined with respect to a certain range of objects and processes necessary for a high-quality productive activity in relation to them.

Competency is possessing a certain competence including a personal attitude to it and the object of activity.

Enterprise in Turbulent Environment

Analyzing this issue, L. Zanina, N. Menshikova, and D. Ivanov distinguish the two concepts (Ivanov, 2008; Shalashova, 2007, p. 31):

- "competence" as a set of interrelated abilities (knowledge, skills, ways of activities), defined with respect to a certain range of objects and processes necessary for high-quality productive activities in relation to the them;
- "competency" as possession of a certain competence including a personal attitude to it and the object of activity. As for the most commonly used terms "core competencies", they are determined by the European project " Key competencies Identification and selection "as important "in different spheres of life and which serve as the key to life success and effective society functioning".

Gudkov, Ustich use the following definition of this term: an ability to apply knowledge, skills and personal qualities to succeed in a particular area. This is an ability to successfully operate on the basis of practical experience, skills and knowledge when solving professional problems. On the other hand, the educational standard of HSE says that competence is an ability to apply knowledge, skills and personal qualities for success in a particular area. (Educational standard of the HSE from 02/07/2010).

The third generation standards, developed in relation to a split-level education (Bachelor, Master), use the category of 'competence' (from Lat. *competere* - match, fit), which is interpreted as inability to apply knowledge and skills to operate successfully on the basis of practical experience when solving general problems in a wider area.

In the educational standards of the State Education Budget Institutions of Higher Education "State University - Higher School of Economics", in respect of which the category of "national research university" in the direction of preparation 080200.62 "Management" level of "Bachelor", the following terms: general science, instrumental, socio-personal, general cultural and professional competence. The list of fairly complete, but at the same time there are certain problems of formation of the alleged monitoring competencies. Need to develop a system of indicators of formation, a mechanism of formation and choose the methods and tools of their formation.

The question arises - which can act in such a measure - the rating score of the exam, or the ability to perform a specific set of tasks. What is considered a threshold indicator of formation, and that - the maximum. What methods achieved the formation of competencies and how these methods are consistent with the methods used by teachers of different disciplines. These questions are the basis for further study, in which the need to develop a methodology based means of criteria evaluation of formation of competencies that make it possible to carry out quality monitoring during the whole cycle of bachelor's degree in "Management." To answer these questions, first of all, the algorithm was developed by the study.

It includes the following steps:
1. Determining input and output competences forming the prerequisites a manager must have.
2. Selecting testing methods to determine some input competences and managerial qualities.
3. Conducting an entrance test, analyzing and interpreting the results.
4. Selecting methods, forming competences and managerial qualities.

Enterprise in Turbulent Environment

5. Applying the methods during the course "Making Managerial Decisions".
6. Monitoring maturity of the competences during the course.
7. Defining validity of the tests used.
8. Conducting an exit test, analyzing and interpreting the results.
9. Developing the mechanism of forming, monitoring and controlling maturity professional managerial competences.

The article describes the results of the first four stages of the research.
Language review: (может это всё-таки обзор литературы?)
Terminology and definitions used in this paper were accepted and offered by Dublin Descriptors for SHORT CYCLE, First Cycle, Second Cycle and Third cycle awards.

'Dublin' Descriptors
The JQI Dublin descriptors for Bachelors and Masters were first proposed in March 2002 (www.jointquality.org). The JQI meeting in Dublin on 23 March 2004 proposed that for a better understanding of the 'Dublin descriptors' in the context of the Berlin communiqué and their possible future usage, alternative headings, as indicated below, may be more appropriate. The JQI meeting on 23 March also proposed a set of shared descriptors for third cycle qualifications. The higher education short cycle (within the first cycle) descriptor was proposed following the JQI meeting in Dublin on 18 October 2004. The complete set of 'Dublin descriptors' is set out below:

Qualifications that signify completion of the higher education short cycle (within the first cycle) are awarded to students who:
- have demonstrated knowledge and understanding in a field of study that builds upon general secondary education and is typically at a level supported by advanced textbooks; such knowledge provides an underpinning for a field of work or vocation, personal development, and further studies to complete the first cycle;
- can apply their knowledge and understanding in occupational contexts;
- have the ability to identify and use data to formulate responses to well-defined concrete and abstract problems;
- can communicate about their understanding, skills and activities, with peers, supervisors and clients;
- have the learning skills to undertake further studies with some autonomy.

Qualifications that signify completion of the first cycle are awarded to students who:
- have demonstrated knowledge and understanding in a field of study that builds upon and their general secondary education, and is typically at a level that, whilst supported by advanced textbooks, includes some aspects that will be informed by knowledge of the forefront of their field of study;
- can apply their knowledge and understanding in a manner that indicates a professional approach to their work or vocation, and have competences typically demonstrated through devising and sustaining arguments and solving problems within their field of study;
- have the ability to gather and interpret relevant data (usually within their field of study) to inform judgements that include reflection on relevant social, scientific or ethical issues;
- can communicate information, ideas, problems and solutions to both specialist and non-specialist audiences;

- have developed those learning skills that are necessary for them to continue to undertake further study with a high degree of autonomy.

Qualifications that signify completion of the second cycle are awarded to students who:
- have demonstrated knowledge and understanding that is founded upon and extends and/or enhances that typically associated with Bachelor's level, and that provides a basis or opportunity for originality in developing and/or applying ideas, often within a research3 context;
- can apply their knowledge and understanding, and problem solving abilities in new or unfamiliar environments within broader (or multidisciplinary) contexts related to their field of study;
- have the ability to integrate knowledge and handle complexity, and formulate judgements with incomplete or limited information, but that include reflecting on social and ethical responsibilities linked to the application of their knowledge and judgements;
- can communicate their conclusions, and the knowledge and rationale underpinning these, to specialist and non-specialist audiences clearly and unambiguously;
- have the learning skills to allow them to continue to study in a manner that may be largely self-directed or autonomous.

Qualifications that signify completion of the third cycle are awarded to students who:
- have demonstrated a systematic understanding of a field of study and mastery of the skills and methods of research associated with that field;
- have demonstrated the ability to conceive, design, implement and adapt a substantial process of research with scholarly integrity;
- have made a contribution through original research that extends the frontier of knowledge by developing a substantial body of work, some of which merits national or international refereed publication;
- are capable of critical analysis, evaluation and synthesis of new and complex ideas;
- can communicate with their peers, the larger scholarly community and with society in general about their areas of expertise;
- can be expected to be able to promote, within academic and professional contexts, technological, social or cultural advancement in a knowledge based society;

Thus, a set of basic competencies have been identified.

Enterprise in Turbulent Environment

Table 1: Competences for Bachelors

Cycle	Knowledge and understanding:
1 (Bachelor)	[Is] supported by advanced text books [with] some aspects informed by knowledge at the forefront of their field of study ..
	Applying knowledge and understanding:
1 (Bachelor)	[through] devising and sustaining arguments
	Making judgements:
1 (Bachelor)	[involves] gathering and interpreting relevant data
	Communication:
1 (Bachelor)	[of] information, ideas, problems and solutions
	Learning skills:
1 (Bachelor)	have developed those skills needed to study further with a high level of autonomy

With the implementation of the Bologna process in 2010, all the modules and programs in the member states are described using methods based on the results, i.e., in terms of learning outcomes. Learning outcomes are a statement of what a student is expected to be able to do as a result of learning activities (Jenkins and Unwin, 2001).

Since there is no common understanding of the term "competence" in literature, learning outcomes gained a wider circulation as a means of describing what students need to know, understand and/or be able to demonstrate at the end of the module or program (Gidrovich, Egorova and Kurochkin, 2010).

One of the most applicable methods in this case is Bloom's taxonomy with the following classification and learning outcomes:
1. knowledge, 2. understanding, 3. application, 4. analysis, 5. synthesis, 6. evaluation
- Knowledge can be defined as an ability to reproduce or remember facts, not necessarily understanding them.
- Understanding can be defined as an ability to understand and interpret acquired information.
- Applications can be defined as an ability to use learned material in new situations, for example, to apply the ideas and concepts to problem solution.
- Analysis can be defined as an ability to break the information in pieces, for example, to search for links and ideas (understanding an organizational structure).
- The synthesis can be defined as an ability to put the pieces into a whole.
- Evaluation can be defined as an ability to judge the value of material for this particular purpose.

The description of the competences is based on Bloom's taxonomy.

Level of bachelors' preparedness

Increased competition in the labor market creates new challenges for universities. There is a necessity as far as possible ahead of the demands of employers. However, it is very difficult to perform because the state educational standards are a framework and do not timely respond to the dynamics of demand.

Another thing is educational programs developed by educational institutions. They respond promptly to requests from the labor market. However, there may occur some problems, as highlighted above, we have professional competence of the manager may not always accurately describe certain personal qualities and abilities. (In our case it is typical for a manager at various levels). Thus, to have quality programs, it is necessary to identify and analyze the functions of employees' job descriptions and their professional competence. When conducting the research, another definition of professional competence was formulated. (Smirnov, Pahalyuk): "Professional competence is the willingness (ability) of the employee based on the learned knowledge, skills and experience gained to solve the typical professional tasks, to overcome the problem of production situations. They characterize a person as a subject of special activities (as professionals). High competence of employees means that they are guided in a given occupational (industrial) problem, understand its essence, its own ways of successful practical solutions.

Accordingly, a set of leading competences reflects the real expert. The level of developing leading competences is the ultimate result of training, because the specialist does not need to know the individual disciplines (economics, mathematics, chemistry), but be prepared to address common professional challenges, to act in appropriate work situations.

Studies were conducted in the most important branches of economy. They showed the importance of certain qualities and competencies. For example, for senior and middle managers importance assessment of personal qualities are as follows:
1. Responsibility, the ability to work independently as well as the ability to work as a team;
2. Creative approach to business, intuition (estimated from 2.5 to 2.9 points).

Later in the research graduates' overall level of competence has been tested. The results of studies have shown that the highest level refers to theoretical training and expertise, 75% and70% respectively. In this case, the practical application of knowledge is at a much lower level - 40%.

Table 2: Graduates assessment

Preparedness Indicator	Correspondence with the real needs		
	More than enough	Corresponds	Insufficiently corresponds
Theoretical background	10	75	15
Practical skills	30	40	30
Professional skills	20	70	10
The level of learning technology	20	50	30

Similar results were obtained during the 2006 Agency "ReytOR" commissioned by the Foundation for Oleg Deripaska, "The Free Business" study on "Economic education in the universities of Moscow.

In a study in-depth interviews were conducted with heads of schools and businesses, employers, and organized formal surveys of target groups - college seniors, graduate departments of teachers and employers (supervisors of young professionals in the enterprise). The total number of respondents who participated in the study amounted to more than 2,000

people. In general positive results on this issue were received: more than 60% of respondents stated that they have working skills of young professionals meet the requirements of their work. However, these positive results at first glance.

In fact, employers do not take graduates as specialists. For them in many ways it is the material to make a good employee from. Nearly two-thirds of employers believe that graduates with degrees in Economics are necessary to teach additionally. Moreover, the proportion of employers, who have indicated that young professionals match the requirements to the jobs they apply to, is more than 60%.

Thus, there is an obvious necessity to develope a mechanism of monitoring maturity of professional competences according to the algorithm described above. Thus, we have identified certain personal qualities that are to be created when forming undergraduate managemers' professional competence such as:
1. Responsibility,
2. Ability to work independently,
3. Ability to work in a team,
4. Creativity,
5. Intuition,
6. Assertiveness

Let us consider the first stages of the research, conducted by the authors.

Stage 1. Determining input and output competences forming the prerequisites a manager must have
At the first stage we identified training courses, the study of which is preceded by the subject of " Developing and taking management decisions". Since we are interested in a set of competencies that a bachelor must acquire when studying the course "Developing and taking management decisions," it is necessary to determine the location of the course in the academic cycle. In accordance with the educational standards, "Developing and taking management decisions" is studied by third-year- students along with "Business Ethics", "Marketing", "Financial Management","Human Resource Management", "Strategic Management", "Project Management". The variable part consists of two disciplines - "Operations Management" and "Taxes and taxation". In order to create a structure-logical scheme of competence formation when studying "Developing and taking management decisions", it is necessary to bring the competencies to be learned into a single scheme (see Table 2. Let us consider in detail the competencies in each area to identify the disciplines studying of which must precede studying "Developing and taking management decisions".

Enterprise in Turbulent Environment

Table 3: Professional competence formed when studying "Developing and taking management decisions"

Organizational and managerial activities	Information and analitical activity	Business activity
PC-1, PC-18, PC-3, PC-19, PC-29, PC-16, PC-28	PC-35, PC-47	PC-48, PC-49, PC-50

Organizational and managerial activity

PC-1: knows the main stages of the management thought evolution, outstanding managers' experience and knows how to match them with the circumstances of their own practices); PC-3: is able to offer organizational and managerial decisions and assess conditions and consequences of decisions made;

PC-14: considers the implications of management decisions and actions from the perspective of social responsibility;

PC-16: possesses methods of making strategic, tactical and operational decisions when managing organizations;

PC-18: possesses the tools of strategic management to develop the organizational strategy;

PC-19: is able to analyze the relationships among strategies of different levels in order to prepare balanced management decisions;

PC-29: is able to make decisions using corporate information systems;

PC-28: is able to develop management procedures and controls, knows reengineering methods of business process;

Let us bring the competencies formed and preceding disciplines into the table (see Table. 3).

The analysis of this table reveals the sequence of studying the subjects, as well as "incoming" competences, formed in the previous cycles - mathematical and scientific cycle and human, social and economic cycle.

Table 3: Organizational and management activity – preceding disciplines

Preceding discipline	Theory and History of Management	Organizational Theory and Organizational	Business Ethics	Business Ethics	Strategic Management	Strategic Management	Expert Systems and Decision Support Systems	Project Management, Operations Management	Theory and History of Management
Formed competence code	PC-1	PC-3	PC-14	PC-16	PC-18	PC-19	PC-29	PC-28	PC-1

First, it is necessary to define the output competences of the professional cycle subjects, on the basis of which the input competences of the course "Developing and taking management decisions" are generated (see Table 4).

Enterprise in Turbulent Environment

Table 4: Output competencies of the professional cycle disciplines

Preceding discipline	Theory and History of Management	Organizational Theory and Organizational Behaviour	Business Ethics	Strategic Management	Operations Management	Project Management	Research Methods in Management
Competencies generated at the output	PC-1, PC-2, PC3, PC-21, PC-47, PC-50, PC-54	PC-1, PC-2, PC-5, PC-6, PC-7, PC-8, PC-9, PC-10, PC-11, PC-12, PC-13, PC-14, PC-15, PC-	PC-2, PC-3, PC-53	PC-9, PC-16, PC-17, PC-18, PC-19,	PC-16, PC-20, PC-21, PC-47	PC-24	PC-54, PC-55, PC-56, PC-57, PC-58, PC-59, PC-60

In accordance with the educational standards, it is possible to identify output competencies, part of which is the input for the subject studied. For example, as a result of developing "Theory and History of Management", the following competencies should be formed:

Organizational and management activity:
PC-1: knows the main stages of the management thought evolution, outstanding managers' experience and knows how to match them with the circumstances of their own practices);
PC -2: is aware of the social importance of their future profession, is highly motivated to carry out professional activities;
PC-3: is able to offer organizational - managerial decisions and assesses conditions and the consequences of decisions made;
ПК-21: knows modern concepts of organizing operational activity and is able to plan operating (production) activities of organizations;
Information and analytical activity:
PC-47: is able to analyze the operating activities of the organization and use its results to prepare management decisions;
Business activity:
PC-50: is able to assess the economic and social conditions of entrepreneurial activity;
Research and development activity:
PC-54: possesses rules of the problem stating, formulating and testing scientific hypotheses, uses modeling techniques in research, knows the main sources of social and economic information: databases, journals, and conferences.
Besides forming the above-mentioned competencies, studying "Organizational Theory and Organizational Behaviour" leads to forming the next set of competencies:
Organizational and management activity:
PC5: is able to use knowledge about working with groups of people and individual workers in management activity;
PC-6: is able to design an organizational structure to carry out distribution of powers and responsibilities;
PC-7: is able to actively participate in the implementation of the organizational change program;

Enterprise in Turbulent Environment

PC-8: is able to apply the basic results of motivation theory, leadership and power to solve management problems;

PC-9: is able to participate in the development of organizations' human resource management strategy, to plan and carry out activities aimed at its implementation;

PC-10: possesses modern personnel management technologies;

PC-11: is capable of analysis and design of interpersonal, group, and organizational communication;

PC-12: possesses different ways of conflict resolution;

PC-13: is able to effectively carry out management functions in a multicultural environment;

PC-14: considers the implications of management decisions and actions from the perspective of social responsibility;

PC-15: considers aspects of corporate social responsibility in developing and implementing the organization's strategy;

Studying "Business Ethics" adds to competence formation:

Business activity:

PC-53: ensures the implementation of corporate social responsibility through a close interaction in the business process with all stakeholders, including local authorities, trade associations, local communities, etc.

"Strategic Management" at the output assumes formation of the following competencies, besides the above mentioned.

Organizational and managerial activity:

PC-16: possesses methods for making strategic, tactical and operational decisions in the management of organizations;

PC-17: is able to participate in developing marketing strategies of organizations to plan and carry out activities aimed at its implementation;

PC-18: possesses the tools of strategic management to develop organization strategy;

PC-19: is able to analyze the relationship between the strategies of different levels in order to prepare balanced management decisions;

The subject "Operational Management" is directed to forming competencies in the organisational and managerial activity.

PC-20: is able to participate in the implementation of technological and product innovations;

Information and analytical activity:

PC-47: is able to analyze operational activities of the organization and use the results to prepare management decisions.

The subject "Project Management" provides an opportunity to form the competence of ownership of project management and willingness to implement them using modern software (PC-24).

The course "Research Methods in Management" allows creating the following competences:

Research and development activity:

PC-54: possesses rules of the problem stating, formulating and testing scientific hypotheses, uses modeling techniques in research, knows the main sources of social and economic information: databases, journals, and conferences;

PC-55: possesses methods of quantitative and qualitative analysis and modeling, theoretical and experimental study;

PC-56: is able to collect, analyze and process the data necessary to solving the research problems;

PC-57: is able to select the tools to handle the information in accordance with the set of scientific problem, analyze the results and justify the conclusions;

PC-58: is able to analyze and interpret financial, accounting and other information from reports of enterprises of different ownership forms, organizations, agencies, etc. and use it in the scientific work;

PC-59: is able to analyze and interpret the data of domestic and foreign statistics on socio-economic processes and phenomena, to identify patterns of change of socio-economic indicators;

PC-60: is able to use modern technologies to solve analytical and research problems.

The analysis of the information provided allows seeing that different disciplines are aimed at developing the same professional competencies. For example, the PC-1 and PC-2 competencies are formed when studying the disciplines of "Theory and History of Management", "Organization Theory and Organization Behaviour", "Business Ethics."

The PC-54 competence is formed when studying such subjects as "Theory and History of Management", "Organization Theory and Organization Behaviour", "Research Methods in Mnagement". Formation of many competencies continues in the process of studying "Developing and taking management decisions" which is interdisciplinary. Analysis of the competencies that are to be formed as a result of the course, makes it possible to conclude that almost all the disciplines of professional cycle in a third-year course "Management" should precede the subject "Developing and managing decisions". In this context, the definition of input and output competencies forming prerequisites for the formation of professional competence manager, is only the first step in the process of creating a logical chain formation of professional competence manager.

2   EMPIRICAL METHODOLOGY

According to the developed algorithm for the diagnosis the authors have chosen the following methods:

1. The "Study of motivation in high school" method (T. I. Ilina) includes the three scales: "The acquisition of knowledge" (the desire for knowledge, curiosity); "Mastering the profession" (the desire to master the professional knowledge and build professional qualities); "Getting a diploma" (the desire to acquire a diploma in formal learning, the desire to find workarounds for exams and tests) (Guidance on developmental psychology, 2002, pp. 491–493; http://www.psychometrica.ru/index).

2. Johnson's Creativity Questionnaire (Johnson) to modify E. Tunik (2000, pp. 8–9) is designed to study the development of creative thinking of students. Allows defining characteristics of creative thinking and behavior, available to external observation, on eight scales: sensitivity to the problem, preference of complexity, fluency, flexibility, resourcefulness, creativity, imagination, an ability to structure, originality, creativity and productivity, independence, originality, confident style of self-behavior, self-contained behavior.

3. Verification assertiveness test which is designed to assess assertiveness - an ability to not act against anyone, while respecting the rights of others, but not allowing the "twist of the rope" (http://www.businesstest.ru/).

4. "The willingness to take risks," Schubert (PSK) test to evaluate readiness to take risks. Risk is understood as an action at random in the hope of a happy outcome, or as a potential danger, as action to be taken in the face of uncertainty. Studies based on this test showed that in general: women's willingness to take risk is realized in a more specific situation than men; The military commanders' and business leaders'

willingness to take risks is higher than that of students, with the growth of the individual in a situation of exclusion of internal conflict is growing willingness to take risks, in terms of willingness to take risk is stronger than acting alone, and depends on the expectations of the group (http://www.businesstest.ru/).

5. Test to determine intuition (VV Travin, MI Magura, MB Kurbatova "Preparation and implementation of management decisions ") shows what intuition level a man has.
6. Reference type test
7. This test is mainly used in order to understand whether the trainee is a responsible person. It is likely to predict whether he/she will take responsibility for the progress achieved or will constantly refer to the interference of some external circumstances, the effect of "no season", third parties, etc. Besides, if he would wait help from the outside or try to solve problems on their own, whose estimate they will more rely on - their own or other people's. Also, the test results will indicate the degree of self-confidence, personality strength, and maturity level.

The methodology is based on two conditions:
People differ in how and where they localize control over the events which are significant for themselves. There are two polar types of such localization: external and internal types refer to external and internal reference. In the first case, a person believes that the events that happen to them are the result of external forces – chance, other people, etc. In the second case, a person interprets significant events as a result of their own activities. A person has their certain position on a continuum stretching from external to internal type.

Locus of control, which characterizes an individual, universal in relation to all types of events and situations he has to face with. The same type of control characterizes the behavior of the personality in case of failures and achievements in the field, and this applies equally to the different areas of social life.

The study involved 70 third-year undergraduates of Management faculty.

3   DIAGNOSTIC RESULTS

First, testees were asked to describe the competencies a Bachelor of Management, in their opinion, should have. Test results showed that about 30 percent of students do not fully understand what the competence is, confuse these concepts with the traits and personality characteristics, etc. About 50 percent of respondents said two or three taxonomic competencies that match level of analysis and two or three qualities that a manager should have, for example - an ability to take risks and to work in a group.

The next step was to conduct a series of tests to determine the presence of formation and some of the qualities that we identified in the previous step of the algorithm.

We conducted motivation diagnostics for learning with a test "Studying motivation in high school" (T.I.Ilinoy) (See Chart 1).

The tests showed that among the respondents there is domination of "Getting diploma" scale i.e., the desire to acquire a diploma in formal learning, the desire to find workarounds for exams and tests - 75% of students surveyed.

In second place there is "The acquisition of knowledge" scale, i.e., the desire for knowledge, curiosity. About 75% of the students also preferred this third direction, while about 12% have set this direction on the first place for themselves.

And finally, "Skills development" sale takes the third place, i.e., the desire to master the professional knowledge and build professional qualities. In this case, only 1,25% of the students have put this direction in first place.
Chart 1: Test results "Motivation to learning in Higher Educational Instittions"

In general, it can be concluded that, first, a sufficiently large number of students are not satisfied with their chosen profession, or they have made the inappropriate choice because of some circumstances.

Second, the data from this study repeat findings mentioned above: in training students the weakest point is practical application of knowledge and skills, while theoretical background is at a higher level.

Next "Risk tolerance" test was conducted (Chart 2)
Chart 2: Risk Sentiment–Test Results

Assertiveness test results are shown in Chart 3.

The test results show that about 20% of the respondents tend to make high-risk decisions, while the rest have an average tendency to risk, i.e., make balanced and rational decisions.

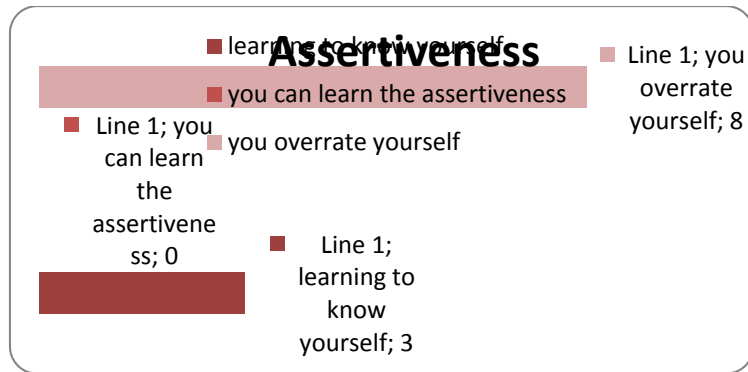
Enterprise in Turbulent Environment


Chart 3: Assertiveness Test Results. Row 1

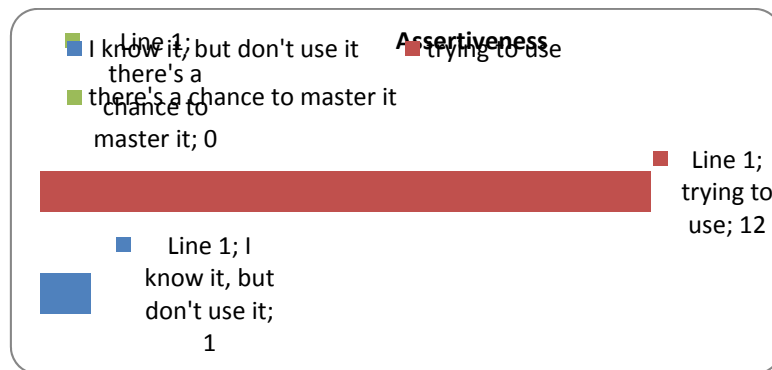
The chart shows that about 78 % of the respondents overestimate their ability to achieve the desired result, about 21 % are willing to learn to be themselves, and 1% think it is possible to learn.


Chart 4: Assertiveness Test results. Row 2

The chart says that about 70% of respondents try to apply this technique, while the remaining 30% do not use it.

The following tests show the creativity of students diagnosed (Chart 5). Among respondents low and very low level of creativity is not inherent to any student. The average level of creativity was identified in 14% of students, high and very high - 55% and 31% respectively.
Chart 5: Creativity Test Results

Test of determination the references types revealed that 17% of respondents have a normal level of subjective control. 52% can be attributed to the internal type, which corresponds to a high level of subjective control over any important situations. They believe that the most important events in their lives are the result of their own actions, that they can manage them, and so they feel their own responsibility for these events and their life in general. 31% can be attributed to the external type. Low test level corresponds to the low level of subjective control. These people do not see any connection between their actions and significant events of their life, do not consider themselves being able to control this relationship and believe that most of the events and actions are the result of a chance or other people's actions.

4   CONCLUSION

Thus, making conclusions it should be mentioned, that in the process of work we identified the main professional competencies, formed when studying "Developing and Taking Management Decisions"; identified some characteristics, bachelor management students should possess; chose test methodology and conducted students input test at the beginning of their studying the said discipline mentioned. Tests showed that students have a high creative potential, aimed at a general theoretical knowledge and getting a diploma more than the possibility of its application, they are not very risk averse, and tend to be assertive and willing to learn it.

Further work is aimed at developing and applying techniques of professional competence formation, accurate fixing learning results and further testing. The results of further studies will be described in the following articles.

ABSTRACT
Using a large sample analysis of Thai listed firms, we address an important question. Do board diversity and network add value to firms? This article extends the debate on the benefits and costs of board diversity and network and their effect on the broader picture of corporate governance. Moreover, this article sheds light on the necessity of applying the resource dependence theory in research about boards of directors, in addition to the agency theory. We find that diversity in age and study majors are positively related to Tobin's Q ratio, while diversity in educational levels leads to lower firm value. Our results suggest that boards with diverse age groups and study areas might generate useful advice and complement each other; however, those with diverse educational levels might create costs due to possible conflicts and a lack of coordination and communication. In addition, the results show that alumni networks have a positive effect on Tobin's Q ratio. The findings further suggest that an alumni network is significant to firms because it could help firms obtain external resources. Overall, our research provides significant findings for policy makers to widen viewpoints about corporate governance practices and human resource development in emerging countries.

Keywords: Board of Directors, Diversity, Firm Value, Network, Thailand

1 INTRODUCTION

In a world of increasing globalization, where countries cooperate in order to create even larger economic communities, questions arise as to what are the most important characteristics in determining the success of a firm in a particular market? Given that many countries have different cultural backgrounds and legal frameworks, it is not necessarily going to be the case that the characteristics that guarantee success in one market lead to success in another. However, a common characteristic of many firms is the presence of a board of directors.

A board of directors is one effective governance mechanism, the efficacy of which is widely recognized in both U.S. and non-U.S. models (Globerman, Peng and Shapiro, 2011; Hermalin and Weisbach, 2003; Kaplan and Minton, 1994; Yermack, 2006). In theory, a board represents all shareholders. It is charged with hiring, monitoring, evaluating, replacing, and advising management to ensure that all managerial decisions maximize shareholder returns. Among these functions, the monitoring and advising functions appear to be the most important (Adams and Ferreira, 2007; Boone, Field, Karpoff and Raheja, 2007; Raheja, 2005). Given the influence that a board of directors has on a firm, and thereby its chances of success, an obvious question is, what characteristics do successful boards share in a particular market?

Because the individuals who constitute boards have a great deal of influence over the decision-making process, shareholders and potential investors need to be aware of, and understand, the various characteristics of the individuals who make up the board. When examining this issue, most existing literature has focused on board composition, in particular the monitoring role of boards in governing management teams based on a principle-agent framework. While board composition is considered an important corporate governance mechanism (Globerman et al., 2011; Hermalin and Weisbach, 2003; Kaplan and Minton, 1994; Yermack, 2006), previous work has suggested that other board characteristics such as qualifications and competency of directors, diverse background of directors and the social network of board members are also important during the decision-making process (Espenlaub, Khurshed and Sitthipongpanich, 2012; Johnson and Powell, 1994; Peng, Buck and Filatotchev, 2003).

Moreover, Jiang and Peng (2011) suggest that institutions matter in corporate governance. Network is one of the major institutional characteristics in economies with inefficient markets. At the micro-level, network—both political and alumni, for example—could increase firm value; on the other hand, policy makers should be aware of unfair treatments from close connections. At the macro-level, improving resource allocation could help institutional and economic development. We ask whether firms could overcome market inefficiency through informal and private networks of directors.

When assessing the significance of boards of directors on firm performance and value, the majority of existing empirical research focuses on board structure, which is based upon a principle-agent framework. Specifically, existing studies examine how the size of the board, degree of separation between the chairman and the CEO, and increasing representation by independent directors make boards more effective in the performance of their monitoring role. While the agency theory views a board of directors as monitors over management teams, the resource dependence theory suggests that directors play an important part in providing various advice to managers and extracting external resources for firms.

This study examines how the characteristics of a board influence decision making within a firm. In particular, this paper examines how diversity in the characteristics of a board such as gender, age, educational background, professional expertise and international perspectives affect firm value. On the one hand, it may result in new ideas and skills being brought into the firm, which improve monitoring and advisory efficiency (Anderson, Reeb, Upadhyay and Wanli, 2011). On the other hand, a board with highly diverse individuals may experience some coordination and communication problems (Milliken and Martins, 1996). Additionally, not only does a diverse board bring ideas and skills, but also they bring their social networks of both personal and professional connections. Agrawal and Knoeber (2001), Khwaja and Mian (2005) and Siegel (2007) document, for example, that political networks could help firms obtain external resources such as government concessions; moreover, networks of friends and alumni could provide useful information including opportunities for investment. Nevertheless, Fan, Wong and Zhang (2007) argue that politically connected boards adversely affect firm value and might lead to expropriation problems.

Additionally, the majority of previous studies have analyzed boards in developed markets such as the U.S., UK, Japan, Germany, and Australia. Little evidence has been documented on how board characteristics influence the decision making of firms in emerging markets, such as those in Asia. This study aims to redress this balance in part by using the experience

of Thailand as an example. The 1997 Thai economic meltdown had been perceived as the origin of the whole Asian region's financial failure, indicating that more understandings about Thai firms are needed (Peng, Au and Wang, 2001). Moreover, institutional settings in which corporate governance is embedded are different between developed and emerging markets (Claessens, Djankov and Lang, 2000; Globerman et al., 2011; La Porta, Lopez de Silanes and Shleifer, 1999). Furthermore, a single country study provides a unique analysis because the influence of board of directors can vary under different legal systems, institutional settings, and governance frameworks (Filatotchev, Jackson and Nakajima, 2012).

This study aims to make a number of contributions. First, in addition to examining board composition, an area that has already been extensively studied, we examine how diversity in gender, age, educational background, professional expertise, and international perspectives affect firm value. Second, previous research by Yammeesri and Herath (2010) determines that board composition is not related to firm value in Thai firms. Hence, in this paper we attempt to determine what are the characteristics of Thai boards that do influence firm value. Third, we extend the research done by Choi, Park and Yoo (2007), who focus on the role of outside independent directors as a mechanism of corporate governance in response to the regulatory reform after the Asian financial crisis. The authors find the strong effect of board independence on firm value. We extend their paper by looking at the characteristics of Thai boards in response to public attention of good governance practices, e.g., director qualifications, board diversity and network, and board composition in the wake of the Asian financial crisis. Finally, networks are found to be one of the key institutional characteristics in the Asia-Pacific region (Bunkanwanicha and Wiwattanakantang, 2009; Espenlaub et al., 2012; Peng et al., 2001; Siegel, 2007). In Thailand, Peng et al. (2001) find that military directors are significant to multinational firms. This article differs from Peng et al. (2001) in that proxies of networks combine both political connections, namely ex-military and ex-bureaucrats, and university alumni networks. The remainder of this article begins with backgrounds of corporate governance in Thailand, followed by hypotheses, methods, findings, and discussion.

2 HYPOTHESES

This study breaks down our question of diversity and network into eight discreet hypotheses. Six hypotheses concerning diversity are addressed: 1) gender, 2) age, 3) educational levels, 4) study majors, 5) expertise, and 6) international perspectives. The two remaining hypotheses concerning network are addressed: 7) political connections and 8) alumni networks.

2.1 Gender

From the view that female directors bring different ideas and attributes to board discussions and provide additional board monitoring (Letendre, 2004), gender diversity on boards benefits the firms. We hypothesize that a higher proportion of female directors increases firm value.

Therefore:
Hypothesis 1 Diversity in gender has a positive impact on firm value.

2.2 Age

Regarding how age diversity in boardrooms affects performance, Hagendorff and Keasey (2012) document that director age diversity increases merger returns in the banking industry. McIntyre and Mitchell (2004) find a positive effect of the variation in director age on firm performance. They also find that there exists an optimal level of age diversity among board

Enterprise in Turbulent Environment

members. Thus, they argue that boards with too little diversity may lack a variety in knowledge, skills and experience, while boards with too much diversity may have conflicts and communication problems.

Therefore:
Hypothesis 2 Diversity in age has a positive impact on firm value.

2.3 Educational levels
As noted by prior research, the educational level indicates an individual's knowledge base and intellectual ability (Bhagat and Black, 1999). A director could use his/her educational knowledge to come up with distinctive perspectives and innovative ideas in advising the management team. It is expected that a board of directors with diverse educational levels could provide applicable and constructive advice to boards, thus resulting in higher firm value.

Therefore:
Hypothesis 3 Diversity in educational levels has a positive impact on firm value.

2.4 Study majors
Various academic majors of directors likely provide managers with broader advice, consistent with the findings of Kim and Lim (2010). They document that diversity in study areas is positively related to Tobin's Q ratio.

Therefore:
Hypothesis 4 Diversity in study majors has a positive impact on firm value.

2.5 Expertise
A board of directors could effectively perform as a result of the presence of diverse functional knowledge and skills of directors. A diversity of talented members could allow firms to obtain different external resources. Using their area of expertise, directors can contribute ideas and share their experience in board meetings (Anderson et al., 2011). It is expected that the expertise of directors matters to firms and will increase the effectiveness of boards and possibilities to obtain external resources, thus leading to higher firm value.

Therefore:
Hypothesis 5 Diversity in expertise has a positive impact on firm value.

2.6 International perspectives
We hypothesize that directors graduated from abroad are expected to have wider viewpoints and to conform to the international environment, which might bring higher competitive advantages over their local rivals (Leblanc and Gillies, 2005). Therefore, it is expected that directors with international perspectives could bring higher benefits, hence increasing firm value.

Therefore:
Hypothesis 6 Diversity in international perspectives has a positive impact on firm value.

Enterprise in Turbulent Environment

2.7   Political connections

Political connections are found to be related to firm performance. The relationship between outside directors with government experience and firm value is positively significant (Kim and Lim, 2010). The experience of retired bureaucrats is considerably useful in some industries, and firms that deal with the government generally appoint ex-bureaucrats as their directors (Agrawal and Knoeber, 2001; Miwa and Ramseyer, 2005). we expect that political connections of directors are beneficial to firms.

Therefore:
Hypothesis 7 Political connections of directors have a positive impact on firm value.

2.8   Alumni networks

Directors graduated from elite universities are expected to be socially united because of strong ties among alumni and a long history of their institutions. Directors who are tied to such social networks are believed to obtain useful information because of lower asymmetric information among network members (Palmer and Barber, 2001; Siegel, 2007). The relations among network members could facilitate connected directors to extend relations to other stakeholders of firms. Such linkages can obviously help firms in accessing potential markets and finding financial or strategic partners. As a result, connected directors would be able to bring higher financial benefits to firms.

Therefore:
Hypothesis 8 Alumni networks of directors have a positive impact on firm value.

3   SAMPLE, DATA AND METHODOLOGY

Sample firms are non-financial firms listed on the SET, covering the period of 2001 to 2005. This sample period reflects the consequences of one of SET's best practice responses to the financial crisis in 1997, which was to promote professionalism through the training of directors of Thai listed firms. In addition, the period highlights the foresight of listed firms and policy makers in improving corporate governance concerning boards of directors.

The information used to define board characteristics is publicly available from the SET. We focus only on director data, which are provided in Form 56-1, which the Stock Exchange of Thailand requires all listed firms to submit. It is used to disclose relevant information of the company to the public. In addition, financial data are collected from the SETSMART database, which compiles company information of Thai firms listed in the SET. In this study, all financial data are winsorized at 1% and 99%.

We exclude firms in the banking and financial sector because of their non-traditional financial statements. Firms with missing 56-1 forms and financial statements are also removed from the sample. In addition, observations are excluded from the sample if the firm data are in the year of rehabilitation.

We obtained director biographies, including gender, age, educational background, and previous work experience over the previous five years (or more). The individual director data are quantified and aggregated for the whole board to describe the characteristics of a board of directors. Then we define board diversity and network.

Regarding variables in director characteristics, gender diversity is measured by the ratio of the number of female directors to the total number of directors. Diversity measures of age, educational levels, study majors, and expertise are defined by a modification of the Herfindahl Index (HHI). HHI is a concentration measure, while our modified index is a measure of diversity, which is also applied by Hagendorff and Keasey (2012) and Kim and Lim (2010).

Age of directors is divided into five age cohorts: less than 30 years old, 31-40 years old, 41-50 years old, 51-60 years old, and greater than 60 years old. Diversity in age is defined as follows:

$$\text{Diversity in Age}_{i,t} = 1 - \left[\sum_{g=1}^{n}\left(\frac{Age_g}{Total\ number\ of\ directors}\right)^2\right]_{i,t}$$

where Age_g = the number of directors in each age cohort (g).

The educational levels are categorized into the four highest educational levels, i.e., below bachelor's, bachelor's, master's, and doctoral degrees. The variable of the educational levels is defined as a percentage of directors with each of the highest degree level within a board of directors. Diversity in educational levels is defined as follows:

$$\text{Diversity in educational levels}_{i,t} = 1 - \left[\sum_{g=1}^{n}\left(\frac{Edu_g}{Total\ number\ of\ directors}\right)^2\right]_{i,t}$$

where Edu_g = the number of directors in each category of educational levels.

We also classify different knowledge bases into six study areas: 1) accounting/finance/economics, 2) business-related knowledge, 3) law, 4) engineering/science, 5) medicine, and 6) others.[1] Diversity in study majors is defined as follows:

$$\text{Diversity in study majors}_{i,t} = 1 - \left[\sum_{g=1}^{n}\left(\frac{Major_g}{Total\ number\ of\ study\ majors\ of\ all\ directors}\right)^2\right]_{i,t}$$

where $Major_g$ = the number of majors held by all directors in each study area.

Work experience of directors is divided into seven areas of expertise: 1) accounting/finance/economics, 2) business, 3) law, 4) engineering/science, 5) medicine, 6) academic professor, and 7) others.[2] Diversity in expertise is defined as follows:

---

[1] The Type 2 knowledge base is defined to capture the effect of business-related degrees, which are excluded from Type 1.

[2] We use pairwise correlation analysis to test whether variables of diversity in study majors and diversity in expertise are highly correlated. We find that these two independent variables are not significantly correlated.

$$\text{Diversity in expertise}_{i,t} = 1 - \left[\sum_{g=1}^{n} \left(\frac{Expertise_g}{Total\ number\ of\ work\ experience\ of\ all\ directors} \right)^2 \right]_{i,t}$$

where $Expertise_g$ = the number of work experience held by all directors in each area of expertise.

The variable of diversity in international perspectives of directors is defined as the ratio of the number of directors graduated from abroad to the number of directors graduated from local institutions.

Network variables are defined to demonstrate director abilities in seeking and obtaining external resources and information from their social networks. We define political connections as a dummy variable that is equal to 1 if there is a former government, police, or military officer on board, and zero otherwise. The alumni network variable is defined as a proportion of directors who graduated from Chulalongkorn University, which is the most elite and longest established university in Thailand.

Considering board composition, board size is defined as the number of directors. Board independence is measured by the fraction of independent directors. CEO duality is a dummy variable equal to 1 if the CEO also holds the position of chairman of the board, and zero otherwise. The percentage of executive and non-executive directors to total directors is also provided in the descriptive analysis.

We investigate the impact of board diversity, network, and composition on firm value, using a regression analysis. The model is controlled by industry and year effects as follows:

$$Firm\ value_{i,t} = \alpha_{i,t} + \beta_1 Gender_{i,t} + \beta_2 Age_{i,t} + \beta_3 Edu_{i,t} + \beta_4 Major_{i,t} + \beta_5 Expertise_{i,t} + \beta_6 Inter_{i,t}$$

$$+ \beta_7 PolCon_{i,t} + \beta_8 Alumni_{i,t} + \beta_9 BoardSize_{i,t} + \beta_{10} Independence_{i,t} + \beta_{11} Duality_{i,t}$$

$$+ \beta_{12} Size_{i,t} + \beta_{13} Leverage_{i,t} + \beta_{14} Firm\ age_{i,t} + \beta_{15} Sales\ growth_{i,t} + \beta_{16} Ind_{i,t} + \beta_{17} Year_{i,t} + \varepsilon_{i,t}$$

Firm value is measured by the market to book ratio (a proxy of Tobin's Q ratio), which is the ratio of market value of total assets to book value of total assets. Our main independent variables include board diversity and network as discussed in the previous section. We also introduce several variables into our analysis to control for board composition, firm characteristics, and industry and year effects. Board composition includes board size, board independence, and CEO duality. Firm characteristics include size (proxied by the log of sales), leverage (proxied by the ratio of total debt to total assets), firm age (proxied by the number of years since establishment), and sales growth (proxied by the annual change in sales).

4   FINDINGS
Table 1 shows that gender diversity is low in Thai boardrooms. Only about 16% of total directors are female. Nevertheless, around three quarters of the sample firms have at least one woman on the board. Concerning director age, the results show that the average age of

directors is roughly 55 years old, with the youngest average age of around 40 years old and the oldest average age of around 70 years old. When separating director age into five cohorts, we find that directors who are in the range of 51-60 years old are appointed most often, with the average number of four directors and the maximum number of 18 directors per board. Moreover, about 95% of companies have at least one director who is in the 51-60-years-old age cohort. Interestingly, directors who are younger than 40 years old occupy only one board seat on average. Nonetheless, these young directors are appointed by almost 60% of firms. As for age diversity measure, the mean value is 0.59 (median, 0.62), while the highest value is 0.78.

Regarding educational levels of directors, almost 10%, 40% and 35% of directors have the highest degree of a doctoral, master's, and bachelor's degree, respectively. Diversity in educational levels is similar to diversity in age. Specifically, the average diversity index is 0.57 (median, 0.59) and the maximum is 0.75. The results of study majors of directors show that business administration is the most frequently found academic major on the board, followed by accounting/finance/economics and engineering/science, respectively. It is interesting to find that law is one of the least commonly found study areas in our sample. Diversity measure of educational majors appears to be higher than that of educational levels. More precisely, the mean value of diversity measure of study majors is 0.65 (median, 0.68) with the maximum value of 0.82.

As expected almost all firms have a director with some business expertise, while roughly 60% of the firms have a director with accounting, financial, or economics skills. Consistent with the results of educational background, only 20% of firms appoint a director with legal experience. Also, academicians are appointed as director in less than 10% of firms. Compared with other diversity indices, expertise diversity index is the lowest. The average is 0.4 (median, 0.42) and the highest is 0.79. This result shows that expertise of directors is not as diverse as study areas. Furthermore, on average, about 60% of the directors have studied overseas. As a diversity measure of international perspectives, the average ratio of the number of directors with international education to the number of directors with local education is 2.13 (median, 1.4). The ratio ranges from 0 to 18.

Considering networks of boards of directors, interestingly, a large number of Thai listed firms appoint directors who were in government sectors. Approximately 70% of the sample firms appoint former bureaucrats as the directors. As for the network through education from alumni of the most prominent university in Thailand, about 15% of the directors are alumni of Chulalongkorn University.

In terms of board composition, the results show that the average number of directors on board is around 11, with the minimum of five (as stipulated by the law) and the maximum of 25. Independent directors account for about one third of total directors, which is consistent with the regulation by the SET. This may imply that listed companies appointed independent directors only to meet the minimum requirement. However, when considering the fraction of external directors (i.e., independent and non-executive directors), these directors consist of roughly 60% of total board seats, which is the majority of the board. We also find that almost one quarter of Thai companies combine the CEO and chairman positions.

Table 2 shows the impact of board diversity and networks on firm value. Model 1 presents the regression results of the effects of diversity on firm value. In addition to board diversity, we investigate the impact of board networks on firm value as shown in Model 2. In Model 3, we combine variables of board diversity and networks.

Focusing on board diversity, the results of Model 1 and Model 3 show no evidence to support the impact of gender diversity on firm value. Hence we reject Hypothesis 1. These findings are consistent with Zahra and Stanton (1988), Shrader, Blackburn and Iles (1997), and Rose (2007). Model 1 also shows the insignificant result of age diversity. However, in Model 3, age diversity becomes positively significant to firm value, which supports Hypothesis 2. The significance level is marginal, though. The significance of age diversity to firm value is in line with McIntyre and Mitchell (2004) and Hagendorff and Keasey (2012). In both Model 1 and 3, we find that diversity in educational levels leads to lower firm value. The significantly negative relationship between the diversity in educational levels and firm value indicates that Hypothesis 3 is rejected. In contrast, the firm value is positively associated to the diversity in study majors. Thus, we accept Hypothesis 4. Nevertheless, the results show that diversity in expertise and international perspectives of boards are not significant to firm value. Thus, we reject Hypothesis 5 and Hypothesis 6.

In addition to board diversity, we investigate the impact of board networks on firm value as shown in Model 2. We find no supporting evidence about the impact of political connections on firm value; thus, we reject Hypothesis 7. However, the value of firms is positively associated with the proportion of directors with an alumni network, therefore, we accept Hypothesis 8. The network of directors who were graduated from the oldest and arguably most prestigious university seems to be beneficial to Thai firms; this result is consistent with the findings of Siegel (2007). In Model 3, in which we combine variables of board diversity and networks, the effects of board networks on firm value remain significant as shown in Model 2.

Regarding the aspects of board composition as control variables, we find the influence of board size on firm value in all three models. The number of directors on a board is negatively related to firm value. This implies that large boards might adversely affect communication and coordination in Thai firms and might not play an effective monitoring role as documented by Jensen and Zajac (1993) and Lipton and Lorsch (1992). Our findings concerning the impact of board size on firm value confirm the results of Eisenberg, Sundgren and Wells (1998), Mak and Kusnadi (2005), Van Ees, Van der Laan and Postma (2008), Van Essen, Van Oosterhout and Carney (2011) and Yermack (1996). However, the impacts of board independence and CEO duality on firm value are not significant in this paper, which is similar to previous research (Chen et al., 2008; Dahya et al., 2009; Daily and Dalton, 1997; Dalton et al., 1998; Van Essen et al., 2011).

The results of Model 1 to Model 3 also show that firm size and sales growth are positively associated to Tobin's Q ratio. The larger firms and firms with investment opportunity are more valuable. In contrast, we find that the leverage ratio and firm age are negatively related to firm value. The higher leverage ratio could lead to poor firm value, and the younger firms seem to have better growth opportunity to generate higher value.

5   CONSLUSION
Boards of directors are one of the most important mechanisms of corporate governance to monitor and advise top management. In response to the financial crisis in 1997, the SET has recommended firms to appoint competent directors and has highlighted the importance of directors' qualifications and board composition. We investigate the board characteristics and their impact on firm value by introducing several measures of board diversity (gender, age,

educational levels, study majors, professional expertise, and international perspectives) and networks (political connections and alumni networks).

The results show that the diversity in age and academic majors of Thai boards appears to be beneficial to firms, while diversity in educational levels adversely influences firm value. In 2006, the revised version of *Principles of Good Corporate Governance* added the principles about the structure of the board of directors. That is, a board should consist of directors with various skills, experience, and expertise that are useful to the company. However, we find that Thai listed firms are concerned about the importance of director diversity in different dimensions at the wake of the Asian financial crisis. Our findings also confirm that networks are one of the key institutional characteristics in emerging markets. However, we find only the value of the alumni network of an elite university in Thailand, not those of political connections. Board composition (size, independence and CEO duality) was also included, and the results show that smaller board size is more valuable to Thai firms, suggesting a more effective monitoring role.

Our findings have important implications that diversity and networking of human resources, especially directors, are important for firms in today's dynamic and competitive business environment. Given similar features of corporate governance among Asian countries (Globerman et al., 2011), our results provide additional evidence for relevant authorities to widen their viewpoints about corporate governance practices and human resource development in Asia-Pacific region. In addition, the findings are consistent with the direction of the best practices in enhancing board competencies and director qualifications.

INTERPRETATION OF THE DIRECTIVE 2010/32/EU AND ITS IMPACT ON COMPETITIVENESS OF COMPANIES WHICH PRODUCE DEVICES FOR VACUUM BLOOD COLLECTION

Anita Sluga
VenoFarmacija, d. o. o., Slovenia
venofarmacija@gmail.com

ABSTRACT

The council of the European Union has issued Directive 2010//32/EU, which speaks about the implementation of the Framework Agreement on prevention from sharp injuries in the hospital and healthcare sector. The aim of the Directive is to prevent injuries to workers caused by medical sharps. The recommendations are certainly welcome, however, is the interpretation of manufacturers of such products harmonized and what does the Directive bring to these companies in terms of competitiveness? The purpose of this study is to determine what impact the Directive will have after May 2013 when it comes into effect on the competitive advantage of companies that produce these products and whether the interpretations of individual companies, providing medical devices which incorporate safety-engineered protection mechanisms, vary from company to company. The aim of the research with the detailed view of three world famous brands and their products for blood vacuum system is to present their products which should ensure the compliancy with the Directive and to assess their impact on the competitiveness of individual companies. A qualitative method with the usage of case studies was use for this study. Based on a desktop research, we have found out that the companies indeed interpret the directive in a different way, giving them a competitive advantage, or otherwise competitive disadvantage, which depends on legal representatives and legislation in every country.

Keywords: Competitive advantage, Directive 2010/32/EU, Needlesticks, Qualitative research, Safety devices for vacuum blood collection

1 INTRODUCTION

Thousands of years ago people started using discharge of blood to treat a variety of illnesses. Discharge of blood can be classified as one of the oldest forms of medicine, which was popular among physicians until the end of 19th century. The vein was cut and the blood was squeezed into containers. They thought this would make a sick person get well. Due to the excessive discharge of blood a president George Washington was supposed to die. A major turning point in philosophy of medicine began when people discovered more about a human body. Dr. Pravaz Charles Gabriel, a French surgeon, and Alexander Wood, a Scottish doctor invented a hypodermic syringes, which were first used for the injection of morphine and then for a drawing of blood. In 1897 the Maxwell Becton and Farleigh S. Dickson founded the company, which began producing glass syringes (following the example of French). In 1970, laboratory personnel started to take blood with steel needles and glass syringes. After analysis they washed syringes and test tubes, however, needles were washed and then re-sharpened and finally sterilized. In 1949, Kleiner Joshep invented the "Evacutainer", which consisted of tubes and needles. The needle consisted of front part, which went in to a vein and a back part through which blood was dripping into a test tube due to the pressure in the vein. While replacing the tubes, the problem occurred how to stop the leakage of blood from the back part of the needle during switching of tubes. In 1973, Sinae Miyake found a solution for this problem by placing a multiple sample sleeve over the proximal needle. The existing glass

tubes were replaced with plastic tubes containing vacuum (Stoker, 2009, pp. 1–2). As we can see, companies have always been looking for better solutions. They have been trying to manufacture a new innovative product to solve problems.

Nowadays blood is used for the analysis and diagnosis. There are several companies that manufacture devices for vacuum blood collection. Three of the most common systems are Vacutainer (Becton, Dickinson and company), Vacuette (Greiner Bio-One GmbH) and VenoSafe (Terumo), which follow the guidelines and demand in the sector and market. Compared with previous products, new products are user-friendly for the patient as well as for laboratory technician, but there is still a room for upgrading and improvement.

Among the 35 million health workers worldwide, about 3 million experience percutaneous exposures to blood borne pathogens each year; two million of those to HBV, 0.9 million to HCV and 170 000 to HIV. These injuries may result in 15 000 HCV, 70 000 HBV and 1 000 HIV infections. More than 90% of these infections occur in developing countries (Rapiti, Prüss-Üstün and Hutin, 2005, p. 49). Estimates indicate that 600,000 to 800,000 needlestick injures occur each year. Unfortunately, about half of these injuries are not reported (NIOSH, 2000, p. 2).

Chart 1: Where Do the Accidents Occur (Vacuette Safety brochure, 2011, p. 5)

Chart 1 shows that the most accidents with needlesticks injuries occur in patient's rooms - 66%, followed by other reasons – 19%, 9% occur in theatre/intensive care and the least accidents occur in a laboratory - 6%.
Enterprise in Turbulent Environment

Chart 2: Which Objects Cause Injuries (Safety first Kooperative, Bundesverband der Unfallkassen, referenced by Vacuette Safety brochure, 2011, p. 5)

Chart 2 shows that the most injures are caused with syringes and needles - 70%, followed by surgical instrument - 25%, 3% injures are caused by other object and the least accidents occur with glass object -2%.

According to statistic data it can be concluded that injures with needle-sticks in the medical field are really a reason for concern and that it is more than necessary to reduce them, therefore, Directives 2010//32/EU, which speaks about the implementation of the Framework Agreement on prevention from sharp injuries in the hospital and healthcare sector is more than welcome. In accordance with the Directive and 3 Article, Member States should adopt the laws, regulations and administrative provisions necessary to comply with it, or they have to ensure implementation of the measures required no later than by 11th May 2013 (Official Journal of the European Union, 2010, p. 67). The purpose of this framework agreement is to achieve the safest possible working environment, to prevent workers injuries caused by all medical sharps (including needlesticks) and to prevent workers at risk. This agreement includes hospitals and health centers and appeals to all employees in these institutions. All employees are required to comply with this Directive.

The most important clause in the Directive, which includes safety vacuum blood draws is Clause 6: Elimination, prevention and protection, which in the second indent says: »Eliminating the unnecessary use of sharps by implementing changes in practice on the basis of results of risk assessment, providing medical devices incorporating safety - engineered protection mechanisms« (Offical Journal of the Eupropean Union, 2010, p. 71).

Safety is a matter of different aspects. Who decides what safety devices with engineered protection mechanisms mean? An individual in an institution in a certain country will decide and consequently limit competitors by prejudicing the company that markets medical devices. Market can be defined as individuals or companies where a certain need arises, which companies try to meet with their product or services (Kotler and Trias De Bes, 2004, p. 23). It is true that companies are trying to adapt quickly to the demand of the market and be innovative, but innovation process includes research and interpretation for opportunities of new or improved products or processes, which are based on "know-how", changes on the market or a combination of both (Fagerberg, Mowern and Nelson, 2005, p. 88). Companies must thoroughly consider their strengths and weakness and prepare the appropriate strategic plans. Strategic planning must include creativity and innovation. In order to make changes, managers must be one step ahead from the competition and think in a different way, find a

different solution than the competition, consumers and their needs must be a center of their attention (Principles of general management, 2007, p. 569). If they can recognize the signs, the theories of innovation can be a useful method for the future (Christensen, Anthony and Roth, 2004, p. 243).

The purpose of this study is to determine what impact the Directive will have after May 2013, when it comes into effect, on the competitive advantage of companies that produce these products and whether the interpretations of individual companies, providing medical devices which incorporate safety-engineered protection mechanisms, vary from company to company. The aim of the research is with the detailed view of three world famous brands and their products for blood vacuum system, to present their products which should ensure the compliancy with the Directive and to assess their impact on the competitiveness of individual companies. On this basis, we set two hypotheses:

  H1: Interpretation of the directive differs from company to company (a manufacturer of devices for vacuum blood collection).

  H2: Interpretation of the directive will affect the competitive advantage of companies that manufacture and market products for vacuum collection.

2   METHODS SECTION

A qualitative method with the usage of case studies was use for this study. With desktop research, we want to find out how many sharps injuries were between health-care workers worldwide, what are the guidelines of WHO on drawing blood Safety-engineered devices, view the biggest risks for health worker between the blood drawn and examined how to decrease the risk. We examine in detail, tree the most common systems in the world Vacutainer (Becton, Dickinson and company), Vacuette (Greiner Bio-One GmbH) and VenoSafe (Terumo). We wanted to found, what the companies offer to meet the directive, which talks about using safety-engineered protection mechanisms.

3   BLOOD DRAWN AND NEEDLESTICKS

Phlebotomy – the drawing of blood – has been practiced for centuries and is still one of the most common invasive procedures in health care. Each step in the process of phlebotomy affects the quality of the specimen and is thus important for preventing laboratory error, patient injury and even death (WHO guidelines on drawing blood: best practices in phlebotomy, 2010, p. 13). Phlebotomy involves the use of large, hollow needles that have been in a blood vessel. The needles can carry a large volume of blood that, in the event of an accidental puncture, may be more likely to transmit disease than other sharps. Blood borne organisms that have been transmitted after needlesticks include viruses such as hepatitis B and human immunodeficiency virus (HIV), bacteria such as syphilis and parasites such as malaria. (WHO guidelines on drawing blood: best practices in phlebotomy, 13). In the year 2000, sharps injuries to health-care workers worldwide resulted in 16 000 HCV infections that will cause 145 (53−766) early deaths between the years 2000−2030; 66 000 HBV infections that will lead to 261 (86−923) early deaths by 2030; and 736 (129−3578) health-care workers will die prematurely from 1000 HIV infections by 2030 (Rapiti, Prüss-Üstün and Hutin, 2005, p. 43). Accidental needlesticks per day – 2400; Estimated accidental needle-sticks injuries sustained by health workers worldwide per year is 1 million (Ernest, 2005, p. 244). Because all the above mention facts is definitely need to adopt guidelines / directives to avoid future stitches.

4   SAFETY DEVICES

Definitions for Safe injection and for Sharp protection device, of WHO guideline are: »Safe injection - An injection that does no harm to the recipient, does not expose the health worker to any risk and does not result in waste that puts the community at risk, sharps protection device: A sharp or needle device used for withdrawing body fluids, accessing a vein or artery, or administering medications or other fluids. The device has a built-in safety feature or mechanism that effectively reduces the risk of an exposure incident« (WHO guidelines on drawing blood: best practices in phlebotomy, 2010, p. 109).

Table 1: Safety-engineered devices (WHO guidelines on drawing blood: best practices in phlebotomy, 2010, p. 71)

Passive		
Auto-disable (AD) syringes NOT recommended for blood drawing.	Not recommended for phlebotomy. Designed to prevent reuse, does not reduce the risks of needlesticks.	During probing, safety mechanism can be activated, requiring new venepuncture. Requires blood transfer, creating risk of needle-stick injuries. Difficult to draw large or multiple blood samples. Does NOT offer needle-stick prevention. Air in the syringe can affect test results. Requires additional training.

Safety-engineered device should offers protection to health worker, but they should be suitable for the specific task. As we can see from the table above auto-disable syringes are not appropriate for phlebotomy. Let's look the type of risk for health workers and how can they reduce the risk.

Enterprise in Turbulent Environment
Figure 1: Summary of risks and risk-reduction strategies to health worker (WHO guidelines on drawing blood: best practices in phlebotomy, 2010, p. 55)

4.1   Safety devices in accordance with Directive

Based on previous findings, we examined individual products of worldwide companies (Becton, Dickinson and company, Greiner Bio-One GmbH and Terumo) which should meet the Directive.

Becton, Dickinson and company

The company was established in 1897. BD is a medical technology company that serves healthcare institutions, life science researchers, clinical laboratories, industry and the general public. BD manufactures medical supplies, devices, laboratory equipment and diagnostic products and sells it in more than 50 countries worldwide.

Enterprise in Turbulent Environment

*Figure 2: BD Vacutainer® Eclipse™ without holder or with holder
(http://catalog.bd.com/bdCat/search.doCustomer?searchText=368651)*

»These sterile, safety-engineered, multi-sample blood collection needles offer a simple, effective way to collect blood while reducing the possibility of needlestick injuries« (https://us.vwr.com/store/catalog/product.jsp?product_id=4646701).

As we can see from the pictures BD Vacutainer Eclipse can be removed from the holder, which means that medical workers can remove them from the holder and reuse them. Because BD Vacutainer Eclipse is attached to the needle it can be used with BD Vacutainer* Pronto* Quick Release Needle Holder - reusable plastic holder, which can be used for multiple use.

Figure 3: Pronto Quick Release Needle Holder

Greiner Bio One International AG
GBO started with as a small cork manufacturing company at the end of the 19th century. Today, Greiner Bio-One International AG is a world market leader in the field of biotechnology, diagnostics, pharmaceutical, medical and In Vitro diagnostics. The product range includes products for blood collections. The products are sold in over 100 countries worldwide.

Figure 4: VACUETTE® QUICKSHIELD Safety Tube Holder with needle or without needle (VACUETTE QUICKSHIELD Safety Tube Holder, 2011, p. 3)

»The VACUETTE® QUICKSHIELD Safety Tube Holder is especially suitable for use in daily blood collection routines. Without the need to change collection techniques, the holder helps prevent needlestick injuries« (VACUETTE QUICKSHIELD Safety Tube Holder 2011, p. 3). Holder produced by GBO has a pre-assembled protective cap, which means that user can choose the thickness of the needle. All the needles have a thread, which means that they need to be tightened into the holder. After use, the entire set has to be discarded, because the needle is locked with a protective cap.

Figure 5: VACUETTE® PREMIUM Safety Needle System Tube-Touch (VACUETTE Safety brochure, 2011, p. 19)

The user manual says: »When the user pushes in the tube, the pressure of the tube onto the back end of the needle releases the safety shield, automatically covering the needle which moves forward lightly resting against patient´s skin« (VACUETTE Safety brochure, 2011, pp. 19–20).

Terumo Corporation
Terumo foundation dates back to the year of 1921 as a manufacturer of clinical thermometers. Terumo Corporation has grown worldwide to a position of leading manufacturer of medical devices. They develop, manufacture, export, import, markets, distribute and sell a diverse portfolio of medical devices, supplies, and accessories. They have 13.000 employees worldwide.

Figure 6: Quick fit system holder with needle, needle (http://www.terumo-europe.com/laboratory/products/acc_holders.php)

From our pictures we can see that manufacturer Terumo is the only one on a market that produces needles without a thread, therefore the holder can be used only with Terumo needles (Quick – Fit), which means that after the needle has been inserted into the holder, it cannot be removed again. Their holders come with safety shields or without them.

Figure 7: Terusafe Disposal Boxes (http://www.terumo-europe.com/laboratory/products/acc_boxes.php)

Figure 8: VENOSAFE HOLDER (http://www.terumo-europe.com/laboratory/products/acc_holders.php)

The holder from Figure 8 is compatible with Quick fit needle from Figure 6. Pressing the bayonet or by pushing the holder in the special QUICK FIT release aperture, disposes the needle safely into the TERUSAFE box, without touching the holder. (Terumo - Recommendation for use)

5   CONSLUSION

Based on a desktop research, we have found out that the companies indeed interpret the directive in different ways they manufacture various products which incorporate safety-engineered protection mechanisms in order to meet the Directives.

According to the purpose we examined the part of the directive, which applies to our case study. The aim of the research was achieved, as with a case study we found, that the companies produce a variety of products to provide devices with a built-in safety system.

Becton, Dickinson and company
They produce safety-engineered, multi-sample blood collection needles »Eclipse«, which go on a holder and can be reused. As we can see the »Eclipse« needles do not provide a product for single use, as a holder can be reused.

Greiner Bio One International AG

The company manufactures »VACUETTE QUICKSHIELD« Safety Tube Holder, which has a pre-assembled protective cap. User can choose the thickness of the needle. All the needles have a thread, which means that they need to be tightened into the holder. After use, the entire set has to be discarded because the needle is locked with a protective cap. This system is good as user can choose the size of the needle, disadvantage of this system is that the needle has to be threaded into the holder. We can say that this system meet the Directive.

The second product they offer, VACUETTE® PREMIUM Safety Needle System Tube-Touch is automatic product. If we look at Table 1: Safety-engineered devices, we can see that the WHO organization does not recommend automatics products because safety mechanism can be activated during blood drawn.

Terumo Corporation

Terumo is the only manufacturer on the market that produces needles without a thread, therefore the holder can be used just only with a Terumo needle »Quick – Fit«, which means that after the needle has been inserted in the holder, it cannot be removed, which means it provides SAFETY for a user. Terumo produces holders with a safety shield for a single usage (Figure 8). To meet the Directive, Terumo recommends Quick-Fit needle with a holder for multiple usage together with Terusafe Disposal Boxes (Figure 7), Quick Fit release aperture on the cap for safety disposal needle.

On the basis of the above facts it can be said that the aim of the research was achieved. Companies offer a variety of products to meet the Directive, therefore we accept our H1 which says that the interpretation of the directive differs from company to company (manufacturer of devices for vacuum blood collection). Which of the above mentioned products are appropriate to meet the Directive, are decided by a clients. A restriction of competition starts here. We can say that a market share of the companies depends on the representatives in each country. If the brand is well represented and advertised the sales of these products will be successful. Based on the results we can also accept H2, which speaks about the interpretation of the Directive to affect competitive advantage of companies that manufacture and market products for vacuum collection. Based on a desktop research, we have found out that the companies indeed interpret the directive in different ways, giving them a competitive advantage, or otherwise competitive disadvantage, which depends on legal representatives and legislation in every country.

For further research we recommend the exploration of the interpretation of the Directive according to a client's their response to the adoption of the Directive, which will drastically raise the cost of vacuum collection.

PUBLIC UNIVERSITY MANAGEMENT UNDER NEW CONDITIONS OF CHANGE

Dita Stefenhagena
University of Latvia, Faculty of Economics and Management, Latvia
dita.stefenhagena@llu.lv

ABSTRACT
Economic crisis, limited resources, rapid globalization and growing competitiveness are the main factors influencing higher education institutions during the last decades. Expectations from society (all types of stakeholders: students, scientists, businesses, industries, government institutions, etc.) have enlarged goals of the university. Along with traditionally managed university goals of providing higher education studies and research, there is an emphasis on better higher education compliance with labour market and research transfer into commercialized investments of national economy. Along with that universities have to strive for international recognition and competitiveness. Along with these issues public university governance and management have become complicated and challenging, and along with enlarged decision making freedom, university leaders are faced with difficulties and problems in university management. The latest literature sources as well as European and other countries' experience demonstrate that one of the public university management challenges is a change from the traditional bureaucratic management approach to the New Public Management which emphasizes new management processes and approaches at the university institutional level. The purpose of the research is to identify and analyse new management processes and approaches for the university to reach its goals under the new conditions. University governance in this paper is acquisition of strategic directions, forms of decision making institutions, regulations, management ways and approaches at institutional level and higher education system level nationally and internationally in order to ensure university as public institution's goal oriented performance for needs of target groups (internal and external stakeholders – students, employers, entrepreneurs, industries, state and local government entities, etc.) By governance processes the author means institutionalized operational and strategic management activities which ensure effective functioning and development of an institution (university) in order to reach its goals. Research methods: literature analysis, data from the quantitative inquiry carried out at the universities of Latvia in Spring, 2012. Research results have indicated that serious improvements in personnel management, assessment and optimization of structures and functions, information flow and communication, internal and external cooperation, as well as improvement of leadership and management skills are necessary university management preconditions for the implementation of modern university goals.

Keywords: Goals, Institutional management, University

1   INTRODUCTION
In the context of repaid changes in society and its relationship with higher education, countries throughout Europe have responded in a variety of ways to the widespread need to re-think and re-design the governance structures of universities. Universities as public institutions are now accountable for their behaviour in new ways: they must show that they are responding appropriately to the needs of society; they must demonstrate that public funds they receive are being used responsibly; and they must maintain standards of excellence in higher education studies and research, the primary mission of higher education institutions.

Increased autonomy and accountability have brought about many changes which mark a shift away from traditional modes of academic self-government in a closed community of academicians and scholars (Higher Education Governance in Europe, 2008).

Higher education system in Latvia is fragmentized. There are more than 60 higher education institutions (public universities, public and private academies and colleges in Latvia (Higher education institutions in Latvia, LR CSP, 2012). 17 out of these are public higher education institutions. There are six public universities in Latvia, they are situated in the capital city of Latvia, as well as at the regions of Latvia. Public and private higher education institutions had approx. 939 study programmes which incorporated close to 100 000 students in study year 2011./2012 (Ministry of Higher Education and Science report, 2011). At the same time the number of employment age persons, incl. young people, is decreasing. Based on 2011 population census, there are 2 million inhabitants in Latvia, and 10 000 to 15 000 persons of employment age emigrate from Latvia annually (Central Bureau of Statistics, 2012). These facts raise issues concerning necessity of all higher education institutions and study programmes, more effective usage of higher education resources and quality assurance.

The majority of Latvian higher education institutions (including public universities) were not prepared for economic crisis, severe decrease of public resources, negative demography as well as rapid globalization and competitiveness in higher education. These factors have created crisis and have determined necessity for change in higher education in Latvia. During the upcoming years the higher education sector will face serious threats for sustainability, and overcoming of these threads will ask for serous and even radical solutions in higher education, including reforms at the institutional management level.

Foreign university researchers have emphasized the necessity for change in university management. That is justified by the fact that in order to implement university goals under conditions of rapid globalization and socio-economic crisis university governance have to undertake best management experiences from the public and private sectors (Wolf, 2011; Guerrero, 2010; Starratt, 2004; Anderseck, 2004). Successful university governance is characterized as management of institutional structures and processes in close compliance with changing external environment. Also, there is a challenge concerning shift from the traditional university self-governance decision making form to corporate or integrated governance which is more characteristic for the entrepreneurship (Brunner, 2011).

2   UNIVERSITY GOALS ANDER NEW CONDITIONS OF CHANGE

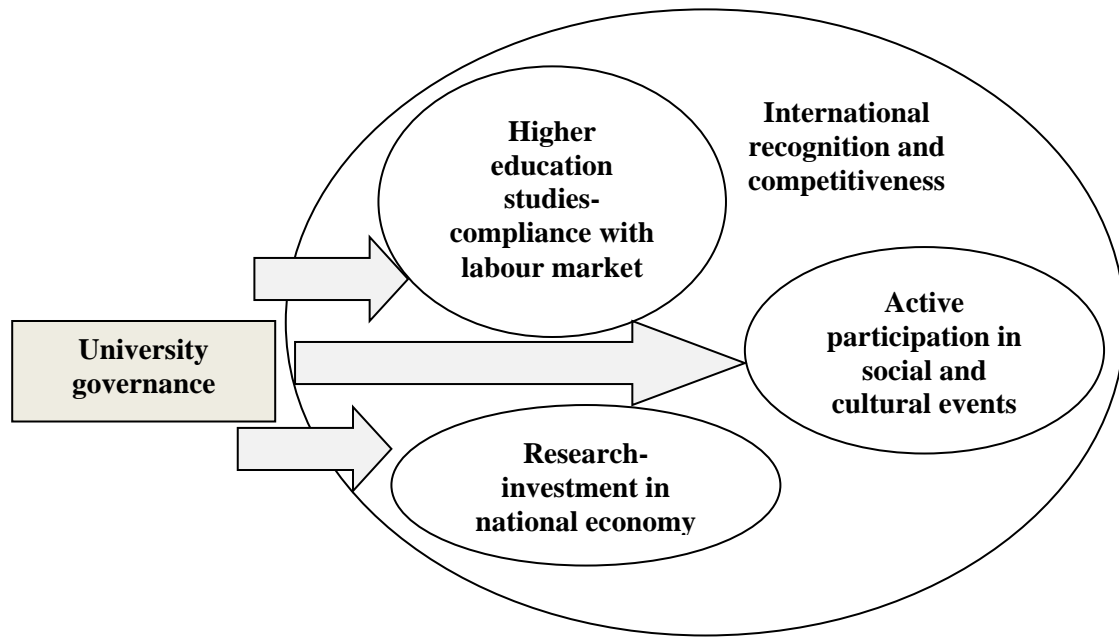
The university goals (Figure 1) of providing higher education studies and research are traditional, but nowadays there is an emphasis on better higher education compliance with labour market and research transfer into commercialized investments of national economy. Necessity for university to be open and active in state, city or regional social and cultural events is relatively new. University becoming an open public institution have to make cooperation with various social partners in order to better integrate their needs into university strategy implementation. All three goals of the university are covered by necessity to strive for international recognition and competitiveness in studies, research and social/cultural activities. Thus, considering university goals, the university governance have to be performed in a way that theoretical goals are implemented in practice.


Figure 1: University goals under new conditions of change (author's developed by R. Hagen, R. Barnett, C. Rytmeister, S. Marshall, T. Christensen, B. Barker and EUA reports and findings)

The author has concluded that implementation of university goals in practice is complicated. This conclusion is supported also by various foreign authors, including European University Association (EUA) reports and findings. Because of increased university role, goals and functions, the university management have become larger in its scale and more complicated in its meaning. New management processes and approaches are necessary to implement university goals under new conditions of change.

3   CHANGE IN UNIVERSITY GOVERNANCE

Change from the traditional bureaucratic management approach to the New Public Management which emphasizes new management processes and approaches at the university institutional level is characteristic of universities in all Europe and other countries.

Higher education reforms, including university governance reforms lately have been researched by many authors in Great Britain (Trakman, L., Brown, R., Crellin, M. A., Chapleo, C.), Australia (Carnegie, G., Tuck, J., Rytmeister, C., Marshall, S., Smith, C., Bath, D., Blackman, D., Kennedy, M., Harman, K., Treadgold, E.), Germany (Anderseck, K., Norback, L. E., Henze, R), USA (Kezar, A. J., Jenicke, L. O., Kumar, A., Holmes, M. C., Starratt, R. J., Gallo, J. V., Nadler, D. P., Miller, M. T., Modica, J.), Finland (Linna, P., Pekkola, S., Ukko, J., Melkas, H., Aarevaara, T.) and other countries.

One of the latest higher education reforms which foresee radical changes in higher education system is the Finnish University Act, adopted in 2010. It has been stated that Finnish universities are about to enter a period of radical change. As in the case of many European countries, Finland has become used to inflexible higher education structures and a reactive university system. This has led to a heavily bureaucratised administration, slow decision

making and permanent funding deficiency in the publicly owned universities (Aarrevaara, 2009).

Latest research results highlighted university management challenges under new conditions of globalization, request for knowledge based economy and international competitiveness. Publications emphasize new university role, increase of its importance: „Harmonized higher education and science area have to be developed, based on strong, autonomous financially sustainable universities which are able to perform in a more complicated global environment" (EUA Annual Report, 2009, p. 7). „Conditions raised by globalization and knowledge based economy have changed the traditional role of university. Universities have to become target organizations of education policy making, universities are larger knowledge based institutions in cities and regions" (Hagen, 2002, p. 204).

One of endeavours to raise efficiency and effectiveness in public sector is to introduce New Public Management Theory (NPM). NPM is popular and widespread in Europe and other countries, the ideas of this theory have been researched by various authors (Boston, 1996; McLaughlin, Osborne and Ferlie, 2005; Pollitt and Bouckaert, 2000; Ingraham, 2001; Vanags, 2007).

Summarizing author's ideas on possibilities and challenges to introduce NPM in public sector institutions, it has been stated that public institutions (including public universities) following classical bureaucratic management principles are not able to ensure achievement of goals and performance results in accordance with society needs under new conditions of change. NPM principles are introduced in public organizations by emphasizing the following principles of governance (Osborne and Gaebler, 1992; Comparative Public Administration, 2000):

- Management leadership, professionalism and competence;
- Support of management innovations, ability to be flexible, striving for quality and excellence;
- Achievement of goals, strategy and tasks in accordance with society needs;
- Systematic and consistent analysis of efficiency and effectiveness, its controlling and measurement;
- Improvement of horizontal communication and cooperation;
- Accountancy and transparency of management work, etc.

These principles of governance are crucial also in public university governance.

4 RESULTS FROM QUANTITATIVE INQUIRY CARRIED OUT AT UNIVERSITIES OF LATVIA

The author carried out quantitative research – inquiry at the public universities in Latvia in Spring 2012. Different level managers (higher, medium and lower level) were respondents of the inquiry. The total number of respondents were 209 people (n=209). The aim of the inquiry was to research what are management processes and approaches in public universities and what is their compliance with modern management principles. Respondents' answers (scale 1 to 10 and in some questions – scale 1-5) were divided into three groups: 1st group - "strongly disagree, disagree, rather disagree" (answers in a scale 1,2,3,4); 2nd group – "doesn't have a clear opinion, lack of information" (answers in a scale 5,6); 3rd group – „strongly agree, agree, rather agree"grupā (answers in a scale 7,8,9,10).

Almost equal number of respondents were of opinion that a board with external stakeholders have to be introduced/shouldn't be introduced as university decision making body (Chart 1).
Chart 1: Responses (%), Do you think that a board with external stakeholders have to be introduced as university decision making body? – n=209 (author's research in Latvian universities)

Those who demonstrated a positive opinion regarding this issue were of opinion that a board with external stakeholders would increase university linkage with entrepreneurship and industry, university performance results would be in better conformity with labour market needs, and it would make university governance more professional by decreasing management preconceptions and stereotypes.

Respondents who were of opinion that a board with external stakeholders shouldn't be introduced as university decision making body were of opinion that it is enough that external stakeholders take part in university advisory bodies, external stakeholders lack knowledge on university management specifics, and higher decision making power has been successfully implemented by university senate.

Other results obtained from inquiry:
- More than half of respondents (64%) were of opinion that reforms in university institutional governance are necessary in order to implement university goals under new conditions of change;
- Majority of respondents were of opinion that the number of administrative personnel is too big and it is not proportional with decreased number of students in latest years;
- Majority of respondents (39%) didn't have opinion regarding issues concerning planned, consistent training and improvement of professional skills of administrative personnel, and 37% of respondents were of opinion that administrative staff does not have enough training;
- 39% of respondents were of opinion that assessment of knowledge and skills of the administrative staff is carried out on a regular basis, 34% of respondents were of opinion that assessment of administrative staff is irregular and insufficient, and 27% didn't have opinion regarding this issue;
- Although more than 60% of respondents were of opinion that university higher level managers support management innovations, higher level university managers have management competence and leadership skills, they undertake responsibility of their decisions, and evaluate university performance results, comparatively high percentage (11%-29%) of respondents didn't agree to these statements;

- 27% of respondents were of opinion that they can't influence university strategic management processes. That may lead to assumption that middle and lower level managers are not involved in strategic management decision making processes;
- 69% of respondents were of opinion that support functions are not outsourced;
- More than 30% of respondents were of opinion that decision making processes and systematic and consistent problem solution activities are insufficient;
- More than 20% of respondents were of opinion that university management have problems with planning, performance effectiveness and efficiency, analysis, assessment and monitoring.
- More than 25% of respondents were of opinion that university management information flow is insufficient and that usage of material and technical resources is not enough productive;
- Based on the results of inquiry, the author proposed several recommendations to the higher level university managers regarding university management issues:
  - (1.) Number of administrative staff, their functions (duplication of functions, uneven work load), qualification and annual assessment have to be reviewed and reconsidered;
  - (2.) Improved implementation of recommendations proposed by performance audit and quality audit;
  - (3.) Re-organization and optimization of institutional structures, outsourcing of support functions;
  - (4.) Improved financial management, especially such issues as attraction of private financing, increased possibilities of self-income, calculation of costs concerning performance results and transparency of financial management systems.
  - (5.) Improved information and communication flow and access to all level university managers and employees;
  - (6.) Participation of all level university managers in strategic management decision making processes.

The results of the inquiry partly support the thesis raised at the beginning of the research (doctoral thesis "Governance processes as a factor influencing university effectiveness") - „University management processes are not enough effective. That is supported by insufficient knowledge and skills in managing university as autonomous public institution, unwillingness to make reforms and outdated management approaches." Respondents' opinion regarding majority of questions were balanced in negative, positive and „don't have opinion" answers. That draws to a conclusion that universities have serious management problems, including insufficient information and communication flow and access on important management issues to all level university managers. Thus, many issues concerning university management have become critical or may become critical in the nearest future.

5 CONCLUSION
The theoretical basis of higher education, incl. university governance reforms is developed by New Public Management (NPM) theory. That supports statement that universities are part of the public sector and best ideas and practices from the public sector management experiences have to be introduced also in university governance.

Based on public sector and university researchers' conclusions, management leadership and support to management innovations, implementation of strategy, goals and tasks in accordance with society needs, management professionalism and competence, horizontal

communication and cooperation, systematic and consistent assessment of efficiency and effectiveness, management accountability and transparency are the main governance processes of a modern public institution, incl. public university, under new conditions of change.

Introduction of a board with external stakeholders as a university decision making body is a popular and widespread concept in European and other countries' universities, but there is no a united opinion about advantages and disadvantages of this corporate or integrated university governance form in Latvia. On the one hand, the board could be a good solution to professionalism of university governance (representatives from entrepreneurship with management competence would be included), as well as that would increase university linkage with national economy and society in general. On the other hand, a threat may occur that university performance is a subject to political or private interests.

University governance reforms are actual in European and other countries' as well as Latvian universities. At the same a united European university governance reform is not possible, because university governance structures develop differently across all Europe. United university governance reform in Latvia would be possible if all internal and external stakeholders unite in a common goal, but currently stakeholders (responsible ministries, social partners, students, university managers) have different opinion on necessity of governance reforms.

University higher and middle level managers' insufficient competence on optimization and change of governance structures (change management) is one of the reasons why university governance reforms are not implemented in Latvia.

ABSTRACT
The paper will examine the most relevant factors that influence job satisfaction, with the example of several organizations from different sectors. Motivating employees and creation of satisfaction are the most important activities of management and leadership in the organization. Since those are sensitive mechanisms, particularly in terms of personality traits, attitudes and expectations of individual, the paper will analyze these factors, critical for motivation illustrated by organizations practice where the research was conducted.

Keywords: Management, Motivation, Organization, Satisfaction

1 INTRODUCTION

The study of variables and determinants affecting job satisfaction of employees is vibrant and dynamic research field in recent years and represents subject of raising interest among scientists. Job satisfaction is analyzed from the standpoint of indicators, as well as consequences and potential influence on organizational and individual behavior of employees. Growing interest for work attitudes of emloyees is justified by the fact that in contemporary business environment human resources and knowledge are becoming key sources of acheiving and maintaining competitive advantage. Another reason is that employee's commitment to the organization is dependent upon degree of job satisfaction. Therefore, it is important to find out which job dimensions contribute the most to job satisfaction, and identify others, perceived as a source of employees' discontent. In this context, special attention should be payed to personality traits that influence and shape a number of organizational behavior variables, as well as characteristics of the job and the organization, affecting job satisfaction.

One of the most important effects of higher job satisfaction is higher level of employees motivation. Motivation is the cornerstone of modern human resource management, having in mind fact that creation of effective motivation mechanism can help organization to improve competitive position (Robbins and Coulter, 2005, p. 392).

Job satisfaction and employees' motivation can not be regarded only as psychological and sociological aspects of organizational behavior, since they directly affect other dimensions of organization and overall company performances. Incentives for individual behavior originate from internal psychological driver fostering him to act, and as a result his work performance

is affected not only by his ability but to a large extent by his motivation, in other words his job sattisfaction.

The *research goal* of this paper is to point out and analyze the most important factors influencing job satisfaction, positive effects of higher satisfaction, as well as testing of theoretical propositions and deliberations within business practice of several Serbian companies. Accordingly, work paper structure has been devised. Firstly, job satisfaction factors are presented, with speciall attention given to main personality traits, followed by analysis of job satisfaction effects. Finally, the results of research conducted in several Serbian enterprises are explained, reffering to employees attitudes in respect of the particular dimensions of job satisfaction.

2 JOB SATISFACTION FACTORS

Job satisfaction reffers to attitude toward work incorporating cognitive (certain assumptions and beliefs about job), affective (feelings towards work) and evaluative (work perception) individual reactions of individual employee. Job satisfaction is resulting from compliance between objective working conditions and employe's expectations. Employee, for instance, may be dissatisfied with salary, position or status, but in the same time to be relatively satisfied with job, due to relatively low expectations. Conversely, an employee may be dissatisfied inspite of high salary, if his expectations are not primarly related to money compensations, but for interpersonal relations with colleagues or promotion opportunities. Numerous factors influencing job satisfaction are usually classified in two categories: those related to the characteristics of organization and job, and those related to the personal traits of the employees (Robbins, 2003, p. 352).

There are several organizational factors that are associated with the employees' satisfactionf: job characteristics, reward system, working conditions, working environment and organizational structure (Janićijević, 2008, pp. 92–93).

Job characteristics – job content is reffering to a scope, variety, work autonomy, complexity and the consistency, and, as such, can cause both, satisfaction as well as dissatisfaction of employees. In general, people tend to be much more satisfied if they find their job to be intelectually challenging, unstructured, creative, in comparison with simplistic, repetitive, routine work, with little or none aythonomy.

Reward system - this factor is one of those most directly affecting employees satisfaction. Combinations of tangible and intangible compensations and incentives are designed aiming to achieve job satisfaction, which ultimately reflects on motivation, productivity, efficiency and overall performance. Tangible, material forms of rewards are: financial compensations, raise or bonus, but indirect gains that contribute standard of living improvement (various perks and various benefits), too. Intangible rewards incorporate nonfinancial compensation, and these are: respect, challenging job, status, opportunities for career development and promotion. It should be noted that employees often regard impartial and fair implementation of reward system as more important, comparing to the amount of remuneration (Bogićević, 2010). Rewarding employees is a tool for encouraging creativity, achieving higher performance, increase responsibility and willingness to participate. Conversely, arbitrarly implemented reward system may become main cause of discontent, especially if employees perceive it as unfair.

Enterprise in Turbulent Environment

Working environment - pleasant working conditions are foundation for higher efficiency in performing daily duties and achievemet of expected results. Employees are satisfied if they work with colleagues whom they are having good interpersonal relations with, in other words in postive working environment. In several studies employees said that they would gladly trade a part of material compensation for motivating working atmosphere. They also highlighted that they prefer frendly working environment over well payed job in hostile conditions (Stojanović Aleksić, 2007, p. 305).

Organizational structure. Organizational structure affects job satisfaction through parameters, primarily centralization and decentralization. Centralization will have a positive impact on employee satisfaction if they are reluctant or unwilling to participate in decision making process, while it can cause disssatisfaction if employees expected authority to be delegated and demonstrate willingness to take responsibility. Centralization and decentralization effects on job satisfaction are determined by the nature of the work, employees expectations, as well as national cultural characteristics. In countries with high power distance, centralization is accepted as normal practice and people will not demostrate disssatisfection if it exists in their company. National culture characteristics define relationship with other structure parameters, meaning that some cultures have more direct propenstity to control, high formalization, functional structure, while others favor informal communications and team structure (Sapic, Eric and Stojanovic Aleksic, 2010).

In addition to organizational factors, there are a number of personal trait that influence job satisfaction, too. Job satisfaction and professional success lead to a pleasant emotional status of the individual, boosting his selfconfidence. Personal factors that influence job satisfaction are: compliance of professional and personal interests, working experience and position, status and overall life satisfaction.

Compliance of professional and personal interests - studies have shown that higher corespondence of personal and professional interests is leading to increased job satisfaction. In fact, numerous studies have confirmed that the nature of the business is one of the most important factors producing positive work attitude of employees. This does not imply that a well-designed compensation system is irelevant, but that higher job satisfaction can as well be acheived through interesting and challenging work design, compatible with the employee's personal preferences.

Work experience and position - employees develop on daily basis, gaining work experience. Work experience includes managing social relationships, managing problems, tasks and other challenges employee is facing. Job satisfaction is changing during time. Generally, it is estimated that people tend to be happier at the beginning of career, then level of satisfaction slowly decreases and finally increases again as retirement is approaching. Also, employees will be more satisfied if his position provides higher influence on decision-making process and social influence; factors usually associated with mature career and significant work experience.

Overall life satisfaction - without going into the philosophical deliberations about the purpose of human life, it is evident that the circumstances person lives in reflect on his job satisfaction. Researchers assume that there are three types of relationships between job and life satisfaction: 1) overflow, when business and personal life of individual overlap, 2) segmentation, when business and life experiences are separated and have little or no

connections, 3) compensation, where the individual is seeking to compensate job dissatisfaction with fulfilled and happy personal life, or *vice versa.*

3 PERSONAL TRAITS AS A JOB SATISFACTION FACTOR
The way people perceive their work and its aspects, to large extent depends their personal traits. Personal characteristics directly affect the sense of satisfaction and dissatisfaction, shaping the individual perceptions, and perception of specific work experience aspects as satisfactory or unsatisfactory. Employees create innovative ideas, overcome rigid organizational hierarchy, make necessary modifications and strive to obtain key resources and support for their implementation (Eric and Stojanovic Aleksic, 2010).

Researchers dealing with personality generally reached consensus on its structure, and today most of them as set of dimensions that can describe each individual accept the five-factor model, or a model called *'big five'* (Janićijević, 2008). According to this classification of personality traits, all features are classified into five categories: extraversion (introversion), friendship (agreement), conscientiousness (responsibility), emotional stability (neuroticism), and curiosity.

Each of these traits represents combination of multiple factors. Thus, extraversion, characterized by positive emotional approach, incorporates friendship, entrepreneurial spirits, ambition, while the emotional stability reffers to emotional reactivity, sensitivity and level of security. Friendship usually relates to kindness, cooperation and wilingnes to help, while conscientiousness reffers to components such as the need for control (vs. impulsivity), prudence, reliability, achievement and propensity to hard work. Curiosity, as well as the previous four traits is a mixture of various components of personality, intellect in the narrow sense (intelligence, ingenuity, creativity), openness to experience (imagination, liberalizm), and some aspects of culture, personal attitudes, preferences and orientations (for instance artistic interests, non-conformism, unconventional and progressive values, the need for diverse experiences). Conditions for success is persistence, but endurance in overcoming obstacles, too (Zimmerer and Scarborough, 2002, pp. 28–31).

Apart from these, other personality traits are essential for human behavior in organizations, too. Recognizing their existance can improve understanding of individual differences and pointing out possible ways of influencing other people behavior, as well. Some of those traits follow (Janićijević, 2008):
- *locus of control* – reffers to degree person belives he can influence and control his own destiny. People differ significantly on this matter, some of them believe they are in control of their own life, while others have more deterministic approach, beleiving that their destiny is predetermined and there is no much they can do about it;
- *machiavellizm* – to whtat extent person behavior in defined and consistent with the principles of pragmatism, arrogance and opportunism;
- *self-esteem* - the extent to which man recognizes and respects himself and his abilities;
- *risk propensity* - the degree of individual willingness to take risk.

These traits are interrelated and influence each other: people with internal locus of control believe that they can influence their fate, and are, therefore, more willing to take more responsibility and higher risk, since they are primarily oriented proactively, toward future. They are willing to take initiative, identify and solve problems, and have higher self-esteem comparing to people with external locus of control, who believe that their life is

predetermined and heavily controlled by higher authority. Employees with an internal locus of control are less perceptive to coercive and manipulative influence techniques, they easily accept mistakes and don't consider them as bad luck, but the possibility for learning (Stojanovic Aleksic and Babic, 2012, p. 94). Generally, they are more satisfied if their job is in compliance with their personal characteristics. People with an internal locus of control are focused on the positive outcomes and have higher ability to experience job satisfaction; however, care must be taken not to cross the boundaries of the real optimism (Antes and Mumford, 2012).

Finally, important traits that should be considered in analyzing employees' behavior and level of satisfaction, are demographic characteristics, age, gender and marital status. For example, it is considered that age affects people's behavior in terms of higher satisfaction, productivity and reduced likelihood of leaving the organization. Considering gender, research studeis provide evidence that women are easier to comply than men, they are more sensitive, but more ekstrovert and willing to demonstrate empathy, while men are more aggressive, determined and more likely to take risk (Rosenber, 1999, p. 124).

All above mentioned characteristics can affect the level of job satisfaction and motivation mechanisms. What motivates extroverted, curious and empathetic individual is certainly different from the motivation mechanisms of intravert, emotionally unstable and rigid person. Likewise, attitude toward life, environment, personal values, will certainly contribute to certain aspects of the job to be ranked as satisfactory or unsatisfactory, and therefore will affect employee motivation.

4 JOB SATISFACTION EFFECTS

Job satisfaction is not a goal in itself. Although there are raising theories claiming that social responsibility involves the tendency to keep employees as important stakeholders satisfied, representing internal aspect of corporate social responsibility (Stojanovic Aleksic and Domanović, 2012). However, there is general agreement that purpose of satisfaction is increased motivation and performance of both, employees and the entire organization. Better focus on the goals, increased work effort, superior performance, and higher organization commitment are results of higher motivation (Mitchel, 1997, p. 63).

Job satisfaction is related to their work, and can result in several basic effects (Janićijević, 2008):

- *Productivity*. The assumption is that there is a strong correlation between satisfaction and employee productivity, meaning that employees will be motivated to make greater efforts, resulting in higher productivity.
- W*ork absence*. More satisfied workers will be less absent, which was confirmed in empirical research studies. Vice versa, there is no clear correlation regarding relationship between less satisfaction and higher absence (anxiety caused by possibility of losing job or sense of responsibility can cause even dissatisfied employee to be rarely absent from work).
- *Job fluctuations*. It was found that it is less likely that satisfied workers will leave job, comparing to dissatisfied colleagues. It is also established that whether or not employee will live his job depends upon other factors as well, for instance overall life satisfaction.

Enterprise in Turbulent Environment

It is believed that these positive effects are achieved, directly, as a result of higher motivation, and indirectly, through organizational commitment, representing one of the most significant consequences of job satisfaction (Newstorm, 2007, p. 221). Organizational commitment refers to positive attitudes of employees toward the organization and co-workers (a group of employees), as opposed to job satisfaction, referring to positive feelings toward job itself.

Employees' referent objects of commitment can be defined at two levels, the organizational and group commitment. When considering commitment of employee to organization, it is possible make distinction between dedications to organization per se, as well as dedication to management. Similarly, if we look at the individual commitment to a group, we can distinguish dedication to close associates, to group or immediate superior.

Organizational commitment of employees at any level may result from many sources. It can be preference toward safety, compliance of individual and organization goals, as well as feelings of obligation of the responsibility and loyalty. Orientation to safety means that the employee is committed the organization due to long working experience and personal investment, aware of risk that in case of leaving work connections and position will be lost, and he would have to face uncertainty of finding new job. An employee may be dedicated to organization because he believes that the realization of the organizational goals is the best way to achieve his own, individual goals. Employee may feel that he has obligation to remain in the organization, and to invest his knowledge, energy and time. However, most durable and strongest organizational commitment exists when it occurs as a result of job satisfaction.

In addition, factors that influence job satisfaction level (job characteristics, organizational factors and personal traits) to great extent overlap with those affecting organizational commitment. Therefore, it is considered one of the most important effects resulting from job satisfaction is high organizational commitment, manifested in higher levels of motivation and productivity, less work absence, reduced staff fluctuation etc.

5 CASE STUDY

For the purposes of this study survey was conducted, about employees' attitudes and job satisfaction, and certain aspects of motivation theories were examined. In this study three companies in the city of Kragujevac were analyzed, one in the field of public administration (A), second public entity (B) and third profit organization (C). Interview was data collection method. Liquert 1-5 scale was used in filling out questionnaire. The research included a total of 51 respondents, 19 men and 32 women. Analysis of the obtained data revealed common characteristics of organizations that are the subject of research, but in the same time enabled relevant comparisons and making adequate conclusions. Number and structure of respondents is displayed in Table 1.

Table 1: Sample size and structure

Compa ny	RESPONDENTS			EDUCATION LEVEL					Average age of responde nts
	Me n	*Wome n*	*Tota l*	*Universi ty degree*	*Vocation al educatio n*	*High school graduat e*	*Othe r*	*Tota l*	
A	10	22	32	20	5	6	1	32	49,10
B	3	8	11	7	2	2	-	11	35,27
C	6	2	8	5	1	2	-	8	35,25

When it comes to employees' personality traits evaluation, it is interesting that in all three organizations women demonstrate higher levels of extroversion, kindness, conscientiousness, emotional stability and openness, comparing to men. This applies to Machiavellian behaviour and internal locus of control, as well (Tables 2 and 3).

Table 2: Propensity to machiavellizm

Company	*Percent of respondants with propensity to machiavellizm*	*Women (%)*	*Men (%)*
A	31,25	80,00	20,00
B	63,64	71,43	28,57
C	50,00	25,00	75,00

Table 3: Propensity to internal locus of control

Company	*Percent of respondants with propensity to internal locus of control*	*Women (%)*	*Men (%)*
A	74,25	56	34
B	34,64	58	42
C	53,25	59	41

It can be concluded that the highest level of Machiavellian characteristics demonstrate employees in company B. This has to do with the lowest perception of job security, in this very company (Table 8), shows the Machiavellian attitudes of employees in the attempt to keep the job. On the other hand, this company has the lowest percentage of employees with internal locus of control, they don't believe that they are responsible for life achievements, which can be regarded as a consequence of high job and promotion uncertainty. Regardless of that, the employees at company B highly appreciate strong interpersonal relationships with colleagues, while other aspects of the job are graded relatively low. Table 4 depicts average grades respondents have given to different job/organization aspects.

Enterprise in Turbulent Environment

Table 4: Respondents attitudes toward different job/organization aspects

Job aspect/organization	A	B	C
Salary	2,44	2,91	2,37
Working autonomy	3,75	3,18	3,63
Safety	4,84	3,73	2,63
Learning possibilities	3,00	2,81	2,14
Promotion possibilities	2,31	2,91	2,71
Interpersonal relationships	4,13	4,45	4,00
Conflict absence	3,75	3,80	4,43
Challenging job	2,78	2,60	3,14
Working conditions	2,71	2,40	3,13
Relationship with superior manager	4,06	3,50	4,65
Overall satisfaction	3,41	3,40	3,75

It is possible to conclude that all three observed organizations, the highest marks are granted to aspects of interpersonal relationships (relationships with colleagues, the absence of conflict, relations with superior manager), and the lowest scores are related to the level of salary, promotion and learning opportunities. Even though the grades in company C in general were the lowest comparing to other two organizations, overall level of satisfaction of employees is highest. Possible explanation is related to fact that employees cherish the most working relationships, and obviously demonstrate high level of social needs. This conclusion is also corroborated by the data presented in Table 5.

Table 5: Different types of needs assessment

Company	Basic needs	Social needs	Need for development
A	3,84	3,74	3,43
B	3,50	3,60	4,00
C	3,50	3,75	3,60

The above table presents data on how much importance employees attach to specific groups of needs (classification of needs was used according to *model of motivation Alderfer ERG*). Comparing the data in Table 5 with the average respondents age in Table 1, we can infer that employees approximately 35 years old pay relatively higher attention to the development needs (B and C), while employees with an average age of 50 years (A) are focused on maintaining standard of living in terms of basic needs, meaning that in this career phase they have already reached desired level of development needs, and confirms thesis that work experience and age are in positive correlation with job satisfaction. However, the average scores of needs assessment shows that the social needs are evaluated slightly higher in all three organizations, comparing to basic and needs for development. Table 6 presents the respondents degree of satisfaction to certain job aspects.

Enterprise in Turbulent Environment

Table 6: Respondents attitudes toward different job aspects

Aspekt posla	Dissatisfied	Not dissatisfied	Not satisfied	Satisfied
Company policy	19,60%	27,45%	37,25%	15,70%
Control	8,00%	42,00%	34,00%	16,00%
Interpersonal relations	4,00%	21,60%	5,90%	68,50%
Relations with manager	3,95%	29,40%	11,75%	54,90%
Acknowledgments	15,90%	45,45%	25,00%	13,65%
Promotion opportynities	23,50%	47,05%	21,55%	7,90%
Achievements	7,85%	56,85%	19,60%	15,7%
Proffesional development	8,00%	36,00%	44,00%	12,00%

It is evident that the most important source of satisfaction are interpersonal relations, followed by relations with managers (corresponding with previous findings on the evaluation of social needs.) Major source of dissatisfaction is company policy, control and professional development.

Finally, overview of results on the importance of job security for employees is shown, as well as the average rating of the perceived safety of current employment.

Table 7: Respondents attitudes toward job security relevance and safety perception

Company	Job security relevance	Average rating of the current employment safety perception
A	4,45	3,60
B	4,60	2,90
C	4,87	3,50

Table 7 provides evidence that employees give highest possible grades to of job security. This leads to conclusion that job security is considered as one of the most important factors of job satisfaction and motivation in Serbian companies. This is understandable if we take into account high unemployment rate and enormous impact of the global crisis, so employees feel constantly anxious about possibility of losing job. Average rating of job safety perception in all organizations is low, employees believe their position at work is uncertain, regardless of real possibility of losing job.

6   CONCLUSION

Managing employee motivation is one of the most important responsibilities of a manager, and main prerequisite of high motivation is job satisfaction. It is influenced by many factors, organizational and personal, such as the job characteristics, working environment, relationship with colleagues and managers, experience, personality traits, etc. The effects of high job satisfaction are multiple. They are reflected in the increased organization commitment and productivity, improved performance, reduced employee fluctuation, increased work effort and goal orientation. Although the motivation of employees is influenced by many factors, the

most effective form of motivation is to create an environment in which employees will be happy and motivate themselves (Certo, 2008, p. 382).

Multiple case study in Serbian organizations provided evidence that most of the factors of job satisfaction are common to all three organizations, meaning there is no significant difference in the evaluation of various job satisfaction aspects. National culture characterized by high power distance, collectivism and low uncertainty tolerance implies bureaucratic organizational culture characterized by pronounced hierarchy, subordination, centralization and resistance to change (Stojanovic Aleksić, Babić and Erić, 2011). The most relevant job satisfaction aspect is social, for instance interpersonal relationships with colleagues and managers, and the needs for development, related to the promotion and recognition. Lowest rank has job security, despite the fact that it is considered one of the single most important job aspects in Serbian organizations.

In facing the future, managers must learn analytical thinking in unpredictable and complex situations (Gold, Thorpe and Mumford, 2010). Further research in this area will have to incorporate increased number of organizations and participants in an effort to define more precisely which job aspects are the most important for creation of effective incentive mechanisms to motivate employees, especially in the context of the crisis affecting Serbian and global economy.

EDUCATION FOR CREATIVITY: MOTIVATION AND LEARNING

Luke Strongman
Open Polytechnic of New Zealand, New Zealand
Luke.Strongman@OpenPolytechnic.ac.nz

ABSTRACT

This presentation explores motivation as it is related to teaching and to the workplace. As Yoshida et al., suggest, motivation is related to a variety of educational outcomes which include curiosity, persistence, motivation and performance (2008, p. 1401). As such it is an internal state that may be effected by external factors which in turn "arouse, direct and sustain behaviour" (Tan, 2009, p. 156). Motivation is also related to calibration. As Hallinan states, "Calibration measures the difference between actual and perceived ability. If you're as good as you think you are, then you are said to be well calibrated. If you are not as good as you think you are, then you are said to be poorly calibrated" (Hallinan, 2009, p. 155). Consequently in the educational enterprise (or in any learning task) it is preferable that the learner starts of in a well calibrated condition. This will entail a reasonably realistic view of their learning competencies and be less likely to result in demotivation from negative feedback should these learning competencies by too widely calibrated. Secondly, a well calibrated individual is more likely to respond to the conditions of optimal motivation that are possible in the learning situation of a self-determined learner. Related to calibration is the fact that students and employees can be motivated when they do not perceive contingencies or opportunistic incentives or barriers between actions and outcomes (Yoshida et al., 2008, p. 1401). Diminution of autonomy may lead to mal-adaptive consequences (Deci, 1996, p. 31). Whilst in everyday life it serves as justification for service and job performance, morally it is not in itself self-justificatory. In the teaching context, Gardner and Lambert (1972) describe motivation as persistence that is shown by teachers and learners in the learning environment towards achieving a learning goal. In both the teaching and business context a distinction can be made between intrinsic motivation (behaviour for its own sake) and extrinsic motivation (behaviour as a means to some external reward) (Bektas-Cetinkaya and Oruc, 2011, p. 72).

Keywords: Education, Motivation, Teaching

1 INTRODUCTION

An integral part of any learning requires motivation for that learning to take place. Motivation is not only a feature of student learning but also of classroom instruction and moreover the interactive teaching techniques that are part of the classroom learning experience. As Pintrich states, motivation is derived from the Latin verb *movere*, meaning 'to move' (2003, p. 699). As Dykstra et al. suggest, "Students who are intrinsically motivated engage in an activity for enjoyment, to learn, and/or out of a sense of accomplishment, while extrinsic motivation arises out of a need to be rewarded, for example with a higher grade, or to avoid a penalty." (2011, p. 2). The 'control theory' of motivation assumes that people are compelled to act from the "promise of reward or the threat of punishment" (1996, p. 1). This is consistent with the behaviourist concept of stimulus and response, however peoples' and particularly educationists' cognitive complexity reveals that there is far more to motivation in learning than 'sticks and carrots'. There is continued debate of whether there is a motivational 'ethic' but in as much as motivation is an inherent part of human nature, everyone has a right to find motivation – a willingness if not inherent justification to act towards a particular goal. Although people are conditioned by their environment there is a difference between acting for

others and acting from 'free will' in accordance with one's own volition. As Deci suggests (1996, p. 2).

When autonomous, people are fully willing to do what they are doing, and they embrace the activity with a sense of interest and commitment. Their actions emanate from their true sense of self, so they are being authentic. In contrast, to be controlled means to act because one is pressured. When controlled, people act without a sense of personal endorsement. Their behaviour is not an expression of the self, for the self has been subjugated to controls.

However, what is widely known is that there is a significant correlation between intrinsic motivation and academic achievement (Goldberg and Cornell, 1998). Conversely as Deci explains, "[m]otivation requires that people see a relationship between their behaviour and desired outcome, and instrumentalities are the linkages that allow people to see these behaviour-outcome relationships" (Deci, 1996, p. 59). This linkage can in some circumstances (more remotely) be economic or intrinsic (by affective bonds). Motivation and its associated affective elements is one of the most important factors in students' learning and academic performance which is implicit but seldom formalised within teaching pedagogy. Motivation is commonly defined within the teaching and learning environment as the inter-relation of motivational beliefs (the inherent value of tasks) with achievement emotions (such as enjoyment, boredom or anxiety) and academic performance and hence also in the workplace (Artino et al., 2010, p. 123). Motivation has given some educators pause to reflect on the appropriate theories of mind which might encompass motivation in the teaching and learning process. In this respect the main challenge to the 'information processing' model of learning has come from the necessity to include more subtle emotions and intentional beliefs in the learning process. Social cognitive theory holds that human functioning results from 'triadic, dynamic and reciprocal' inter-relation of behaviours (individual actions and choices) with personal factors (beliefs, intentions, and expectations) and factors in the physical and social environment (Artino et al., 2010, p. 1204). According to this model task value is balanced with self-efficacy. Task value involves students' beliefs of how relevant or interesting an activity (such as a course module or a qualification) is to them, whereas academic self-efficacy involves beliefs about the inter-relation of student's self-assessment and outside reinforcement of their ability to perform academic tasks (Artino et al., 2010, p. 1205). As Botkin et al., suggest academic learning requires a shift from maintainence learning (acquiring knowledge do deal with cuurent issues) to dynamic learning (requiring development of new ideas) and this experience can be in itself highly motivational (1979). By comparison the control-value theory of motivation defines achievement related emotions as 'internal affective rewards' which are associated with completion of learning tasks. This emotional self-evaluation may vary from enjoyment associated with new learning, to anxiety in completing a specific task to frustration and disappointment if the result is disproportionate to the effort involved (Artino et al., 2010, p. 1205). Consequently motivational beliefs defined in terms of task value, self efficacy are correlated with course or learning-activity elated enjoyment and anxiety in learning activities (Artino et al., 2010, p. 1205). Task value beliefs are therefore reasonably accurate predictors of learning satisfaction or boredom. If a learning task or course is believed to be useful, relevant and important students are more likely to feel motivated to task completion by their enjoyment of it (Artino et al., 2010, p. 1210).

1.1 Emotion and motivation

Emotion and affect are described as 'feeling[s], emotion[s] or desire[s], especially leading to action' (Sikhwari, 2007, p. 523). Students who are confidant of their learning and of their

learning environment are less likely to be disadvantaged by experiencing the inhibitory effects of anxiety in the learning performance. Enjoyment of the learning process is positively associated with successful educational outcomes whereas boredom and anxiety are negatively associated with academic performance. Consequently it behoves teachers to provide motivations inspiration in learning environments as well as subject content and the application of teaching pedagogy wherever possible. It is useful for teachers to find ways to enhance the inter-relation between self-concept, motivation and academic achievement (Sikhwari, 2007, p. 520). Understanding of motivation takes place in the context that most teaching pedagogies emphasise cognitive factors at the expense of affective factors. In this context intelligence is seen as the prime contributor to student success however, increasingly the affective component of learning – what teachers and students feel about themselves in relation to the learning task is increasingly important. Increasingly affective factors play a critical role in the motivation, attitude and self-concept of students. Higher achievement is associated with optimal attitude and positive self-concept and efficient use of study time whereas students who have a negative attitude may impose limitations on their achievements (Sikhwari, 2007, p. 521). Whether students see themselves of having ability of feeling successful or failing, of being accepted or rejected, have having positive emotions in the learning environment – such as happiness, joy of learning, self-satisfaction, reciprocity – or whether students feel defeated influences aspects of behaviour or learning (Sikhwari, 2007, p. 521). Sikhwari suggests that the main influence that high motivation has on students is in giving them the ability to effectively select and persist in information processing (2007, p. 522). If a student is motivated and interested then there is an increase in depth of processing, memory, knowledge acquisition, attention and comprehension (Sikhwari, 2007, p. 522).

1.2   Self-concept and motivation

A student or employee's self-concept is central to their understanding and perception of the learning process, it refers to a set of ideas that a student may believe about him or herself which exists on a continuum of positive and negative effect. As (Teoh et al., 2009, p. 721) suggest, factors related to personal beliefs include: "significance of learning, confidence, interest, efforts, family support, independence, self-direction, teacher's attention". In this context, although affect can have a large effect on student motivation it is more dangerous when unaccompanied by conscious cognition and the possibility for remediation through the introduction of motivational elements which improve it. Secondly, positive and negative affect may or may not be related to a student's actual potential for educational performance and from a third-part objective perspective its influence may thus be over-rated. A student can be negatively motivated and pass an examination and positively motivated yet fail – motivation is one intervening factor in a complex inter-relation of effects, including mastery of subject content, experience and self-reliance.

A self-concept is an evolving factors in the construction of learners educational lives, it is neither finite nor static and may change on a ratio of positive or negative influence depending on the learners values, thoughts and intentions, the hospitability of the learning environment and prevailing organisational culture and circumstances (Sikhwari, 2007, p. 523). Motivation also involves personality and will as is seen as a driving force in closing the gap between current and future states of knowledge involving skill acquisition and qualifications. It is not inherently something that is "done to people rather is something that people do" (Deci, 1996, p. 21). It is also an intrinsic factor in workplace organisation as well in the personal psychological fabric of students' lives.

Sikhwari suggests that it comprises a set of dependent/independent variables in relationships between the learning and the learning activity which account for the persistence and direction of a learner's behaviour if all other factors such as aptitude, skill, understanding, intelligence and environmental constraints are held constant (Sikhwari, 2007, p. 523). Furthermore, any learning-teaching situation may be characterised by what may be termed "autonomous dependence" (Deci, 1996, p. 90). This differs markedly from overly-controlled environments which are characterised by "coerced or controlled dependence" which may be amotivational (Deci, 1996, p. 90). Motivation is also related to attitude as an underlying constant in the formulation of a learning disposition. A more precise definition of attitude is offered as "[m]ental and neural states of readiness, organised through experience, exerting a directive or dynamic influence on a person's response to objects and relations" (Sikhwari, 2007, p. 524). As such attitude is seen as a concept which might be real or imagined and involves a cognitive, evaluative orientation of an individual (Sikhwari, 2007, p. 524). Attitude differs from motivation in so much as the former concerns a general tendency to behave in a particular way towards a task whereas the latter is concerned with providing the reason or driving force towards accomplishing the task (Sikhwari, 2007, p. 524).

Individuals who have relatively high stress and feelings of discomfort at University but a lower sense of control are more likely to experience a lowered sense of well-being and correspondingly may feel limited enjoyment and motivation (Gavala and Flett, 2005, p. 52). In comparison in situations where people report a higher sense of academic control with higher comfort from the environment there is correspondingly higher well-being. People desire to be a causal agent in managing their own learning (Deci, 1996, p. 94). Interestingly Gavala and Flett found no moderating effects of cultural identity on motivation (2005). If people are presented with a comfortable working environment that is culturally congruent to them then there are corresponding increases in psychological well-being and academic enjoyment and motivation (Gavala and Flett, 2005, p. 52). Factors contributing to academic success include a.) maintaining good working relationships (or at least a sound relationship with one other), and b.) having solid family support. Motivation is related to attitude in so far as evaluation of experience as positive or negative may interact with motivation to continue change or discontinue a particular task. Academic achievement, for example, may be its own reward or it may be a means to further reward such as qualification for employment. However, motivation becomes particularly important when equity issues such as socio-economic status, low incomes, low education, produce limited opportunities for development. In such situations where there are few external drivers of motivation and negative stimulants for attitude, intrinsic motivation becomes far more important. Extrinsic rewards, when they are part of educational development, need to be equitable (Deci, 1996, p. 55).

Choice is also relevant for motivation. If an individual chooses to be involved in a particular activity for curiosity or intrinsic reasons they are more likely to value it (Shroff et al., 2008, p. 114). Coping behaviour is also predicated on personal efficacy in relation to task engagement, if personal efficacy in task engagement is seen as higher than people will be more motivated, if it is seen as lower then demotivation may result (Shroff et al., 2008, p. 121). Coupled with intrinsic motivation, extrinsic motivation such as teacher's attitudes or instructional design quality are important but these factors are one pedagogical overlay on stimulating self-regulation among students which may include three factors: "personal functioning by goal setting, self-evaluation in academic performance" and utilising the "learning environment by seeking information and assistance" (Teoh et al., 2009, p. 712).

1.3 Concepts in academic motivation

Curiosity contributes to motivation in so much as it is one driver of persistence in learning and performance (Yoshida et al., 2008, p. 1401). The antithesis of motivation is the situation of 'learned helplessness' which can arise when people are exposed to uncontrollable stresses which condition them to fail to recognise and escape from controllable stresses – causing demotivation and even in some cases, depression (Yoshida et al., 2008, p. 1401). Conversely the motivation for accomplishment of learning tasks can be defined as the psychological propensity for pleasure and satisfaction following successful task completion. Classroom motivation is also related to certain instructor/teacher characteristics such as "fairness, caring, enthusiasm, consistency and impartiality" (Dykstra et al., 2011, p. 2). Motivational values such as a desire to learn, personal incentives (intrinsic and extrinsic) and striving for excellence may be affected from such conditions as: Interest, learning from others, taking responsibility for learning, intrinsic and extrinsic task and social rewards (Yoshida et al., 2008, p. 1402). While completed tasks are seen as more pleasant and incomplete tasks as less pleasant, tasks recall is higher for completed tasks than incomplete tasks. Moreover, instructors who maintained highly structured, organized and outcome-focused lessons are more likely to inspire motivational learning confidence in students (Dykstra et al., 2011, p. 2). For students of lower ability, completion of low-level tasks is more rewarding than attempting to complete higher level tasks which motivate other groups (Yoshida et al., 2008, p. 1410). Tan suggests that student achievement is attributable to both environmental and genetic conditions (2009, p. 156) however it is not possible to improve the learning performance of someone who is not motivated.

As Wilson suggests, motivation explains behaviour and actions (Wilson, 2009, p. 272). It is defined as being "the force which starts and sustains our activities towards achieving our goals" (Wilson, 2009, 272). If a performance orientated student has high motivation without an internal interest then it is more likely for them to adopt approaches to learning that are 'surficial' (Wilson, 2009, pp. 278–279). This emphasises the need in some learning situations for intrinsic goal setting rather than over-reliance on external goal setting (Wilson, 2009, pp. 278–279). Surface learning is thought to be a characteristic of 'performance avoidance students; whereas performance approach students adopt a more strategic approach t learning in which intellectual achievement is valued and obligations are intended to be fulfilled (Wilson, 2009, p. 279).

According to Dornyei and Shekan (2003) motivation describes three factors: 1.) why they do something, 2.) how long they do it for, 3.) how hard to pursue it. However, because people are infinitely complex there is no one definitive path to peoples' motivations. Putting money into consideration in motivational contexts is more complex and is not in itself to be considered an entirely beneficial ingredient in the learning process. As Deci explains, "When people say that money motivates, what they really mean is that money controls. And when it does, people become alienated – they give up some of their authenticity – and they push themselves to do what they think they must do" (1996, p. 29). Consequently monetary motivation is thought to undermine autonomy and volition in some circumstances. At the level of extrinsic reward Adair also points to the shortcomings of money as a motivational tool, "At best money is a crude measure of the value of work. Is a pop star really worth a thousand times more than a brain surgeon?" (2006, p. 113).

Diminution of autonomy may lead to mal-adaptive consequences (Deci, 1996, p. 31). Whilst in everyday life it serves as justification for service and job performance, morally it is not in

itself self-justificatory. In the teaching context, Gardner and Lambert (1972) describe motivation as persistence that is shown by teachers and learners in the learning environment towards achieving a learning goal. A distinction can be made between intrinsic motivation (behaviour for its own sake) and extrinsic motivation (behaviour as a means to some external reward) (Bektas-Cetinkaya and Oruc, 2011, p. 72). Many peoples' motivations may be seen as being on a continuum between self-determined and controlled motivation (Bektas-Cetinkaya and Oruc, 2011, p. 72). However, little attention is often made to the environmental factors of motivation be they physical or social in effect. However, a study by Clemens (2008) revealed that students' socio-economic status has a large effect on academic achievement and that motivationally supportive environments are positively related to academic achievement (Bektas-Cetinkaya and Oruc, 2011, p. 72).

1.4   A summary of different theories of motivation

As Wilson suggests, motivation is the term used to explain why we act in certain behavioural patterns at given times, and is a "force which starts and sustains our activities towards goal achieving" (Wilson, 2009, p. 272). There are four major theories of motivation. Attribution theory suggests that our actions are the result of making sense of our environment, the search for causes to perceptions, feelings and events creates a behavioural dynamic of socially constructed reality (Wilson, 2009, p. 272). In comparison, expectancy value theory suggests that the amount of motivation or effort for a task is dependent on the expectant value of success. The fact that individuals calibrate themselves or set gaols based on interpretations of past achievements is the basis for self-efficacy theory. Fourthly, goal orientations explain how we view success give orientation towards a particular activity (Wilson, 2009, p. 272). The mastery of goal expectation is based on a desire for increased understanding which is more likely to occur in learning environments in which students receive sufficient feedback in response to learned competencies. There is also a distinction between performance approach goals and performance avoidance goals. Performance approach goals refer to orientation toward demonstrating high ability whereas performance avoidance goals orientation towards demonstrating low ability. In the education context overly-controlling behaviour is thought to reduce choice, diminish autonomy and if applied in too rigid an environment lead to reduced motivation. As Deci suggests, "Deadlines, imposed goals, surveillance, and evaluations undermine intrinsic motivation. People experience them as being antagonistic to their autonomy, so these events drain people's sense of enthusiasm and interest in controlled activities." (1996, p. 31). However, if such controls are delivered in such a way to make them appealing, with corresponding intrinsic and extrinsic rewards, people may feel more motivated to accomplish them.

1.5   Motivational attitudes

According to Pintrich there are four types of extrinsic motivational styles which are expressed on a continuum from externally influenced (learning environment controls) to internally influenced (self-controlled). These are: a.) external – regulated by others according to constraints and rewards, b.) introjectors who internalise values but who are still externally controlled, c.) identification – more internal control and self-validation with learning values, d.) integration – high internal control and alignment with learning values (2003, p. 673).

According to Pintrich suspension of perceived control in some learning situations may valuable for students as it necessitates adaption to the learning task (2003, p. 673). If students fail they then are more likely to attribute it to a cause outside their control – thus teachers need to provide intrinsic motivational rewards that do not cause students to negatively

externalise their learning task self-efficacy. As Deci suggests, "to be intrinsically motivated people need to *perceive themselves* as competent and autonomous; they need to feel that they are effective and self-determining." (1996, p. 86). However, in many situations student and learning environment stability rather than control is more important in predicting future outcomes from motivated behaviour although control is reflected in the difference between the learning gap in adaptive (shapeable) or unchanging levels of knowledge acquisition and intelligence (Pintrich, 2003, p. 673). Adair suggests there are eight principles of motivating others (2006, p. 109):

- Be motivated yourself
- Select people who are highly motivated
- Treat each person as an individual
- Set realistic and challenging targets
- Remember that progress motivates
- Create a motivating environment
- Provide fair rewards
- Give recognition

However, even if all other motivational factors are successful and students learn in optimal environments – external influences may undermine student engagement – these include family and employment commitments, personal and personal and cultural factors (Ross, 2010, p. 5). Overall however, whatever the characteristics of the learner, instructor or the environment motivation is the "attainment of a state of being" (Deci, 1996, p. 21).

2   CONCLUSION

Motivation is a central though under-researched factor in teaching and learning and workplace performance. It is a intrinsic characteristic of any learning process but is frequently over-looked in many pedagogical models of teaching practices. Motivation is inherently concerned with a 'desire to learn', it is the cognitive and affective elements that provides the drive to close the gap between one state of knowledge and another more advanced state in any learning practice. Motivation has both intrinsic and extrinsic causations and is often predicated on a mixture of self-determined and environmental conditions. It behoves any teacher both in contact and in distance education to design environments in which students are given the optimum conditions to flourish and realise their learning potential. Because of the combination of self-determined and extrinsic features of any motivational learning environment, motivation requires a form of learner-instructor interaction which is at least interested and self-sustaining and at best a fully engaging humanistic exchange of curriculum knowledge and ultimately within the workplace.

REGRESSION ANALYSIS OF CUSTOMER LOYALTY IN EDUCATION SERVICE INDUSTRY

Hana Suster Erjavec
Faculty of Commercial and Business Sciences Celje, Slovenia
hana.erjavec@fkpv.si

ABSTRACT
Customer loyalty is important for institutions in education service industry since loyal students/graduates, are the best guarantee to ensure sufficient student enrolment in the future. Our main purpose was therefore to investigate what effects customer loyalty in education service industry. We conducted a quantitative research using online survey. The empirical study was done on a sample of graduates of undergraduate and postgraduate studies at Faculty of Commercial and Business Sciences in Slovenia. The analysis of multiple regression offers a very good model as it explains as much as 69,7% of the variance of the concept of customer loyalty in education service industry with only two antecedents of customer loyalty, being customer satisfaction and expectations. This result confirms findings of some other empirical studies that were done in different service industries and shows that customer satisfaction has a great positive impact on customer loyalty. Besides customer satisfaction, expectations that students form about the quality of knowledge and competences that the Faculty would provide after finishing their studies is also significant antecedent of customer loyalty. This determinant is not seen as antecedent of customer loyalty in similar studies of customer loyalty. It therefore opens a whole new area of interest for further research.

Keywords: Customer Loyalty, Customer Satisfaction, Education, Expectations, Regression Analysis

1 INTRODUCTION

Education service industry in Slovenia is becoming highly competitive market with creating new privately owned educational institutions as well as expanding some educational programs on public universities and secondary schools. Since changes are most visible in higher education, we are particularly interested in this segment.

In recent years tertiary education in Slovenia is expanding. Many colleges establish their own programs at higher levels (eg Masters, PhD), so it is very important that their students are loyal to them. Customer loyalty is important to create a strong and reliable base of customers (Gee et al., 2008, p. 364) and education service industry is no exception.

We observe that in education service industry loyal customers, namely students/graduates, are the best guarantee to ensure sufficient student enrolment in the future. Loyal students continue their studies at higher levels in selected institution if they offer ones. Loyal students also speak highly positively about the education institution. Loyal students recommend their selected education institution to their colleagues, friends, and relatives. We can say that loyalty is the best policy for institutions in education service industry.

Our main purpose is therefore to investigate what effects customer loyalty. If educational institutions wish to ensure high customer loyalty of their students, it is important for them to understand, how to achieve customer loyalty. These were our guidelines in setting our research question: **»What does customer loyalty in education service industry depend**

on?« Based on this research question we set the goal to research which determinants affect customer loyalty in education service industry in Slovenia and how.

We carried out quantitative research through online surveys. The research was implemented in May 2012. The sample included graduates of the Faculty of Commercial and Business Sciences who have completed studies at undergraduate or postgraduate level. Sample consists of 92 graduates. Response rate was 35.8%. The analysis was made using the statistical software package SPSS 19.

2   THEORETICAL BACKGROUND

Sirdeshmukh and Singh (2000, p. 150) identified customer loyalty as a marketing currency of the 21st century. Marketers wish to build relationships with their customers, but they are aware of the difficulties of doing it. Customer loyalty is seen as a deep commitment of customer to certain product that he or she buys and intends to prefer it in the future, regardless of the marketing efforts of the competitors (Oliver, 1999, p. 34; Oliver, 1997, p. 392). Customer loyalty is a long-term attitude and a long-term pattern of behaviour, that is stimulated by a variety of experiences, acquired by the customer over time (Terblanche and Boshoff, 2006; Gee et al., 2008, p. 360). Customer loyalty is seen as a repeated purchase or a repeated relative size of purchase of the same brand (Tellis, 1988; Oliver, 1999, p. 34).

Uncles et al. (2003, p. 294) conclude according to their literature review on popular conceptualizations of customer loyalty there is no universally agreed definition (Jacoby and Chestnut, 1978; Dick and Basu, 1994; Oliver, 1999; Uncles et al., 2003). Instead, there are three popular conceptualizations (Uncles et al., 2003, 294):
1. Customer loyalty as primarily an attitude that sometimes leads to a relationship with the brand;
2. Customer loyalty mainly expressed in terms of revealed behaviour (i.e. the pattern of past purchases); and
3. Customer loyalty as buying concept moderated by the individual's characteristics, circumstances, and/or the purchase situation.

Despite the diversity of definitions of customer loyalty, two major approaches have been developed over time: behavioural and emotional. Initially, researchers have focused on the behavioural approach. In this approach, loyal customers are seen as those who buy and re-buy the same brand, appreciate that exact brand and are not looking for information on competitive brands. Such loyalty is measured in academic researches through the frequency of re-purchase the same brand or through relative share of this brand in the total consumption of the customer. Later, academics defined customer loyalty from the emotional point of view, which shows customer's attitudes to the certain product. It refers to the company's commitment, willingness to recommend the company, demonstrates positive emotions and feelings to the company or its products.

Different researchers define customer loyalty and further operationalize customer loyalty differently. Operationalizations may include: "Customer speaks positively about the company"(Boulding et al., 1993, p. 14); "Customer recommends company to others" (Parasuraman et al., 1988) or "Customer remains loyal to the company" (LaBarbera and Mazursky, 1983, p. 394; Rust and Zahorik, 1993, p. 199).

According to these findings we have operationalized customer loyalty with three manifest variables:
- "I speak only positively about my Faculty."
- "I will recommend my Faculty to friends and colleagues."
- "If I were to start my studies, I would have chosen my Faculty again."

Both aspects of loyalty, emotional and behavioural, were included in the measurement, because this is consistent with measuring customer loyalty in current academic researches. And also in order to get a latent variable, customer loyalty, that best presents the loyalty of our students. The first two variables refer to the measurement of the emotional aspect of customer loyalty, while the third variable measures loyalty from the behavioural point of view.

Empirical researches show that antecedent which most strongly affects customer loyalty is customer satisfaction. Oliver (1997, p. 13) defines customer satisfaction as an emotional and cognitive evaluation of experience with the product. Customer satisfaction is the estimation whether the characteristics of a product or a service have reached a level of performance that gives a pleasant feeling. Oliver's definition of customer satisfaction is based on the paradigm of unconfirmed expectations (1980, pp. 460−462; 1997, pp. 98−126) and derives from the belief that customers have developed the expectations about the product. Customer satisfaction is a dynamic process that occurs on the basis of confirmation of expectations and gradually develops into customer loyalty. Martin O'Neill et al. (2008, p. 232) emphasize that it is necessary to measure customer satisfaction as cognitive and emotional aspects in order to better understand how customers form their customer satisfaction.

Fornell et al. (1996, p. 10) operationalize customer satisfaction with three manifest variables: customer satisfaction as a whole, as an estimation how expectations were fulfilled, and as comparison with the ideal service or product. This choice they explain as consistent with the orientation of American consumer satisfaction index (ACSI). We find this operationalization of customer satisfaction also in empirical studies by Johnson et al. (2001, p. 235) in the proposed new model of customer satisfaction, based on the American consumer satisfaction index (ACSI), further empirical studies by Türkyilmaz and Özkan (2007, p. 677) in the index of customer satisfaction with Turkish mobile services and in studies by Kristensen et al. (2000, p. 1009) in the European customer satisfaction index (ECSI).

According to these findings we have operationalized customer satisfaction with three manifest variables:
- "My expectations about the studies at the Faculty are totally met."
- "Studies at the Faculty are consistent with my idea of ideal Faculty."
- "Studies at the Faculty are better than studies at other Faculties."

Expectations are likely to be beneficial to establish a positive or negative attitude towards the phenomenon (Olson and Dover, 1979; Oliver, 1981, p. 33). We believe that expectations that students form about the quality of knowledge and competences that the Faculty would provide after finishing their studies are important antecedent of customer loyalty. Rego (1998, p. 132) believes that customer satisfaction reflects a delivery of expectations, which have been obtained as the product was experienced. It seems almost self-evident that expectations affect customer satisfaction inversely; lower than expectations, higher customer satisfaction is, or higher than expectations, harder to meet customer satisfaction is, therefore customer

satisfaction is lower. Regardless of several researches that confirmed positive affect of expectation to customer satisfaction, there are rare empirical studies that investigate the link between expectation and customer loyalty. According to our literature review this link is indeed neglected. This opened question in literature forms a challenge for our research.

3 RESEARCH

3.1 Gathering the data and the sample

In May 2012 we have sent an e-mail with online survey addressed to every student of the Faculty of Commercial and Business Sciences who have graduated in the period from 1st October 2011 to 1st May 2012. The survey was sent to 257 graduates, 207 of them are graduates of undergraduate study and 50 graduates of master's titles. We have received 92 answered surveys. Response rate was 35.8%. Our sample consists of 62 bachelor's graduates, which means that their response rate was 30% and 30 masters' graduates, which means that their response rate was 60%.

The sample consists of 69.6% women and 30.4% men. 35.9% of all respondents are over 41 years old, 32.6% are between 31 and 40 years old, 23.9% are between 26 and 30 years and 7.6% are between 21 and 25 years old. Most students (40.2%) were attending studies in Celje, further Ljubljana (29.3%), Maribor (14.1%), Murska Sobota (8.7%), Nova Gorica (5.4%) and Kranj (2.2%). Majority of students in the sample, 94.6%, are attending part-time studies, and the remaining 5.4% are full-time students. 67.4% of the students in the sample are undergraduate students and 32.6% are graduate students. Majority of students (84.4%) are employed, 12.0% of them are unemployed, 2.2% of them still own a student status and 1.1% is working on contract.

3.2 Regression analysis

According to literature customer satisfaction affects customer loyalty. Expectations are also important determinant in archiving customer satisfaction according to some empirical studies, but researching the connection between expectations and customer loyalty is seldom neglected in academic studies. We believe that expectations about the quality that Faculty provides impact customer loyalty. Therefore we have formed a model that predicts positive impact of customer satisfaction and expectations to customer loyalty. As the output variable, the key latent variable in the model, we set customer loyalty. The model includes the concept of customer satisfaction and expectations. Multivariate analysis of multiple regressions was used to analyze the data. The program we used was SPSS.19.

In researching for the best model that explains what effect customer loyalty, we used stepwise method in multiple regressions analysis as we wanted to include antecedents of customer loyalty that are otherwise rarely confirmed in empirical studies, but might have been important antecedents of customer loyalty in the case of education service industry. Analysis eliminated insignificant antecedents and explored two models that are both significant. We will hereafter devote more attention to the second model, because it confirms our belief that not only customer satisfaction, but also expectations are important determinant in achieving customer loyalty.

Table 1: Results of multiple regressions for customer loyalty (Customer loyalty of graduates at FKPV, survey, 2012)

Model Summary[c]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change
						Change Statistics			
1	,824[a]	,679	,675	,40903	,679	173,297	1	82	,000
2	,839[b]	,704	,697	,39480	,026	7,017	1	81	,010

a. Predictors: (Constant), customer satisfaction

b. Predictors: (Constant), customer satisfaction, expectations

c. Dependent Variable: customer loyalty

Coefficients[a]

Model	Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.
1 (Constant)	1,088	,228		4,776	,000
customer satisfaction	,803	,061	,824	13,164	,000
2 (Constant)	,581	,291		1,995	,049
customer satisfaction	,767	,060	,787	12,687	,000
expectations	,152	,057	,164	2,649	,010

a. Dependent Variable: customer loyalty

The value of F-test regression model for the concept of customer loyalty is statistically significant (Sig. = 0.000). The model explains 69.7% of the variance of the concept of customer loyalty and can be written using the following regression equation:

Customer loyalty = 0.545 + 0.774 × customer satisfaction + 0.157 × expectations

The key variable in the prediction of customer loyalty is customer satisfaction.

4   CONCLUSION

The analysis of multiple regression offers a very good model as it explains as much as 69,7% of the variance of the concept of customer loyalty in education service industry with only two antecedents of customer loyalty, being customer satisfaction and expectations.

By far the most important, the key variable in the prediction of customer loyalty is customer satisfaction. This result confirms findings of some other worldwide studies that were done in different service industries and shows that customer satisfaction has a great positive impact on customer loyalty. These conclusions are important contribution to education service industry in particular for Faculties. It is important that students are satisfied with the service that the Faculty provides as customer satisfaction of graduates is by far the most important antecedent of customer loyalty. Besides customer satisfaction, expectations that students form about the

quality of knowledge and competences that the Faculty would provide after finishing the studies is also significant antecedent of customer loyalty.

Several academic studies confirm that measuring customer satisfaction is important as customer satisfaction is the key in achieving customer loyalty. Our empirical study confirms these findings. Faculties wishing to achieve loyalty of its graduates will have to focus their attention on achieving satisfaction of their students. Regular monitoring of customer satisfaction and adopting measures which leads to achieving higher customer satisfaction of students is right way for Faculties that want to compete in this highly competitive market. Besides customer satisfaction, expectations are also an important antecedent of customer loyalty of graduates. These findings are important contribution to Management of Faculties. Management is therefore obliged to ensure that students enrolling the Faculty get a picture that is as real as possible about the knowledge and competences the Faculty provides to their students. In this case their expectations can be realized and fulfilled expectations would help to build loyal students.

We see the limitation of our study is our choice to implement empirical research on the population of graduates from one selected Faculty. Therefore we suggest implementing such a research on broader population of graduates from other Faculties, with this we have in mind public ones and privately owned.

The survey left number of other open questions for the future. The question that rises in the context of ownership of the Faculties is also whether graduates from public and privately own Faculties have different expectations about the quality of knowledge and competences they would receive and further, does ownership plays a moderating role in this regression model.

It would be interesting to investigate the impact culture has on customer loyalty and its antecedents. This can be implemented only by empirical study with the data being collected in other cultures. Therefore we urge researchers from other countries to verify our model among their graduates.

ABSTRACT
Logistics companies have been dealing with an increasing amount of material flows caused by economic growth in recent years. Energy consumption, air and waste pollution, and resource wastefulness have become serious problems. Therefore, the concept of green logistics, in the context of sustainable development, has emerged.This paper conducted a literature review to summarize the implications of green logistics and the current status of green logistics development in Taiwan and overseas. It also interviewed academics and experts from government agencies, research institutes and industries; in order to identity the strengths, weaknesses, opportunities and threats of green logistics development in Taiwan. Finally, this study produced a TOWS matrix for the strategy mapping and formulation of green logistics strategies in Taiwan.

Keywords: Expert interviews, Green logistics, SWOT analysis, TOWS matrix

1 INTRODUCTION

Logistics activities and social/economic development are the two sides of the same coin. On one hand, logistics is the pillar that supports economic development. On the other hand, economic development increases the total volume of logistics flows. Over the past decades, the vibrant development of regional blocs, such as the North American Free Trade Agreement, the European Union and the World Trade Organization, have led to the development of global logistics. Meanwhile, zero-inventory and just-in-time distribution strategies have also emerged in response to lifestyle changes. All these factors contribute to the growing frequency of logistics activities. However, logistics activities cause air and waste pollution, resource wastefulness, and traffic jams. As the global economy continues to expand, the impact of logistics activities on the environment also increases.

The international community has also come up with measures to curb the pace of global warming. The United Nations Framework Convention on Climate Change, the Kyoto Protocol and the Copenhagen Accord all require participating countries to individually or collectively control the amount of greenhouse gas emissions, in order to reduce the impact of greenhouse effects on the global environment. As wastefulness in fuel consumption and packaging materials in the logistics process generate a huge amount of carbon emissions, the low-carbon requirements in the international community have confirmed the necessity of green logistics.

Green logistics have been in operation in some developed countries for years, and this has become part of the international trend. The European Union, the US and Japan have all enacted relevant regulations so as to promote the development of green logistics. Taiwan has been playing catch-up. In 2004, the Ministry of Transportation and Communications published a whitepaper for transportation policies and set out a vision of efficiency, intelligence, liberalization and sustainability for the development of cargo transportation. However, green logistics is still new to Taiwan and there have been few relevant studies. As a result, most people and enterprises are not clear about the concept of green logistics and hold a wait-and-see attitude when government agencies and companies seek its promotion.

Therefore, this paper conducted a literature review to summarize the implications of green logistics and the current status of green logistics development in Taiwan and overseas. The purposes of this paper were as follows: (1) a literature review to gain an understanding of the implications of green logistics and the current status of green logistics development in Taiwan and overseas; (2) interviews with experts to identify the strengths, weaknesses, opportunities and threats for Taiwan to develop green logistics; (3) the production of a TOWS matrix for the mapping of SO, WO, ST and WT strategies. The aim of the above was to formulate strategies for the development of green logistics in Taiwan and serve as a reference for the promotion of green logistics in both the public and private sectors.

2   LITERATURE REVIEW

Green logistics is a new logistics concept that was proposed by corporations and academics in the West in 1990. Logistics activities and social/economic development have been, in fact, two sides of the same coin over the past few decades. The booming of regional blocs has been a driving force for highly efficient global logistics. Meanwhile, lifestyle changes (e.g. the popularity of convenience stores and shopping malls, and the emergence of e-commerce) have been increasing the frequency of logistics activities. These factors have been contributing to the growing problems associated with energy consumption, air and waste pollution, and resources wastefulness. This is why the concept of green logistics that focuses on sustainable development has come into play.

2.1   Definitions of Green Logistics

Scholars in Taiwan and overseas have come up with various definitions of green logistics. Sbihi and Eglese (2007, pp. 99–116) suggested that green logistics is the production and distribution of products in a sustainable way. They argued that environmental and social factors are also part of the equation. Petersen and Petersen (2007) from Demark in their book *Green Logistics* pointed out the implications of green logistics in a brief and concise manner. Green logistics is the ecological management of both forward logistics and reverse logistics. Rodrigue et al. (2001) suggested that green logistics is a logistics system that coordinates with the environment. It is an environmentally friendly and effective logistics system. The

American Reverse Logistics Executive Council (RLEC) in its research publications provides a definition of green logistics, also known as eco-logistics, as a process of delving into how logistics impacts the ecosystem. RLEC also compares green logistics and reverse logistics. It indicates that reserve logistics is the process of products and packaging materials moving from consumers to manufacturers. It aims to re-acquire product values or properly dispose of products. Therefore, reverse logistics is an element of green logistics. Wu and Dunn (1995, pp. 20–38) suggested that green logistics is a combination of the greening of forward logistics, i.e. material acquisition, production, packaging, transportation, storage, and final delivery to end-users, and the reverse logistics that includes waste recovery and disposal.

To sum up the previous definitions of green logistics by scholars, this paper suggests that green logistics is the adoption of measures to reduce environmental impacts in all the elements of conventional logistics, including the material flow throughout its procurement, production logistics within factories, sales, marketing and distribution of merchandise, and the reverse logistics of wasted final products. The measures to mitigate environmental impacts can be the application of advanced technologies or changes in transportation models. Therefore, green logistics, defined by this paper, encompasses green design, green procurement, green production, green packaging, green warehousing, green distribution, and reverse logistics. Below is a list of the relevant explanations.

2.2   Current Status of Green Logistics Development in Different Countries

Major developed countries have been promoting green logistics as the focus of the industry by encouraging the application and development of green logistics technologies and environmentally friendly new materials. These efforts cover the theories and practices concerning recycled materials and are accompanied with relevant green logistics policies and regulations. The purpose is to ensure green material flows and sustainable development. This section summarizes the current status of green logistics development in the US, the European Union and Japan.

2.2.1   United States

The US is the origin of the concept of logistics and has been a world leader in logistics research, design and technology development. In the US, the government promotes a free economy. Economic development increases the frequency of logistics activities. To reduce the environmental impact of logistics activities, the US has to pay increasing attention to green logistics. In a strategic blueprint for national transportation technologies, the US government set out its targets to be achieved by 2025 in its transportation industry structure and technology. These targets are the establishment of safe, highly efficient, sufficient and reliable transportation. It is international in scope, comprehensive in format, intelligent in features and environmental friendly in nature. In terms of corporate activities, many advanced technologies have been developed for the transportation, distribution and packaging of materials. These technologies include electronic data interchanges (EDI), distribution planning, and green packaging. All these efforts provide a strong technical support and guarantee for green logistics activities.

2.2.2   European Union

The European Union began in the 1980s to explore a new collaborative model for logistics systems, i.e. the integration of logistics and supply chain management. The aim was to combine the material flows and information flows between the end consumers and the initial suppliers. It emphasizes the inter-company cooperation in the distribution process of products

by changing the distributed logistics management across companies. The purpose is to achieve logistics efficiency that was previously impossible to reach and reduce the impact of inefficient logistics on the environment. In 2002, Europe came up with an overall transportation project that used a monitoring system to control ships, in order to avoid and eliminate marine pollution caused by transportation. Meanwhile, Freight Forward Europe (FFE) has developed a set of environmental standards corresponding to transportation, loading/unloading and management. It also encourages corporations to apply the new concept of green logistics in their logistics activities and step up their R&D and application of green logistics techniques.

2.2.3   Japan

Since the introduction of total logistics management from the US in 1956, Japan has spared no effort in building the infrastructure of modern logistics. In fact, reforms in the logistics/shipping industry have become a priority in the development of its economy. To reduce the environmental impact of the logistics/shipping industry and to improve the efficiency of logistics, the Japanese government has enacted a series of regulations and requirements. In 1989, Japan proposed three targets for green logistics, to be achieved within ten years. These three targets were a reduction by 30~60% of nitrogen compounds, a reduction by over 60% of granule exhaust particles and a reduction by 10% of the sulphur content in petroleum. To curb greenhouse effects and air pollutions and to reduce pollutions/emissions, the Japanese government and the logistics industry have been promoting a change in transportation models (from vehicles to railways and marine transportation, as the environmental impact is lower), and the infrastructure of a joint railway system. In the cities, it is encouraged to establish joint distribution systems and conserve the energy required for transportation. In 2001, Japan published the Outlines for Logistics Implementation Strategy for Japanese Logistics. One of the highlight measures is to reduce air emissions/pollution, promote environmental protection, and recycle/reuse usable resources. The vision is to establish a positive cycle of resources, ecosystems, society and economy by building up new logistics systems in compliance with environmental requirements. In 2005, a law governing the integration and efficiency of logistics was proposed, with an aim to establish a logistics centre-point by integrating the current inefficient logistics systems (e.g. traditional warehouses, distribution/processed plants and trunk stations), in the hope of facilitating advanced logistics that are efficient and have smaller environmental impacts.

2.3   Basic Concepts of SWOT and TOWS

The TOWS Matrix is a strategy formulation method that falls under the SWOT framework. It is the most frequently used analytical tool in strategic planning in Taiwan and overseas. This paper applied the TOWS Matrix to develop a strategy for green logistics in Taiwan. Below is an introduction of the basic concepts of SWOT and TOWS.

2.3.1   SWOT Analysis

SWOT is an analytical framework used to organize, discern, collate, control, analyze and synthesize relevant data. Many organizations use SWOT analysis as the first step in strategic planning. SWOT, developed by Fred (1986), is a generic strategic management model that consists of the three steps of strategy generation, implementation and evaluation. In the strategy generation process, strengths and weaknesses, as well as opportunities and threats, are identified from the perspectives of the organization (internal) and the environment (external). The purpose is to develop appropriate targets and strategies. A systematic approach in analysis can ensure definite strategies and robust analyses.

Enterprise in Turbulent Environment

2.3.2 TOWS Analysis

SWOT analysis is no more than an analytical framework and it does not shed light on strategic development. Many scholars and experts have sought to identify a strategic-planning methodology that combines endogenous and exogenous variables. Weihrich (1982, pp. 54–66) proposed the TOWS matrix, which proved to be superior to other analytical tools of the same time. However, the TOWS matrix is a strategy development method that falls under the SWOT analysis framework.

The TOWS matrix presents strengths and weaknesses (within a company) and opportunities and threats (of the external environment) in a matrix. A total of four strategic patterns (2*2) are established using strategic mapping. Below is a summary of the individual strategic implications.

The combination of strengths and opportunities (SO strategy), i.e. Maxi-Maxi, if an opportunity in the external environment and the organization happens to have an advantage, this strategy focuses on the utilization of strengths to capture the opportunity. It actively aligns the external environment and internal conditions to form a niche, so as to maximize the effects of the combination of strengths and opportunities.

The use of strengths to avoid threats (ST strategy), i.e. Maxi-Mini. This approach aims to minimize the impact of external threats by leveraging internal strengths.

The overcome of weaknesses to grasp opportunities (WO strategy), i.e. Mini-Maxi. Although the external environment is in favor of the organization, the internal weaknesses may lead missing the opportunity. It is necessary to improve the weaknesses and leverage external opportunities so as to maximize the benefits to the organization. The improvement of weaknesses to avoid threats (WT strategy), i.e. Mini-Mini. In this situation there are external threats and the organization is disadvantaged. This strategy emphasizes the improvement of weaknesses to avoid threats, so as to minimize the impact of external threats.

3 RESEARCH METHOD

This study collected data, reviewed the literature and conducted interviews with experts. As green logistics is a relatively new topic in Taiwan, there is a limited amount of literature. Hence, the major source of information was gathered via interviews with academics and professionals in industries, government agencies and research institutions. Secondary information was mainly sourced from relevant journals and papers in Taiwan and overseas (e.g. green logistics, strategic planning and SWOT analysis), books and proposals (e.g. project plans by the Department of Commerce, the Ministry of Economic Affairs and the Institute of Transportation of the Ministry of Transportation and Communications), corporate social responsibility reports, and the Internet.

This study focused on the strategic development of green logistics in Taiwan. It was an explorative and qualitative study. Semi-structured interviews were conducted, in order to obtain in-depth and comprehensive data. Table 1 is the list of prepared questions that aimed to facilitate the face-to-face interviews. The interviewees expressed their opinions on the surveyed questions and reflected other opinions whenever necessary. The interview agenda was modified according to the situation and feedback from the interviewees, in order to make up any insufficiencies in the practical elements in the study.

Table 1: Interview Agenda

Questions to the Experts
1.   Do you think it is necessary for Taiwan to develop green logistics?
2.   What do you think are the near-term, mid-term and long-term challenges for Taiwan in developing green logistics?
3.   What do you think are the strengths and weaknesses of Taiwan in the development of green logistics (legal, policy, technology or economic aspects)?
4.   What do you think are the opportunities for Taiwan in the development of green logistics?
5.   What do you think are the threats for Taiwan in the development of green logistics? What can be done about it?
6.   What do you think are the policies and corresponding measures, in terms of legal regulations and economic incentives, for green logistics to be successful? What do you think are the government agencies that should be involved in joint collaborations?
7.   What are the problems or difficulties you encounter in the implementation of green logistics in your organization?
8.   Are there any other suggestions or issues we have not covered?

4 CURRENT STATUS OF GREEN LOSGISTICS IMPLEMENTATION IN TAIWAN

Green logistics is still relatively new to Taiwan, and few large corporations have been promoting green logistics in compliance with international environmental regulations and conventions or as part of their corporate social responsibility initiatives for the environment. This study aimed to analyze the motivations of the electronics and electric machinery industry and marine shipping industry in Taiwan to implement green logistics and summarize their approaches and measures.

4.1 Electronics and Electric Machinery Industry

Most of the companies in the electronics and electric machinery industry in Taiwan operate as OEMs (original equipment manufacturers) or ODMs (original design manufacturers). Given the limited demand from the domestic market, the majority of the industry's output goes to large markets such as the US and the EU. In recent years, in response to the rising environmental concern and in order to reduce the pollution caused by electronics and electric machinery products, the European Union has come up with a series of environmental directives, e.g. Waste Electrical and Electronic Equipment (WEEE), enacted in August 2005, Restriction of the use of Certain Hazardous Substance (RoHs) in electrical and electronic equipment, enacted in July 2006, and Eco-Design Requirements for Using Products, published in 2005. These three EU directives extend the producer's responsibility and require manufacturers to ensure pollution-free manufacturing processes, from materials acquisition, manufacturing, transportation, and delivery to consumers to the recycling/disposal of waste products. Manufacturers now have the responsibility to follow their own products throughout the products' lifecycle.

Taiwanese electronics and electric machinery industries have developed green logistics mainly to comply with the environmental laws and regulations of the countries where Taiwanese products are imported, in order to avoid non-tariff trade barriers. Global warming and resource depletion have also made companies aware of the importance of environmental protection, causing them to initiate green policies, fulfill their corporate social responsibility and seek to achieve sustainable development.

Enterprise in Turbulent Environment

4.2 Logistics Industry

Currently, more than 90% of imported/exported cargoes are transported via marine routes. The marine transportation industry can be compared to the artillery of the global economy. The heavy use of marine transportation generates 3~4% of global carbon emissions. Since marine transportation is highly international, it is regulated by a set of international norms and standards to ensure the safety of international marine transportation and safeguard the operations of international marine operators. To reduce the environmental impact of marine transportation, the International Maritime Organization (IMO) has published a series of international covenants for the member organizations to abide by. Currently, Taiwan is not an IMO member; however, its ships are still governed by IMO regulations when stopping at harbors, because marine transportation is international in nature. Therefore, the marine transportation industry in Taiwan has been forced to follow the green logistics measures required by the international covenants of the IMO.

Meanwhile, marine operators have assumed their corporate social responsibility by following in the footsteps of the multinationals to combat global warming. They are seeking more than their own financial benefits. In fact, they are trying to avoid environmental damage and the wasting of resources with a variety of green policies. This aims to achieve sustainable development and play their roles of corporate citizens.

5 STRATEGIES FOR GREEN LOGISTICS DEVELOPMENT IN TAIWAN

Based on the interview results, this paper generalized the goals for green logistics in Taiwan. The next step was to use the SWOT framework to analyze the strengths and weaknesses (within Taiwan) and opportunities and threats (outside of Taiwan), in the context of these goals. A TOWS matrix was developed and mappings of the SO, ST, WO and WT strategies were presented in the formulation of competitive strategies for green logistics in Taiwan.

5.1 Necessity for Taiwan to Develop Green Logistics

Climate change and environmental destruction have become the top priorities of the global agenda. The rising awareness about environmental protection has made green issues a global concern. The interviewees all agreed that it is necessary for Taiwan to develop green logistics, as it is an international trend and an urgent necessity. Table 2 summarizes the opinions of the interviewees.

Enterprise in Turbulent Environment

Table 2: Feedback from Interviewees Regarding the Development of Green Logistics in Taiwan

	Do you think it is necessary for Taiwan to develop green logistics?
Industries	It is a must-do for Taiwan to connect with the international community.
	The development of green logistics is essential; otherwise, we may be faced with trade barriers.
Government	The development of green logistics is a good thing for Taiwan. Taipei Harbor will surely become a green and low-carbon harbor in the future.
	It is absolutely critical, as the two guidelines for the Ministry of Transportation and Communications are the re-establishment of the international gateway over the air and the seas and the improvement of national competitiveness and the promotion of sustainable and green transportation and tourism, and the encouragement of energy efficiency and carbon reduction.
Academics	It is necessary from the perspective of legal requirements and economic benefits. Green logistics are part of the international agenda and the EU directives. Meanwhile, the development of green logistics can save costs.
	It is necessary, in the context of environmental changes, energy shortages and global warming. We are all part of this global village. Individuals, companies and governments should all make contributions to the environment. In the logistics development, it is important to consider environmental impacts. Environmental friendliness is critical, in terms of carbon emissions and waste disposal.
Research Institutes	The necessity of green logistics can be elaborated in terms of the demand from the government, industries and consumers. The government wishes to connect with the international community. Industries want to cater to customers' needs. Consumers are increasingly environmentally aware. Hence, from the perspectives of the government, industries and consumers, it is necessary to develop green logistics.
	It is indeed necessary. All the other countries are doing it. Also, an ignorance of carbon taxes will increase the company costs incurred in the future.

5.2 SWOT Analysis on the Development of Green Logistics in Taiwan

This study reviewed relevant literature and interviews with experts from the academics, industries, research institutes and government agencies, and analyzed the internal and external conditions for Taiwan to develop green logistics. Table 3 summarizes the SWOT analysis on the development of green logistics in Taiwan.

Enterprise in Turbulent Environment

Table 3: SWOT Analysis on the Development of Green Logistics in Taiwan

Strengths	Weakness
S1:Government's concern aboutsustainable development and green logistics S2: Completeness of industry clusters S3: Development of IT technologies S4: Growth of IT industry S5: Rising awareness among the public	W1:Insufficient awareness amongcorporations and the public in green logistics W2: A lack of policy guidance W3: A lack of a uniform contact window in the authorities W4: A lack of technologies and facilities to develop green logistics among SMEs W5: A lack of professionals in green logistics W6: A lack of local experience in Taiwan
Opportunities	**Threats**
O1: Green trade barriers for international trades O2: Requirements from international brands and leading manufacturers (driver) O3: Emergence of fourth party logistics O4: The signing of the Economic Cooperation Framework Agreement between China and Taiwan O5: Social benefits and economic benefits brought about by green logistics	T1: Numerous international regulations governing green logistics T2: High upfront investments T3: Industry chain yet to be integrated

5.3 Strategy Development for Green Logistics in Taiwan

In this section the factors developed in the SWOT framework were mapped into a TOWS matrix. There were five factors about strengths, six about weaknesses, five about opportunities and three about threats. Strategies were developed by placing the internal strengths and weaknesses in the context of external opportunities and threats. The mapped strategies, symbolized as SO, WO, ST and WT, are the benchmark for the strategic development of green logistics in Taiwan. The results are summarized in Table 4.

Table 4: TOWS Matrix for the Development of Green Logistics in Taiwan

Internal / External	Strengths	Weakness
Opportunities	SO1: Signing of FTAs to increase the total volume of cargoes and achieve the economies of scale; an incentive to encourage green logistics SO2: Promotional campaigns targeted at manufacturers to increase awareness in the necessity of green logistics SO3: Green logistics as part of an eco-labeling system to encourage the purchase of green logistics products/services SO4: Promotion of fourth party logistics	WO1: Establishment of a committee across multiple ministries WO2: Formulation of relevant regulations WO3: Utilization of fourth party logistics by SMEs WO4: Establishment of demo cases as a reference to industries WO5: Enhancement of professional education to nurture talents in green logistics
Threats	ST1: Offering technical support, incentives and subsidies to manufacturers implementing green logistics ST2: Enhancement of green logistics capabilities among corporations and the reduction of resource wastefulness and environmental impacts ST3: Adoption of an integrated transportation model to mitigate environmental impacts	WT1: Following up on the international regulations governing green logistics and understanding their similarities/differences WT2: Promotion of green logistics in stages to achieve the integration of industry chains

6 CONCLUSIONS AND SUGESTIONS

The strategies for the development of green logistics generated with a TOWS matrix were divided into the three aspects of government, corporations and society.

6.1 Government

The government should drive the development of green logistics in stages. Joint efforts are required from the Ministry of Economic Affairs, the Ministry of Finance, the Ministry of Transportation & Communications and the Environmental Protection Administration. The top priority is the establishment of a cross-ministry committee to centralize the planning of green logistics development. This committee should be the focal point of initiatives and the planning of relevant regulations.

In the initial stage of green logistics implementation, the government should serve as a guide by organizing seminars and workshops for manufacturers, so that they are aware of the concept of green logistics. The government has to articulate the implications, scope and technological aspects of green logistics and ensure that manufacturers understand the current status of green logistics in other countries, as well as relevant international regulations governing green logistics. Meanwhile, incentives, subsidies and technical support should be provided in order to encourage participation and attract more companies to the bandwagon of green logistics.

As far as mid-term plans are concerned, the government should select an industry to run a pilot program in green logistics. This will allow the establishment of demo cases, so that other manufacturers can become aware of the benefits of green logistics and duplicate the success

of the demo cases in the implementation of green logistics. Meanwhile, the government can incorporate green logistics into the eco-labeling system. This can encourage the awareness among consumers in the choice of environmental friendly products and prompt companies to develop green products to meet with the market demand.

To attract more manufacturers to the initiatives of green logistics, the government is offering various subsidies and incentives. It should also enter into FTAs. For companies, business opportunities are a prerequisite for logistics. Only with a large economic scale of cargo shipments is it possible to reduce the costs associated with green logistics.

Finally, at the end of the pilot program, the number of participating companies will have grown and the majority of businesses will be willing to operate green logistics. At this juncture, it will be possible to integrate the supply chain and maximize the effects of green logistics through legal enforcement.

6.2   Corporations
For small-and-medium enterprises without sufficient equipment and technology, fourth party logistics operators can be outsourced and an integrated transportation model can be established during the initial stage of green logistics implementation, in order to provide the reduction of environmental impact with the simplest method. The next step is the introduction of advanced logistics technologies, green procurement and sales, packaging reductions and standardization, and reverse logistics. All these initiatives can gradually build the capability of green logistics.

6.3   Society
The government, companies and schools should work hand-in-hand to fill in the talent gap in the development of green logistics. Green logistics involves multiple disciplines, such as sustainable development theories, ecological economics, ecological ethics, and logistics cost/performance. In addition to a multi-disciplinary approach and an emphasis on fundamental theories, it is necessary for companies to provide hands-on opportunities to marry theory with practice, so as to develop green logistics talents equipped with professional expertise and practical experience.

THE IMPACT OF TRADE COMPETITION ON MANAGERIAL INCENTIVES AND PRODUCTIVITY

Cristina Tello-Trillo
Yale University, USA
cristina.tello-trillo@yale.edu

ABSTRACT
We study a model of monopolistic competition with firm heterogeneity –in terms of productivity- in which firms provide incentives to managers to reduce marginal cost. In our model managerial incentives are endogenously determined by firm's productivity and the intensity of competition. We show how tougher competition, generated by large market size or trade, induces stronger incentives to reduce marginal cost for the more-productive firms while the opposite holds for the less-productive firms; this further affects the selection of heterogeneous producers into the domestic and foreign markets. Aggregate productivity growth is decomposed in two sources, within-firm growth and between-firm growth, a decomposition that has not been theoretically analyzed before. We provide a useful theoretical model to analyze how exposure to competition leads to firm productivity growth and how this further affects aggregate performance measures and selection.

Keywords: Competition, Heterogeneous Firms, Managerial Incentives, Productivity, Trade

1 INTRODUCTION

Over the last decade, a number of studies have examined the relationship between trade openness and productivity finding major improvements in firm productivity as a result of trade liberalization (Amiti and Konings, 2007; Trefler, 2004; Pavcnik, 2002). However, there is a lack of theoretical and empirical literature on the precise mechanisms underlying this relationship. In this paper I will highlight a particular mechanism through which trade openness might affect productivity: managerial incentives.

The empirical literature on trade and productivity has revealed two facts: first, that increased exposure to trade leads to firm and industry productivity gains (Pavcnik, 2002; Schott et al., 2006; De Loecker, 2007) and second, that exporting firms are more productive than non-exporting firms (Bernard and Jensen, 1999; Clerides et al., 1998). These well documented empirical facts motivated the creation of trade models that incorporated firm heterogeneity to explain industry's productivity growth as those of Melitz (2003) and Bernard, Eaton, Jensen and Kortum (2003). These models indicate that trade liberalization leads to industry productivity gains due to market share reallocation from the less productive to the most productive firms, what I call the "between-firms" effect. However, they assume firm productivity as given throughout the opening up to trade process, disregarding the possible within-firm productivity gains, what I call the "within-firm" effect, that further contribute to aggregate industry productivity growth. In our model, we will be able to capture both effects "between-firms" and "within-firm", considering managerial incentives as the source of the within effect.

Managerial incentives (as stocks/equity-based-pay) can be used to alleviate the agency problem by aligning managers' interests with those of the shareholders. Thus when firm owners' provide stronger incentives, the manager exerts effort to reduce marginal cost,

increasing the productivity level of the firm as has been empirically tested by Bulan, Sanyal and Yan (2007).

A contribution of this paper is to provide a model that incorporates the standard principal-agent problem (to characterize the effect of manager's practices on firm productivity) into a heterogeneous firm model of trade with monopolistic competition. We characterize the way trade competition affects firm owners' optimal choice of managerial incentives and analyze in what measure aggregate industry productivity growth results from the interaction of the between-firms and within-firm effects.

The rest of the paper is organized as follows. In the next section, I present the setup of the model describing the role of consumers, firms and managers. In Section 3, I solve for the equilibrium of the model in a closed economy case. Section 4, presents the open economy case. Finally, Section 5 concludes and discusses further research.

2   THE MODEL

In this section we present a monopolistically competitive model of trade with firm heterogeneity and managerial incentives based on Melitz and Ottaviano (2008). The timing of the events is as follows. First, firm's make a decision about whether or not to enter the market. Entering firms have to pay a fixed entry cost f_e and observe their marginal cost c, which is drawn from a Pareto distribution with bound $[0, c_M]$. Each entering firm has a manager. The firm owners decide how much incentive to offer their manager, the higher the incentive the higher the effort he/she exerts and hence the higher the probability that marginal cost will decrease. The effort of each manager is not directly observable, hence the firms are involved in a moral hazard problem where the manager is risk-averse and the firm's shareholders are risk-neutral and maximize their profits net of the manager's payment. Once the manager exerts effort, the firm can finally observe its realized marginal cost c_e, which takes into account the effort of the manager, this is the marginal cost at which the firms faces other competitors. Given c_e the firm decides the optimal output and price in a monopolistic competitive market structure. To ease exposition, I consider first the closed-economy case and then extend my model to the open economy case.

2.1   Consumers

There are L consumers in the economy. Each consumer has one unit of labor which they sell in the market at wage w. Consumers have quasilinear-quadratic preferences which are defined over a continuum of differentiated varieties indexed by $i \in \Omega$, and a homogenous good chosen as numeraire. All consumers share the same utility function given by,

$$U = q_0^c + \alpha \int_{i \in \Omega} q_i^c \, di - \frac{1}{2} \gamma \int_{i \in \Omega} (q_i^c)^2 \, di - \frac{1}{2} \eta \left(\int_{i \in \Omega} q_i^c \, di \right)^2 \qquad (1)$$

where q_0^c and q_i^c respectively represent the individual consumption levels of the numeraire good and each variety i. The degree of product differentiation between varieties is $\gamma > 0$, as γ increases the consumer prefers to diversify his/her consumption across varieties. The parameters $\alpha > 0$ and $\eta > 0$ index the substitution pattern between the differentiated varieties and the numeraire good. The introduction of the numeraire good implies that marginal utilities are bounded; hence a consumer may have zero demand for some goods. We

will assume that the consumption of the numeraire good q_0^c is always positive. The market demand for each variety is then given by

$$q_i = Lq_i^c = \frac{\alpha L}{\eta N + \gamma} - \frac{L}{\gamma}p_i + \frac{\eta N}{\eta N + \gamma}\frac{L}{\gamma}\bar{p}$$ (2)

where $\Omega^* \in \Omega$ is the subset of varieties that are consumed $(q_i^c > 0)$; $\bar{p}$ is the average price of the consumed varieties and N is the measure of consumed varieties in Ω^*. Since marginal utilities are bounded, consumers can demand zero of a particular good. In other words, there is a threshold price level p_{Max}, where, if a good's price is less than this threshold price $p_i < p_{Max}$ then the good will have positive demand otherwise it will have zero demand[1].

This maximum price is defined by,

$$p_{Max} = \frac{\gamma\alpha + \eta N\bar{p}}{\eta N + \gamma}$$ (3)

Then we can write the price-elasticity of demand as,

$$| = \left[\frac{p_{Max}}{p_i} - 1\right]^{-1})$$ (4)

In contrast with the CES case, the elasticity of demand is not constant and will depend negatively on p_{Max} and positively on the price of the good p_i. This is, the 'tougher' the competitive environment -lower average price $\bar{p}$ or larger number of competing varieties N- the lower p_{Max} and hence the higher the price-elasticity of demand at any given price p_i.

2.2   Production and Firm Behavior

We assume labor is the only factor of production and is inelastically supplied in a competitive market. The numeraire good is produced under constant returns to scale at unit cost; its market is also competitive[2]. These assumptions imply a unit wage. Entry in the differentiated product sector is costly as each firm incurs product development and production start-up cost, f_e. Subsequent production exhibits constant returns to scale at a marginal cost c_e. Labor input is a linear function of output, $l = c_e q$, where the realized marginal cost of the firm c_e, is defined as

$$c_e = c - g(c)(e + u)$$ (5)

---

[1] The set Ω^* is the largest subset of Ω that satisfies $p_i < p_{Max}$

[2] For simplicity, we do not model any overhead production costs. This would significantly degrade the tractability of our model without adding any new insights.

where c is the marginal cost draw that firms learn after making the irreversible investment f_e required for entry. This draw is from a common (and known) distribution $G(c)$ with support on $[0, c_M]$. The observed cost reduction induced by manager's effort is $e + u$, this term is decomposed in agent's effort e and a pure noise term u with mean 0 and variance σ^2. Function $g(c)$ measures the degree at which the observed cost reduction $(e + u)$ affects firm's realized marginal cost. We will assume that $g(c)$ is a differentiable increasing function. The latter property implies that c_e is sub-modular in c and e, i.e the marginal decrease in the realized cost for a given increase in effort is higher for low-productivity firms. This assumption is necessary to avoid negative realized marginal cost.

Since the entry cost is sunk, firms that can cover their marginal cost survive and produce. All other firms exit the industry. Surviving firms maximize their profits using the residual demand function (2). In doing so, given the continuum of competitors, a firm takes the average price level $\bar{p}$ and number of firms N as given. This gives us the monopolistic competition outcome. Firm maximizes $p_{\pi}(c_e) = p(q)q - c_e q$. Hence, the profit maximizing quantity $q(c_e)$ is

$$q(c_e) = \frac{L}{\gamma[p(c_e) - c_e]}$$

Let c_D be the reference cost at which the firm is indifferent between operating or shutting down. This firm earns zero profit as its price is driven to its marginal cost $(c_D) = c_D = p_{Max}$, and its demand level $q(c_D)$ is driven to 0. We assume that $c_D < c_M$ so the firms between these two levels will exit. All firms with $c_e < c_D$ earn positive profits (gross of the entry and managerial cost) and remain in the industry. The threshold cost c_D is a sufficient statistic that summarizes the effect of both, the average price and the number of firms on the performance measure of all the firms. Hence the performance measure of the firms can be written as a function of their realized marginal cost and the cut-off c_D. From (3) we have that,

$$p(c_e) = p_{Max} - \frac{q(c_e)\gamma}{L} \quad \text{thus,}$$

$$q(c_e) = \frac{L}{2\gamma[c_D - c_e]}$$

$$p(c_e) = \frac{1}{2[c_D - c_e]}$$

$$\mu(c_e) = \frac{1}{2[c_D - c_e]}$$

$$\pi(c_e) = \frac{L}{4\gamma}[c_D - c_e]^2$$

Finally, firm's shareholders choose optimally the manager (CEO) total compensation scheme. Following the CEO compensation literature, managers compensation is decompose on a fixed salary, s, and a performance or incentive-pay b. Thus total compensation for the manager is,

$$W = s + b(e + u)$$

2.3 Managers Behavior

All managers simultaneously choose effort levels given their linear compensation[3], $W = s + b(e + u)$. If we let the random variable W denote the financial wealth of the CEO in the firm, then the CEO's pay-off is represented by the usual additively separable utility function:

$$E[u(W)] - \psi(e)$$

where is the CEO's hidden cost of effort function, which we assume to take the simple quadratic form $\psi(e) = \dfrac{de^2}{2}$. We make an additional simplifying assumption, that the CEO's attitude towards risk can be summarized by the following mean variance preferences

$$E[u(W)] = E[W] - \frac{r}{2}Var[W]$$

where $r > 0$ measures the CEO's aversion to risk. CEOs chose effort level e to maximize their utility given by the mean-variance preferences:

$$\max_{e} E[W] - \frac{r}{2}Var[W] - \frac{de^2}{2}$$

The first-order condition to this problem fully characterized the CEO's optimal action choice:

$$e = \frac{b}{d} \tag{6}$$

Managers accept any contract (s, b) with an expected utility of at least his/her reservation utility $\overline{U}$. Hence the manager's fixed salary s has to satisfied

$$s = \overline{U} - \frac{b^2}{2d[1 - rd\sigma^2]} \tag{7}$$

2.4 Optimal Incentive Contact

The shareholders' (firm owners) problem is to choose the contract (s, b) that maximizes profits net of agent cost, subject to satisfying the manager's participation and incentive constraint. Formally the shareholder's problem is given by,

$$\max_{s,b} E_u[\Pi(c)] = E_u\left[\frac{L}{4\gamma}(c_D - c_e)^2 - s - b(e + u)\right]$$

Subject to

$$\max_{e} \left[E[W] - r/2\, Var[W]\right] - (de^2)/2 \geq \overline{U}$$

---

[3] Note that this linear contract is not the optimal contract given our assumptions but is the one that gives a simple and intuitive closed-form solution for the wage scheme (See Bolton and Dewatripont, 2004).

Enterprise in Turbulent Environment

Combining equations (5), (6) and (7) we can formulate the shareholder's optimal contracting problem as follows,

$$\max_{s,b} E_x[\Pi(c)] = E_x\left[\frac{L}{4\gamma}\left(c_D - c + g(c)\left(\frac{b}{d} + u\right)\right)^2 - \bar{U} + \frac{b^2}{2d}[1 - rd\sigma^2] - b\left(\frac{b}{d} + u\right)\right] \qquad (8)$$

For expression (8) to be strictly concave in the incentive-pay b for any c, we need to make the following assumption,

Assumption 1 $\quad \dfrac{L}{2\gamma} < d(1 + dr\sigma^2)$

This assumption ensures that the optimal incentive-pay b is small enough so that the manager will not cut costs to a level that makes marginal costs negative. The optimal incentive contract in this way is described in the following proposition,

Proposition 1 *When the cost draw of the firm is less than the cut-off $c < c_D$ the optimal level of effort is given by*

$$e = \frac{\dfrac{Lg(c)}{2\gamma d(c_D - c)}}{1 + rd\sigma^2 - \dfrac{Lg^2(c)}{2\gamma d}} = \lambda(c)(c_D - c) \qquad (9)$$

where $\quad \lambda(c) = \dfrac{\dfrac{Lg(c)}{2\gamma d}}{1 + rd\sigma^2 - \dfrac{Lg^2(c)}{2\gamma d}}$, otherwise e=0. Proof: See Appendix.

The optimal level of effort follows an inverse U-shaped pattern in terms of the cost draw c. This is shown in chart 1a, where the optimal effort is graphed against the initial cost draw c or the initial productivity draw $\frac{1}{c}$ in chart 1b. Chart 2 shows the expected realized cost as a function of the initial cost draw. In a model with no incentives the productivity of each firm will be the same as the productivity draw of each firm (the 45^0 dashed line in chart 2), while in a model with incentives each firm's productivity depends on the degree of managerial incentives which is different across firms. At extreme values of productivity, either very high-productive or low-productive firms, it is optimal to provide low level of incentives. High productive firms find it optimal to provide low level of incentives due to little expected productivity gains of an additional unit of effort, and low productive firms provide low incentives due to their lack of profits. Thus only firms in the middle of the distribution of productivity will provide the highest level of incentives, as we can observe in Chart 1a and Chart 2.

Enterprise in Turbulent Environment
Chart 1: Equilibrium Level of Effort
Chart 2: Expected Realized Cost

Given the optimal effort level, we can rewrite the expected value of a firm profit net of agent costs, as a function of the initial cost draw and the parameters of the model[4].

$$ E_u[\Pi(c)] = (c_D - c)\frac{L}{4\gamma} + \frac{L}{4\gamma}2g(c)\lambda(c) + \frac{L}{4\gamma}g^2(c)\lambda^2(c) - \frac{\lambda^2(c)d}{2}[d+\sigma^2+1] + \frac{L}{4\gamma}g^2(c)\sigma^2 \qquad (11) $$

2.5   Free Entry Equilibrium

Firm expected profit -net of entry cost- is $\int_0^{c_D} E_u[\Pi(c)]dG(c) - f_E$. Firms will entry the market until profit is zero. This yields the equilibrium free entry condition

$$ \int_0^{c_D} E_u[\Pi(c)]dG(c) = f_E \qquad (12) $$

---

[4] Without loss of generalization we normalized $\overline{v} = 0$.

which determines the cost cut-off c_D. Given a production technology $f(c)$, from equation (12) we can determine the behavior of c_D in terms of the fundamentals

$$c_D = h\left(\overset{-}{L}, \overset{+}{\gamma}, \overset{+}{f_e}, \overset{+}{c_M}\right)$$

The larger the market size or the lower the sunk cost f_e, the 'tougher' is the competitive environment (c_D lower) as more firms enter the market and average price decreases. In all these cases, firm exit rate is also higher (since the pre-entry probability of survival $G(c_D)$ is lower). We will analyze in more detail the comparative statics in Section 3.

2.6   Parameterization of Technology

Our results so far do not rely on the particular parameterization of technology. In order to simplify the analysis we use a specific parameterization for the cost distribution. Following Melitz and Ottaviano (2008) we assume that the distribution of cost draws given by,

$$G(c) = \left(\frac{c}{c_M}\right)^k \ for \ c \in [0, c_M]$$

The higher the shape parameter k, the larger is the fraction of firms with marginal cost close to the bound c_M. As k goes to infinity the distribution becomes degenerate at c_M. The productivity distribution of surviving firms will therefore also be Pareto with shape parameter k, given by,

$$G_D(c) = \left(\frac{c}{c_D}\right)^k \ for \ c \in [0, c_D]$$

Hence given the Pareto distribution and equation (11) the solution for the cut-off c_D will be obtained by solving,

$$\int_0^{c_D} \left[(c_D - c)^2 \left(\frac{L}{4\gamma} + Z\right) + \left(\frac{L}{4\gamma}\right)g^2(c)\sigma^2\right] dG(c) = f_e \tag{13}$$

Where $Z = \frac{L}{2\gamma}f(c) + \frac{L}{4\gamma}f^2(c) - \lambda^2(c)\frac{d}{2}[1 + d r \sigma^2] > 0$. By Leibniz rule this implies that the cut-off point in an economy with incentives is lower than the cut-off point in an economy without incentives). The cut-off point of an economy with no incentives is given by the solution of the free entry condition $\frac{L}{4\gamma}\int_0^{c_D} (c_D - c)^2 dG(c) = f_e$, as in the Melitz-Ottaviano (2008) model. Hence, the inclusion of incentives makes the economy more competitive since now every surviving firm will have the option to endogenously affect its own productivity, making all surviving firms in the market

more productive than before. We also assume that $c_M > \sqrt{\dfrac{[2(k+1)(k+2)\gamma f_e]}{L}}$ to ensure that $c_D < c_M$.

that.

In order to simplify our analysis and do comparative static we include two additional parameterization assumptions in our model. We assume that $g(c) = c$, and that u is uniformly distributed with mean 0 and variance $\sigma^2 \leq \dfrac{(1 - e_{Max})}{3}$. These two assumptions ensure that the realized costs are always positive for any surviving firm (i.e $c_i e \geq 0$).

3   CLOSED ECONOMY ANALYSIS

In this section we discuss some of the predictions of the model regarding the relationship between competition, managerial incentives and aggregate productivity. In contrast to previous theoretical models our model suggests two channels through which competition affects industry's aggregate productivity: the entry cut-off c_D (same as in Melitz, 2003 and Melitz-Ottaviano, 2008 model) and the incentives level of each firm which affect within-firm productivity.

Proposition 2 *An increase in market size (L) or in product substitutability (lower γ) leads to stronger incentives for sufficiently high productive firms and lower incentives for low productive firms. While a decrease in the sunk entry cost (lower $f_i E$)   leads to lower incentives for all the firms.*

Taking partial derivatives of equation (9) we obtain,

$$\frac{\partial e}{\partial L} = \frac{\partial \lambda(c)}{\partial L}[c_D - c] + \frac{\partial c_D}{\partial L}\lambda(c) \qquad (14)$$

Where $\dfrac{\partial \lambda(c)}{\partial L} \geq 0$ for all the surviving firms (i.e. all) and $\dfrac{\partial c_D}{\partial L} < 0$ (see proof in the Appendix). Hence for sufficiently high values of c (low-productive firms) the first term on the right hand side of equation (14) will approach zero and thus the second term will dominate, making $\dfrac{\partial e}{\partial L} < 0$, the opposite holds for sufficiently low values of c (high-productive firms).

Intuitively, an increase in the toughness of competition -caused either by an increase in market size or in product substitutability- leads to two effects that work in opposite directions: *business-stealing effect* and *scale effect*. First, an increase in market size will make the demand faced by each firm more elastic, making it easier for each firm to increase its quantity demanded by cutting its price. In this environment, is optimal for firms to provide stronger incentives to the manager in order to reduce marginal costs, this is known as the *business-*

stealing effect. Second, an increase in market size makes firm $i's$ rivals charge lower prices, which makes average price, $\bar{p}$ fall, resulting in a decrease in firm demand. A lower demand leads firm i to provide weaker managerial incentives, this is known as the *scale effect*. In previous literature, the net effect of these two forces was ambiguous; however in the particular model studied here the net effect will depend on each firm initial cost draw c. For firms with sufficiently high cost draw the business-stealing effect will dominate the scale effect, otherwise the scale effect dominates the business-stealing effect. Chart 3, shows how each firm optimal level of incentives reacts given a 1% increase in market size. As can be observed from the graph below, firms that have a sufficiently low cost, increase their level

of incentives (b) and thus their effort level ($e = \dfrac{b}{d}$), while the opposite holds for firms that have high cost.

Furthermore, Chart 4 shows the change in firm's quantity sold when market size increases. In the case of high-productive firms, an increase in market size will bring an increase in quantity sold, due to two factors, the larger market and the increase in productivity due to stronger incentives. On the contrary, low-productive firms will decrease their quantity sold losing market share, mainly because they face higher competition (c_D lower) and provide lower level of incentives.

On the other hand a decrease in the sunk entry cost, f_e incentivizes firms entry, resulting in more firms in the market. Since market size remains constant, each active firm faces a reduction in market share. Hence the *scale* effect dominates the *business-stealing* effect and all the firms provide weaker managerial incentives to reduce cost (See proof in the Appendix).
Chart 3: Change in optimal effort due to change in market size

Enterprise in Turbulent Environment
Chart 4: Quantity sold and market size

In order to evaluate the aggregate effects of an increase in competition, we examine a number of numerical calculations over the threshold c_D. The following comparative statics hold -at any parameterization of the model- when assumption 1 is satisfied. However, for illustration purposes we report on the numerical calculation of a benchmark case[5].

First we analyze the effect of market size on the entry cut-off level. Results are shown in Chart 5, as we can observe the entry cut-off is a decreasing function of the market dimension (L). This result emphasizes the pro-competitive effect of an increase in market size which is consistent with previous literature on heterogeneous firms (Melitz, 2003; Ottaviano and Melitz, 2008; Yeaple, 2005). Comparing the effect of market size in the managerial incentives scenario versus the original model of Ottaviano and Melitz (2008) we found that the pro-competitive effect is stronger in presence of managerial incentives, since productive firms find it profitable to increase their productivity by means of stronger incentives.

---

[5] Following the CEO compensation literature we model the coefficient of risk aversion to be equal to 3 (Lambert et al., 1991 use constant absolute risk aversion between 0 and 4 whem modeling CEO compensation portfolios). The index of product differentiation γ takes the value 0.5, and sunk entry cost $f_e = 1$ (as in Borin 2008). Following Ottaviano et al. (2006) calibrations the shape parameter of the pareto distribution takes the value $k = 2.$ Market size L=20, the disutility of effort takes the value of 5. This parameterization leads to the equilibrium cut-off of $c_D^* = 0.69$.

.

Enterprise in Turbulent Environment
Chart 5: Market size and entry cut-off

Second, we analyze the effect of an increase in market size (L) or increase in product substitutability (lower γ) over the aggregate effort of surviving firms

). As we mentioned in proposition 1, productive firms find it profitable to provide higher incentives (thus obtaining more effort from managers) given an increase in market size, while less productive firms optimize reducing their incentives. Our various simulations have proven conclusively that the increase in incentives by the more-productive firms over-compensates the decrease in incentives of the less-productive firms, leading to an overall increase in the industry's aggregate effort. Given our baseline parameters, a 1% increase in market size increases aggregate effort by 0.27%. This holds consistently for different values of market size.

Finally, we analyze the effect of an increase in market size over the industry's aggregate productivity. The expected aggregate marginal cost (which is proportional to industry's aggregate productivity) is decomposed into two sources between and within:

$$c_e = \underbrace{\int_0^{c_D} c \, dG_D(c)}_{\text{Between}} - \underbrace{\int_0^{c_D} g(c)\lambda(c)[c_D - c] dG_D(c)}_{\text{Within}}$$

In contrast with previous literature on heterogeneous firms (that attributes changes in aggregate productivity to only the between-firm, or reallocation, effect as in Melitz (2003) and Melitz-Ottaviano (2008) our model goes one step forward and incorporates within-firm productivity changes through the inclusion of managerial incentives. The industry's aggregate productivity is higher ($\bar{c}_e$ smaller) in a model with incentives than in a model without incentives due to: (i) the cut-off with incentives is smaller than the cut-off with no incentives (as in Chart 5), thus the *between* effect is smaller (ii) in a model with incentives each firm has the option to increase its productivity by providing incentives to his/her manager, this is the *within* effect (see chart 2). Table 1 presents a decomposition of the aggregate marginal cost for different levels of market size.

Table 15: Decomposition of Aggregate Marginal Cost

L	Between Mean	Within Mean	$\overline{c_\theta}$
20	0.46	-0.13	0.33
30	0.42	-0.11	0.3
40	0.39	-0.1	0.28
50	0.37	-0.098	0.27
60	0.35	-0.093	0.26
70	0.34	-0.089	0.25

We claim that an increase in market size (L) or in product substitutability (lower γ) leads to a decrease in aggregate marginal cost (i.e. a proportional increase in the industry's aggregate productivity). Our claim is in-line with previous literature, but in our case the aggregate effect is intensified due to the inclusion of managerial incentives. All the numerical calculations we have made provide support to this claim. Table 2 presents the effect of a 1% increase in L over the aggregate marginal cost showing both the between and within effects. Intuitively, increases in market size, increase the toughness of competition (lower c_D), generating first, a reallocation of market share from the less-productive firms to the more-productive firms (between effect); and second, an increase in expected productivity of the more-productive firms (within effect). Both effects lead to an increase of industry's aggregate productivity.

Table 2: Decomposition of Aggregate Marginal Cost

4 OPEN ECONOMY ANALYSIS
To be completed and submitted ASAP.

5 CONCLUSION
We present a model that predicts how industry responds to changes in the competitive environment. In contrast to previous work that considered firm productivity as given, in our model firm productivity is endogenously affected by firm's incentives to their manager. The higher the incentives, the higher the probability the firm's marginal cost will be reduced. Our model characterizes the way competition affects firm owners' optimal choice of managerial incentives and how aggregate productivity growth results from the interaction of the between-firm and within-firm productivity growth.

We show how market size affects within-firm productivity: larger markets induce the more-productive firms to provide stronger managerial incentives, increasing the probability of higher level productivity; but reduce the incentives and hence the likelihood of higher productivity for low-productive firms. We then analyze how the introduction of incentives affects the selection of heterogeneous producers into the market. A model with incentives generates lower entry cut-off level of marginal cost than a model with no incentives. This is because in the former, each surviving firm can increase its productivity by providing incentives to the manager, hence making the market more competitive.

The model predicts that an increase in market size or increase in product substitutability leads to an increase in the industry's aggregate productivity. Beside the reallocation effect, studied in previous works as the single channel of how market competition affects aggregate productivity, our model adds the within-firm productivity channel as another possible source of aggregate productivity change. The relevance of each channel will depend on the main cause of change in the competitive environment (market size, entry cost, product substitutability or trade) and the parameters of the model. Consequently, empirical calibration is needed to fit the model to the data.

Enterprise in Turbulent Environment

CHANGING ORGANIZATIONAL CULTURE FOR ENTERPRISE PERFORMANCE

Adriana Tidor
Technical University Cluj-Napoca, Romania
adriana_tidor@yahoo.com

Liviu Morar
Technical University Cluj-Napoca, Romania
liviu.morar@staff.utcluj.ro

ABSTRACT
The purpose of this paper is to show the importance of organizational culture in improving the performance of Romanian small and medium enterprises(SMEs). The research was conducted in 40 SMEs inthe North-West area of the country. The method of research used was the survey. The instrument used was a questionnaire that included 35 organizational characteristics considered by the authors the most important. The main idea of the research was that after the employees complete the online questionnaire the manager can receive a complete report about the answers, underlyining the weaknesses and strengths of the organizational culture according to the answers. The evaluation of cultural weaknesses and strengths is made after a guideline established considering the scales included in the questionnaire. After this phase of the research, if the manager wishes we can provide him with a set of strategies to mend the problems(the weakenesses). This step is very important because many researches regarding organizational culture just diagnose the type of culture but do not offer solutions for the problems. Changing culture is a difficult task and a long-term one, but in our opinion change is more easy to achieve considering the special attributes of SMEs and the period in wich culture may be changed will be shorter. Any change within an organization must start with the change of culture.

Keywords: Enterprise performance, Organizational culture, Small and medium enterprises

1 INTRODUCTION

Organizational culture is a quite new term for the Romanian enterprises. Few are the companies that take in count organizational culture when they elaborate the strategies and set the objectives for their organization. That is why few recognize the importance of organizational culture and the influence it has on the organizational performance. In a moment in wich the economic crisis daily dizolves dozens of enterprises, SMEs fight for survival. The author's belief is that this sector of the economy is the key of economic revival.

The research had as main purpose the analysis of organizational culture in 40 SMEs from the Cluj county and the observation of the link between organizational culture and the financial performances of the enterprises. Also the authors wanted to elaborate a methodological set of rules that can be applied to any enterprise not just to the ones in this study, in order to diagnose quick and efficient the main components of organizational culture, to detect the problems appeared and to take the best measures in order to mend the cultural problems and initiate the process of organizational change.

In the recent years the researchers are in search of a model of demonstrating a link between organizational culture and enterprise performance. The direct linking between organizational

culture components and performance is not a new idea. But it is an idea that few managers take in count when defining the strategies of their enterprise. One can say that is difficult to link two notions so different such as organizational culture (a qualitative dimension) and performance(in most cases a quantitative dimension defined through indicators). Organizational culture through it's specific values influences directly the way objectives, policies and strategies are made in the enterprise.Organizational culture through it's elements contributes to the increase of the competitivity of the enterprise. As far as organizational culture means respecting norms and ethics in the business, keeping and improving interpersonal relations, team work, keeping and developing traditions, creating and transmitting the most powerfull values and convictions, the competitivity of the enterprise is maintained or even improved.

The objective of studying organizational culture is to help understand organizational life more. Understanding organizational life is important as it is widely acknowledged that organizational cultures have an impact upon company performance. The idea began with the simple observation that small and medium enterprises were very affected by the crisis, many facing bankrupcy.

Culture is a multi-dimensional concept that can be applied to firms, industries or nations. A review of existing literature yields an array of definitions of culture. By far one of the most widely accepted definition is proposed by Schein (2004), who defines organizational culture as "a pattern of shared basic assumptions that the group learned as it solved its problems of external adaptation and internal integration that has worked well enough to be considered valid, and therefore, to be taught to new members as the correct way you perceive, think, and feel in relation to those problems".

Culture matters. It matters because decisions made without awareness of the operative cultural forces may have unanticipated and undesirable consequences. Not only does culture reside within us individuals, but It is also the hidden force that divides most of our behavior both inside and outside organizations (Schein, 2004). The essence of culture is not what is visible on the surface. It is the shared ways groups of people understand and interpret the world. If culture is to be analyzed and managed, it is important that we be clear about what is meant by the term. Failure to clearly specify what "culture" is can result in confusion, misunderstanding and conflict about its basic function and importance (O'Reilly, 1996).

The authors wanted to present a software solution any manager could use, to rapidly assess some of the basic elements of organizational culture from his enterprise and get the best measures to address the weaknesses resulting from this analysis. It is not the first time this idea appears in researches. Many consulting firms have conducted surveys that were sent to firms to be completed online and then have made so-called cultural profiles, defining companies in a particular cultural group. However we notice that the researches are missing the other side, equally important to any assessment, the solutions for improvement.

Continuous performance must be the primary objective for any organization because only through performance organizations have the possibility to progress and evolve. When selecting to use financial performance indicators one of the motives was that using them is easier for a person outside the organization to evaluate performance using those indicators. And also the limited resources and refuse of the managers in helping us did not permit us to make a more deeper analysis of the enterprise performance.

SMEs have a more organic culture than big organizations. A small number of people are usually united under common beliefs and values and that means that in SMEs changing organizational culture should be easier. The most influence on the organizational values and beliefs in SMEs has the owner. This was the main reason we focused our research on the SMEs in Romania. The recent economic crisis had a bad influence on the financial performances of the majority of the enterprises in Romania. But the most hit sector was the sector SMEs. So in order to avoid future problems and to begin reconstruction organizational culture must be diagnosed and the change must begin with it. The authors consider that organizational culture change would be easier to achieve in SMEs and would not require 10-15 years as in big companies.

2   METHODOLOGY

The research was conducted with the aim of verifying one main hypothesis (the organizational culture influences the financial performances of the firm) and 35 secondary hypothesis, that were the same with the main characteristics included in the final questionnaire. The method used to collect data was the survey technique. The instrument used was the questionnaire sent through email to firms in the Cluj county. The online questionnaire was realised on the Google Docs platform. The questionnaire was structured in three parts. The first part contained 25 statements about the organization with responses possible on a Likert scale from 0 to 5. The second part contained 20 organizational characteristics and the respondents were asked to give a note from 1 to 5 according to the importance in their organization of each characteristics. The final part contained questions about the organization including year of foundation, domain of activity and number of employees.

The domain of activity for the enterprises used for this study is presented in chart 1.

Chart 2 presents the size of the enterprises that participated to our research, in number of employees.
Chart 1: Domain of activity of the enterprises that participated in the research

Enterprise in Turbulent Environment
Chart 2: Size of the enterprises that participated in the research in number of employees

After observing the results of the organizational culture questionnaire for the first part the components with scores bellow 2,8 were considered weaknesses and the components with the scores above 3,7 were considered strengths. For the second part of the questionnaire strengths were considered the components with the scores over 3,7 and weaknesses those with scores below 3.

The survey achieved a cultural profile of each company, and the results were grouped into strengths and weaknesses. This classification aims at differentiating the points where must be made changes to remedy the cultural issues. The study included an analysis of key performance indicators belonging to the SMEs considered thus observing that most companies have problems in terms of profit, which should be a warning. The economic crisis may be a motive for this problems, but evaluating the results obtained from questionnaires centralization it is observed that the same companies with the biggest problems have recorded the worst results in terms of organizational culture.

The guide for resolving the weaknesses was developed by the author in collaboration with several managers of SMEs that have problems to highlight the applicability of the guideline and the importance of continuing research in this area. Discussions with managers were conducted based on a interview draft with free answers and the topics were restricted to the characteristics of organizational culture contained in the questionnaire. The guideline contained the most important cultural characteristics, and these were presented in a booklet.

In order to evaluate the financial performances of the enterprise we used financial performance indicators.The performance indicators were calculated using the data on the Ministery of Finance site. The number of indicators was limited because on the site you can not find all the data needed in order to calculate all financial indicators. So the authors used the following performance indicators: return on gross business, return on net trade, the return on investment, return on equity, general liquidity ratio, acid test, financial leverage, rotation of total assets.

In order to exemplify adequate the methodology used we will present the steps on a case study, underlyining the fact that this were the steps used for each of the 40 enterprises in the study. The conclusions will be presented generally.

3   RESULTS
The enterprise on wich we present the method is from the communication domain and has till now 20 years of activity in the field of IT components.

The first step in our research was to look for the mission and values the leadership of the enterprise states on the web page that presents the enterprise. The mision stated was:
»Helping clients to capitalize their potential by providing advanced integrated solutions hardware - software – communications and by personalizing the products and services depending on the needs of each customer.«

Declared values:
- Commitment to the client;
- Commitment to the employees;
- Commitment to the partners;
- Work environment that promotes teamwork;
- Jobs based on performance challenge;
- Various forms of training for job satisfaction;
- Listening carefully to customers.

The scond step was to centralize the results of the questionnaires and to determine wich of the cultural characteristics are strengths and wich are weaknesses for this particular enterprise. Table 1 presents the results of this second step of the methodology.

Table 1: Strengths and weaknesses regarding organizational culture

STRENGTHS	WEAKNESSES
Stability	Low motivation
Professional development for the employees	Lack of innovation
Corectitude	Poor organization
Good communication	Low adaptability
Competitivity	
Quality	
Enthusiasm	
The attachement for the organization is encouraged	
The employees trust the leadership	
Team work	
Long term planning	
Continuous improvement	
Good reaction to the global economic crisis	
Interest for the welfare of the employees	

Enterprise in Turbulent Environment

Comparing the stated values and the ones resulted from the questionnaires we can observe that there is no big diference. The enterprise is competitive, has interest in the welfare of the employees, promotes quality and communication in this way underlining the fact that this company endeed is interested both in its employees and its customers.

After evaluating the organizational culture the third step was responsible for the evaluation of the financial performance indicators. Table 2 presents the eight performance indicators that could be calculated with the data available for years 2009, 2010 and 2011.

Table 2: Performance indicators for the enterprise considered

Indicator	2009	2010	2011
RC_b	0.09	0.11	0.13
RC_n	0.08	0.1	0.11
RI	0.17	0.29	0.19
RF	0.34	0.67	0.63
RLG	2.17	1.74	1.78
RRL	1.88	1.57	1.46
PF	2.07	2.30	3.26
ROA	2.09	2.89	1.71

One can easily see from the data presented that indeed this enterprise has no problems beacuse of the global economic crisis and the values stated by the leadership are present also in the category of the strengths after evaluating the questionnaires. Also we can observe that the weknesses are points that characterize the whole sector of SMEs in our country such as lack of innovation and adaptability. But this enterprise does not have such big problems concerning organiazational culture and this problems may be mended by initializing an organizational change, starting with the structure because this was one of the weaknesses.

Regarding the fact that organizational culture influence4s organizational performance we can say at this point that we strongly believe that the fact that this enterprise has more strengths than weaknesses and that the financial indicators have good values considering the economic state of our country is the result of the positive influence that a strong organizational culture has on the financial results of an enterprise. To underline the fact that this a case study and that each organization has it's own culture and characteristics.

We consider that this guideline in four steps can be applied to any enterprise and can be the first step in initializing the organizational cultural change.

4 CONCLUSION

The most important point of this research is to highlight the characteristics of the organizational culture in Romanian SMEs and to initiate an analysis that can prove that were there are strong cultures there is performance. These data collected and analysed can not be generalised. After analyzing the enterprises we could observe that many have financial problems due to the global economic crisis. Our important point is that if an organization seeks to make changes to increase performance the first point is to analyze and change organizational culture. Without a strong culture performance can not be at the levels desired. The financial indicators show the economic problems that SMEs had to face during this turbulent period of crisis and the cultural analysis revealed the fact that problems also come from inside the organization.One can not achieve performance when employees are not involved in decision making, when procedures are not respected, when innovation is not a priority, when people think negative or when appears any of the weaknesses we found in the enterprises. Without managers understanding the importance of organizational culture the step ahead con not be made and performance in the true meaning will remain just a dream. Organizational culture is the most important component of the organization. It is imperative to known the elements of organizational culure so that we can use the strengths for competitive advantage. It is not simple to diagnose organizational culture and it can not be modified in one year, but the authors consider that without diagnosing and changing organizational culture the organization can not achieve performance. Change must begin with the culture. It is very important for every manager to know to use the strengths of his own enterprise and the weaknesses of the competitors.

ROLE OF MARKETING IN FORMING OF EFFECTIVE PROFESSIONAL ORIENTATION SYSTEM

Ingrida Veipa
Jekabpils Agrobusinesss College, Latvia
ingrida.veipa@jak.lv

ABSTRACT
The main goal of the professional orientation is to forward the youth to choose the profession suitable to their aims, skills and the demands of the labour market. To provide the choice of the youth future profession and at the same time to decrease the amount of the college dropouts the professional orientation system in Latvia has to be developed and promoted. In its term to offer the competitive specialists by vocational education institutions, the cooperation among vocational education institutions and employers and entrepreneurs has to be promoted to improve study programs and to train skilled manpower. Professional orientation can be compared with product, that functions and satisfies client's needs in certain segment. Marketing helps to explore the situation in the market, to choose the most appropriate ways of the product promotion and to emphasise product's strong points. Use of the effective marketing strategy gives better possibility to inform the youth about the work of Career centre consultants in Latvia and with the help of career consultant the young person can make wilful and independent decision of career planning. On the other hand education institutions cooperate with entrepreneurs and it also needs marketing activities for successful cooperation and information change. From the marketing point of view, explicit target audience helps in choice of correct marketing events. One of the current and brightest means of marketing is the advert in internet.

Keywords: Employer, Marketing, Professional orientation

1 INTRODUCTION
Competition between professional education institutions increases with every year; it is substantially affected by demographical and economic factors. One of the ways how to increase competitiveness of Professional education is development and effective use of marketing complex. Before marketing strategy implementation one should verify if professional education institution aims and resources conforms to needs of target auditorium, that can be divided into two parts – inner and outer client. Main mission of professional education – to support competitiveness and development of enterprise and industry. Professional education institutions require development in order to attract new talents, to offer options of growth, to satistfy interested parties and to compete in market more effectively; to choose marketing strategy, the level of marketing activities must be defined: responsive marketing anticipative marketing or need-shaping marketing.

2 EVALUATION OF PROFESSIONAL ORIENTATION OF LATVIA
State has to consider development of Professional Orientation system, where students, starting from elementary school, would be involved. By choosing certain profession student can have a concept of what does his chosen profession involve and what skills have to be developed. I suggest to develop united professional career information system in internet, with an options to visit other websites, that would offer more precise and specific answer to a question and to find the best solution, by choosing activities that would improve chances of future career and would help to develop new professional competences.

There should be developed entrepreneurs support program, that would motivate the above mentioned ones to provide opportunities of internship for students of professional education institutions.

Transition from secondary school to professional and higher education (e.g. college, vocational school) has to be organised in several stages, as that may help to anticipate different versions of possible problems, whereas transition would help to choose career more successfully. Problems depend on individual, social networks, society, cultural and institutional circumstances. Although previous pschological research pays attention to one's career and its transition, there hasn't been much of studies on peer opinions on choices of youth. Nevertheless, it is undeniable – opinion of friends and peers is of a great importance while choosing the education institution to develop one's career (Dietrich, Parker and Salmela-Aro, 2012, pp. 1575–1593).

Means of advertising for professional education must be chosen in compliance with youth perception, age peculiarities. Social networks and internet influence on youth career choice keeps expanding.

Some of the most important marketing skills are communication and promotion. Promotion is part of the communication and includes enterprise information that stimulates awareness, interest and purchase of the product. Promotion cannot be effective if it does not attract attention. Nowadays we are over flooded with printed, broadcasted and electronic information. Every year we interface 2 million websites, 18 thousand magazines and 60 thousand new books. That is the reason why marketing specialists must do research on how people that are in the same target audience, divide time and attention. Marketing specialists are looking for the optimal way on how to attract more of consumers behavior. Marketing specialists to attract the attention use movie stars, sportsmen, highly-respectable people that are close to target audience shocking stories, statements or questions, etc.

If free advertising opportunities in internet are used skillfully, every owner of website, portal or vortal can increase numbers of visitors. The most popular way is to feature free information in the internet search engines, although, this is also not a faultless way.

It would be great advantage if youth, before making his choice of profession and education institution, had a chance to "be a shadow" in enterprise, organization. Chance to experience and see his future profession might help youth with independent right choice.

Municipalities in Latvia provide career consultants for students of secondary schools, however, there has not been developed united activities conception, and information is not available for all the students. The opportunity to have a consultation most often depends on administration of elementary or secondary school, form teacher. In my opinion, Latvia needs united professional orientation system that is being advertised and is available to everybody, including parents of the students.

Now there are 54 career consultants actively working in Latvia, 11 (20%) of them are in charge of different regions, and 43 (80%) are in charge of cities.

There is another group of people in career education sphere. They are appointed right in the schools by choosing the most appropriate candidate from staff. Currently the number of above

mentioned people in Latvia is 54, some of them work also as teacher – career consultant. 76% out of 54 consultants are in charge of regions, and 24% are in charge of cities.

Professional education contents adequacy to labour market demands is provided by existence and topicality of profession standards. Currently organizations of employers are not able to take full responsibility development of profession standards and description of proficiencies. Therefore it is being done by Ministry of Education and Science. Nevertheless, activity, initiative and skills of employers throughout this process is insufficient. Profession standards have not been developed to all the professions demanded in the labour market, as the process of creating new professions are still ongoing. Market economy, by nominating new demands for professional qualification, develops more rapidly than offer of adequate professional education programs. Significant issue that delays purposeful contribution in professional education is undefined demand of economic sectors in middle-term (http://www.aic.lv/ENIC/lat/lno/prof_1999/3.htm).

3 OPPORTUNITIES TO POPULARIZE PROFESSIONAL EDUCATION INSTITUTIONS

The most popular ways of advertising professional education institutions in Latvia are:

- Repetition – guarantees recognition;
- References to the popularity of institution – joining institution because of the crowd effect;
- Sharing of experience – experts or students that currently study in particular institution tell about it;
- Pressure – students are invited to join in while there are openings to free studies;
- Associations – efforts to associate institution with e.g. some particular celebrity.

Author of the paper holds a view that PR is a powerful tool, but its potential is not fully reached to popularize professional education in Latvia.

Developing and keeping in touch with journalists is significant precondition of work with media. In that way, mutual trust promoting relationship is built. Once in a while it is advisable to contact journalists and to inform them about activities or updates of education institution, as during the conversation joint idea as about new articles of institution may rise. In most cases exchange of communication happens when education institution organize some of the following events – professional competitions or research conventions.

The goal of the PR is to develope and build image of institution. Image is the concept that person of group of people ensue while evaluating the entity (Herbst, 2006). Valuation entity can be (Herbst, 2006, p. 184):

- Person,
- Location where the action takes place,
- Idea.

For instance, if target auditorium sees institution as respectable, trustworthy partner of communication, then institution is known as social and competent. Client knows he will receive high-quality services, that satisfies his dreams and expectations. Clients see it as an important factor therefore wants to use its services.

Why is image so significant? It helps to be competent by substitution knowledge. Nowadays noone can be aware of everything tha thappens around. On the ground of his concept, client evaluates if institution supports his values. Author emphasizes importance of image in one's choice of education institution.

Audience needs a concept about institution to be able to have an opinion of it and to make decisions. Why is image significant to institution ? Image affects perception and defines target audience attitude. If image is positive, so is the response form target audience, they will participate in events organised by institution, visit «Open Door Days or Informative Days ». That is why it is important for institutions to develop and build positive concept of themselves. If institution is innovative and progressive but is seen as traditional, it is possible to change the image – by leaflets, Open Door Days, communication with journalists.

4 CONCLUSION

- United professional orientation system, that would help students, starting already from the elementray schools, should be developed in Latvia.
- Career consultants should be obliged to cooperate with entrepreneurs and Professional education institutions in order to provide more effective consultations and help youth with choice of suitable profession and education institution.
- Before marketing strategy implementation one should verify if professional education institution aims and resources conforms to needs of target auditorium.
- In order to popularize education institutions the PR instruments should be used, as target auditorium trusts them more.
- Education institution has to communicate with its target audience on regular basis, in that way positive image is created.

ABSTRACT
Good marketers think to make a first time sale as not the end of a process but as the starting point of the relationship with the customers. It is necessary to protect added value if a firm wants to create and extend long-term relationship with the customers. Developing close, cooperative relationship with customers is more important in the current era of intense competition and demanding customers, than it has ever seen before. Public sector banks in India are facing tough competition from the private and foreign banks. Managing good customer relationships and offering products as well as services as per the convenience of customers is the most challenging task to the present day bank. Employee behaviour, bank location, layout, cleanliness, timely service, online banking services etc. are becoming the determinants of success or failure of the banks. The present study is a modest attempt to examine the perceptions of the customers towards banking services. The prominent banking organizations both from public sector (SBH) and private sector (ICICI) were studied.

Keywords: CRM, Employee behaviour, Information Technology

1 CONCEPT OF CRM
"Customer Relationship Management is a comprehensive strategy and process of acquiring, retaining and partnering with selective customers to create superior value for the company and the customer".

According to Ferguson (2000), CRM is basically a technology that allows a business to store and sort information about customers' preferences, purchase histories, and demographics. The business uses this data to customize its marketing strategies and delivery methods, making them more efficient for both buyer and seller.

According to CRMGuru.com (2001), CRM can be defined as "a process designed to understand and anticipate the needs of current and potential customers."

Thompson (2002) defined CRM as "Customer Relationship Management (CRM) is a business strategy to select and manage customers to optimize long-term value. CRM requires a customer-centric business philosophy and culture to support effective marketing, sales, and

service processes. CRM applications enable effective Customer Relationship Management, provided that an enterprise has the right leadership, strategy, and culture."

2   NEED FOR THE STUDY

The forces of deregulation (liberalization), globalization and advancing technology have greatly increased the competitive pressures in the banking industry. The banking industry in India too is going through turbulent times. Since the financial reforms started, banks have been given a great degree of flexibility in determining their rate structure for deposits and advances, as well as their product range.

Further, the banking sector has undergone a sea-change from the time when the previous Customer Service Committees were appointed. There has been a huge proliferation of bank branches. Further, de-regulation has brought in its wake numerous banking services, niche products etc. Widespread use of technology also enhanced the customer expectations, specifically on the aspects of speed and quality of service delivery. In addition, technology implementation has made branch banking redundant on many aspects, redefined several of the existing services and raised customer expectations regarding reasonableness of service charges.

2.1   Objectives of the study

The main objective of the study is to explore various practices adopted by banks to maintain the customer relationship. The other objectives include:
- ❖ To explore the reasons for opening account with the bank / branch.
- ❖ To study the employee behaviour in SBH and ICICI bank.
- ❖ To examine the usage of Information Technology by SBH and ICIOCI bank.

3   DATA SOURCES AND METHODOLOGY

To study the customer perceptions, primary data collected from the bank customers through a well structured questionnaire. Primary data is supplemented by secondary sources of information available from records, brochures, annual reports and other publications wherever required.

3.1   Sample size & design

The present study covers the CRM practices of SBH and ICICI bank. The size of the customer sample is 400. Branches from Nalgonda, Mahabub Nagar and Twin Cities (Hyderabad and Secunderabad) are covered. Convenient sampling method is used.

3.2   Data Processing and Statistical tools

Appropriate care is taken to process the collected data. The collected data has been processed and analyzed by using various statistical tools. The data processed with the help of MS – Excel and SPSS software.

3.3   Scope of the Study

The scope of the present study geographically is limited to Nalgonda, Mahabub Nagar and twin cities of Hyderabad and Secunderabad. The period of study is from 2009 to 2012. State Bank of Hyderabad (Public Sector) and ICICI bank (private sector) were covered in the present study.

Enterprise in Turbulent Environment

Table 1: Respondents Profile (Gender) (Primary Data (Figures in the brackets indicates percentages))

Bank	Male	Female	Total
ICICI	171 (85.5)	29 (14.5)	200 (100)
SBH	133 (66.5)	67 (33.5)	200 (100)
Total	304 (76)	96 (24)	400 (100)

From the above table, there are 171 male customers of ICICI bank and 133 male customers of SBH. The sample also consists of 29 female customers of ICICI and 67 female customers of SBH. A total of 304 male customers and 96 female customers were studied in the present study. Respondents consist of different age groups and different professions.

Table 2: Respondents profile (Age wise) (Primary Data (Figures in the brackets indicates percentages))

(Age in years)

Bank	18-25	26-35	36-45	46-55	56 & above	Total
ICICI	19 (9.5)	148 (74)	25 (12.5)	4 (2)	4 (2)	200 (100)
SBH	55 (27.5)	84 (42)	36 (18)	12 (6)	13 (6.5)	200 (100)
Total	74 (18.5)	232 (58)	61 (15.25)	16 (4)	17 (4.25)	400 (100)

Table-2 presents the details of respondents on the basis of their age. There is clear distinction in the age group of customers of ICICI and SBH. Customers in the age group of 26 – 45 are choosing ICICI bank. Out of two hundred customers of ICICI there are one hundred and seventy three customers are in the age group of 26 – 45 years. In case of SBH, majority of the customers are in the age group of 18 – 45 years. The reasons for opening with bank may be due to near to residence, near to office or information technology advancement.

3.4   Educational Qualification of the customers
The customers classification based on their educational qualification is given below: the composition of ICICI bank customers on the basis of education qualification is three customers educated to the level of primary education; six customers have completed their high school education, one customer was educated till tertiary/intermediate level, sixty five customers did their graduation. One hundred and twenty one customers have completed their Post Graduation and four customers did their doctoral studies.

The educational qualifications of SBH customers are as follows: one customer has no formal schooling; nine customers have completed their primary education, three customers did their high school education; sixty customers have completed their graduation; one hundred and seventeen customers have done their post graduation, ten customers have completed / to be completed their doctoral studies. We can find the similarity in terms of educational qualifications of the customers of ICICI bank and SBH bank. (table 3)

Table 3: Educational Qualification

Bank	No schooling	Primary	High school	Tertiary	Graduate	PG	Ph. D	Total
ICICI	0 (0)	3 (1.5)	6 (3)	1 (.5)	65 (32.5)	121 (60.5)	4 (2)	200 (100)
SBH	1 (.5)	9 (4.5)	3 (1.5)	0 (0)	60 (30)	117 (58.5)	10 (5)	200 (100)
Total	1 (.25)	12 (3)	9 (2.25)	1 (.25)	125 (31.25)	238 (59.5)	14 (3.5)	400 (100)

4 REASONS FOR OPENING BANK ACCOUNT WITH THE BANK/BRANCH

4.1 Near to Residence

The role of distance (or location) has a long history in the marketing literature and has been examined across a wide range of contexts, including marketing-mix decisions (e.g., Howard 1957), retail structure (e.g., Cox, 1959); distribution channel design (e.g., Bucklin, 1966), and manufacturing investment (e.g., Alderson and Green, 1964; Greenhut, 1956). In general, this earlier literature focused on spatial distribution of buyers and sellers and physical distribution costs. More recent marketing studies examine the role of geographic proximity in inter-firm relations, finding that firms in close geographic proximity face lower costs (Cannon and Homburg, 2001), display a weaker competitor focus (McEvily and Zaheer, 1999), and draw on each other's knowledge base when developing new products (Rosenkopf and Almeida, 2001). Thus, the marketing literature has shown an enduring interest in geographic location; however, it has given relatively little attention to the role of location in inter-organizational new product development.

Residence is one of the important factors which influence the customers to choose the bank/branch. In general people/customers prefer the banks/branches which are well connected to transport facilities. Near to residence will result in comfort to customers to transact with bank. Time can be saved; cost of transportation can be avoided or reduced significantly. Several times customers used to postpone the bank activities if the location of the bank is far. Nowadays, banks are analysing the merits and demerits of locations by analysing the population and their financial status etc. banks are also designing their products according to the location of the bank/branch.

Table 4: Near to Residence (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	80	40	120	60	200
SBH	114	57	86	43	200
Total	194	48.5	206	51.5	400

From the above table, with regard to ICICI bank eighty respondents felt that they have opened their account with the bank due to the reason of near to residence. In case of SBH, one hundred and fourteen respondents opined that they have opened accounts because of nearness to residence. Overall, one hundred and ninety four respondents felt that the location of bank/branch made them to open the account. Customers can save time and feel convenient if the bank is located to their residence. The problems such as transportation can be avoided by

selecting the bank which is near to their residence. In the present study it is found that a significant number of customers have opened their accounts because of the reason of nearness to residence (table 4).

4.2   Near to Office

Majority of the customers considering the banks which are located near to their working place to open account. This is because it is easy to transact with the bank while coming to office or leaving the office or in between. In the present study, with regard to eighty nine customers responded that near to office is one of the reasons for opening their account with the bank. In case of SBH sixty customers said that they have opened their account being the bank located near to their working place/office (table 5).

Table 5: Near to Office

Bank	Yes	Percentage	No	Percentage	Total
ICICI	89	44.5	111	55.5	200
SBH	60	30	140	70	200
Total	149	37.25	251	62.75	400

4.3   Due to employer

One of the important factors which forcing the customers to open account with some particular bank/branch is due to the employer account. In majority cases, employer after appointing the employees opens account to each employee with the bank/branch with whom already they holds account. To avoid the problem of introducer signature etc. Employers making all arrangements to open the accounts. More particularly, private sector employers making it mandatory to open account with the specified bank/branch.

Table 6: Due to Employer (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	137	68.5	63	31.5	200
SBH	103	51.5	97	48.5	200
Total	240	60	160	40	400

While appointing employees majority organizations used to open the account with the employer's bank/branch. With regard to ICICI bank, One hundred and thirty seven respondents out of two hundred opined that due to employer account they have opened bank account with the bank/branch. Whereas in case of SBH bank one hundred and three customers responded that their employers made it mandate to open account with the bank/branch (table 6).

4.4   Timings

Timings of the banks are also one of the influencing factors while opening the bank account. Banks with extended working hours and banks which functions on Sundays are interested by customers. Convenient timings imply flexibility to the customers to transact with comfort. In the present study total of one hundred and six customers responded that convenient timings is one of the reasons to open the account with bank. Bank wise responses are as follows: sixty five customers of ICICI opined that because of convenient timings they have opened their

account. Forty one customers of SBH expressed that convenient timings of the bank have made them to open account with the bank (table 7)

Table 7: Convenient Timings (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	65	32.5	135	67.5	200
SBH	41	20.5	159	79.5	200
Total	106	26.5	294	73.5	400

4.5 Prompt service

In present situation prompt service is gaining importance. The customers are expecting faster and cheaper services and they are trying to establish relationships with those firms who are capable of delivering prompt service. Promptness implies service delivery as per promise and according to the agreed conditions. Promptness means simply delivering the goods / service to the right customer, at right time, right product, right price without compromising the quality (right quality).

The following table depicts the responses of customers with regard to prompt service. Eighty five customers of ICICI bank responded that the prompt service of the bank made them to open account; thirty seven customers of SBH opined that the prompt service offered by the banks is one of the reasons behind opening the account. A total of one hundred twenty two customers responded that prompt service of the bank made them to open account (table 8).

Table 8: Prompt Service (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	85	42.5	115	57.5	200
SBH	37	18.5	163	81.5	200
Total	122	30.5	278	69.5	400

4.6 Modern technology

Technology is the order of the day. The emergence of internet has paved way for drastic changes in the banking sector. Internet banking, mobile banking etc., payments of electronic bills, telephone bills, insurance premiums, commercial payments were made easy because of the technology.

Nowadays, customers are searching for the most convenient and easy way of doing transactions with bankers. To avoid delays in depositing money, making payments etc., they are using technology and making payments. The modern technology has not only saved time of customers but also increased the quality of service and ultimately increased customer satisfaction. To know the impact of technology, the respondents were asked whether technology made them to open their account with the bank/branch or not. The following table depicts responses of the respondents. Total of one hundred and eighteen respondents amongst which ninety three of ICICI and twenty five respondents of SBH opined that because of modern technology they have opened their accounts with that particular bank/branch (table 9).

Enterprise in Turbulent Environment

Table 9: Modern Technology (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	93	46.5	107	53.5	200
SBH	25	12.5	175	87.5	200
Total	118	29.5	282	70.5	400

4.7 Friends & relatives

To know the effect of word of mouth, the respondents were posed a question under the category of reasons for opening the account with the bank/branch. Several times, satisfied customers may refer their family members or friends to start an account with the same bank/branch. Another thing is, while opening a new account; the introducer's recommendation is mandate. In some cases, customers may be interested to open their accounts with the bank/branch where their friends or family members have the accounts. The responses are as follows (table 10)

Thirty eight respondents of ICICI opined that they have opened their accounts with that particular bank/branch because of their friends and family members. The same number thirty eight respondents opined that their friends and relatives are the reason behind opening the account with that particular bank/branch. With regard to the impact of friends and relatives, it is similar in case of both ICICI and SBH.

Table 10: Friends & Relatives (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	38	19	162	81	200
SBH	38	19	162	81	200
Total	76	19	324	81	400

4.8 Interest rates

It is quite understandable that customers prefer a bank where they can get more interest on their deposits and where they can avail loans or advances at lower interest rates. To know the influence of interest rates the respondents were asked a question on the interest rates.

A total of forty two respondents out of four hundred have opined that because of the attractive interest rates they have their account with the bank/branch. It is clear that only about ten percent of the respondents are looking for attractive interest rates. The bank wise responses are as follows: thirty respondents out of two hundred have said that the attractive interest rates made them to open account with ICICI bank, in case of SBH only twelve respondents expressed that because of attractive interest rates they have opened accounts with the bank/branch. Here we can draw the inference that the customers are not that much looking for monetary benefits rather they are looking for non monetary benefits like service quality, prompt service, modern technology etc. (table 11).

Table 11: Interest rates (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	30	15	170	85	200
SBH	12	6	188	94	200
Total	42	10.5	358	89.5	400

4.9 Insurance Coverage

Presently firms are planning to offer different products with variety of combinations and special privileges. The main intension is to create an impression in the minds of customers that they are superior in the offerings as well as quality. Insurance coverage is one of the privileges offered by the banks to their customers. The following table (Table 12) depicts the responses of customers.

Table 12: Insurance Coverage (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	31	15.5	169	84.5	200
SBH	7	3.5	193	96.5	200
Total	38	9.5	362	90.5	400

Thirty one customers of ICICI opined that the insurance coverage offered by the bank made them to open the account with the bank. Seven customers of SBH bank opined that the insurance coverage offered by the bank made them to open the account with the bank. A total of thirty eight customers responded that insurance coverage offered by the bank is the reason which made them to open account with the bank.

Table 13: Other Reasons (Primary Data)

Bank	Yes	Percentage	No	Percentage	Total
ICICI	0	0	200	100	200
SBH	30	15	170	85	200
Total	30	7.5	370	92.5	400

The list of reasons for opening the bank account is exhaustive. The above table (Table 13) presents the responses of customers regarding the other reasons. Thirty customers responded that they have opened their account with the bank due to other reasons. The prominent among the other reasons are Sunday working, students have opened their account with the bank which already their college has bank account. Bank timings are also the reasons behind opening the bank account.

4.10 Employee behaviour

"Happy employees are more productive" Sayulu and Showry (2012) in their research paper titled "Employee Productivity in Indian Banks" have examined employee productivity in public sector, private sector and foreign banks in India. Profitability and effectiveness of the banks has been attracting the attention of all stakeholders owing to intense competition, financial crisis and failure of few banks like Global Trust Bank and others in abroad. In addition to the popular measures related to finance, number of accounts, deposits, income,

assets, and branch network employee productivity can also be considered to contribute significantly to the effectiveness and productivity of the banks.

"If you treat your employees in right manner, they will treat your customer in the right manner". It is true that productivity of bank can be raised by enhancing the productivity of employee through better human resource practices that attract, recognize and reward productive employees. In this study it is found that the business per employee in public sector banks is more than private sector bank. Foreign banks are dominating in terms of business per employee. When it comes to net profit per employee, the net profit per employee in public sector bank is less than private sector bank. Foreign banks are dominating in terms of net profit per employee. The study has pointed out that there is significant difference between the public sector banks, private sector banks and foreign bank in respect of employee productivity.

Table 14: Employee Behaviour (Primary data (Figures in brackets indicates percentage))

Bank	Friendly	Normal	Rude	Total
ICICI	3 (1.5)	90 (45)	107 (53.5)	200 (100)
SBH	11 (5.5)	136 (68)	53 (26.5)	200 (100)
Total	14 (3.5)	226 (56.5)	160 (40)	400 (100)

The above table depicts the responses of customers regarding the behaviour of employees. (table 14) Overall fourteen customers expressed that the employee's behaviour is friendly; two hundred and twenty six customers opined that the bank employee's behaviour is normal. One hundred and sixty customers which counts for forty percent have expressed that the employee's behaviour is rude. Banks need to train their employees to mould their behaviour in friendly manner.

Chen and Popovich (2003) stated that re-engineering a customer-centric business model requires cultural change and the participation of all employees within the organization. This change may result in the change of roles of many employees. Business processes and organization structure adjusts the staff's behaviour. However, they cannot adjust all rules. If the employees have to succeed in changing these rules, then the banks' top management must create and make clear to employees the vision of the change together with clear rules, which the staff can accept and identify with. The success of CRM will depend mainly on a professional approach to work of all company employees, on their motivation, skills and knowledge, but also on systemic and consistent measurement and appraisal of their achievement.

4.11   Hypothesis Result

Null Hypothesis: there is no significant difference between ICICI bank and SBH bank with regard to employee's behaviour.

Alternative Hypothesis: there is significant difference between ICICI bank and SBH bank with regard to employee's behaviour.

Test employed: Chi – Square Test

Degrees of Freedom: 2

Table 14(a): Chi – Square Test (Primary Data)

Test tool	Degrees of Freedom	Asymp. Sig. (2 – sided)	Value
Pearson Chi – Square	2	.000	32.159

Chi square calculated value is 32.159, and table at 5% level of significance with 2 degrees of freedom is 5.991. Here, the calculated chi square value (32.159) is greater than the table value (5.991) hence, the null hypothesis is rejected. It can be concluded that there is significant difference between the ICICI bank and SBH bank with regard to employee's behaviour.

4.12 Information technology

CRM frequently employs IT technology as a means to attract, develop, and retain customers. For example, the application of IT technology allows for IT-based interactivity that makes it possible for customers to have access to product and service information much faster than earlier. It also permits businesses to leverage information from their customer databases to achieve customer retention, and to cross-sell new products and services to existing customers (Falque, 2000; Foss and Stone, 2001; Ghodeswar, 2000; Natarajan and Shekar, 2000). It must be emphasized, though, that CRM does not necessarily involve Information technology. "Customer Relationship Management is a comprehensive strategy and process of acquiring, retaining and partnering with selective customers to create superior value for the company and the customer" (Parvatiyar and Sheth, 2000, p. 6).

Technology adoption has changed the face of banking in India. Wide spread technology deployment in the banking business has also brought to the fore some new issues and challenges. These can be broadly divided into two categories - costs and risks. Costs, in terms of increasing expenditure on IT deployment and risks that are resulting from reliance on IT systems without necessary safeguards. Cost aspects can be addressed by synergizing IT deployment objectives with the broader, strategic business objectives to ensure adequate operational and management controls over purchase as well as maintenance of appropriate technology solutions. The second aspect relating to IT risks is a very critical issue. With the increased use of IT, there are attendant risks posed to the banks as well as their customers in terms of monetary loss, data theft, breach of privacy and banks need to be extremely cognizant of such risks. Another significant aspect of banking business is regulatory and supervisory compliance. With the growth and globalisation of markets in general and in the aftermath of recent crisis in particular, number of such compliance requirements is increasing. Basel II and III implementation brings in huge challenges. Banks have adopted technology, but the benefit of technology has not fully percolated in terms of cost, speed and convenience. Empowering customers with technology-driven benefits is a big challenge.

Table 15: Information Technology Usage by the bank (Primary Data)

Bank	Response	No. of Respondents	Percentage
ICICI	Excellent	0	.25
	Good	1	4.25
	Average	33	17.75
	Poor	127	23.5
	Very Poor	39	4.25
SBH	Excellent	2	1.25
	Good	5	7
	Average	74	13.5
	Poor	102	18.5
	Very Poor	17	9.75
Total		400	100

Information technology(IT) has long being recognized as an enabler to radically redesign business processes order to achieve dramatic improvements in organizational performance (Davenport and Short, 1990) is of the view that CRM software solution is only a "TOOL" for procedures already in place. IT assists with the redesigning of a business process by facilitating changes to work practices and establishing innovative methods to link a company with customers, suppliers and the entire stakeholders (Hammer and Champy, 1993). CRM applications take full advantage of technology innovations with the ability to collect and analyse data on customer patterns, interpret customer behaviour, develop predictive models, and respond with timely and effective customized communications and deliver product and service value to individual customers. CRM solutions deliver depositories of customer data of a fraction of the cost of older network technologies.

The above table (table 15) presents the responses of the customers of ICICI bank. One customer responded that the Information Technology is good; thirty three customers opined that the Information Technology of the bank is average. One hundred and twenty seven customers expressed that the IT is poor and thirty nine customers opined that the IT used by the bank is very poor. SBH customers responded as follows: two customers responded that the IT used by the bank is excellent; five customers opined that the IT used by the bank is good. Seventy four customers responded that the IT of bank is average. One hundred and two customers responded that the IT used by the bank is poor and seventeen customers expressed that the information technology used by the bank is very poor.

4.13 Hypothesis result
Null Hypothesis: there is no significant difference between ICICI bank and SBH bank with regard to use of Information Technology.
Alternative Hypothesis: there is significant difference between ICICI bank and SBH bank with regard to use of Information Technology.
Test employed: Chi – Square Test
Degrees of Freedom: 4

Table 15(a): Chi – Square Test (Primary Data)

Test tool	Degrees of Freedom	Asymp. Sig. (2 – sided)	Value
Pearson Chi – Square	4	.000	31.749

Chi square calculated value is 31.749, and table at 5% level of significance with 4 degrees of freedom is 9.49. Here, the calculated chi square value (31.749) is greater than the table value (9.49) hence, the null hypothesis is rejected. It can be concluded that there is significant difference between the ICICI bank and SBH bank with regard to Information technology deployment.

5   CONCLUSION

It is clear that the banks are striving hard to satisfy their customers. Innovative services like net banking, mobile banking, online payments etc. are able to satisfy the customers to a greater extent. Banks have to understand the importance of physical facilities such as seating facility, parking facility, cleanliness etc. globalization is the order of the day banks are not exception to this. Banks need to gear up themselves to face the new entrants from abroad.

ABSTRACT

The problem to be discussed – finding the key groups of academic success factors, setting proper indicators for them, investigating quantitatively and qualitatively their influence on programme success and to manage them when possible. The key factors considered – students' admission, grouping, teachers' appointments, students' assignments, workload and knowledge evaluation, motivation, individual students' characteristics. The indicators to reflect the academic outcome - average grades and standard deviations, progression rates, shares of pass or excellent grades, starting from admission to the graduation and placement. Modeling of the relationships between exogenous and endogenous factors and indicators allows to undertake proper managing policy measures. Since 2009 admission to Russian universities is done on the basis of scores of Unified State Exams (USE) in Mathematics, English and Russian languages. Every year econometric analysis of the USE scores as factor of further success is done at ICEF. It shows that the USE sum is reasonable indicator of success, and all three scores have individually significant, though gradually decreasing, influence on further success at the programme. The analysis allows to give recommendations on the admission criteria in further years. After the year 1 ICEF students are admitted to the UoL International programme on the basis of Advanced Placement tests (APTs). The following factors are considered in econometric models for APT results: grouping of the students, lecturers' and classteachers' appointments, external factors (worldwide grades dynamics), personal students' indicators, entrance qualifications and the progress during the year. The progression of the years 2-4 students on double degree programme depends both on International (University of London) exams and local exams and other activities. Factor analysis of final success in each subject is regularly done using econometric methods. It allows to improve the programme, teaching and the students' motivation. The regression analysis showed that only stronger students staying in stronger groups win from the regrouping, while all the other students loss in terms of peer effect, and such a regrouping reduces the progression rate. There are few indicators used for the teachers' performance at the ICEF: the grades at the international exams, students' evaluations, and peer reviews. The average scores, standard deviations, pass rates and excellent grades' shares are analysed after receiving the exams grades. Dummy variables for particular classteachers are used in the models of student achievement, and those who do significantly worse (though this happens rather seldom) get additional training. This analysis allowed to develop the teachers' appointments policies at ICEF. Another set of indicators of teachers' performance comes from the students' evaluations of teacher's clarity, logic, feedback, control, availability. Again, econometric analysis shows that the "clarity" indicator is the most important for the students' overall teaching evaluation. Students' evaluations should be taken into account

together with the course results and peer review reports. An intensive programme for new teachers' induction is implemented at ICEF, taking into account the factors from evaluations. Modeling of the factors of academic success allows to develop the policy of admission, teachers' appointment and support, the students' grouping, motivation and workload distribution. This approach is planned to be extended in ICEF to the analysis of developments and evaluation of all kinds of knowledge and skills requested by the employers, to the wider range of subjects, indicators and activities.

Keywords: *Academic Success, Econometric Analysis, Education, Factor, Model, Policy Measures*

1 INTRODUCTION

Achievement of high academic results is the key objective for a university. There are different factors of achieving this objective – on the sides of students, teachers and the institution. The problem to be discussed in the paper – investigation of how to formulate the key groups of academic success factors, to set proper indicators for them, investigate quantitatively and qualitatively their influence on programme success, and hence to manage these factors when possible.

The key factors considered – students' admission, grouping, teachers' appointments, students' assignments, workload and knowledge evaluation, motivation stimulation, individual students' characteristics. The indicators to reflect the academic outcome - average grades and standard deviations, progression rates, shares of pass or excellent grades for different students' groups and subgroups, at different stages of studies, starting from admission to the graduation and placement. Modeling of the relationships between exogenous and endogenous factors and indicators allows to undertake proper managing policy measures. The double degree BSc programme at the International College of Economics and Finance (National Research University Higher School of Economics, Moscow, created and implemented in cooperation with the London School of Economics) is organized in such a way that provides sufficient data on students' academic success that allows serious statistical and econometric analysis of the factors of academic achievement. The students get BSc Degree in Economics of NRU HSE and the BSc degree of the University of London, and hence have regular and detailed knowledge control by both universities. ICEF also has MSc programme in Financial Economics also developed in cooperation with the LSE, and investigation of its academic success factors is also very important though being outside the scope of this paper.

2 ADMISSION

Since 2009 admission to Russian universities is done on the basis of scores of Unified State Exams (USE) in Mathematics, English and Russian languages. Every year careful econometric analysis of the USE scores as factor of further success is done at ICEF. It shows that the sum of three USE scores is reasonable indicator of success, and all three scores have individually significant, though gradually decreasing, influence on further success at the programme. Those candidates who have the sum of three USEs scores 205 or more were admitted in 2011–2012, and various econometric models were estimated on the basis of admission criteria, further students' efforts and individual characteristics. The analysis allows to give particular recommendation of the admission criteria raise in further years. The fee discounts on the year 1 are given on the basis of weighted sum of USE scores, with the weights corresponding to the average contribution of each USE in final rating estimated using

regression model (3 for Math, 2 for English, 1 for Russian). Modeling of the academic success also allows to give further recommendations for fee discounts policy.

3 ACADEMIC SUCCESS DURING THE STUDIES

After the year 1 ICEF students are admitted to the UoL International programme on the basis of Advanced Placement tests (APT) in Calculus, Statistics, Microeconomics, Macroeconomics. To prepare the students to these exams, local exams in the same format are set three times during the year. Local grades serve as a good indicator for further APT success: normally the correlation of 0.7-0.8 is observed which is rather high. The average scores and the pass rates in each AP exam are analysed in dynamics, and the following factors are considered basing on econometric models: grouping of the students, lecturers' and classteachers' appointments, external factors (worldwide grades dynamics), personal students' indicators, entrance qualifications and the progress during the year. The results of analysis are used for programme developments. For example, in 2012 the Microeconomics was found being the bottleneck for further progression (together with Macroeconomics), and these courses were extended in time and in content.

The regression of the AP_AVE (the average of 4 APT scores, out of 5) in 2012 on three USE scores (USE_M, USE_R and USE_E for Mathematics, Russian and English languages), as well as gender dummy (MALE), being high school Olympiad winner (OLYMP), end being from non-Moscow region (REGIONS) is given below:

Dependent Variable: AP_AVE
Method: Least Squares
Included observations: 176

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-5.471	0.967	-5.656	0.000
USE_M	0.050	0.008	6.471	0.000
USE_R	0.026	0.009	3.104	0.002
USE_E	0.032	0.010	3.110	0.002
MALE	0.309	0.149	2.076	0.040
OLYMP	0.436	0.212	2.060	0.041
REGIONS	-0.071	0.169	-0.421	0.674

R-squared	0.405	Mean dependent var	3.543
S.E. of regression	0.926	S.D. dependent var	1.180
Sum squared resid	144.8	F-statistic	19.19
Durbin-Watson stat	2.221	Prob(F-statistic)	0.000

It can be seen from the regression that all USE grades are significant indicators for further student's success, both as a group and individually, and even the contributions of the grades in the overall APT mean score are approximately proportional to their weights for the indicator of fee discount. It is important that the High school olympiads' winners (who are likely the people most interested in the Economics subject area) perform significantly better than other students (with other factors fixed), male students doing slightly better than female (this should be confirmed by other models and years in order to judge, though in principle some motivations difference is possible due to different army service responsibilities in case

of failure in studies), and popular opinion that the students from the regions other than Moscow can perform differently from the Moscovites is not correct.

At the same time, the overall explanatory power of the regressors is not too high (judging by the Determination coefficient 0.4), and the effectiveness of the personal student's effort throughout the year of study at ICEF (based on his/her abilities, motivation, and the quality of teaching) is very important. Adding to the regression above the average mid-term exams grades (4 ICEF exams in April, in the same subjects as APTs, out of 100) as an additional regressor allows to raise the R^2 value from 0.4 to 0.75 immediately, and "absorbs" the explanatory power of Mathematics and Russian USE exams, as well as of OLYMP (but not MALE) variable.

While the average score shows the overall group's level and its factors, the progression rate (here the University of London admission rate) is also very important for investigation and analysis. The student is admitted to the University of London in terms of APT results (qualification in English is also needed) if he/she has passed (got 3 or more out of 5) 2 subjects out of 3 (Calculus, Statistics, Economics). To pass Economics means to pass both Micro- and Macroeconomics. In 2012, the UoL admission rate for ICEF students was about 76%, and the binary variable UL_PASS indicates if the student was admitted. Here below the results of Logit model estimation are presented, and in terms of the variables significance they are similar to those of the model for the AP_AVE variable factors. Even the order and ratios of the USE exams contributions are similar: the Mathematics exam has the highest coefficient, then English and Russian languages. Though MALE variable becomes insignificant here, as one could expect.

Dependent Variable: UL_PASS
Method: ML - Binary Logit (Quadratic hill climbing)
Included observations: 174

Variable	Coefficient	Std. Error	z-Statistic	Prob.
C	-20.206	3.615	-5.590	0.000
EGE_M	0.111	0.029	3.859	0.000
EGE_R	0.057	0.028	2.084	0.037
EGE_E	0.093	0.031	3.030	0.002
MALE	0.636	0.470	1.352	0.176
OLYMP	1.875	0.984	1.905	0.057
REGIONS	-0.010	0.530	-0.188	0.851

Mean dependent var	0.753	S.D. dependent var	0.433
S.E. of regression	0.358	McFadden R-squared	0.308
Sum squared resid	21.41	LR statistic (6 df)	59.92
Log likelihood	-67.33	Probability(LR stat)	0.000

The estimation shows that in order to provide higher than 50% progression rate to the year 1, the admission criteria should be set at about the level of 235 points, which means about 10 points more on average in each exam on average (out of 100) than now.

The progression of the years 2-4 students on double degree programme depends both on International (University of London) exams and local exams and other activities. Factor analysis of final success in each subject is regularly done using econometric methods. Current activities and motivation to study become more significant each further year of studies, and local performance is again very good indicator of the UoL exams grades: normally the R^2 coefficient of regressions is 0.7-0.8. Lectures attendance or home assignments grades are usually significant for the forthcoming exams grades while if this grade is included as a factor for further success, it normally crowds out the influence of those indicators.

Here is an example of regression of final exam in Econometrics (FINAL) on the rating (average grade) for the previous year (RATING), lectures attendance (LECT), home assignments average grade (HA_AVE), and the mid-term exam result (MIDTERM); all variables out of 100 (the lecture attendance in %).

Dependent Variable: FINAL
Included observations: 85

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-19.67	6.319	-3.113	0.0026
MIDTERM	0.191	0.082	2.320	0.0229
LECT	0.057	0.024	2.172	0.0328
HA_AVE	0.273	0.089	3.058	0.0030
RATING	0.660	0.174	3.801	0.0003

R-squared	0.755	Mean dependent var		49.67
S.E. of regression	9.478	S.D. dependent var		18.67
Sum squared resid	7185.9	F-statistic		61.53
Durbin-Watson stat	2.25	Prob(F-statistic)		0.0000

All the variables are here significant, and the coefficients allow to estimate the average influence of each factor on the final exam grade. This type of analysis allows to adjust the teaching and knowledge control methods, also to improve the students' motivation in terms of informing them on the factors of success. Unlikely many other students, ICEF students usually study intensively throughout all academic year. By now, ICEF students presenting about 2.5% of the UoL EMFSS students, usually get 15-20% of awards for best academic achievement, 10-15 top scores out of 19 exams taken, and have average grade of about 60 (second upper class level) against 40-42 overall UoL average.

4 GROUPING

Basing on the data on academic success after the students' regrouping on the basis of previous achievement, the regression analysis was done. It showed that only stronger students staying in stronger groups win from the regrouping, while all the other students loss in terms of peer effect, and such a regrouping definitely reduces the progression rate. In 2013 such a regrouping has not been done in accordance with recommendations, and an investigation of different approaches for initial grouping (from completely random to some "soft" streaming in accordance with their level/motivation are at further investigation. Some key results of regrouping analysis done are available below.

Enterprise in Turbulent Environment

In August groups are formed on the basis of Unified State Exam (USE) in Mathematics. In 2011-2012 year ICEF had two types of groups: "stronger" and "weaker": top 40% of students were distributed among 4 groups quasi-randomly, other 60% of students were distributed among 6 groups also quasi-randomly.

In January 2012, after December exams, the groups were re-distributed on the basis of ICEF AP subjects exams rating (Calculus, Microeconomics, Statistics). Each group kept its "core", but some student were "upgraded" to the "stronger" groups, some were "downgraded" to "weaker" (24 and 32 respectively), and some with the lowest results left the programme. Finally all who took the rating in top 40% after winter exams were in "stronger" groups, and next 60% in the weaker.

The analysis of regrouping efficiency was done on the basis of April ICEF exams. Here RAT_APR shows the students' April average scores in the 4 AP subjects, CALC_APR, STAT_APR, MIC_APR and MAC_APR are their scores (out of 100) at the April mid-term exams in Calculus, Statistics, Microeconomics and Macroeconomics respectively. The explanatory variables (ended by _JAN, no Macroeconomics since it was taught in semester 2 only; HIST means History elective) are the scores at the final semester 1 exams after which the students were regrouped. Dummy variables WE_WE, WE_ST, ST_WE and ST_ST mean the initial and final group type for each student: for example, WE_ST equals one for those moved from the weaker to stronger group, while WE_WE equals one for those who stayed in their weaker group. Those who stayed in the stronger group are the reference category.

Dependent Variable: RAT_APR
Included observations: 182

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.303	3.560	0.366	0.7148
STAT_JAN	0.187	0.070	2.674	0.0082
CALC_JAN	0.229	0.059	3.901	0.0001
MIC_JAN	0.353	0.065	5.458	0.0000
WE_WE	-3.088	1.858	-1.662	0.0983
WE_ST	-4.628	1.733	-2.671	0.0083
ST_WE	-3.793	1.915	-1.981	0.0492
HIST_JAN	0.082	0.030	2.758	0.0064

R-squared	0.809		Mean dependent var	38.89
S.E. of regression	6.725		S.D. dependent var	15.04
F-statistic	104.5		Durbin-Watson stat	2.087

In the regression for overall rating all three categories of students got in April significantly (at least at 10% level) less than the reference category (if other factors are equal). This means that only those stronger students who stayed in their initial stronger groups won comparing to the others. As for the particular subjects, the most significant results in line with the overall ones were observed for Calculus (see below) which is based on Mathematics being the basis for initial grouping:

Dependent Variable: CALC_APR
Included observations: 199

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	5.680	5.000	1.136	0.257
STAT_JAN	0.167	0.095	1.760	0.080
CALC_JAN	0.474	0.082	5.784	0.000
MIC_JAN	0.297	0.087	3.394	0.001
WE_WE	-9.008	2.606	-3.457	0.001
WE_ST	-7.430	2.472	-3.005	0.003
ST_WE	-6.344	2.738	-2.317	0.022

R-squared	0.759	Mean dependent var	41.82
S.E. of regression	9.811	S.D. dependent var	19.69
F-statistic	100.9	Durbin-Watson stat	1.961

According to statistical analysis, regrouping of the students according to rating positively influenced the performance of the students that stayed in the stronger groups. This category of students is taken as reference category, and its dummy is called ST_ST. Regressions estimated with AP main courses grades as dependent variable gives us the same positive influence on strong students' performance.

Students who moved from stronger groups to weaker ones according to their academic performance, do not benefit from the movement. Their overall results decreased by 3.7 points, calculus results decreased even more, by 7 points. It can be assumed that strong students play the role of locomotive in weaker groups, so weaker students are more motivated to study and get additional peer support.

The students who moved from weaker groups to stronger ones have also demonstrated worse performance than the reference group. This result can be explained by the fact that in weaker groups such students were leaders that stimulated them to learn more, in particular in active interaction with the classteachers, as well as with their peers. In stronger groups these people are of the medium level and this fact discourages them.

The largest decrease in academic performance show the weaker students who stayed in weaker groups: the estimated decrease in calculus goes over 9%. The explanation of this fact is that after the movement stronger students are gone to stronger groups and in weaker ones only weaker students stay. Weaker environment makes weaker students even less motivated. They also do not get some peer support from the stronger students who left the group.

So, generally, the regrouping of students does not influence positively the academic performance, and it was not done in 2013 due to this.

5   TEACHERS
There are few indicators used for the teachers' performance at the ICEF double degree programme. First, these are the students' grades at the external (international) exams. Since the exams are external and properly set at the stable level, the grades' changes are not large and happen mostly due to the teachers' work and the students' motivation and effort. The

average scores, standard deviations, pass rates and excellent grades' shares are analysed after receiving the external exams grades, also compared with the dynamics of the "other world" grades. The absolute changes corrected by the overall changes may be the "exam performance" indicators for teachers' and students' achievement. For example, if in 2011 the Elements of Econometrics ICEF students' average score went up by 7%, and the "other world" average went down by 6%, then hence the "corrected" increase was about 13%, - and this is the indicator to be regressed on other factors.

Dummy variables for particular classteachers are used in the models of student achievement, and those who do significantly worse (though this happens rather seldom) get additional support, or may be even replaced by more efficient colleagues. This analysis allowed to develop the teachers' appointments policies at ICEF.

6   STUDENT EVALUATIONS

Another set of indicators of teachers' performance comes from the students' evaluations, - different features of teaching are evaluated in 1-5 scale: clarity, logic, feedback, control, availability. Again, econometric analysis shows that the "clarity" indicator is the most important for the students' overall teaching evaluation. Students' evaluations are important but should be taken carefully: usually the students evaluate lower the teachers of more advanced courses, classes are evaluated higher than lectures, and electives higher than mandatory courses – irrespectively to the actual quality of teaching. But they should be taken into account together with the course results and peer review reports done by the experienced teachers and teaching methods specialists on a regular basis. Since 2011, the intensive programme for new teachers' induction was implemented at ICEF, and the programme of teaching quality assurance (in co-operation with the LSE Teaching and Learning Center) was developed. Statistical analysis of the students' evaluations showed that the new teachers in 2011-2012 got significantly higher evaluations than before, and even higher than most of more experienced teachers. Also, ICEF graduates coming further to teach have significantly higher evaluations (other factors equal) than the others. This is due to the availability of many talented students in ICEF, good preparation for further academic or professional activity, good further education (mostly at the Western Master programmes), and also understanding of the programme requirements and students expectations.

The result of regressing Clarity evaluation (out of 5) on a number of factors is shown below. The variables shown to be significant (at 5% level) are LECT=1 for lecturers, CLARITY_SD – standard deviation of clarity – supposed to be higher for more advanced and complicated courses taught on the final year of the programme, GRAD=1 for ICEF graduates teaching at the programme, BEGIN – teaching for the first year at ICEF. The variables FTA =1 for full time academics with PhD degree, MSC=1 for master students teaching BSc class, UoL=1 for the University of London courses, YEAR2-4 dummies for the years of ICEF programme, NATIVE=1 for English native speakers, and ELECTIVE=1 for elective courses shown to be insignificant. Again, the students evaluate lower more advanced courses and activities, not just because of lower teaching quality, but essentially due to their own lack of understanding, and this should be taken into account when judging about the teachers' performance.

Dependent Variable: CLARITY
Method: Least Squares
Included observations: 117

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	5.556	0.147	37.74	0.000
FTA	-0.207	0.139	-1.492	0.139
LECT	-0.166	0.077	-2.163	0.033
MSC	-0.045	0.120	-0.373	0.710
UOL	-0.192	0.098	-1.957	0.053
GRAD	0.228	0.096	2.380	0.019
CLARITY_SD	-1.462	0.140	-10.44	0.000
BEGIN	-0.347	0.110	-3.171	0.002
YEAR2	0.038	0.108	0.352	0.725
YEAR3	0.039	0.122	0.319	0.750
YEAR4	0.006	0.131	0.043	0.966
NATIVE	0.087	0.099	0.872	0.385
ELECTIVE	0.019	0.102	0.190	0.850

R-squared		0.670	Mean dependent var	4.064
S.E. of regression		0.332	S.D. dependent var	0.547
Sum squared resid		11.436	F-statistic	17.62
Durbin-Watson stat		1.1629	Prob(F-statistic)	0.000

Modeling of the factors of academic success allows to develop the policy of admission, teachers' appointment and support, the students' grouping, motivation and workload distribution. This approach is planned to be extended in ICEF to the analysis of developments and evaluation of all kinds of knowledge and skills requested by the employers, to the wider range of subjects, indicators and activities (including the research type activities), and to the analysis of academic success factors at the MSc programme in Financial Economics where not just the grades but research quality is among the key academic results.

ROLE AND POSITIONS OF LEADING COMPANIES ON INDUSTRIAL MARKETS: EVIDENCE FROM RUSSIAN ECONOMY[1]

Almira Yusupova

Novosibirsk State University, Economics department, Russia
Institute of Economics and Industrial Engineering, Siberian Branch of Russian Science
Academy
yusupova@ieie.nsc.ru

ABSTRACT

Paper deals with the analysis of role and positions of leading corporations. Basic approach of industrial economics is used as the starting point of analysis. Special indicators of companies' leading positions are suggested. Empirical part is based on data provided by national rating agency Expert Ra. The main aim is to analyze the positions of Russian largest corporations, to determine the character and dynamic characteristics of their leadership. Long term period from 2000 to 2011was studied. National and regional markets were compared.

Keywords: Leading corporations, Market power, Stability and sustainability of leadership

JEL Codes: G20, L10

1 INTRODUCTION

The processes of real industrial markets emergence and formation occur in Russian economy during last 20 years. Level of economic activity of large enterprises and level of dominance (market power) of one or several firms are among important market indicators. Current structure of many markets in Russian and market structure in general is related to the activities of few large companies. Leading position provides market power for a company. It is important to determine whether there are such market leaders and of so – how stable is their leading position.

An approach to the analysis of company's leading position is suggested in the paper. Under this approach we analyze "sustainability" and "stability" of leading position and therefore market power on the industrial market.

2 GENERAL CHARACTERISTICS OF MARKET LEADERSHIP

Large corporations play important role in the economy of any country. They make significant contribution to the formation of main economic indicators, they get key market positions, and their performance has great influence to the development of national economy. These companies have extended investment potential. Historical background and contemporary integration processes form very specific conditions in Russia. Under such environment the role of leading companies is especially important. Our estimations show that in 2007 total turnover of 20 largest companies was equal to 37% of GDP; similar indicator for 10 companies was equal to 28%. In 2010 after crisis these figures increased and were about 38% and 30% accordingly. Figure 1 shows the share of 1, 3, 5, 20 and 50 largest companies in

---

total turnover of 400 national leaders – conditional concentration ratios CR_1, CR_3, CR_5, CR_{20}, CR_{50}.

Chart 1: Concentration of the set of 400 Russian corporations which are leaders in turnover, % (estimated basing on the data provided by ExpertRa agency)

Results show that in general large companies are very different. In 2011 first 20 companies (from 400) formed about 50% of all turnover. It is possible to note basing on the figure 1 that most markets are characterized by the existence of definite leaders. Is should be mentioned that shares of 5, 20 and 50 leaders decreased during period from 2000 till 2011. CR_1 and CR_3 coefficients increased but these coefficients are influenced by many non market reasons.

The broad descriptive model of industrial markets development was conceived by Edward Mason and developed by Joe Bain. It is well known as The Structure – Conduct – Performance Paradigm (Scherer and Ross, 1991). Any industrial market structure is described with several basic structural indicators. Level of economic activity of large enterprises and level of dominance (market power) of one or several firms are among such indicators. Concentration is one of the main characteristics of market structure, it reflects the number of firms on the market and it shows how much they differ from each other. Concentration is related to the level of competition, to the market power of selected firms. It is known from the economic theory that level of concentration should be rather low for competitive markets. At the same time competition led to the companies' consolidation and increase of concentration (Perloff and Carlton, 2004).

Limited number of large companies concentrates main part of economic activities in most countries. N. Collins and L. Preston analyzed changes in the lists of American leading corporations since the beginning of the 20-th century (Collins and Preston, 1961). They found that this list is not stable; changes were explained by many factors. Demand plays the most important role. The list of US market leaders became more stable at the middle of 20-th century due to following reasons:
-   Positions of large firms became stronger;
-   Rate of demand changes decreased;
-   Management turned to be more professional;
-   Economic activities got diversified character.

Current structure of many markets in Russian and market structure in general is related to the activities of few large companies. Leading position provides market power for a company. It

is important to determine whether there are such market leaders and of so – how stable is their leading position.

An approach to the analysis of company's leading position is suggested in the paper. Under this approach we analyze "sustainability" and "stability" of leading position and therefore market power on the industrial market. The set of leading firms could be created on the basis of different criteria. It is possible to form a group of top (10, 20 etc) firms – leaders on sales, a group of leaders according to the level of profit, cost of assets, value added etc. Many groups of leaders could be defined on each market. These sets may include the same or different firms. According to our definition "sustainability" of leading position of the company means that this company is included to the set of leaders more than one time, i.e. is included in more than one group. If leading position is sustainable it is based on various criteria. If leadership is unsustainable, groups of leaders are very different; if leadership is sustainable, they are similar.

"Stability" of firm's leading position in our approach means that it remains in the group of tops during several (more than one) years, it reflects long term leadership.

Summing up definitions described above we could formulate that leading position of the firm is sustainable and stable if this position is based on various criteria in long term period. If such firms could be found at the definite market, leadership at this market is sustainable (or stable) and it would be possible to make forecasts on market's further development and main tendencies.

We suggest special calculable indicator – sustainability (stability) coefficient (CS).

$$CS = 1 - \frac{Nfact - N\min}{N\max - N\min}$$

Where: N fact – real number of leading firms included in all sets;
N min – minimal possible number of leading firms included in all sets;
N max - maximum possible number of leading firms included in all sets;

It should be noted that coefficient characterizes market situation in general, it is relevant to the whole market.

These coefficients vary from 0 to 1. If coefficient is equal to 0 it means that leadership is unsustainable (unstable). If it is equal to1 it means that leadership is absolutely sustainable (or stable).

The main aim of our paper is to analyze the positions of Russian largest corporations, to determine the character of their leadership. We studied the dynamics of these indicators during long term period, compared national and regional markets.

Basing on the assumption of classical Industrial Economics we looked at the stability and sustainability of groups of Russian leading companies. Empirical basis was presented by annual rating Expert 400, provided by ExpertRa agency. We've chosen following years: 1995, 2000, 2005, 2008, 2009, 2010, 2011. This time interval includes periods of economic stability as well as unstable ones.

Groups of companies with the highest levels of turnover, gross profit and level of capitalization were formed for each year. Then the compositions of these three groups were compared. We use the assumption that if company is leading on the market according to several criteria its position is sustainable. The existence of such companies shows that market structure is formed; tendencies of its development could be forecasted, basing on the performance of leading companies. If groups of leading companies don't intersect leadership on the market is unsustainable, market structure is uncertain (Yusupova, 2009).

3   LEADERSHIP OF RUSSIAN AND SIBERIAN CORPORATIONS

We took sets consisting of 20 and 5 leading firms. The stability of leadership was estimated by comparison of leading sets formed for different years. Leaders were determined according to turnover. Analysis was applied for national economy and for Siberian region. Results are presented on charts 2 and 3.

Chart 2: Sustainability coefficients (SC) for Russian and Siberian leaders

Results show that in general in Russian sustainability of leadership was rather high till 2008. This means that the same firms were leading according to different criteria. This situation indicates that market structure was rather mature, level of competition under such structure could not be high, and competition is far from perfect. Large corporations have high market power. This is relevant for sets of 20 leaders as well as for 5 leaders' sets. Sustainability of 5 leaders was slightly lower than of 20, except data for 2000 year. We consider that this could be explained by noneconomic factors.

Coefficient of leadership sustainability in 2009 decreased for 20 firms and increased for 5, in 2010 all coefficients decreased greatly. Such dynamics could be explained by reaction to general instability under crisis and post crisis environment. It became difficult for companies to keep leading positions in all directions. Following economy revival caused new increase of coefficients in 2011. It should be noted that some corporations are actually affiliated with each other (for example Gasprom and Gaspromneft). Formally they are separate entities, their results are registered separately. Therefore real sustainability of leadership should be higher than estimated.

Siberian companies show another picture. Sustainability coefficients of leadership in general are lower than national ones. This is observed h for 5 leaders and for 20 leaders. So positions of regional leaders are weaker, more competitive structures are developed in regions.

Reaction to crisis revealed sooner in regions. Already in 2008 SC for 20 leaders decreased greatly, SC for 5 leaders even was equal to 0. Growth of indicators was observed already in 2010, which also reflects more quick reaction to general changes than within national markets.

Dynamic of national and regional coefficients was different at national and regional level. In some years they even demonstrated opposite movement. Differentiation between national and regional markets is more definite for 5 leaders. We could propose the existence of regional specifics and regional autonomy.

Chart 3: Stability coefficients

Stability of leadership during long term period is reflected on chart 3. These data are less relevant to crisis influence. In general stability indicators are rather high. We calculated similar coefficient using data from N. Collins and L. Preston's study for the US. American was higher (0,78) than Russian indicator (0,75). We consider that Russian indicator would be even higher without state interference (case of Ukos company).

Stability of Siberian leaders was lower comparing with national level.

Tables 1 and 2 show some characteristics of leading corporations. As we can see most of them operate in strategic areas of economy such as oil and gas sector. Level of competition at these markets is not high. In 2005 9 out of 20 leading companies worked at oil and gas sector, in 2011 8 leaders belonged to this sector. In general most of the leading corporations work in fuel energy complex. Besides list of leaders includes well known national monopolists such as Russian Rail Ways and Sberbank.

Enterprise in Turbulent Environment

Table 1: Industrial Characteristics of 20 Russian leading corporations (number of firms within each industry)

2005 year	2011 year
Oil and gas - 9 Banks– 1 Non ferrous metallurgy – 1 Telecommunications and communications – 3 Electrical power engineering– 1 Ferrous metallurgy – 4 Food industry - 1	Oil and gas - 8 Banks – 2 Non ferrous metallurgy – 2 Chemical and petrochemical industry – 1 Telecommunications and communications – 2 Electrical power engineering – 2 Ferrous metallurgy – 2 Precious metals and diamonds industry - 1

Industrial specifics reflected the levels of calculated indicators of stability and sustainability of leadership. List of Siberian leaders includes companies which belong to national giants. They conduct regional expansion tending to widen areas of influence.

Table 2: Industrial Characteristics of 20 Siberian leading corporations (number of firms within each industry)

2005 year	2010 year
Oil and gas - 2 Non ferrous metallurgy – 3 Telecommunications and communications, IT – 1 Electrical power engineering – 3 Ferrous metallurgy – 3 Transport – 2 Coal and turf industry - 6	Oil and gas - 2 Non ferrous metallurgy – 2 Telecommunications and communications, IT – 1 Electrical power engineering – 4 Ferrous metallurgy – 1 Transport and logistics – 2 Coal and turf industry - 3 Trade - 2 Banks -1 Manufacturing– 1 Precious metals industry - 1

Siberian leaders also belong to strategic areas, but fewer firms operate in gas and oil industry. As we showed earlier levels of leadership stability and sustainability are also lower for Siberian companies.

4 CONCLUDING REMARKS

Our research is going on. The existence of clearly defined leaders is important characteristic of any market. Positions of leading corporations, their role and market power is one of significant factors of market structure. Our research is based on data of Russian rating agency. We showed that most national and regional leaders in Russia operate on high concentrated markets with low level of competition. There are several other ratings of leading companies. It is necessary to mention Global 2000 rating which is based on Thomson Reuters Fundamentals Worldscope data and is constructed with the help of FactSet Research system. This rating takes into account same indicators: turnover, gross profit and capitalization. Only information on public companies trading on stock market is used. 26 Russian corporations were included into the set of 2000 world biggest firms in 2011.

DOMESTIC BANKS' RESPONSES TO THE ENTRY OF FOREIGN BANKS IN CHINA

Tao Zeng
Wilfrid Laurier University Waterloo, Ontario, Canada
tzeng@wlu.ca

ABSTRACT

China is a unique market because, before 2006, the presence of the foreign banks in China was negligible. Prior to this time, the market was competitive locally but relatively dominated by the Big Four state-owned banks. The historical development of China's market provides an opportunity to investigate important questions regarding the functioning of the market for banking services that are difficult, if not impossible, to test in other globally established markets. The purpose of this study is to examine the effect of the market entry of the foreign banks into China on transaction and service fees charged by the domestic banks. Market research has little to offer on local bank pricing responses to the entry of foreign banks in any market, mainly because in western countries such as the Canada, England, and the United States, those foreign banks are the oldest banks operating in the market. Thus, we rely primarily on the incumbent pricing literature (Simon 2005; Geroski 1995) to help us develop our specific hypotheses and empirical tests. Using data from the annual reports of Chinese listed banks from 1994 to 2009, this paper examines whether domestic banks cut transaction and service fees in response to foreign bank entry and whether ownership structure is associated with domestic banks' pricing response to the entry of the foreign banks. Results suggest that domestic banks cut the transaction and service fees before entry but state-owned domestic banks did not.

Keywords: *China, Domestic banks, Foreign banks, Market, State-owned banks, Transaction and service fees*

1 INTRODUCTION AND LITERATURE

China is a unique market because, before 2006, the presence of the foreign banks in China was negligible. Prior to this time, the market was competitive locally but relatively dominated by the Big Four state-owned banks. The historical development of China's market provides an opportunity to investigate important questions regarding the functioning of the market for banking services that are difficult, if not impossible, to test in other globally established markets. The purpose of this study is to examine the effect of the market entry of the foreign banks into China on transaction and service fees charged by the domestic banks. Market research has little to offer on local bank pricing responses to the entry of foreign banks in any market, mainly because in western countries such as Canada, England, and the United States, those foreign banks are the oldest banks operating in the market. Thus, we rely primarily on the incumbent pricing literature (Simon 2005; Geroski 1995) to help us develop our specific hypotheses and empirical tests. Using data from the annual reports of Chinese listed banks from 1994 to 2009, this paper examines whether domestic banks cut transaction and service fees in response to foreign bank entry and whether ownership structure is associated with domestic banks' pricing response to the entry of the foreign banks. Results suggest that domestic banks cut the transaction and service fees before entry but state-owned domestic banks did not.

Enterprise in Turbulent Environment

This study examines the effect of the entry of the large multinational banks on the transaction and service fees charged by domestic banks in China. The entry of new firms has important effects on incumbent firms and clients. New entrants increase competition, reducing market share and profits of incumbent firms. It is obvious, therefore, that incumbents have strong incentives to deter entry, and/or protect their market share while entry is beneficial to clients as new firms lower prices for banking products, increase access to finance, forcing incumbents to become more efficient and innovative. In the event of entry, incumbents have to decide on the most effective response in the face of increased competition (Simon, 2005). Specifically, we use transaction and service fee and other relevant data to examine the domestic incumbent banks' pricing responses to the increasing presence of the large foreign banks in the Chinese banking market.

The incursion of foreign banks into the long protected local market has been a gradual process, accelerated by the terms of China's 2001 entry into the World Trade Organization (WTO). From 2001 to 2006, previously the foreign banks were limited to handling foreign currency services and in some cases Chinese currency services for corporate customers. At the same time, state-owned local banks have been rushing to restructure and forming alliances with foreign partners as they work on upgrading services, technology and management.

With the continued opening up of the banking sector under the terms of China's WTO accession, by the end of 2006, there have been a number of foreign banks investing in China's financial sector. The year of 2006 saw an influx of foreign institutions buying into Chinese retail banks in advance of the new WTO measures to allow foreign banks to compete on more equal terms with local institutions. That is, China removed all geographic and business restrictions on overseas banks in line with its WTO commitments. As of December 2006, overseas banks operating in China must incorporate locally to offer the same services as local banks, such as wealth management, mortgage loans and credit cards. In 2005, JPMorgan became the first foreign company approved to set up a locally incorporated bank in Beijing. In 2006, other locally incorporated banks include, Citibank, HSBC, Standard Chattered Bank and ABN Amro. It is also expected that more than 20 to 30 banks will incorporate locally in China by 2010.

According to data reported by the China Banking Regulatory Commission (CBRC), at the end of 2006, 74 foreign banks from 22 different countries and regions had established 200 branches and 79 sub-branches in 25 Chinese cities. A further 242 representative offices have been established. Table 1 presents shows the total assets of State-owned banks, foreign banks, and other listed domestic banks. Assets of foreign banks in China have climbed steadily. In particular, in 2007, assets of foreign banks doubled.

Enterprise in Turbulent Environment

Table 1: Total assets of domestic and foreign banks (www.stats.gov.cn/tjsj/ndsj/;
www.cbrc.cn/Chinese/info/twohome/index.jsp?itemCode=9)

Billion Yuans

Year	State-owned domestic banks*	Increase from last year	Other stock-owned domestic banks**	Increase from last year	Foreign banks	Increase from last year
2009	400890	25.9%	117850	33.7%	n/a	n/a

2002	135496	n/a	n/a		2881	n/a

*The state-owned domestic banks include the Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), the China Construction Bank (CCB), and Bank of Communications (BOCOM).

**The stock-owned domestic banks include CITIC Industrial Bank, Everbright Bank of China, Huaxia Bank, Guangdong Development Bank, Shenzhen Development Bank, China Merchants Bank, Shanghai Pudong Development Bank, Industrial Bank, China Minsheng Banking Co. , Evergrowing Bank, China Zheshang Bank and China Bohai Bank.

Theories of entry deterrence and incumbent response to entry have generated a variety of predictions (Bain, 1956; Modigliani, 1958; Milgrom and Roberts, 1982). Empirical research across several industries has produced inconsistent results (Frank and Salkever, 1997; Yamawacki, 2002; Desai et al., 2012). Simon (2005) suggested that results may be varied because incumbents vary in their incentive to respond to entry and those incumbents with greater incentives to respond are more likely to respond aggressively. This paper tests the predictions of the entry pricing literature in the Chinese banking market by studying the pricing response of the local banks in China to the entry of the large multinational banks.

This study has important implications for the large multinational banks as it provides useful information about the pricing strategies likely to be used by local banks in a new market. Local banks in emerging markets can also gain useful insights about the pricing strategies adopted by the large multinational banks when they enter a market. Huang and Xu (2006) study the efficiency of the domestic banks for 10 years from 1996 to 2005, but not the price response of these banks to the entry of the large multinational financial institutions. Mao and Li (2006) study the reaction of Chinese local banks to a potential entry of foreign banks in Chinese banking market through examining domestic banks' interest margins. This paper investigates the effect of the foreign entry in Chinese banking market by examining the

transaction and service fees charged by the local banks before and after the foreign entry. It finds that incumbent local banks reduced transaction and service fees in 2005, the year immediately before the expansive entry of the large multinational banks in the market, but the incumbent local banks did not reduce transaction and service fees post entry in 2006 to 2009.

The paper is interesting to policy maker, academics and bank management. In particular, recently there were many recent discussions regarding large abnormal profits earned by domestic banks in the years of 2010 and 2011; at the same time, there was also an observation of foreign banks shrunk in the Chinese banking market. It implies that domestic banks earned more profits when there were less competitions from foreign banks.

2   LITERATURE AND HYPOTHESIS

2.1   Entry Pricing Literature

Several empirical papers, across various industries, have studied incumbent pricing responses to entry and report conflicting results (Joskow et al., 1994; Windle and Dresner, 1995; Frank and Salkever, 1997; Desai and Zeng, 2012). Given the lack of consistent findings, Yamawacki (2002) posits that incumbent pricing responses to entry are firm-specific, depending on the incumbent's ability to respond to entry, which in turn depends on its relative resource position. Simon (2005) offers a more general explanation for why some firms may respond to entry more aggressively than others: incumbents vary in their incentive to respond to entry. Several factors influence the incumbents' response to entry such as the incumbent's age, the incumbent's scope of services, and the market structure. This is consistent with Yamawacki's (2002) argument that responses may be firm specific depending on the specific incumbent's resource position. Further it suggests the potential for a complicated interaction between firm specific factors and market structure.

2.2   Incumbent pricing expectation in a banking setting

Existing literature on the effects of legal, institutional and other factors on banking competition includes Barth et al. (2003), who found that more restrictive entry requirements are negatively linked with bank efficiency, which led to higher expenses and interest rate margins. Moreover, restricting foreign bank participation tent to increase local bank fragility. Demirgüç-Kunt et al. (2003) studied the impact of bank concentration and regulations on bank efficiency. They find that bank concentration has a negative and significant effect on the efficiency of the banking system except in developed countries with sound financial systems and economic freedoms. Furthermore, they find bank- level-based support that regulatory restrictions on entry of the new banks, particularly concerning foreign banks, and implicit and explicit restrictions on bank activities, are associated with lower levels of bank margins. Laessens and Laeven (2003) used bank-level data in 50 countries and found that banking systems are more competitive with more foreign entry and less entry restrictions. However, there is no significant negative relationship between bank competition and concentration.

A number of studies examined the effect of foreign bank entry on local banking market and found that entry of foreign banks improves competition and force domestic banks become more efficient. Claessens et al. (2001) investigated the role of foreign banks and showed that entry by foreign banks made incumbent local banks more efficient by reducing margins. Okuda and Suvadee (2007) examined the impact of foreign bank entry on Thai domestic banks. They found that the increase of presence of foreign banks made domestical banks increase overhead expenses, reduce profits and increase the interest spreads. Liuhto et al.

(2006) examined the central and eastern European banking market and found that foreign bank entry reduced local banks' revenue from both interest and non-interest activities, and raised overhead expenses of local banks. Manlagnit (2011) studied the effect of liberalization of foreign bank entry in Philippines and found that entry of foreign banks improved competition to the extent that it reduced profits and overhead costs of domestic banks.

The above literature studies the impact of entry of foreign banks on domestic banks performance. It focuses on how domestic banks reacted post-entry. One paper (Mao and Li, 2009) investigated how local banks reacted before entry by examining their responses to a potential foreign entry in China, when the country jointed WTO and promised to remove entry barriers for many products and services. They found that incumbent local banks lowered their interest margins when facing a potential entry of foreign banks and thus their earnings were reduced. Since interest margin, used in Mao and Li (2009), is more likely to be subject to government regulations in China, we used service fees charged by Chinese local banks to study the response of domestic banks to the entry of foreign banks. Therefore, our paper adds to this literature by examining the service fees charged by the domestic banks at the time of both before and after entry by the foreign banks.

In summary, we offer the following hypotheses:
> *Hypothesis 1: Local banks significantly reduced their service fees when facing a potential entry by large multinational banks.*
> *Hypothesis 2: Local banks significantly reduced their service fees post entry by large multinational banks.*

3 MODEL SPECIFICATION AND DATA COLLECTION

Financial data is collected from the China Stock Market Financial Statement Database (CSMAR). The database covers all corporations listed on the Shanghai Stock Exchange or Shenzhen Stock Exchange for their financial statements since 1990. The firms selected for this study meet the condition that they are in the banking sector with financial statements available in any year from 1994 to 2009.

To investigate the pricing response of incumbent banks, a longitudinal transaction and service fee model is used for the full sample for the entire data span of 1994 to 2009. In this model, the purpose is to compare the transaction and service fees charged by the domestic banks to their clients or customers before or after the time of entry.

$$FEE_{it} = \alpha_0 + \alpha_1 SIZ_{it} + \alpha_2 ROA_{it} + \alpha_3 LEV_{it} + \alpha_4 STA + \alpha_5 CPI_t + \alpha_6 Y05 + \alpha_7 Y06 - 09 + \varepsilon_{it}$$

Where,
> *FEE*= the ratio of commission and fee income over the sum of commission and fee income and interest income
> *SIZ*= the natural logarithm of total assets
> *ROA*= net income divided by total assets
> *LEV*= long-term debt divided by total assets
> *STA*= indicator variable (1=the state-owned domestic banks, including the Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), the China Construction Bank (CCB), and Bank of Communications (BOCOM))
> *CPI*= consumer price index

Y05= indicator variable (1 = year 2005)
Y06-09 = indicator variable (1 = year 2006-2009)

Y05 and Y06-09 are indicator variables that seek to capture the domestic banks' response before and after the entry of the multinational banks. Should incumbent domestic banks reduce their transaction and service fees in response to new entrants, these variables are expected to be negatively related to *FEE*.

FEE is measured as the commission and fee income, which can be obtained from income statement. *CPI* can be obtained from national statistics of China.

The control variables include, firm size (*SIZ*), measured as the log of total assets; return on assets (*ROA*), measured as profit, divided by total assets; Leverage (*LEV*), measure as the ratio of long-term debt to total assets; ownership structure (*STA*), a indicator variables for banks owned by the state; and *CPI*, consumer price index, used to control for inflation rate.

4   TESTING RESULTS

Table 2 provides descriptive statistics of the variables including mean, median, 1st quartile, 3rd quartile, maximum, minimum, and standard deviation values. For example, the mean value of firm size is 11.6; leverage ratio is 0.95; profitability is 0.01; The mean value of bank service fees is 0.08; median value is 0.07; maximum value is 0.24 while minimum value is 0.01.

Table 2: Descriptive statistics of variables

	Mean	1st Quartile	Median	3rd quartile	Stdev	Max	Min
SIZ	11.63349	11. 15073	11.65363	12. 06181	0.72497	13.07133	9.970248
LEV	0.946395	0. 93117	0.951147	0. 968022	0.026319	0.9816	0.869288
ROA	0.011239	0. 007032	0.010839	0. 013669	0.006116	0.034319	0.000834
CPI	1. 038010	1. 015000	1. 048000	1. 052000	0. 037782	1. 241000	0. 986000
FEE	0.083529	0. 045575	0.070996	0. 115308	0.049836	0.240222	0.009973

Enterprise in Turbulent Environment

Table 3 presents the correlation matrix showing the correlations between major variables. The largest absolute value of the correlation is 0.7642 between *LEV* and *ROA*.

Table 3: Correlation matrix

	SIZ	LEV	ROA	Y05	STA	FEE
SIZ	1					
LEV	0.245002	1				
ROA	−0.18935	−0.76424	1			
Y05	0.16482	0.131142	−0.12245	1		
STA	0.636181	0.064369	−0.06272	0.086422	1	
FEE	0.749645	−0.07806	0.160505	−0.04885	0.598905	1

FEE= the ratio of commission and fee income over the sum of commission and fee income and interest income
SIZ= the natural logarithm of total assets
ROA= net income divided by total assets
LEV= long-term debt divided by total assets
STA= indicator variable (1=the state-owned domestic banks, including the Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), the China Construction Bank (CCB), and Bank of Communications (BOCOM))
Y05= indicator variable (1 = year 2005)

Table 4 reports results for the empirical regression model. The coefficient on Y05 is negative and statistically significant at 0.02 level, suggesting that, on average, incumbent domestic banks cut prices before entry by the foreign banks into the Chinese banking market. It is consistent with the finding by Mao and Li (2009), who found that domestic banks cut prices (interest margins) when facing a potential foreign entry.

CPI	0. 001537	0. 106698	0. 014409
R2(adj)	0.685369		

*** Significant at 0.01 level; ** significant at 0.02 level; * significant at 0.05 level based on two-tail t test

FEE= the ratio of commission and fee income over the sum of commission and fee income and interest income
SIZ= the natural logarithm of total assets
ROA= net income divided by total assets
LEV= long-term debt divided by total assets
STA= indicator variable (1=the state-owned domestic banks, including the Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), the China Construction Bank (CCB), and Bank of Communications (BOCOM))
CPI= consumer price index
Y05= indicator variable (1 = year 2005)
Y06-09 = indicator variable (1 = year 2006-2009)

The coefficient value on Y05 is -0.032, which suggests that local Chinese banks, on average, cut prices by around 3.2% in 2005.

The coefficient on Y06-09, however is not significant, suggesting that, domestic banks did not cut prices post entry by the foreign banks.

Three control variables of *SIZ, ROA* and *STA* are positive and statistically significant, which suggests that, (1) large domestic banks charge high transaction and service fees to their clients or customers; (2) profitable banks charge high transaction and service fees; and (3) state-owned banks charge high transaction and service fees. The reason why large or state-owned banks can charge high transaction and service fees may be due to their reputation for high quality services.

The revised R-squared is 0.685.

5 DISCUSSION AND CONCLUSION

The results of this study indicate that entry had a significant effect on incumbents' pricing in the Chinese banking market. One industry-specific explanation for the effect of entry may be the previously relatively low rate of entry in the banking market due to entry barriers. Because entry was rare in the Chinese banking market, incumbent domestic banks, when faced with serious competition, were motivated to cut prices, i.e., transaction and service fees charged to clients, to protect their market share and salvage some monopolistic profits. However, this finding should be treated with caution as it was not robust to changes in the timing of its measurement, changes in the estimation approach, and changes in the sample.

There are, of course, limitations in this paper which need to be addressed. One concern with this study is that local banks may respond to entry with non-price strategies. For instance, incumbent banks may upgrade the quality of their services (e.g., shortening clients' waiting time) or provide more services at the same price. These non-price responses however, may tend to be cost increasing, leading to price increases (or reductions in margin). As a result, these non-price responses may cause a spurious, positive relationship between entry and price (Simon 2005). This may create a bias against finding a negative relationship between entry and price, thereby strengthening the results found in this paper.

Further more, there were arguments regarding the large abnormal profits earned by domestic banks in the recent years of 2010 and 2011, when there was also an observation of foreign banks shrunk in the Chinese banking market, which implies that domestic banks earned more profits when there were less competitions from foreign banks. Therefore, further researches may examine domestic banks' reactions to the withdrawal of foreign banks.

Entrepreneurship Between Creativity and Bureaucracy

METHODOLOGICAL APPROACH TO THE MANAGEMENT ENHANCEMENT IN SMALL INNOVATIVE COMPANIES BASED ON THE STUDY OF FEATURES OF THEIR BUSINESS MODELS

Ekaterina Aleshchenko
Novosibirsk State University, Russia
yttak@mail.ru

ABSTRACT

Innovations play increasingly crucial role in the economics of developed countries today. Entrepreneurship, inherently innovative and high-risk, is a key aspect in the innovation creation and diffusion. Most researchers agree to the fact that the development of the innovative business largely depends on the business model chosen by management since the successful commercialization of innovation and business growth are provided by two interrelated processes: technological innovations and business model change under which the economic logic of the company described in the terms of specific characteristics of criteria is understood. The correct choice of the business model is particularly important for small innovative companies that carry the highest risk of the initial stages of commercialization of innovations. Analyses of domestic and foreign literature in this field shows that the main objects of research are mechanisms of small innovative companies' creation while their development process is usually studied at the level of isolated case studies. The variety of innovations, specificity of their commercialization and, as a result, peculiarities in innovative business management causes the poor level of knowledge of small innovative companies. For this reason the issue of the development of a systematic approach to the study of economic logic of this kind of business as well as identification of possible strategies for small innovative enterprises is rather urgent. The author suggests a methodological approach combining four basic parameters found in the treatises of the majority of researches with criteria describing the activities of small innovative companies. It includes:

1) *Method for the identification and analyses of the business models of small innovative companies;*
2) *Classification of small innovative companies;*
3) *Description of their standard business models;*
4) *Matrix of possible strategies for small innovative companies and recommendations for its application for entrepreneurs.*

Keywords: *Business model, Entrepreneurship, Innovation, Small innovative companies, Strategy*

1 INTRODUCTION

Innovations play an increasingly crucial role in the economics of developed countries today. Entrepreneurship, inherently innovative and high-risk, is a key aspect in the innovation creation and diffusion. Most researchers agree to the fact that the development of the innovative business largely depends on the business model chosen by management since the successful commercialization of innovation and business growth are provided by two interrelated processes: technological innovations and business model change under which the economic logic of the company described in the terms of specific characteristics of criteria is understood.

The correct choice of the business model is particularly important for small innovative companies that carry the highest risk of the initial stages of innovation commercialization. Analysis of domestic and foreign literature in this field shows that the main objects of research are mechanisms of small innovative companies' creation while their development process is usually studied at the level of isolated case studies.

The variety of innovations, specificity of their commercialization and, as a result, peculiarities in innovative business management causes a poor level of knowledge of small innovative companies.

For this reason the issue of developing a systematic approach to the study of economic logic of this kind of business as well as identification of possible strategies for small innovative enterprises is rather urgent. It should be noted that there is lack of empirical research at this field, so the relevance and the need of such kind of study is obvious.

Fundamentals in the theory of innovative entrepreneurship were laid in the works of T. Schultz, W. J. Baumol, K. Menger, F. A. Hayek, and J. Schumpeter. Later various aspects of innovative enterprise were considered in the research of L. Abalkin, T. Davila, I. Dezhina, P. Drucker, A. Dynkin, V. Ivanova, F. Johansson, P. Kvintas, G. Kleiner, C. Christensen, J. Magretta, H. Mintzberg, M. Porter, B. Santo and many other academics whose works became the basis of the theoretical framework of this study. The accumulated experience of empirical studies of innovative entrepreneurship can be characterized by considerable heterogeneity and, consequently, by difficulty of the interpretation as it has no common base for comparative analyses which can become a business model concept.

Basis of the business model concept were formulated by A. Afuah, L. Bossidy, D. Debelak, M. Johnson, H. Kagermann, S. Cantrell, B. Katkalo, V. Kotelnikov, J. Lindrel, C. Markides, A. Osterwalder, J. Ricard, A. Slivotski, N. Strekalova, C. Tucci, G. Hamel, H. Chesbrough and others.

The proposed concepts and methods of research have limitations caused by the peculiarities of small innovative companies which give the draft to the research, defining its purpose and solving problems.

2   METHODOLOGICAL APPROACH TO THE STUDY OF BUSINESS MODELS OF SMALL INNOVATIVE COMPANIES

The analyses of the different approaches to the business model concept of researches showed the diversity of their views on the essence of the phenomenon. Thus some authors are more focused on creating value and defend business model as "a description that explains how companies work" trying to understand the nature of this process. For others, the business model is more related to the assignment of value, and therefore focuses on how to generate income and profit. Others offer a broader view of the business model which includes two aspects: creation as well as assignment of value. And, finally, the fourth consider a business model as a unit of analyses which covers the accumulation of potential value creation in the process of interaction between the company and its stakeholders.

In fact, despite the difference in emphasis all given interpretations of this concept are close enough which allows us to identify business model as the economic logic of the company described in the terms of specific characteristics of criteria. Review of a number of domestic

and foreign researches showed that four parameters are present at the approaches and methods of all authors: value for customer, revenue model, the key processes and resources (Table 1). The rest are determined by the specific character of the studied companies.

Table 1: Comparative analyses of the approaches to the business models research

Author of the approach	Business models' characteristics	The methods used	Peculiarities
Afuah and Tucci	*Value for customers*, market share, pricing, revenues, maintenance activities, performance, competence, stability	List of control questions	3 levels of analyses: incomes + profitability + qualitative parameters of business model
Chesbrough	The scale of investment to support business model. The degree of openness of the model	List of questions; 6 types of business model	Innovation process management and management of intellectual property
Johnson and others	*Customers' value of a product, profit formula, key processes and recourses*	Structure of analyses is suggested	3 general types of business models are identified with examples of industries
Debelak	Characteristics of clients, customer value for the company, *value for customers, profits from sale*, investment, attraction of new customers	Ranking of business model characteristics	Assessment of the business model condition
Lindrel and Cantrell	The need to change the business model	7 mechanisms of changes	Singular focus on changes
Osterwalder	*Key partners, key activities, offer advantages*, relationship with customer, customer segments, *key resources*, supply chains, cost structure, *incomes*	List of control questions	2 levels of analyses: TCC+ qualitative characteristics of business model
Authors' approach	position in the industry business system, *created value for customers, model of income generation*, types of innovation, *success factors and problem areas*	In-depth interview	Specificity of small innovative business; standard business models and strategies

In this regard, the limitations of existing methods for small innovative business were identified. The majority of them are caused by the complexity of determining the presence of basic characteristics of business models which are necessary for a certain method. The most important are the following:
- Owner / manager cannot always define how the company creates value for customers and as a result profits;
- Managers of small innovative companies usually do not know about the occupied share of the market, consumer segments and their characteristics;
- Architecture of such companies often has not yet developed, the business is largely dependent on stakeholders – the parent institution, the leader of the company, suppliers and customers.

The author suggests a methodological approach combining four basic parameters found in the treatises of the majority of researches with criteria describing the activities of small innovative companies. It includes:

1. Method for the identification and analyses of the business models of small innovative companies;
2. Classification of small innovative companies;
3. Description of their standard business models;
4. Matrix of possible strategies for small innovative companies and recommendations for its application for entrepreneurs.

3 METHOD OF ANALYSES OF BUSINESS MODEL CONSIDERING PECULIARITIES OF SMALL INNOVATIVE BUSINESS

The method of analyzing business models of small innovative companies is developed in the framework of systematic approach that provides an opportunity to return to any of its phases as more information occurs (Figure 1).

Figure 1: Scheme of the analysis method of a business model

4 CLASSIFICATION OF SMALL INNOVATIVE COMPANIES ON THE BASIS OF EXERCISED BUSINESS MODEL

A major limitation of the most of the considered methods of classification with a respect to small innovative companies (classification of the European Commission in 2003, typology by K. Pavitt, J. Tidd and J. Bessant, types of competitive strategies by L. Romensky etc.) is their unspecialized nature, not taking into account peculiarities of SME. Proposed approach to classification is based on the factors that determine peculiarities of companies' business model: degree of interaction with consumer and diversified applications of the product. The last can be understood as characteristic of a position of a company in an industry business system, and the second factor – the degree of interaction with consumer – allows taking into consideration such characteristics of the company as innovation and "commodity maturity" of the companies' offer (Figure 2).

**Entrepreneurship Between Creativity and Bureaucracy**

Figure 2: Classification of small innovative companies

The study identifies four groups of companies whose characteristics are given in Table 2.

Table 2: Characteristics of small innovative companies

First group (6,7 %)	Second group (30 %)	Third group (30 %)	Fourth group (33,3 %)
Project integrator	Specialized high-tech supplier	Specialized supplier	Prick manufacturer
Virtual structures Project factory / shell company Work in any market. Owner of the rights to intellectual property Not involved in promoting. Flexibility and territorial proximity to customers. Incremental and partly radical innovations	Leaders in their sphere. The significant role of intellectual property and links with the scientific community. Orientation to the worlds' markets. General purpose technologies. Solutions to the specific needs of clients from high technology industries. Part-time employees/ commercialization of state research centers innovations	Solutions do not lead to a change into consumers' technological paradigm but contribute to the efficiency of their business Proposal is determined by application tasks of the consumers. Orientation on import substitution. Reputation is significant Incremental innovations. «Niche» inhabitants.	Offer products to a wide market. Prick product. The need for product already exists but the market has not yet formed Significant role of distribution networks, operating efficiency of the business. Marketing and organizational innovations. Finished integral product.

The first group includes two types of structures: project factory – the company that accumulates a pool of ideas and grows them up into itself; and the shell company that transmits part of its business functions to outsourced contractors.

Companies included into the second group are leaders in their field. Intellectual property, liaisons with the scientific community and focusing on the global markets are significant for them. Companies of this group produce products with the use of general purpose technologies.

The key differences of the companies of the third group are that solutions proposed by them do not lead to a change into consumers' technological paradigm but contribute to the efficiency of their business. Their proposal is determined by application tasks of the consumers.

The companies of the fourth group offer products to a wide market. As usual it's a prick product, the need for which already exists but the market has not yet formed.

5   STANDARD BUSINESS MODELS OF SMALL INNOVATIVE COMPANIES

The proposed classification allowed distinguishing standard business models for each group of companies.

A peculiar type of business model inherent to a group of companies described by terms of a certain key indicators is understood by "standard model" in the research. As such important indicators for the companies' business model are considered: position in the industry business system, created value for customers, model of income generation, types of innovation, success factors and problem areas (Table 3). Detailed characteristics listed in the Table 3 are given in the thesis and publications of the author.

For example, a "prick manufacturer" model is executed by ten companies (30% of respondents). These are companies that work not only in segment of B2C, but also in the segment of B2B. These small innovative companies offer finished product to the market, the demand for which already exists but the market is not yet formed.

The most important characteristic of consumer product value of these companies is impact point accuracy: how well it fits exact consumer need. The position of such companies in the industry business system cannot definitely be determined; it can be anything – from the complete cycle companies with progressive marketing functions transfer to partners to patent / know-how owners with the highest outsourcing of all processes. A key feature of the implementation of their activities is the scale of production with a constant expansion of the range of manufactured goods and instant cost management.

Supply chains and work with consumers play crucial role for them. Dealer, as usual, is a company – a major player in the related market with recognized brand.

The most of these companies have complete finished product which can form a market segment. The majority of companies with such business model are newcomers. They have recently been on the market, but some of them have been able to overcome the "valley of death" and find their customers. Others are in the early stages of their development addressing organizational and market challenges. The numbers of employees in them vary from 3 to 200. They usually have their own resource base and R&D department. These companies carry out most organizational and marketing innovations.

Table 3: Standard business models of small innovative companies

Business model key features	Business model type			
	Project integrator	Specialized high-tech supplier	Specialized supplier	Prick manufacturer
Position in the industries business system	Diverse	Specialized supplier for various industries	Supplier for traditional industries	Diverse
Created value for customers	Complex solutions of the unique problems	High innovation	Increase in efficiency	Rational / marketing
Model of income generation	Diversification of supply	Export orientation	Import substitution	Operating efficiency
Types of innovations	Proactive innovation (push)	Proactive innovation (push)	Custom innovation (pull)	Mixed type of innovation (pull/push)
Success factors	Flexibility and mobility in decision-making, *territorial proximity to the consumer*, special competence	*Close relationship with science*, flexibility, complex solutions, high reputation	Expertise in narrow field, *the ability to adopt them to a peculiar customer*, customer service	Meet customer needs *more effectively* than competitors
Problem areas	Excessive dependence on the external environment and the willingness of the consumers to change	Excessive dependence on the leader	Encumber by assets, companies shift to production type	The need to establish *sales channels*

6 MATRIX OF POSSIBLE STRATEGIES FOR SMALL INNOVATIVE COMPANIES AND RECOMMENDATIONS FOR ITS APPLICATION FOR ENTREPRENEURS

Analyses of collected empirical data supplemented by theoretical concepts allowed forming a matrix of possible strategies of small innovative companies (Table 4).

Quadrant I – possible strategies: assignment of rights to intellectual property to consumer or realization of the product with the ability to create a legal entity.

Quadrant II – possible strategies: comprehensive product +1 strategy, bowling strategy (in the terminology of G. Moor). Identifying new areas of application of the product company creates subsidiaries. Future scenarios: the creation of partnership with global corporations or transformation to engineering firm.

Quadrant III – possible strategies: protection of its own market niche or bowling strategy with preservation of focus on the consumers from traditional industries. As the company grows the possible strategy is establishment of subsidiaries in order to stay in the small business category.

Table 4: Matrix of possible strategies of small innovative companies

Sphere of product application	Degree of interaction with consumer	
	High	Low
Wide	**I. Project integrator** *Strategy:* project implementation, assignment of rights	**II. Specialized high-tech supplier** *Strategy:* comprehensive product +1, creation of subsidiaries, bowling strategy
Narrow	**III. Specialized supplier** *Strategy:* niche strategy, creation of subsidiaries, bowling strategy	**IV. Prick manufacturer** *Strategy:* variety of strategies with a focus on business development and increasing of efficiency

Quadrant IV – possible strategies: diverse but focused on business development and increasing of effectiveness. A certain strategy depends on the type of the market company operates, the duration of companies' existence as well as on non-market factors.

Positive testing of the proposed methodology on the case studies of small innovative companies from other regions is presented in Table 5.

Table 5: Positive testing of the method of analyses of business models

company №	Product	Sphere of application	Strategy	
			Type	Description
1	Probe microscopes, atomic scale	Science, medicine	II	Expensive high-tech product; strategy is an investor attraction to expand production, subsidiary establishment
2	Device for control of metal quality	Metallurgy	III	Innovation increases the efficiency of a client; strategy is to occupy its' own niche, capture of related niches
3	Drug marker	Medicine	IV	Has its' own niche, production is on outsourcing, distribution is given to huge distributor; strategy – diversification
4	Antifoam device	Food processing industry	III	Innovation improves the efficiency of the client; strategy is to occupy its own niche
5	iPad Apps	IT	II	The product complements famous brand; global cooperation is the strategy
6	Cure for schizophrenia	Medicine	IV	Own niche is found

7   CONSLUSION
In this paper the first step toward the systematic study of business models of small innovative companies' was made. Methodological approach to the study of business models was suggested that can be used as guidance on business model identification and its further modification in order to improve management system and develop adequate leaders' competences as every day more and more challenges appear.

Variety of business models chosen by small innovative companies' management provides movement, change and development of the national innovation system, combining science and industry, translating scientific achievements in popular consumer goods and services,

increasing productive potential of society. The work that has been done is only the beginning of the systematic study of these interesting processes as it raises more questions than it answers and provides a foundation for further work on the question on how the company successfully performs in the changing environment.

Entrepreneurship Between Creativity and Bureaucracy

SMALL AND MEDIUM ENTERPRISES (SMEs) DEVELOPMENT AND POVERTY ALLEVIATION IN DEVELOPING COUNTRIES: EVIDENCE FROM EKITI STATE, NIGERIA

Ebenezer Kayode Bowale
Adekunle ajasin university, Akungba-akoko, Ondo state, Nigeria
kayobowale@yahoo.co.uk

ABSTRACT
The focus of the study is to investigate the role of small and medium enterprises (SMEs) in poverty alleviation in Ekiti state, Nigeria. Specifically, the study analysed the characteristics of SMEs in Ekiti State and then examined the socioeconomic factors influencing the capacity of SMEs to alleviate poverty. There are two reasons for this focus. First, the existing studies concentrated on aggregate effects of SMEs on poverty alleviation with little attention on individual traits of the firms in developing economies. Second, the existing studies failed to examine the underlying factors that could explain any weak relationship between small and medium scale enterprises development and poverty alleviation especially in developing economies. A systematic random sampling technique was used to select 75 respondents and structured questionnaire administered on them to collect relevant data used. The data were analyzed using descriptive statistics and probit regression. The results showed that majority(72%) of surveyed businesses were microenterprises employing less than 10 workers while only 21% and 7% of the respondents engaged in small scale and medium scale enterprises, employing between 10-50 and 51-250 workers respectively. The results also showed that business size, nature of business and source of capital were the major factors determining both income and employment generation potentials of the small and medium enterprises. Finally the results showed that income from business was the most significant determinant (p<0.01) of per capita consumption of the SMEs owners in the study area. The study therefore concluded that SMEs in Ekiti State, Nigeria had contributed to poverty alleviation through income generation and job creation.

Keywords: *Ekiti state, Poverty alleviation, Small and medium enterprises*

1 INTRODUCTION

Poverty has been one of the key economic problems facing the African continent in general and the Nigerian economy since independence. Since early 1990s, in Nigeria, there has been a decisive shift from the capital intensive large-scale industrial policy. The promotion and development of small and medium enterprises as a channel to poverty reduction is perceived as pertinent given the large geographical spread of poverty across ethnicities, large unskilled and unemployed rural and urban labour force and limited supply of capital. Most small and medium enterprises utilize local raw materials. In this regard SMEs are viewed as a subsector that creates substantial employment opportunity as they are relatively labour intensive and also employ more people per unit of investment when compared with large firms. Thus a given amount of capital will create more jobs, if it is spread over a large number of SMEs than if it focuses on few large firms. Discussions on development policy are paying increasing attention to the issues of how to reduce poverty, encourage economic empowerment of the citizen and growth through various reforms and developmental programs. This has brought a renewed focus from the macro perspectives of tackling poverty to micro-perspectives through the promotion of SMEs from both the government and the private sector.

Government at various levels has long recognized the need to promote the development of SMEs in order to reduce poverty; stimulate employment; mobilize local resources; reduce migration from rural to urban area and disperse industrial enterprise more evenly across the country. This prompted the establishment of various policy reforms and programmes in both state and federal levels of government. Unfortunately the impact of all existing credit schemes in providing funds for meaningful and sustained development among the SMEs had hardly been noticeable. The question still remains as to whether the development of the SMEs has reduced poverty and enhanced economic growth.

Notwithstanding the intense debate in both academic and policy making circles about the relationship between SMEs, economic growth and poverty reduction, much of the views about the links are void of any careful empirical analysis. Understanding characteristics and impact of small businesses on local economy is crucial in designing specific and appropriate development policies. Many researchers have made many attempts to establish statistical nexus between poverty rates and overall microeconomic performance on the basis of aggregate time series data. Some of these studies have produced results that rejected the view that small businesses are the engines of employment creation and economic growth (Rosenzweig, 1988). Most of these studies are cross-country specific whereas the experience of each country is not the same. In addition, different countries have priorities among competing policy goals .The absence of comparable international data on SMEs has hampered cross-country analysis of SMEs and poverty alleviation as countries are different in many respects.

Therefore, the broad objective of this study is to assess the role of SMEs in reducing incidence and prevalence of poverty among the people of Ekiti State, Nigeria. Specifically, the study analyses the types and forms of SMEs, and examines the factors influencing the capacity of the SMEs to alleviate poverty with a view to assessing the relative contribution of SMEs ownership to poverty reduction in the study area.

2   LITERATURE REVIEW

Literature is replete with different ways of classifying SMEs. Researchers such as Akerele (2000) classified SMEs as formal and informal SMEs, rural and high technology and knowledge driven small scale enterprises. SMEs in the informal sector are difficult to control as they fall outside the modern or formal sector of the economy. In most cases, these informal SMEs are based on indigenous technology e.g dyeing, pot making and brick making. However they contribute job creation. Many of these enterprises usually make use of simple and crude method of production (Dutta, 2005). Those SMEs in the formal sector are usually registered under the statutory company laws.Another classification of SMEs is the rural based SMEs. It is not actually easy to define the term rural SMEs. Some scholars are of the opinion that rural SMEs are those in cottage industry. Islam (1987) believes that the manufacturing enterprises using modern technology can also be so regarded. Some believe that rural enterprises must necessarily have a direct relationship with agriculture. It is important to know that diversifying rural economy through promotion of small business would amount to rural industrialization.Classification can also be viewed from the angle of the size of business. The United Nations Development Programme in its study UNDP (1988) defines micro enterprise as business engaging one to four employees while small enterprises are those with 5 to 25 employees. Others have classified those enterprises engaging 1 to 9 employees as micro enterprises and those engaging 10 to 49 as small enterprises while those engaging 50 to 300 employees as medium enterprises (CBN, 2005).We have adopted this classification in our

Entrepreneurship Between Creativity and Bureaucracy

study. The importance of identifying various classes of SMEs is to enable policy formulator to know the types of enterprises that could generate sustainable growth.

In spite of various opinions on the classification of SMEs, there are common characteristics of SMEs. These include the lack of capital,lack of managerial skill,crude technology and labour intensive (World Bank, 2005).

Over the years there has not been a consensus on the definition of poverty due to its multidimensional nature. However, appreciable efforts have been made to provide operational definitions of the concept. Aku et al., (1997), Sen (1981), Soludo (2004) define poverty as a condition of low consumption. Others have adopted broader definitions such as inability to meet basic material needs which include food, water, clothing, shelter, education, health as well as environmental requirement, such as air, serenity and basic non-material needs such as political and community participation, identity, dignity etc (Ajakaiye, 2001). In literature of poverty less attention has been paid to strategy of using small business development to alleviate poverty.

The definition of poverty in terms of subsistence level of living has given rise to the concept of absolute poverty which has been defined as lack of sufficient income or earnings to obtain the minimum necessities of life (Akinlo, 2004) and Ogwumike (2001). The concept of absolute poverty has received a lot of criticisms. It appears only expenditure relating to those basic necessities of life would be considered. For instance, one may have enough money but divert it to non-basic needs. Another problem of absolute poverty is difficulty in determining the necessary minimum standards for subsistence living which will form the basis of identifying the poor from the non-poor.Absolute poverty also ignores the influence of socio-cultural factors. Poverty should in addition to lack of sufficient income to meet basic needs but also all other aspects of individuals related to marginalization, vulnerability, powerlessness. Owing to the weaknesses of absolute poverty, the concept of relative poverty arose. Relative poverty has been viewed as a situation where individual income overtime fell short of the average income of the average in the society in which they live. The relative poverty may be as a result of unbalanced distribution of resources. The problem with concept of relative poverty is that it lacks a scientific basis for determining the lowest limit to which the average income of the household should fall to become relatively poor.

 The problem associated with both the absolute poverty and relative poverty is that the two concepts focus mainly on economic resources. This has led to failure of policies and programme in most developing countries as attention is usually concentrated on economic issues of poverty at the neglect of other socio-cultural and political issues.

In order to develop a more robust concept of poverty, Ajakaiye, (1989) was of the opinion that a review of theory of human need would be important. He supported the theory of human needs would be important. He supported the theory of human needs. The theory states that basic human needs should be able to establish links among individual needs, the achievement of goals and social institution in addition to the framework of Maslow hierarchy of needs. Ajakaiye (1998) therefore looks at poverty concept to include in addition to economic factors, enabling socio-cultural and political system which will eliminate weaknesses of the instant perpetrating poverty.

United Nations Development Programme (UNDP, 2005) introduced another dimension of poverty-human poverty. UNDP (1997) classified poverty into two aspects namely income poverty and human poverty. The income poverty comprises both absolute/extreme poverty and overall/relative poverty. These are based on economic and basic needs perspective but the concept of human poverty focuses on what individuals have or do not have. This study looked at both the economic and non-economic aspects of poverty.

Literature is replete with poverty issues and SMEs development. Gebremariam (2004) examines the roles of small businesses in economic growth and poverty alleviation in West Virginia. In OLS and 2SLS regression analysis a positive relationship exists between small business and economic growth. A strong inverse relationship also exists between the incidence of poverty and small business and economic growth. Thus, the empirical result establishes the linkage between small business, economic growth and the incidence of poverty. But this study does not show systematic relationship between net job creation and firm size and the data used are state- specific.Small and Medium Enterprises (SMEs) have also been believed to be important in supporting economic development within a country (e.g.; CDASED, 1999). One of the important roles of SMEs in this context includes poverty alleviation through job creation. They find a strong, positive association between the size of the SME sector and the rate of economic growth. But, they do not find that SMEs cause growth. Furthermore, the comparisons do not indicate that SMEs exert a particularly beneficial impact on poverty or income distribution. Agupusi (2007) assessed the role of the small business sector in poverty alleviation in Alexandra and to examine both government and private sector initiatives for supporting small business development for poverty alleviation. It is observed that small businesses are not playing the expected role due to number of constraints including a lack of policy that deals adequately with the semi-formal and informal business sectors, the predominant sectors in Alexandra. There is also a shortage of small business development agencies that would help in developing a culture of entrepreneurship and business management skills. The overall finding indicates that with positive interaction between development agencies, and small businesses in Alexandra, predominantly informal and semi-formal SMMEs in Alexandra could not only alleviate poverty but could also contribute to the general transformation process.

In Nigeria, most of the studies on SMEs and poverty have concentrated on the aggregate effects of SMEs sub sector on poverty reduction and economic growth. The studies failed to look at the roles of different types of small business. Okpara (2011) carried out a study on the factors affecting small businesses in Nigeria The study focused on the aggregate effects without taking into consideration different classes and nature of enterprises. Most previous studies ignored the fact that micro, small and medium have different features which could affect their respective roles in economic growth and poverty alleviation, hence this study.

3 THEORETICAL FRAMEWORK
The Keynesian theory of income determination in a closed economy is used to model the relationship between SMEs development and poverty alleviation. The theory attempts to explain how the level of income and output is determined in a capitalist economy.

Given some assumptions the equilibrium level of income can be determined by the equality of aggregate demand and aggregate supply or by equality of savings and investment. It is shown by the following identities:
$Y \equiv C + I$. …………………………………………………………3.1

Disposable personal income $Y_d \equiv C+S$. …………………………...3.2
But $Y \equiv Y_d$ …………………………..……………………………3.3
and
Therefore $C+I \equiv C+S$ or $I=S$…………………………………...3.4

Based on this framework, SMEs role in poverty alleviation is model developed in line with a model developed by Asia Development Bank (2005). The model assumed that consumption expenditure can serve as proxy for poverty against which we regressed with certain respondents' socio-economic variables. This specification followed Adeyeye (2003). Consumption assumed to be inversely related to poverty. Any parameter that will increase consumption will alleviate poverty. Thus, the model included those variables that impact upon consumption of respondents in the study area. Most of the explanatory variables are derived from the consumption function. The Keynesian theory in macroeconomics known as the Absolute Income hypothesis implied that current real disposable income is the most important determinant of consumption in the short run (Riley, 1999).Disposable Income (Y_d) = gross income − (deductions from direct taxation + benefits). The standard Keynesian function is written as follows:
$C=a+c \ Y_d$…………………………………………….3.5

Where, C= Consumers Expenditure a= Autonomous consumption. This is the level of consumption that would take place even if income was zero. If an individual's income fell to zero some of his existing spending could be sustained by using savings. This is also known as dis-saving. Short-run studies of the consumption function suggest that a is positive. The c is called the marginal propensity to consume (MPC). This is the change in consumption resulting from a small change in income (MPC = dC/dY). Simply, it is the percentage of each additional naira earned that will be spent.

4 RESEARCH METHODOLOGY

4.1 Study Area
Ekiti State is situated entirely within the tropics. It is located between longitudes $4^0 \ 5^1$ and $5^0 \ 45^1$ East of the Greenwich meridian and latitudes $7^0 \ 15^1$ and $8^0 \ 5^1$ north of the Equator. It lies south of Kwara and Kogi State, East of Osun State and bounded by Ondo State in the East and in the south. Ekiti State has 16 Local Government Councils. The 2006 population census by the National Population Commission put the population of Ekiti State at 2,384,212 people with the capital located at Ado-Ekiti.An important feature of the state is the large number of hills it possesses, which are often the site of towns in which much of the population resides. In fact, the word 'Ekiti' was derived from the local term for hill.The state was chosen because it is one of the least developed states in the country with sizeable number of micro and small firms.The state is a true representation of emerging economy where we have large unemployed rural and urban labour force.

4.2 Population, Sampling Procedure and Size
The target population is all registered small and medium scale businesses in Ekiti State, Nigeria. The number of questionnaires administered was based on the number of SMEs that were identified in the local governments selected for the survey. Such SMEs in each local government was first identified and 50 percent of SMEs in each Local Governments were sampled using systematic random sampling procedure.

The sample size adopted for the questionnaires was 75. These constitute 6% of the entire sample frame. The sample size is adjudged suitable and adequate especially since the sample frame is relatively small.

4.3 Methods of Data Collection

The questionnaires have five sections with socio-demographic profile in section A, Businesses Characteristics of the SMEs in Section B, Information on changes in income generation and consumption patterns as measures of poverty incidences among the SMEs Owners in Section C, Contribution of SMEs to Poverty Reduction in Section D, factors influencing of SMEs capacity to generate income and create jobs in Section E. The data collected are analysed using appropriate descriptive statistics and inferential techniques.

The sampling frame for the survey consists of SMEs which employ not more than 10 for micro, between 10–50 people for small firms and between 51–250 for medium firms. Since not all the SMEs are formally registered with government and even trade associations, the population size cannot be exactly pre-determined. The sample SMEs are selected based on the following criteria:

(i) SMEs employing between ten to 50 people is considered as Small Scale Enterprise (SSEs) while Firms employing not more than 250 full –time employees is considered as Medium Scale Enterprise (MEs).Enterprises employing less than 10 people are micros. This criterion was in line with methods adopted by other studies in the literature (such as Al-ashi (1990) who carried out a research on small businesses performance.

(ii) Access to the business profiles of these SSEs (name, address, ownership details, type of business, employment data and date of formation were readily available). These profiles would facilitate the process of identifying and selecting the appropriate sample SMEs. Firms are privately owned by their management who have all decision-making rights.

To ensure that the SMEs selected were evenly distributed and all facets of SMEs were included, five local governments with the highest concentration of SMEs were identified and selected.

4.4 Variables description

The questionnaires were used to collect data on two sets of variables. The first sets of variables were used to assess the role of small scale businesses in poverty alleviation, some core variables were examined. These variables were: Entrepreneurs' sources of disposable income (ranked according to importance), Income generation in terms of profit margins, according to income generation in term of salaries and wages and employment generation. Respondents were asked to estimate their monthly revenues and costs, from which their profit margins are calculated. The guiding principles for this part of the analysis are the levels of income that are perceived by respondents to be poverty reducing. The second sets of variables were used to analyse the critical factors influencing the ability of Small Scale business to contribute to poverty reduction and alleviation. The critical factors identified include owner's sex, education, motivation, for starting their businesses, activities undertaken before establishing their current business, sources of initial capital, and technology being used.

4.5 Analytical Technique

The role of small and medium businesses in poverty alleviation was analyzed using descriptive statistics and econometric techniques such as regressions.

4.6   Model specification

The analysis of the constraints to capacity of SMEs to alleviate poverty was examined by estimating a Probit model. The model regresses with the probability of whether SMEs is able to alleviate poverty on a set of both economic and non economic factors. These model variables have been identified as growth determinants of firms (and thus determinants of employment growth). These include the characteristics of business owners such as ownership structure, level of education, activities undertaken before establishing their current business, motivation for starting businesses, sources of initial capital, and the types of technology used.

Theoretically, the explanatory variables in the model are expected to affect the output of small and medium scale enterprises. In addition to these variables, studies on SMEs generally, especially those that used primary data, had added several other variables to the models. Such variables are Business size, Owner/manager's age, Owner/manager's training, and Sources of funds. Probit regression was used to develop the predictive models for whether performance improves or not. The probit model is a simple approximation to other probability model. The probit model is known to produce statistically sound results. The model is also known to produce results that can be easily interpreted and the method is simple to analyse in economics applications. Furthermore probits model is one of the most popular binary response model used in empirical analysis. The probit model for this study is specified as follows:

$$y = \alpha_0 + \alpha_1 x_1 + \alpha_2 x_2 + \alpha_3 x_3 + \alpha_4 x_4 + \alpha_5 x_5 + \alpha_6 x_6 + \alpha_7 x_7 + \alpha_8 x_8 + \alpha_9 9 + e_1 \dots 3.1$$

In a more compact form, equation (3.1) can be re-written as

$$y_i = \sum_i^n \alpha_i x_i + e_i \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots 3.2$$

Where:
y_i = Poverty measures (profit, tuurover, owner,s satisfaction,). If the probability of making profit is high, 1 and otherwise, 0.
x_1 = Age (years); 1 for above 5 years and 0 for otherwise
x_2 = Gender; 1 for male and 0 for female
x_3 = Education; 1 for post secondary and 0 for otherwise
x_4 = Source of start up capital (N); 1 for personal and 0 for otherwise
x_5= Sources of raw material; 1 for local and 0 for imported
x_6 = Business size; 1 for micro and 0 for otherwise
x_7 = Business Registration; 1 for registered and 0 for otherwise
x_8 = Nature of factor Intensity, 1 for Labour intensive, 0, otherwise
x_9 = Nature of Business, 1 for trading, 0, otherwise
α_0= Constant (A);
α_i = Regression Coefficients;
e_i = Error term.

5   RESULTS AND DISCUSSION

5.1   Characteristics of SMEs

5.1.1   Nature of Business

By nature of business, five major business lines were predominant in Ekiti state. These are agro-allied business, trading, light manufacturing, transports and Vocational and professional service providers. Among these five lines of business, trading is the most common form of

business that the SMEs engaged in (39%)). This is followed by Light Manufacturing, (22%) and Vocational and professional services providers (20%). The least is transport business while a substantial proportion (17%) also engaged in agro-allied business. The low proportion of transport business was because most of the transport owners do not consider themselves as part of the trade association. They have their Union -National Union of Road Transport Workers (NURTW), which was not the focus of this research. Expectedly, the trading business remained the dominant business. This is a reflection of the Nigerian economy that is more of consumer state

5.1.2 The size of Business

The SMEs were also classified into three, according to the number of the employees. Those SMEs with less than 10 workers are regarded as microenterprises, those with not more than 50 workers are the small scale enterprises and the SMEs with above 50 workers but below 250 are called the medium enterprises. The findings showed that the majority (75%) of SMEs operation were microenterprises with less than 10 workers. The proportion of the small scale business is (19%) while medium scale was only (6%). There are two reasons for such a pattern, the cost of establishing the bigger business may be enormous and out of reach of most of the potential owners. Secondly, the high incidence of poverty among the peoples had hindered their ability to engage in large scale business enterprises.

5.1.3 Ownership Structure

The distribution of respondents by the ownership structure shows that the bulk of the enterprise (73%) is one- man business. Twelve percent of the SMEs businesses were family joint business while (11%) are owned by different people who are not from the same family. Four percent of the respondents claimed that their businesses were owned by friends.

5.1.4 Year of Operation

It is a generally held view in the literature that most SMEs collapse within five years of establishment. This proposition was also factored into the information collected from the respondents by asking for the years of establishment of their businesses. Most of the businesses 63% were established within the last five years. Twenty-two percent of the SMEs were established within the last ten years while only 15% had been in operation for more than 10 years. Though, it could be said that the proportion of business that fall below five years are higher, the fact that a sizeable number of the businesses are older than five years implies that the survival rate of the SMEs business in the Southwestern part of Nigeria is high and improving. The distribution pattern also shows that two out of every five SMEs in the southwestern will survive more than five years and at least two of every ten survive above ten years.

5.2 Economic Profile of SMEs in Ekiti State, Nigeria

The SMEs ability to generate income and employment thereby contributing to reduction in poverty level and incidence as well as its prevalence depends on the performance of the SMEs in terms of income, employment, sales, profitability and growth potential. To determine these parameters and then juxtapose them with the indicators of poverty reduction, this section explores some of the possible sources of the strength of SMEs to generate income and employment. These factors are divided into two categories: Those factors that relate to the sources of input and material that are used in the production of goods by the SMEs while those that relate to the changes in sales and profitability of the business. These two sets of

factors determine SMEs performance. The SMEs owners who were the respondents in this survey were asked to respond to questions relating to these issues.

5.2.1 Changes in the Well Being of the SMEs Owners

As the majority of small businesses owners were not involved in other income-generating activities, the estimated profit margins represent a better proxy for the disposable income of surveyed entrepreneurs. The respondents were also requested to comment on their profitability trend since the start of their businesses up the time of interview. On the average all the SMEs had an average profit of N60, 000 per month, however, the Medium scale business still remained the most profitable followed by the Small and Micros. This implies that size of the SMEs enhances the profitability potential of businesses.

 The lower profits for Micros were attributed to the lower scale of their business operations as evidenced by low investment capital (the majority of respondents, as discussed earlier), established small businesses due to a lack of other employment opportunities. The overall average profit margin for all the SMEs was estimated at Naira 60,000 per month, which was higher than the average salary in the manufacturing industry which stood atN40,750. The results conform to the occupational choices models, which describe how individuals decide to become entrepreneurs by comparing the wage they can earn from other employment with the entrepreneurial rent they can obtain by managing their own businesses. Opting for alternative self employment will lead to a high probability of earning more than maximum salary in the labour market given that the majority of entrepreneurs even have higher educational qualification. Two observations can be made here on the role of small business on poverty alleviation. The majority of surveyed businesses generated income above poverty lines; and most of the owners were not engaged in other income generating activities. In view of these findings, removing obstacles that limit vertical growth may be more poverty alleviating than policy initiative that emphasize horizontal growth which focuses on high number of the new firms springing up on regular basis. Vertical growth focuses on the survival of existing firms and emphases the growth in size.

5.2.2 Profitability Trends relative to Employment Growth

Entrepreneurs were then asked to comment on their business profit trends' from when the business started to the time of the interview.. The results indicate that 50% of respondents generated more profit over time, with no major differences in findings based on the firm's size. However, small enterprises (22%) indicated no change in profitability compared to (19%) of Micro enterprises. To determine the relationship between profit trends and employment growth, profitability trends were cross-tabulated with data on employment growth. The analysis also showed that, income from small businesses contributes to poverty alleviation. In this case, the hypothesis that small businesses have a role to play in poverty alleviation is accepted. Furthermore, the capability of small businesses to generate employment opportunities is high. In addition, a substantial proportion of firms which started as micros had managed to graduate to SSEs.

5.3 Empirical Results to Determine the Contribution of SMEs to Poverty Alleviation

The variables in the poverty models for Micro enterprises, Small scale enterprise, medium enterprises and the pooled results respectively explained 56%, 53%, 52% and 75% per cent of the variability in poverty among each category. Four variables were significant in microenterprises and small scale enterprises while only two were significant in medium scale enterprises and seven variables in the pooled models respectively. The four variables that

were significant in the microenterprise were Age of the business, educational experience of the business owner, Income of business owner and location of the firm. The variables had positive coefficient and conform to theoretical expectations. The positive coefficient of age of business in the study (0.144) showed that the longer the business survives the more the business contribute to generated income and increase the consumption of the owner and therefore reduce the poverty severity and depth among the business owners. Educational experience is also an important factor in the living standard of the people, the more educated the business owner the more they are able to handle the business better and the more they are able to generate profit and increase their consumption and hence improve their welfare.

Table 1: Alleviation Model for SMEs Contribution to Poverty (Own Computation)

Variable	Micros Model	SSEs Model	MEs Model	Pooled Model
Constant	0.801(2.358)	1.476(4.06)	4.317(4.400)	1.564(5.497)

Age of Owner	-0.003(-0.40)	-0.205(-2.79)	0.038(0.306)	-0.024(-0.209)
Amount of Loan	-0.070(-0.925)	0.025(0.330)	-0.204(1.257)	0.218(2.242)
Asset Indices	0.039(0.574)	0.033(0.330)	-0.143(-1.072)	0.327(3.150)
Capital Invested	0.127(1.503)	0.140(1.652)	-0.275(-1.478)	-0.364(-2.866)
Educational level	0.182(2.688)	-0.038(-0.417)	0.383(3.808)	-0.063(-0.539)
Gender	-0.009(0.127)	0.433(4.343)	0.098(0.782)	0.065(0.600)
Income generated	0.411(6.110)	0.259(2.724)	0.312(2.290)	0.301(2.884)
Location of Firm	0.103(1.757)	-0.166(-2.203)	-0.065(-0.745)	-0.221(-1.980)
Poverty dummy	-0.014(-0.198)	-0.092(-1.129)	-0.481(-1.615)	-0.303(-2.855)
Social cultural	-0023(-0.376)	0.024(0.276)	0.076(0.350)	-0.149(-1.408)
Staff strength	0.013(0.219)	-0.031(-0.361)	-0.120(-0.966)	0.550(4.911)
Size of Business	-	-	-	-0.013(-0.132)
Adjusted R^2	0.564	0.527	0.523	0.749
F-value	8.339(0.0000)	9.191(0.000)	3.109(0.001)	5.610(0.000)

Figure in parenthesis are t-values

The poverty model for the medium scale enterprise performed fairly low. Only two variables were significant and these variables are Education and Income. However, the marginal propensity to consume is 30% which is within the value of other categories of the SMES. The

poverty model for the pooled data had seven significant variables. These were Loan acquired, capital invested, location of the firms, income, Poverty dummy and staff strength. Only capital invested and location were negative and did not conform to theoretical expectation. The negative values of location of the businesses suggested that big firms located in the rural areas perform better than small firms.

The marginal propensity to consume was 0.3 which is to say that an average small business owners in the area will spend 30kobo of every naira earned on consumption. It is important to note that capital invested was negative and highly significant. Thus, committing more resources to investment reduces the amount of money spent on consumption. Such investment stresses the per capita income of respondents and increase their poverty especially where such fund invested are taken from money to be used for meeting up with the daily upkeep of the family. Assets by the business owners were positive and highly significant. This implies that increase in asset index score of any respondent will increase consumption. Poverty alleviation programme in the area could aim at increasing the productive asset of the people. The dummy representing poverty dummy was positive and significant. It shows that poverty alleviation efforts of various governmental and non-governmental organizations in the area were in the right direction.

5.4 Socio-Economic Factors Influencing the Contribution of Small Scale Businesses to Poverty Alleviation

The contribution of small businesses in term of profit margin can be influenced by a number of critical factors. Some of such factors influencing profit margin were identified. The factors identified and examined in the study include the business owner's sex, education, motivations for starting their businesses, sources of initial capital and technology used. Recent empirical studies on small businesses have incorporated a gender perspective through identification of certain gender specific traits of entrepreneurs. Gender factors not only affect the performance of small businesses, but also influence the choice of business opportunities. When asked about their perceptions on the performance of their business ventures, 56% of male entrepreneurs indicated that their businesses had been more profitable, compared to only 45% of the female entrepreneurs. These results imply that male-owned enterprises possess higher potential for the profit generation compared to female-owned businesses.

5.5 Regression Analysis of Socio-Economic Factors Influencing SMEs Capacity in Poverty Alleviation

In this section, probit regression model was specified to analyze the possible factors that may influence SME's potential to alleviate poverty. The results for both Income and employment generation are presented in Table 2. The variables used were as defined in chapter three under the methodology and the definition of the symbols is provided under Table 2.

The findings showed that Age of the business has negative and insignificant effect on the capacity of the SMEs to generate income. The drive to success is higher in new entrepreneur and they are ready to do everything possible to promote the business than market pricing, aggressive marketing, after sales services and many others. The urge to create their own set of customers and to also be a big player in the market makes them to want to achieve greater performance. As they also become contented with their new status and business owners and they have moved from poor to relatively rich, the urge slows down and the ability to drive the business reduces and profit and income fall to an average level. Also the fact that most of the

business owners were either unemployed, retrenched, retired or had no stable source of income made them to be more aggressive than the existing business owners.

However, the results of estimation of employment generation show that age of the business is positive and significant. This is in line with a prior theoretical expectation. The result shows that the older the age of the business the higher the number of jobs and employment it will generate. Theoretically, there is a level of employment at which diseconomies of scale set in. At this stage, addition to employment of labour to fixed capital equipment leads to reduction in productivity and diminishing returns will set in. Since most of the firms hardly watch out for this level then there is a tendency for most of the firms who were more interested in growing the size of their business to end up in reducing their capacity to generate profit.

The results of Business registration are interesting and counter intuitive. The coefficients on the Business registration are negative and significant. This suggests that registration of business was perceived as factor that may hinder the ability of the business to generate income and employment thereby contributing to poverty alleviation. Intuitively, business registration rather than hindering the promotion of SMEs; should boost their status and give them more recognition which invariably leads to higher employment and income generation. The registered business owner should be able to take up many new business opportunities that required formal registration and able also to benefit from government incentives. Thus business registration should rather serve as an incentive than disincentives to enhancing the capacity of the SMEs to employment and income generation and enhance reducing poverty incidence among the SMEs owners. One major reason for this counter intuitive result might strongly be due to the lack of adequate information about the importance of business registration. Also, the experience of some of those business owners who had attempted to register was bad. In many instances, the process of registration is cumbersome and relatively expensive. More importantly it is full of scams and also in most cases the registered business faced a lot of multiple taxations from the three tiers of government. Since those who do not register operate and get away with it, then many new and existing businesses would be discouraged to register and will perceive registration as hindrance to their business survival. The result of the business size corroborates the results on age of business. The coefficient on size is negative and significant. This implies that smaller SMEs experienced higher growth in income and employment generation. Nature of business and factor intensity were also negative and significant. This suggests that expanding the business across other business may hinder the ability of the business to generate more income and employment. The main possible reason for this could be that as the number of business increases, the ability to manage the business effectively declines. The decline in managerial ability possibly affects the income generation capacity and consequently the poverty alleviation ability of SMEs. The sources of raw material whether local or foreign had positive sign and significant effect on employment which also implies that locally sourcing of raw materials tend to alleviate poverty. The sources of finance and capital equipment had negative effects and also might hinder the capacity of SMEs to generate income and reduce poverty by the SMEs.

In general, business registration, business size, nature of business, Sources of capital are significant factors determining both income generation and employment generation potential of the SMEs. However, age of business, educational level and sources of raw material were only significant in influencing the capacity of SME to generate employment, on the other hand, nature of factor intensity, sources of finance and staff strengths were only significant in

income generation capacity of the SMEs. Therefore factors influencing SMEs contribution to poverty reduction differ across the different components of Poverty reduction measures.

Table 2: Summary of Results for the Probit Regression

Variables	Income Model			Employment model		
	Coef	Z-stat	P-value	Coef	Z-stat	P-value

Note: In income model, the dependent variable is the income generation capacity (in terms of profit margin and disposable income) of firms, whilst in employment model; the dependent variable is the employment creation capacity of the firms.

6 CONCLUSION

Based on the summary of the findings of this study, the participation in small and medium scale enterprise by people from Ekiti has contributed significantly to reduction in poverty incidence, prevalence and severity among the people in terms of annual per capita income, consumption and employment creation. However, the current high cost of borrowing, epileptic power supply and competition from foreign goods had remained the major challenges faced by these SMEs to contribute more to poverty reduction in the study area; lending rate may also impair outreach to the poorest of the poor in the area. Generally, savings in the area was far below the amount of business investment, thus public and private concerns need to come to the rescue of smallholders in the area by injecting funds to the area

in form of credit for business investment. There is the need to provide avenue for these business sector to be integrated into formal financial system. Young enterprising smallholders should be encouraged to save and invest in the informal economy. Increased opportunities for sound education, marketing outlets, banking facilities, good health care delivery, good infrastructure and social amenities in the area are some ways to achieve this.

The study established a pay-off between increasing socio-cultural spending to alleviate poverty and reducing same to increase current savings and found that it is better for the SMEs owners to increase such spending. Finally, all indices showed that in spite of the non conducive business environment under which most SMEs operate in Nigeria, SMEs had achieved considerable success in alleviating poverty in the area of study; thus refuting the criticisms against the programme that, it is yet to have impact, it offers illusion of a quick fix and that it gets the poor more impoverished.

PROPOSAL FOR INSTITUTIONAL RELATIONSHIPS AMONG STAKEHOLDERS IN THE DEVELOPMENT AND SUPPORT OF SMALL AND MEDIUM ENTERPRISES IN BOSNIA AND HERZEGOVINA

Elvira Catic-Kajtazovic
University of Bihac, Faculty of Economics, Bihac
elviracatickajtazovic@gmail.com

ABSTRACT
Despite the multiple significances of small and medium enterprises (SMEs) for the economic development in Bosnia and Herzegovina (BiH), the support of authorities is still missing. The circumstances that have negatively affected on the development of SMEs in BiH are numerous: lack of unified legal framework; failure to recognize the significance of development of SMEs; slowness in the processes of economic transition and privatization; the post-war emphasis on efforts to revitalize large enterprises with incidental ignorance for the SMEs. It is relevant to mention that there are two official definitions of SMEs in BiH, one applied in the Republic of Srpska and the other one being used in the Federation of Bosnia and Herzegovina. Existence of multiple levels of authority in BiH (state, entity, canton and municipality) contributed to establishment of a complex legal framework. Furthermore, this system sometimes causes not only overlaps in jurisdiction and applicability of laws, but also conflicting legal regulations. Apart from that, it frequently happens that the efforts for development of entrepreneurship include persons that do not have adequate experience, competencies and readiness to be instrumental in the development of SMEs. In this analysis will be elaborate on fundamental problems in the development of SMEs in BiH, and the effort to identify solutions to the problem of lack of systematic and institutional support in the development of SMEs. Aim of this paper is to present a proposal for structuring of relationships between institutions in BiH in order to facilitate effective support to growth and development of SMEs in BiH.

Keywords: Bosnia and Herzegovina, Development, Institutions, Small and medium enterprises

1 INTRODUCTION

The process of transition in Bosnia and Herzegovina produced significant changes in creation and establishment of the private sector, with emphasis on the relevance of development of entrepreneurship and SMEs. The significance of the small and medium enterprises for Bosnia and Herzegovina is multiple:

1. All of the following emphasize the core significance of SMEs for recovery and development of Bosnia and Herzegovina: General framework of the economic strategy for development (1999), Mid-term development strategy of BiH (2004), other cantonal strategies, signing of the European Charter for small and medium enterprises.
2. According to the last OECD report, the SMEs in BiH constitute the backbone of the economy, producing over 60% of the GDP and most of the new jobs (OECD, 2005, p. 30).
3. According to the Statistical business register (published by the Statistics Agency of BiH as the first register of this kind in BiH), SMEs constitute 99.1% of all the active enterprises in BiH.

4. SMEs are also in focus of the strategies of EBRD (European Bank for Reconstruction and Development) for the period 2010–2013.
5. Along with the EBRD, the World Bank is also actively involved in supporting the growth and development of the SMEs in BiH.

However, despite the multiple significances of the SMEs for the development of BiH, the systematic and institutional support to the development of the SMEs is still lacking.

2 PROBLEMS AND OBSTACLES IN DEVELOPMENT OF SMEs IN BIH

Most of the problems faced by the entrepreneurs in BiH are directly associated with the governmental institutions. This fact logically imposes the need for special attention to be given to the following analysis: 1. Fundamental problems in growth and development of SMEs in BiH, 2. Roles of all the levels of authority in development of SMEs in BiH.

2.1 Fundamental problems in growth and development of SMEs in BiH

For the purpose of this analysis, the following fundamental problems in growth and development of SMEs in BiH have been identified:

1. Inadequate statistical support and the problem of grey economy in in BiH
It is difficult to obtain the correct data on the state of SMEs in BiH. There are information available from the ministries, chambers of economy, and similar institutions, but they are mostly based on their estimates. This situation results in different figures even in the number of SMEs, and those discrepancies are not counted in tens but even in thousands in some instances. The analysis and research of the following official documents, also produces inconsistent data and values:

- Statistical business register of BiH;
- Project „Development of small and medium entrepreneurship in the Federation of Bosnia and Herzegovina", Federal Ministry of Development, Entrepreneurship and Trade;
- Strategy of development of SMEs in the Republic of Srpska, based on data obtained from the Pension and Disability Insurance Fund (PIO) and the Statistical Institute of the RS;
- Strategy for developments of SMEs in Bosnia and Herzegovina 2009–2011.

Even all the listed documents analyze different categories. E.g., the Statistical business register provides data for all the enterprises in BiH (although only 0,9% have over 250 employees) but the trades are not included. The project of the Federal Ministry of Development, Entrepreneurship and Trade considers only SMEs including trades. Nevertheless, the most recent information are provided in the Statistical business register. Along with the listed problems with inadequate statistical support, the closely-related problem of grey economy is also causing difficulties in determination of the state of SMEs in BiH.

2. Problems of financing of SMEs in BiH
According to the Global Competitiveness Index (GCI) BiH is rated 122nd in the list of 142 countries rated for simplicity of procedures in loan availability (Federal Institute for Programming of Development, 2011, p. 20). Analysis of the banking operations indicates a higher rate of provision of loans to citizens rather than to SMEs. Apart from this, even when they provide loans to SMEs, the banks are tendentious in providing loans to large enterprises. The practice has shown that the banks calculate higher interest rates to small and medium

enterprises, as opposed to the interest rates for their regular clients, and the banks name higher risk rate as the reason for this practice. The crediting terms are especially difficult for the entrepreneurs' beginners. On the other hand, over the past couple of years, the micro-credit organizations have been approving loans for the SMEs, particularly trades. However, the fundamental problem is that such credits are expensive (high interest rates). Absence of more acceptable terms of financing frequently represents the main hindrance in the business operations of SMEs.

3. Tax policies and administrative procedures

Tax policies and administrative procedures represent significant obstacles in the business operations of SMEs. The most recent data from 2012 (www.doingbusiness.org) provide some defeating facts: When compared with the OECD member states, every enterprise in BiH makes three times more payments to the administration (40 in BiH compared to the average 13 in the OECD states) and spends over two times more working hours working on administration of taxes (422 hours in BiH compared to 186 hours in the OECD states). Even when compared with the other countries from the region, the enterprises in BiH waste more hours working on administration of taxes than any of the neighboring countries: Macedonia (75 hours), Croatia (196 hours) or Serbia (279 hours). A special problem is recognized in the process of registration of enterprises in BiH. Unfortunately, BiH is the leading country when it comes to the number of days required for registration, enormous administrative demands, and lack of understanding for the need of the entrepreneurs. All of those defeating facts illustrate the difficult position of the SMEs in BiH. Since all those procedures, rules and policies, are directly connected with the governmental institutions, it is evident that there has not been any serious consideration given to the solving of those problems. Also, it is difficult, if not even impossible, to find an excuse for such approach.

The example of Macedonia can be used as a confirmation for the said claims. The table below provides a comparative illustration of progress made in BiH compared to Macedonia (as a similar country in transition, with positive improvements) in the procedures for registration of enterprises and business start-up:

Table 1: Starting a Business, Comparison of BiH with FYR Macedonia (World Bank, 2010 and 2012)

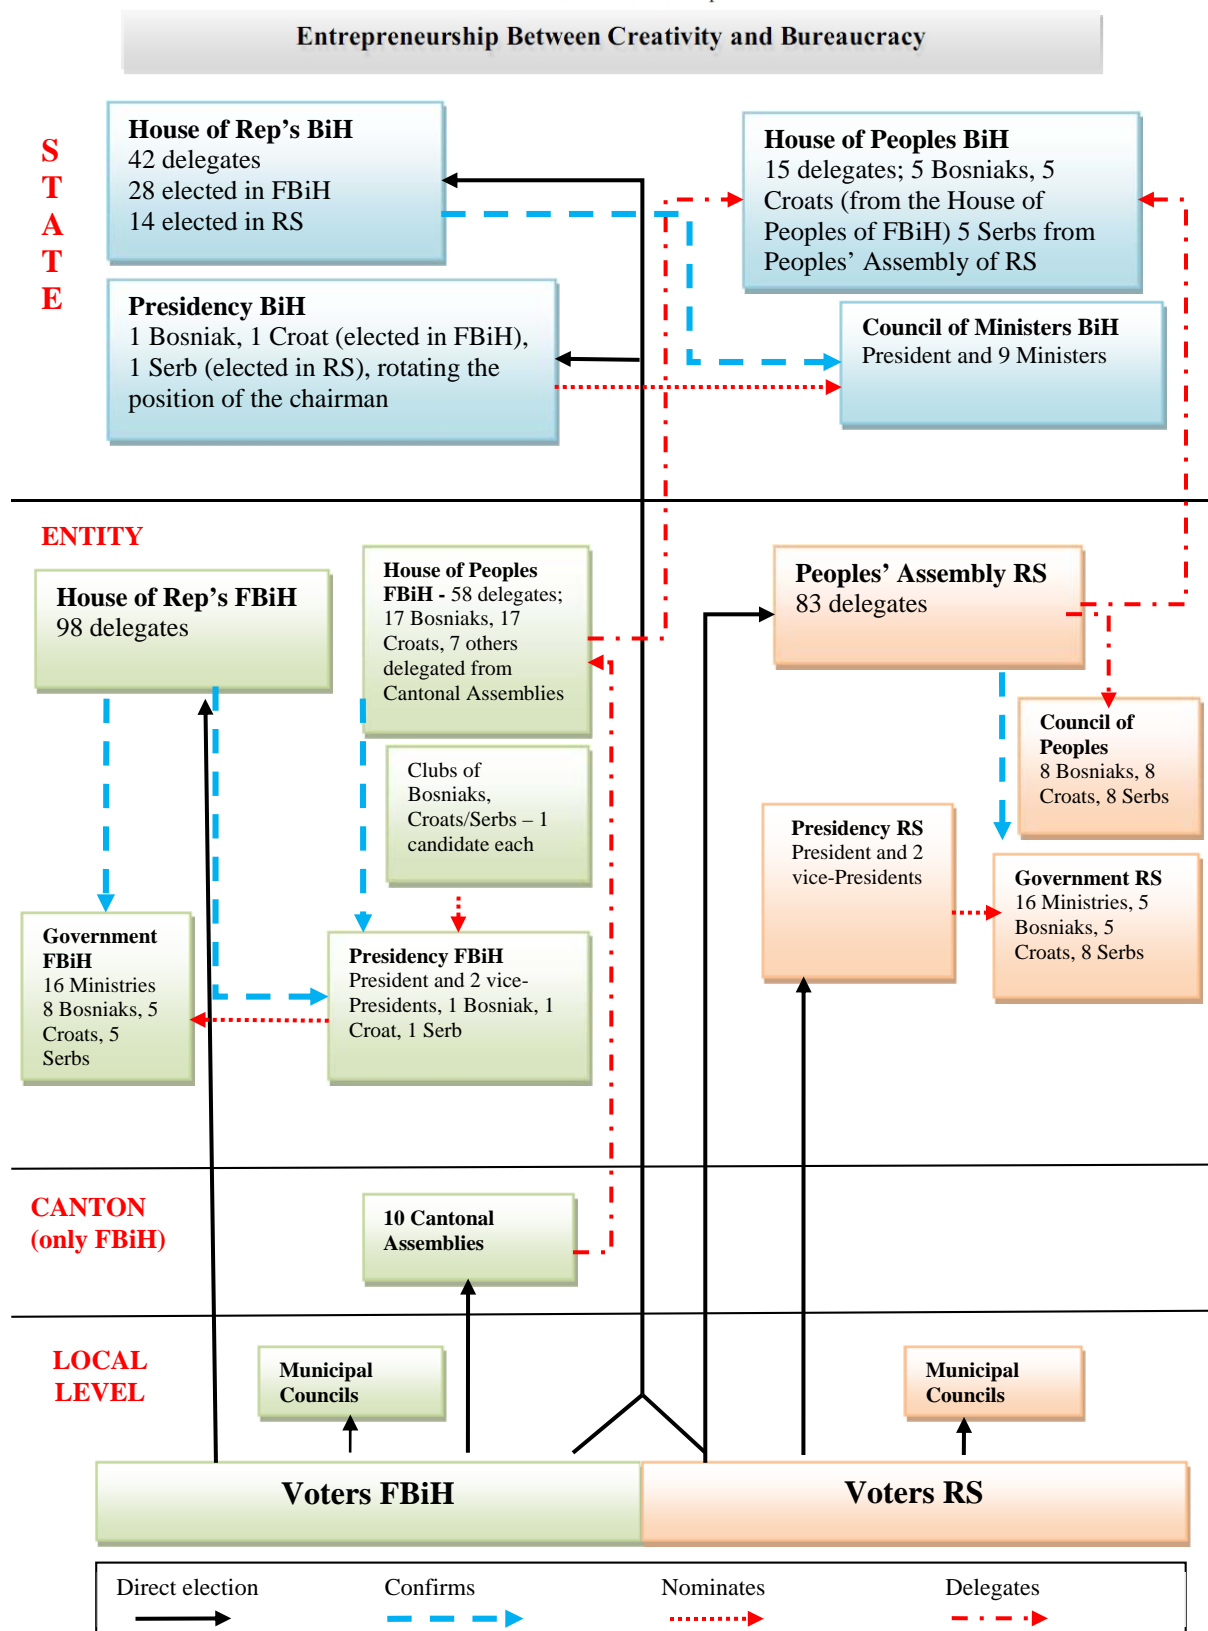
Indicator	2010		2012	
	Bosnia and Herzegovina	Macedonia FYR	Bosnia and Herzegovina	Macedonia FYR
Procedures (number)	12	4	11	2
Time (days)	60	4	37	2
Cost (% of income per capita)	15,8	2,5	14,9	1,9
Paid-in Min. Capital (% of income per capita)	29,8	0,0	29,1	0,0

4. Implementation of policies for development of SMEs in BiH

According to the OECD Report „SME Policy Index 2009, Progress in the Implementation of the European Charter for Small Enterprises in the Western Balkans" (Report made for 2007 and 2009, with preparation of the report for 2012 in progress) the progress made by Bosnia and Herzegovina in implementation of policies for development of SMEs in the period 2007-

2009 is as follows: BiH did not achieve progress in any out of ten areas that were included in the research (Entrepreneurship education and training, Cheaper and faster start-up, Better legislation and regulation, Availability of skills, Improving online access, Getting more out of the Single Market, Taxation-Access to finance, Strengthening the technological capacity of small enterprises, E-business and Developing stronger and more effective representation of small enterprises' interests). Each of the ten areas remained at the level of 2009, i.e. 2007. The report for 2009 addresses the area of business start-up with particular criticism, providing the following conclusion: „BiH is the only country in the Western Balkans that is not implementing a systematic reform in the processes of registration of enterprises". Also, in the subject of e-business i e-governance: „BiH is the weakest of all the countries included in the research"(OECD, 2009, pp. 202–205).

5. Complexity and conditional relationships between authorities' in BiH
Apart from creating legal framework, the State should use its economic policies to create an environment that will foster successful growth and development of the SMEs. The level of undertaking in that direction depends on the ruling structures and their systems of values. It is the complexity and mutual conditional relationships between authorities in BiH that pose the main problem and the main obstruction in the development of the SMEs, and those issues will be separately addressed in the next chapter.

2.2   Roles of all the levels of government in development of SMEs in BiH
In order to completely comprehend the roles of authorities in development of SMEs in BiH, their mutual complexity and terms of interaction, the following scheme of legislative and executive bodies in BiH should be considered.


Entrepreneurship Between Creativity and Bureaucracy

Figure 1: Diagram of legislative and executive bodies in BiH (EBRD, p. 26)

The schematic layout clearly illustrates the complexity of the decision-making process at the state level, that is based on a complex system of leverage, constructed to protect the interests the three constitutional peoples (Bosniaks, Croats and Serbs). Furthermore, those are the peoples that were in a war against each other not so long ago. An additional complication is

the political stage dominated by ethnic political parties. Under the disguise of "protection of national interests" any serious engagement in solving of the economic problems is still missing, and the same applies when speaking of any serious approaches to stimulation of development of SMEs in BiH.

Bosnia and Herzegovina lacks the necessary legal and institutional framework of state-level support for the development of SMEs. Such framework should include the following: Law on SMEs, Strategy of Development of SMEs, Agency for SMEs and a Fund for SMEs. From the listed elements, BiH only has the Strategy of Development of SMEs that was adopted only in 2009 although the first proposal was prepared in 2005. This is to say that despite the evident multiple significance of development of SMEs, the support of the government is still lacking. Lack of a universal legal framework, failure to recognize the significance of development of SMEs, slowness in the process of economic transition, post-war emphasis and efforts on revival of large enterprises while ignoring SMEs – all those are circumstances that have negatively affected development of SMEs in BiH. For eventual acceptance of SMEs as an element in the development of the country, a credit is to be given to the influence of international institutions and successful accomplishments of domestic entrepreneurs.

At the level of Bosnia and Herzegovina, the sector of SMEs is governed by the Ministry of Foreign Trade and Economic Relations. Within that Ministry exists a Sector for economic Development and Entrepreneurship that includes a special Department for Entrepreneurship.

Competencies for SMEs in FBiH are governed by the Law on Incitement of Development of Small Entrepreneurship (Official Gazette FBiH, No. 19/06). According to that Law, the parties charged with program of development of SMEs are:
1. Government of FBiH and Cantonal governments
2. Federal Ministry of Development, Entrepreneurship and Trade
3. Respective Federal and Cantonal ministries and institutions, and
4. Local self-governance units

At the level of FBiH the problems of SMEs are in the jurisdiction of the Federal Ministry of Development, Entrepreneurship and Trade. At the Cantonal level (only in FBiH) the bodies that perform professional and administrative services, also relevant for the SMEs, are in the jurisdiction of respective Ministries of Economy, with the following exceptions:
1. Posavina Canton – Ministry of Economy and Physical Planning.
2. Tuzla Canton – Ministry of Development and Entrepreneurship (Department for entrepreneurship and trade), Ministry of Reconstruction, Development and Return (development and incitement of entrepreneurship, especially trades), and the Ministry of Commerce, Tourism and Traffic (Department for Commerce and Tourism).

In the RS, within the Ministry of Industry, Energy and Mining, there is an Assistant to the Minister responsible for development of SMEs and entrepreneurship. At the lower administrative levels (municipalities) there are also departments or persons responsible for promotion, growth and development of the SMEs.

Nevertheless, without a universal state-level legal framework, this enormous and frequently contradictory system of competencies and responsibilities of institutions can hardly contribute to the development of entrepreneurship and the SMEs. Also, it occurs rather frequently that

any efforts for the development of the SMEs involve individuals without adequate experience, competencies and readiness to assist the process of development of the SMEs.

3   PROPOSAL OF AN INSTITUTIONAL SOLUTION FOR DEVELOPMENT OF THE SMEs IN BIH

However, with consideration for the proposals outlined in the Strategy of Development of SMEs in BiH 2009–2011 and the existing structure of legislative and executive authorities in BiH, the authors proposes the following schematic layout of institutional relationships:

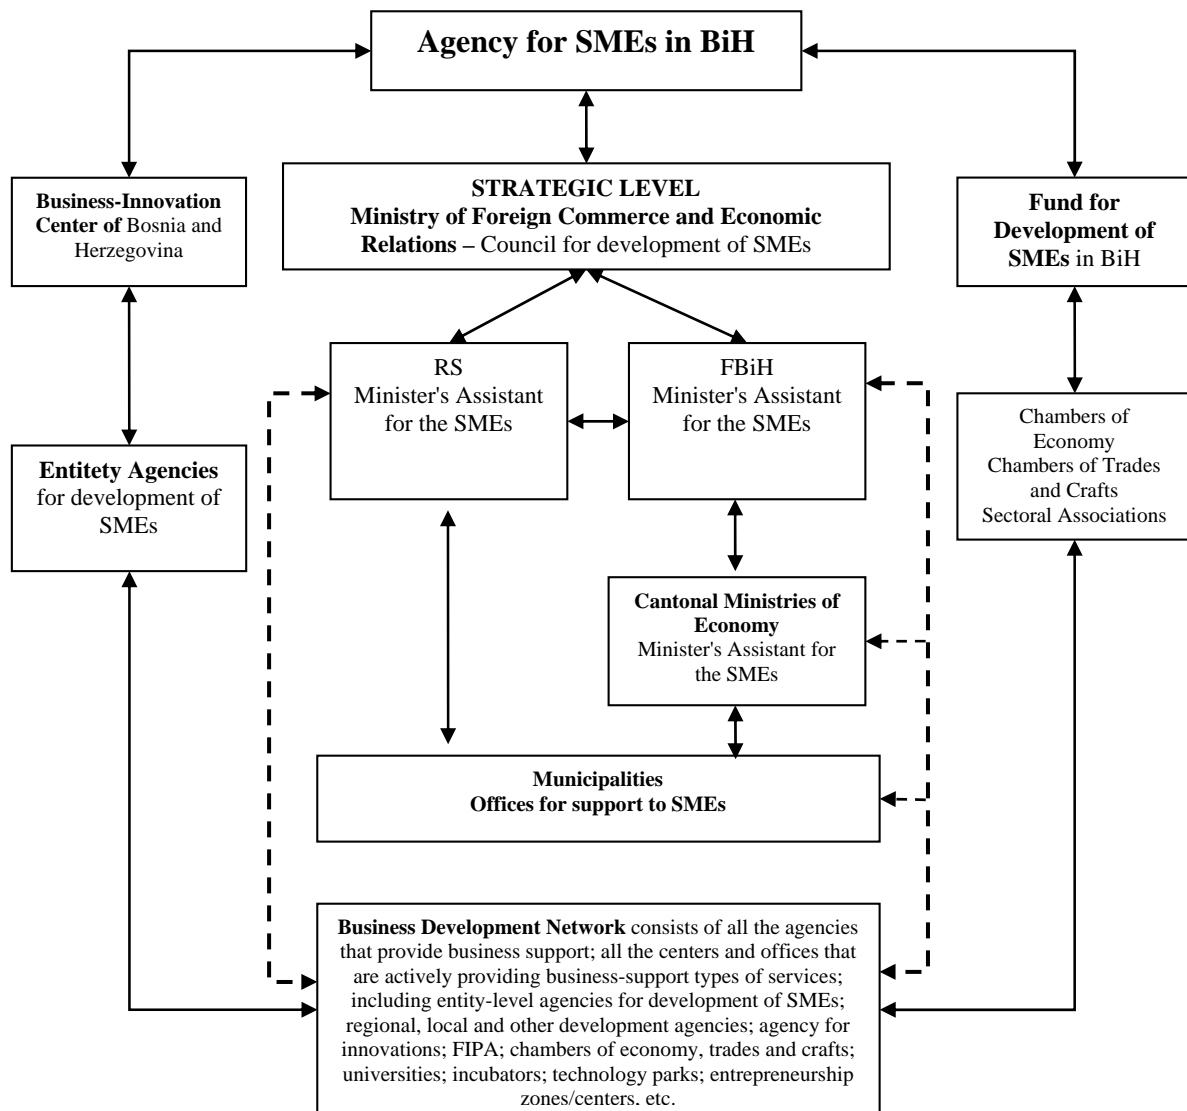


Figure 2: Proposed institutional relationships between stakeholders in development and support for the SMEs in BiH

The central position in the schematic layout is given to the Agency for Development of SMEs in BiH that should be responsible for strategies, plans (especially the urgent adoption of a an action plan for development of SMEs in BiH), but also lobbying for adoption and implementation of laws that concern development of the SMEs at the state level (especially

the Law on SMEs, and the Law on State Aid). Particular start-up efforts the Agency should make in the processes of registration of enterprises (taking a positive example of a successful reform implemented in Albania). A strategic level of support for the development of SMEs in BiH is required for the two main reasons:

1. Bosnia and Herzegovina still does not dispose with a significant, or even the required capacities for a strong development of SMEs
2. Taking into consideration the said circumstances in BiH, the ongoing process of globalization, and the openness of economy of this country; Bosnia and Herzegovina must not allow the "luxury" of dispersion of knowledge, capital and evidently "expensive" business.

So, the Agency would represent a key institution in development of the SMEs in BiH. The Agency would make strategic plans on distribution of financial support for the SMEs (with particular consideration for the types of business), which would ensure to avoid the practices of lump-sum support and uncoordinated support. The Law on State Aid should serve as a basis for a transparent distribution of financial incentives to the enterprises. The Agency would be responsible to the Government of BiH, i.e. directly to the Ministry of Foreign Commerce and Economic Relations.

The Council for Development and Entrepreneurship of SMEs, within the Ministry, monitors and supervises the work of the Agency, collects information from respective entity and cantonal ministries. The Council would have a rather coordinating role between the ministries and the Agency.

Business Innovation center of BiH should be established by the Government of BiH. The Center would have a central role in development and promotion of innovation and technical/technology system. The primary goal of the Center should be incitement of innovations, recognizing potentials in inovative ideas, and support to materialization of those ideas. The Center would also be in charge of the EU funds.

Entity agencies for development of the SMEs would be responsible for implementation of measures associated with provision of business services, trainings, educations, etc., in accordance with the plans prepared by the Agency for MSE in BiH. Entity agencies would cooperate directly with universities and secondary schools, with the primary aim of promotion of entrepreneurship and entrepreneurial spirit in those institutions. Also, they would take on the commitment to participate in the financing of education of entrepreneurs.

The primary task of the Fund for Development of SMEs should be financial mediation, and support to entrepreneurs to overcome difficulties associated with liquidity, and facilitating easier access to funding for development of SMEs (primarily beginners).

In that way, the established Network for business development (the network of support to development of SMEs) would also function efficiently and at its full capacity.

The proposed scheme of institutional relationships would resolve the obligation of the two-way vertical coordination between all the levels of authority in BiH, and also the necessary horizontal coordination and collaboration at the entity level. Such created support mechanism should result in creation of entrepreneurial climate where the entrepreneurial initiative will be rewarded, appreciated and spurred, in ways that will provide incentives and the necessary

skills to the entrepreneurs, and also promote awareness of advantages and benefits of entrepreneurship. The ultimate goal of the proposed institutional relationships would be to awaken the sleepy attitude of BiH towards private initiatives, bearing in mind the fact that one part of the country's legislation and citizens' mindset rests on models inherited from former Yugoslavia, i.e. the former system of socialism. The goal will be achieved when the entrepreneurial ideas and undertakings receive support and become fully recognized as generators of absolutely required new jobs, investment and innovations in Bosnia and Herzegovina.

4   CONSLUSION

Bosnia and Herzegovina is a country consisting of two entities, Federation of Bosnia and Herzegovina, and the Republic of Srpska, and Brcko District as a special territorial unit. BiH is a relatively small country in the region with open economy. The process of transition in BiH (with the ultimate goal of democratization and development of Western-European type of market economy) represents a rather difficult path for this country followed by series of problems such as: inappropriately implemented privatization; split markets and diversified legal regulations; insufficient development of the financial market; lack of universal implementation of crucial economic reforms. An additional aggravating circumstance is the complexity and mutual conditional relationships between legislative and executive authorities in BiH. In such a tangled network of relationships, unscrupulous and arrogant politicians, working under the disguise of protection of vital national interests, any serious engagements in solving of the burning economic problems yet remain to be seen. Also, regardless of the multiple significances of the SMEs, the system of incitement for development of the SMEs sector in BiH is almost non-existent in the true sense of the word. The necessary legal and institutional state-level framework for support to the development of the SMEs does not exist.

This paper presents a schematic illustration of institutional relationships between actors in development and support for the SMEs in BiH, which has the purpose to identify the strategic level of support for development of the SMEs in BiH. The proposed scheme of institutional relationships would resolve the obligation of the two-way vertical coordination between all the levels of authority in BiH, and also the necessary horizontal coordination and collaboration at the entity level. The ultimate goal is incitement, development and imposing of the entrepreneurial mindset, which will be instrumental in bridging of the gaps in development that resulted from dissolution of large enterprises from the former system of socialism. This will be achieved by raising the institutional support to SMEs to a higher strategic level, where the SMEs will be considered as the generators of the absolutely required new jobs, investments and innovations in Bosnia and Herzegovina.

ABSTRACT
Age management is at the heart of the EU policy agenda. The changes in the world of work and the labour market are having a strong effect on human resources policies. Proactive measures are being taken by Member States to maximise employment levels, both amongst the young and older generations. The package of measures includes, for example, active labour market policy with integration programmes for the unemployed, intensification of education and training, improving occupational health and safety, programmes to enable the compatibility of work and family life, enhancement of equal rights and equal opportunities, creation of child care facilities, improving the care of sick and disabled people. Age management should therefore create a friendly environment for older workers and create opportunities for those who want to remain longer within the labour market. The aim of the paper is to encourage the development of the lack of knowledge about age management that exists in the Albanian SMEs and to present recommendation for both policy-makers and enterprises. Innovation and the correct knowledge and experience transmission are basic inside the companies. All this makes necessary to validate and formalize this learning to make the oldest workers leave their defensive position and to favour their professional development, and therefore develop their employability encouraging the integration of the young generation in the Albanian company. From this point of view, encouraging the experienced (the older) workers' participation in the evolution of the SMEs and favouring the integration of the new ones becomes a requirement to achieve the effective competitiveness in companies. This analysis has been carried out through secondary sources, as well as by interviews with industrial companies from different fields.

Keywords: Age management, Albania, SMEs

1 INTRODUCTION

The world of work is changing. The changes in the world of work and the labour market are having a strong effect on human resources policies. Europe's demographic situation is characterised by a growing proportion of older people has, over the last decade, emerged as a central priority for policymakers in the EU. This demographic shift calls into question both the sustainability of pension systems and the future of Europe's labour supply, which in turn raises questions about the prospects for economic growth (European Foundation for the Improvement of Living and Working Conditions, 2008). Age management is on the tip of the 'European tongue', however one commonly accepted definition of this term is difficult to find. It is employed in a variety of contexts and refers to a broad range of issues and

measures. It is also ideologically linked to a number of other terms and concepts - *ageing population, demographic change or ageing, active ageing, management of all ages, diversity management, anti-discrimination*, to name just a few (European Commission, 2007). Despite there being no single definition of age management, there seems to be a common consensus as to what is implied by the term and its other related concepts. Proactive measures are being taken by Member States to maximise employment levels, both amongst the young and older generations. The package of measures includes, for example, active labour market policy with integration programmes for the unemployed, intensification of education and training, improving occupational health and safety, programmes to enable the compatibility of work and family life, enhancement of equal rights and equal opportunities, creation of child care facilities, improving the care of sick and disabled people. Age management should therefore create a friendly environment for older workers and create opportunities for those who want to remain longer within the labour market. The effects of population aging are not only present macroeconomic but also are more and more approached by individual and enterprise levels.

In Albania, the development of policies and practices aimed at improving opportunities for older people have grown significantly in recent years. Nonetheless, the statistics show that the situation has not changed significantly. The impact of ageist attitudes can be seen in the low levels of employment of older people. The employers in Albania are still reluctant to employ older workers because they are told to be inflexible, slow, unhealthy, low-performing or with out-dated knowledge. New approaches, policies and instruments which are so-called age management are not accommodate to the specific situation of the ageing workforce in such a way that to provide incentives and support individuals to be able to achieve their potential without being disadvantaged by their age.

This paper seeks to encourage the development of the lack of knowledge about age management that exists in the Albanian SMEs and to present recommendation for both policy-makers and enterprises.

2   THE OLDER WORKER ON ALBANIAN LABOUR MARKET
Albania has an ageing workforce with labour force participation declining with age (table 1); especially after age 55.

Entrepreneurship Between Creativity and Bureaucracy

Table 1: Activity rates[1] by age and gender, 2007–08 (European Training Foundation, 2010)

%	2007			2008		
	Total	Male	Female	Total	Male	Female
15–64	65.2	74.4	56.2	61.9	72.1	52.8
15–24	39.8	44.9	34.7	33.1	37.8	28.7
25–34	78.4	89.1	68.6	71.5	86.9	60.4
35–44	83.4	93.0	74.5	82.1	91.4	74.9
45–54	80.3	90.4	69.9	79.0	89.1	69.2
55–64	50.7	67.5	33.3	48.0	67.9	27.6

Albania's labour force participation rate for those aged 55-64 is 48.0 percent in 2008. Older workers are a significant group of the long term unemployed, the under-employed trapped in casual work, and those disengaged workers who prefer to identify as retired rather than unemployed. Older male workers (50-64 years) are at particular risk of involuntary separation from work due to redundancy/retrenchment (women are more likely to leave for family reasons, including synchronizing retirement with husbands).

Which are reasons for extremely low participation of older workers on labour market?

One reason behind the low participation of older workers can be found within the transition processes in the 1990s. Transformation period was accompanied with decline in economic activity in general and inflation, which both had negative impact on employment. Albania experienced its highest unemployment rate during 1991–1992, though it continues to be above than 10 percent (INSTAT, 2002). Labor market conditions have radically changed. Furthermore, transition has proceeded alongside a major shift in the relative demand for skill types in the market economies (Commander and Kollo, 2004). Transformation depression has increased the demands for educated employees; those without having qualifications mostly lost their jobs.

Besides transition, there are many other reasons that hinder older workers from staying active, such as (European Foundation for the Improvement of Living and Working Conditions, 2008):
- a perceived lack of flexibility and initiative;
- a poor grasp of foreign languages;
- a reluctance to take part in training;
- limited adaptability to new working conditions;
- a lack of knowledge of new technologies or production processes;
- a greater tendency towards taking sick leave.

3 AGE MANAGEMENT IN ALBANIAN ENTERPRISES

As already indicated, older workers in Albania have been disadvantaged in the labour market, mostly due to the transition from the old socialist economic model to market- oriented

[1] The proportion of the population aged 15–64 that is economically active (i.e. all people who supply labour for the production of goods and services during a specified period).

society. With a total unemployment rate above 10%, it was difficult to explain the necessity of putting older workers back in business (Borloo, 2005). Since then new institutional and legal possibilities have been adopted, however not being efficient very much in solving the problem of the employment of seniors, since the employment rate of old people remain very low.

With certain delay, Albania became aware of some problems, connected with aging workforce – more present at company level. The main drivers for initiating age management development in Albania were the impact of ageing on public expenditure and economic growth rates, underlining the need to extend working life and inevitable fact that employers will have to employ more, over-55s. In addition, some other principal reasons, such as tackling age barriers and discrimination, age management is now considered as an economic and social necessity (Malloch et al., 2011). However, the implementation of age management at company level is legging behind the most developed European countries. Unfortunately, there is limited research on what is actually being done (Farrell, 2005).

This is why this paper discusses the development of the lack of knowledge about age management that exists in the Albanian SMEs. Innovation and the correct knowledge and experience transmission are basic inside the companies. All this makes necessary to validate and formalize this learning to make the oldest workers leave their defensive position and to favour their professional development, and therefore develop their employability encouraging the integration of the young generation in the Albanian company. From this point of view, encouraging the experienced (the older) workers' participation in the evolution of the SMEs and favouring the integration of the new ones becomes a requirement to achieve the effective competitiveness in companies. This paper focuses on the role played by employers, since most decisions on how to deal with an aging workforce will have to be taken within individual organizations, or will, at least, be implemented within these organizations (Remery et al, 2003).

The drivers which make age management practices reasonable are more or less the same within European countries. One of the main reasons that force employers to combat age barriers is age discrimination, which has been called the last unrecognised discrimination, including both open and hidden forms (Walker, 1998).

The scientific evidence shows that older workers are, on average, as effective in their jobs as younger ones—though of course there are variations in performance between jobs. Older staff have fewer accidents than younger ones and are less likely to leave an organisation voluntarily (Walker, 2005). Their average net cost to an employer is similar to that of younger staff (Walker, 2005) or very often cost-benefit analysis talks in favour of older employees (Brooke, 2003). In addition there are pragmatic reasons why the social partners are beginning to look for ways of removing or reducing the impact of age barriers. Some employers have even begun to articulate a business'case in favour of older workers. Some main reasons – why tackle age barriers include (Walker, 1998):
- the age structure of the workforce is changing rapidly in all countries. That fact implies a radical change in human resource strategies and a new approach to managing age at the workplace. Future competitiveness will rest partly on the performance and productivity of ageing workforces and, therefore, on the efficient utilisation of older workers;
- at plant level employers are reassessing the consequences of early exit. It is being seen by some as a waste of experience and human resources and of the investment they

have made in the workforce. Others see roles for older workers in training younger people or in preventing skill shortages;

- there is growing awareness among employers and trade unions that, by artificially limiting the field of candidates, age barriers prevent an organisation from maximising its recruitment potential;
- some enterprises are recognising that the organisation with a diverse age base – a mixture of youth and maturity – is likely to be able to respond best to rapidly changing circumstances. In the service sector in particular, employers are seeing the benefits of adjusting the age range of their employees to better reflect the age composition of their customers;
- there are widespread government concerns about employment rates and the financing of pensions.

Especially in Albania the effect of early leaving employment has been even more present since Albania has gone through its tranzition period in which early retirements seemed to be the most elegant way of reducing employees.

This analysis has been carried out through interviews with SMEs, located mainly in the Korca Prefecture (Albania), in different business sectors. For the purpose of this study, interviews (2011) were carried out with a variety of actors: 100 interviews with the persons with responsibility for human resources development (owner, administrator, HR manager, other). The reason for this composition is based on the responsibility that those actors have on human resources development.

In the majority of the SMEs the person with responsibility for human resources development issues is the owner (44%).

3.1   Key findings
What do employers see as the major drivers of engagement for their workers over 55s?
The main reasons that HR managers have given for working on retention of their aging workers are:

- → special knowledge and experiences that older workers possess (46%);
- → the need to transfer knowledge and experience of older workers to younger (39%);
- → benefiting from older workers' characteristics – strengths, such as: having experiences, responsibility, loyalty etc. (28%); and
- → general labor shortages on the labor market (shortages of younger candidates) (10%).

Which measures are employers taking to recruit or retain older workers?

HR managers answer with the aid of proposed actions upon them the employer had to choose whether certain measure: - is being implemented; - is considered to be implemented or - would not be considered for implementation.

The results indicate that the most commonly used measures, starting with age-neutral advertisement of job vacancies (70% of SMEs are already implementing this measure), were found to be those aimed at keeping older staff with multigenerational workforce (52%), preventive medical check-up (49%), risk identification at workplace (43 %), retirement plans employees communication (45%), communicating about extending working life (51%),

identification and transformation of knowledge (47%), exemption from working overtime for older workers (50%).

What are the reasons for not being inclined to employ or retain older workers?
The main reasons for reluctance are:
→ No compelling business purpose
→ Retaining all valuable employees, regardless of their age.
→ A pressing need for more young blood
→ The nature of the work and the work environment (hard workloads, unsuitable for older workers)
→ Greater affordability of younger workers
→ Abundant supply of workers under current arrangements or even the need to reduce the staff
→ Actual and/or anticipated opposition from workers and/or managers
→ Legal obstacles

In summary, this paper suggests that employers in Albania are not taking the ageing workforce seriously and are failing to seek out and implement sufficient strategies for the retaining, retraining and recruitment of mature workers. Moreover, it is argued that Albanian employers have failed to recognise that they have a shrinking labour market despite all evidence to support this (Farrell, 2005). So, even though Albanian employers experience and/or expect labour market shortages they do not turn massively to older workers as a solution.

4 CONCLUSION
The changes in the world of work and the labour market are having a strong effect on human resources policies. In Albania, the development of policies and practices aimed at improving opportunities for older people have grown significantly in recent years. Nonetheless, the statistics show that the situation has not changed significantly. The older workers in Albania have been disadvantaged in the labour market, mostly due to the transition from the old socialist economic model to market- oriented society.

In this paper three main questions have been addressed: What do employers see as the major drivers of engagement for their workers over 55s? Which measures are employers taking to recruit or retain older workers? What are the reasons for not being inclined to employ or retain older workers? In order to answer these questions we analyzed degree to which employers implement measures or consider implementing measures aimed at retaining older staff. SMEs devote little or no effort to retaining their own older workers. HR managers are starting to familiarise themselves with the concepts, methods and tools, but only a few companies have gained some experience in this matter. Employers will have to develop more effective ways of managing their aging workforce to maintain operational continuity (Parker, 2006).

SMALL INNOVATIVE BUSINESS DEVELOPMENT AS INDICATOR OF CHANGES IN REGIONAL INNOVATION SYSTEM

Sophia Khalimova

Institute of Economics and Industrial Engineering of Siberian Branch of Russian Academy of Science, Russia
sophiakh@academ.org

ABSTRACT

In this paper the problems of small innovative business development in regional economy are under discussion. Here small innovative business is analyzed from the point of view of the concept of Regional Innovation System (RIS). The main goal of the paper is to analyze how the RIS of Novosibirsk region (Russia) has changed in time. Another aim is to understand what role small business plays in the RIS of Novosibirsk region. In this paper we show that by studying small innovative business development we can not only see what its part in the regional economy is but also draw conclusions on the development of the system of innovations itself. Russia is a federation with 83 regions that differ a lot in all spheres including innovation activities, and by analyzing governmental statistical data on regional dynamics we show that there are leaders and followers and there are regions where this sphere is not developed at all. Moreover, there exists certain specialization between the regions with some regions being active in creating innovations and others in using them. Novosibirsk region is one of the leaders in creating innovations. Detailed econometric analysis of the statistical indicators demonstrates that small innovative business is significant for the economy of Novosibirsk region. In this regard special attention is paid to the influence that RIS has on the small business focusing on the problems firms face in their development and their needs for the governmental support. The analysis is based on the small innovative business survey conducted in Novosibirsk region in 2009-2011 in the IEIE of SB RAS. Changes that are taking place in the RIS of Novosibirsk region during recent decades and the evolution of the system itself are discussed in the paper.

Keywords: Innovation systems, Regional development, Small innovative business

1 INTRODUCTION

Russia is a federated state with 83 regions. The regions differ in procurement of natural resources, industries, labor force structure, etc. Under these circumstances it is natural that the regions are at different level of economic development. Innovation activities also are developing differently. This is why our research is based on the concept of Regional Innovation System (RIS).

The concept of RIS is relatively new, it appeared in the early 1990s. The concept of RIS was impelled by the concept of NIS (National System of Innovation). As well the concept of NIS it is based on a similar rationale that stresses territorially based innovation system (Asheim and Gertler, 2005). "The region is increasingly the level at which innovation is produced through regional networks of innovators, local clusters and cross-fertilizing effects of research institutions" (Lundvall and Borrás, 1999, p. 39).

2 NOVOSIBIRSK REGION: REGIONAL INNOVATION SYSTEM INDICATORS

With regions of Russia being different in their innovation activities development there are a lot of discussions about how to compare regions and how to distinguish between developed

and developing ones (Untura, 2012). In any case any comparison to a great extent is based on analyzing governmental statistical data on regional dynamics. Turning to official statistical data (Khalimova, 2011) show that there are leaders and followers and there are regions where this sphere is not developed at all. Moreover, there exists certain specialization between the regions with some regions being active in creating innovations and others in using them. Novosibirsk region is one of the leaders in creating innovations.

Chart 1 gives the idea about the scale of innovation activities in Novosibirsk region, all the indicators are calculated in the prices of the year 2000.

Chart 1: Novosibirsk region: RIS indicators (based on Regions of Russia, 2011)

As we can see from the graph the region spends more on the R&D (that is the indicator of creating innovations) than on technological innovations (that is the indicator of using innovations), this is why we say that the region's specialization is creating innovations. Statistical data shows that through the 2000s innovation activities have been developing greatly: we observe two times rise of both R&D and technological innovations costs and six time rise of innovation production. Hence it is intensive development and it proves that Novosibirsk region is indeed innovationally active one.

3   SMALL INNOVATIVE BUSINESS IN NOVOSIBIRSK REGION

Innovative business, especially the small one, is the central element of the system of innovations. Innovation business is the one to carry out innovation activities; innovation business is the one to promote adoption of innovations being the first to use them. In this respect the study of innovation business is extremely important for finding out the problems of functioning of the Russian innovation system (and of the RIS of Novosibirsk region in particularly) and for searching for the ways to transition towards innovative development.

This analysis is a part of a group research in the Institute of Economics and Industrial Engineering of Siberian Branch of Russian Academy of Science (IEIE of SB RAS) that is conducted since 2009 (Kravchenko et al., 2009; Kravchenko et al., 2011).

In 2009–2011 in IEIE of SB RAS small innovative business study was conducted in Novosibirsk region. The data for the study was collected through the survey of the small innovative companies; 80 managers of small innovative companies took part in the questionnaire.

In the questionnaire managers of small innovative companies were asked to rate factors that influence business development. We analyze the factors at different stages of the life cycle of business, the companies were asked to rate the factors at different stages of development: at the founding stage and at the stage of growth.

Let us give some characteristics of the sample of companies under study. 52 % of the companies are young, they were founded less than ten years ago. Half of the respondents provide services and others produce goods. The companies operate mainly in B2B market. The novelty level is high: more than half of products are new for Russian and world market. Own ideas and results of own research and development (R&D) are the main source of innovative ideas. The majority of the companies (more than 80%) are financed mostly from the firm's resources.

3.1   Small innovative business at different stages of development
All economic agents go through a number of stages of development in their life and their behavior is determined by different factors at different stages. Here we turn to the theory of life cycle of organization.

Theory of life cycle of organization uses biological idea of a life cycle to analyze development of a firm. According to it organizations are born, then they grow and finally die. In this process just as in biology certain patterns can be observed. Different authors in their models distinguish different number of stages: from three to ten. Nevertheless, there is a common understanding in literature (Shirokova, 2006) that:
- The stages are sequential;
- Every following stage is a result of the previous one.

In our analysis we distinguish between four stages of development (we use typology based on generalization of variety of approaches to define number of stages (Shirokova, 2006)):
1. Founding stage;
2. Stage of growth;
3. Stage of maturity;
4. Stage of decline/New business.

Attribution to this or that stage of development is a question that a firm should decide by itself, it is more of feeling that top-management has. Of course, there are certain characteristics necessary to every stage, however, it is almost impossible to make one general scale at what age company should be considered growing and when it is mature. A lot depends of the industry, if use biological analogy again, industries are species; and all species become mature at different ages.

It what follows we analyze the influence of the factors at two stages of development: at the founding stage and at the stage of growth.

It is obvious that mature companies rate factors and elements of the system of innovation using their experience both at the founding stage and at the stage of growth, while some of the young companies' ratings are prospective ones. That is why it is interesting to divide the whole sample into groups depending on the stage of development. The difference in ratings, on the one hand, will be the difference between expected and real influence of this or that factor, and on the other hand, it will indicate the changes in RIS since different groups of companies go through the same stages of development at different moments of time.

Thus, the sample was divided into three groups:
1. Companies at the founding stage (11 companies);
2. Companies at the stage of growth (38 companies);
3. Companies at the stage of maturity and at the stage of decline/new business (31 companies)

Companies at the founding stage rate factors at the founding stage based on their experience that is still fresh, and at the stage of growth their ratings are more speculative and theoretical. Companies going through the stage of growth know how to do business both at the founding stage and at the stage of growth, all their ratings are based on experience. Mature companies as well as companies at the stage of decline not only know how to do business both at the founding stage and at the stage of growth but also had time to analyze and systematize it, that is why these two stages of development are put into one group.

3.2 Problems and hypotheses under discussion
In this paper I focus on the problems that small innovative business faces in its development and what government can do to help business to cope with the problems. First I analyze barriers for development and then I discuss forms of governmental support.

I put forward the following *hypotheses* for the discussion in this paper:
➢ The RIS is becoming more stable and predictable; the barriers caused by uncertainty of the system are becoming lower. Different groups of companies see different barriers as the biggest obstacles for development, with the barriers of instability being lower for young companies.
➢ When growing business becomes stronger and needs less support from the government. At the stage of growth the barriers are lower and support becomes less important comparing to the founding stage.
➢ Governmental support is called to reduce the biggest obstacles that small innovative business can confront. The most desirable forms of support are those that are aimed to fight against the highest barriers for development.

4 SMALL INNOVATIVE BUSINESS DEVELOPMENT AS AN INDICATOR OF CHANGES IN RIS

4.1 Barriers for development
Small innovative business as other economic agents faces various barriers for development in its activities. These barriers that create obstacles for successful development are an integral part of economic environment. This problem is widely discussed in literature, with factors of external and internal environment being considered (Molz, Tabbaa and Totskaya, 2009; Index OPORY, 2007–2008). On the one hand, there are internal barriers created by nature of small

innovative business, and any company finds them in their way of development. On the other hand, there are external barriers that are attributes of particular system of innovation.

Here we consider such barriers as *cash shortages, shortage of qualified staff, high cost of development of the new offering, high economic risk connected with new offering, long payback period* to be the ones of the first group. They are related to the activities of the company and exist regardless of characteristics of system of innovation. The second group of factors deals with characteristics of external environment and includes institutional, organizational and financial infrastructure, governmental policy in the sphere of innovations, etc. Here we talk about such barriers as *lack of a supporting infrastructure, lack of governmental financial support, lack of legal structure for the innovation, low demand for the new offering, lack of ready market for the new offering, lack of information about the new process or product, little information about markets for the product or service, few opportunities for collaboration or cooperation with other firms and institutions*. They are created by the system of innovation itself and all the agents have to overcome these obstacles that are the same for everyone in the system.

Average ratings of barriers for development given by different groups of the small innovative companies in Novosibirsk region are shown in Chart 2 and Chart 3, with 5 standing for the most important factor and 0 standing for the least important one.

Chart 2: Barriers for development at the founding stage
Entrepreneurship Between Creativity and Bureaucracy

Chart 3: Barriers for development at the stage of growth

Where: **B1** *Cash shortages;* **B2** *Lack of governmental financial support;* **B3** *High cost of development of the new offering;* **B4** *Low demand for the new offering;* **B5** *High economic risk connected with new offering;* **B6** *Long payback period;* **B7** *No ready market for the new offering;* **B8** *Lack of a supporting infrastructure;* **B9** *No legal structure for the innovation;* **B10** *Shortage of qualified staff;* **B11** *Lack of information about the new process or product;* **B12** *Few opportunities for collaboration or cooperation with other firms and institutions;* **B13** *Little information about markets for the product or service*

For the whole sample the most significant obstacles for business development are cash shortages (B1), shortage of qualified staff (B10) and lack of legal structure for the innovation (B9). They are considered to be barriers on every stage of development. Only one of these barriers (that is lack of legal structure for the innovation (B9)) is an external one, the other two are internal ones.

The barrier of cash shortages (B1) is the highest one for the whole sample and for each of the groups, with ratings from young and growing companies being higher at the founding stage and ratings from mature companies – at the stage of growth. This can be easily explained if we try to understand the psychology of making business. Mature companies were founded, on the average, in the second half of 1990s, while growing and young companies, on the average, appeared in 2000 and in 2008 respectively. The results that we get show that when starting a new business in the unstable economy of the 1990s companies gave less thought about their future at the beginning; while in 2000s companies had growing confidence in the future and planned what their funding sources would be not only today but also tomorrow. Thereby, the subjective level of uncertainty is lower for younger companies, which leads to lower ratings of the cash shortages at the stage of growth.

Growing companies rate the barrier of cash shortages (B1) higher than other groups. Yes, mature companies' ratings are not so high, however, we think this is the case because mature companies in general are less susceptible to the barriers (on the average they give lower

ratings comparing to other groups). On the other hand, the fact that young companies rate this barrier lower than growing ones proves that there appears more possibilities for raising funds for innovative business development in the RIS of Novosibirsk region.

As for lack of legal structure for the innovation (B9) that is significant for the whole sample the barrier is high mostly for growing firms. We take it as a proof that the RIS is becoming more clear. Growing companies needed the rules when they started and now young companies don't show this need very much which means that the rules are becoming clearer.

Long payback period (B6) is significant only for mature companies and only at the founding stage. The fact that other groups don't rate this barrier that high proves that the system is becoming more stable when one is not afraid to start new business even knowing that the payback period is long. Also, it is interesting to mention that here we see the biggest difference between the rating at the founding stage and at the stage of growth: it is observed for the group of young companies. One may think that the young companies don't have enough experience, but the managers have 14 years of working experience on the average, of course this experience may come from other sectors (since average age of a firm in the group is 3 years) so we can't call them completely inexperienced. Thus, we see one more proof that there appears stability in the RIS.

No ready market for the new offering (B7) is one the most significant obstacles for young companies both at the founding stage and at the stage of growth. No ready market for the new offering is a barrier for young companies even though the main source of innovative ideas is own ideas and results of own R&D. It means that a new pattern of starting innovation business is appearing in Novosibirsk region when the firm is built into the system from the very begining.

On the average young and growing companies rate barriers higher at the founding stage, while mature ones – at the stage of growth. We think this is the result of firms giving more thoughts about their future when they start, so planning is becoming more important for operating of small innovative business.

4.2 Forms of governmental support

The government is an important part of NSI; it determines the rules of the game. Russia is a federated state, and regional governments have power to determine the rules of the game in the region (of course, they don't contradict federal rules and regulations). Hence, regional government is an important part of RIS. One of the government's key functions is to reduce the influence of the barriers for development. The government possesses a variety of instruments to fulfill this function, one of which is governmental support of small innovative business. For the support to be efficient it is necessary to question small innovative business in what parts of the activities they need assistance.

Average ratings of forms of governmental support given by different groups of the small innovative companies in Novosibirsk region are shown in Chart 4 and Chart 5, with 5 standing for the most important factor and 0 standing for the least important one.

**Entrepreneurship Between Creativity and Bureaucracy**

*Chart 4: Forms of governmental support at the founding stage*

Chart 5: Forms of governmental support at the stage of growth

*Where: **S1** Financial support; **S2** Provision of information about markets, etc.; **S3** Creation of associations of related businesses; **S4** Instruction on business practices; **S5** Cooperation with major firms in the area; **S6** Cooperation with research and educational organizations; **S7** Sponsoring of exhibitions; **S8** Operation of technology transfer centers, business incubators and the like; **S9** Changes in legislation*

Provision of information (S2) is the form of the support that is needed most of all by all groups both at the founding stage and at the stage of growth. Information is the thing that business expects from the authorities first of all.

Financial support (S1) is vital only for young and growing companies; this type of support isn't needed that much by mature companies though their ratings are rather high. It means that

small innovative business have started gaining trust in the governmental authorities, now companies have started to understand that governmental financial support can be one of the ways to cope with the barrier of cash shortages. We can say that governmental authorities now play more active role in the RIS not only forming it but also as agent engaged in the innovation activities itself. We should also mention that at the stage of growth young companies give financial support much lower ratings; however, in our opinion it is mostly caused by optimism of the young firms about the future than by absences of the necessity of the financial support at the stage of growth.

Sponsoring of exhibitions (S7) is important for young and mature companies, with this type of the support being especially crucial for young companies at the founding stage. We think that this is the way the group attempts to overcome the barrier of low demand for the new offering (B4) that is high for them at the stage of growth.

One of the most desirable forms of the support for the growing companies is instruction on business practices (S4). In the 2000s innovative entrepreneurs began to understand that it is vital for successful business development to have special knowledge and competences about making business. Nowadays the majority of the managers already posses knowledge about running innovative business so such type of the support is now less needed by the young companies.

Developing of the innovative infrastructure (such as operation of technology transfer centers, business incubators and the like (S8)) is among most need forms of the support only for mature companies; even though other groups of companies give this form of the support rather high ratings it is not one of the most desirable ones. This means that innovative infrastructure is indeed developing and improving.

On the average growing companies rate the necessity of the support higher than the other groups. Rather low ratings from mature companies could be explained by lack of trust in governmental authorities, the main request was not to hamper. That fact that young companies don't make high demands proves that small innovative business feels the support from the government anyway.

Young companies on the average give higher ratings to the support at the founding stage than at the stage of growth, while growing and mature ones – vice versa. We want to believe that this means that, one the one hand, small innovative business becomes stronger, and the regional innovation system takes its shape, on the other hand.

5   CONCLUSION

To conclude we test the hypotheses put forward above:

 ➢ *The RIS is becoming more stable and predictable; the barriers caused by uncertainty of the system are becoming lower. Different groups of companies see different barriers as the biggest obstacles for development, with the barriers of instability being lower for young companies.* – Indeed, the results that we got allow us to say that Russian economy is moving towards stability and predictability when companies start to gain confidence in the future. Though, there are still some barriers (like cash shortages and shortage of qualified staff) that remain unchanged.

 ➢ *When growing business becomes stronger and needs less support from the government. At the stage of growth the barriers are lower and support becomes less*

important comparing to the founding stage. – This is the case, for the small innovative business on the average barriers are higher at the founding stage than at the stage of growth. However, except for young companies, it wants to receive more support.

➢ *Governmental support is called to reduce the biggest obstacles that small innovative business can confront. The most desirable forms of support are those that are aimed to fight against the highest barriers for development.* – Indeed, companies suffer the most from cash shortages and financial support is among the most desirable forms of support. Though, this is true only for the founding stage.

In spite of the problems that still need to be solved the Regional Innovation System of Novosibirsk region is developing and becoming more and more shaped one, it is becoming more stable and one can make predictions about the future. This creates prerequisites for further development of innovation activities in the region.

ABSTRACT
The goal of this study is to show the relationship between regional development and innovation of small and medium-sized enterprises in Poland. In addition to identifying factors that determine the mutual impact of regional development and innovation in SMEs, the possibilities of measuring this phenomenon were discussed.

Keywords*: Innovation of SMEs, Measurement, Regional development*

1   INTRODUCTION

Nowadays, one often hears that innovation contributes to the economic prosperity and the ability to create and adapt innovations is one of the main factors affecting the development. At the level of companies, regions and countries, but also in the broader aspect, innovation, the factors determining innovation and the effects of their implementation are examined. Very often, attention is focused on innovative companies as the source and supplier of innovative products and solutions. One should, however, remember that not only the company itself but also all its components (human resources, know-how) should be taken into consideration while examining innovation.

While creating and implementing innovation, enterprises, and especially SMEs, become part of a larger system, which to operate efficiently, requires the presence of regional environment conducive to innovation and which enhances ability to create innovation and promotes the penetration of innovation into economy. One should therefore strive to increase innovation not so much the innovation of the same enterprises as the whole regional environments, including the improved public awareness of the importance of innovation in the development of the region and enterprises, and to invigorate authorities of the region to take action to support innovation. The regional innovation policy plays an important role in this respect. The main objectives and support areas of the regional innovation policy should include encouraging innovation potential of the SMEs.

It should be noted that innovative small and medium-sized enterprises operating in the region contribute to its development. They engage local resources, including human resources, create new jobs, pay taxes and in many aspects implement the policy of corporate social responsibility. As a result, people do not emigrate from the region and the region itself is developing. Not without significance for SMEs taking innovation activities is the environment in which SMEs operate. A friendly region, encouraging innovation, motivates enterprises to

---

undertake innovation actions. Therefore, both the innovative SMEs contribute to the development of the region but also the region determines that SMEs are undertaking innovative activities.

The purpose of this study is to show the relationship between regional development and innovation of small and medium-sized enterprises in Poland. The above has served as a background for the debate about the possibilities and methods of measurement of mutual influence of the region and innovative SMEs on each other.

2 REGIONAL DEVELOPMENT IN POLAND

In Poland, regional policy is defined as an integral part of the development policy, which in turn is described as "a set of interrelated activities undertaken and implemented in order to ensure the permanent and sustainable development of the country, socio-economic, regional, and spatial cohesion, increasing competitiveness of economy and creating new jobs at national, regional and local level" (The Act of December 6, 2006).

Since 1999, as a result of introducing in Poland a three-tier administrative division, the development at the level of each voivodeship, there are sixteen of them presently, is regarded as a regional development (Rozwój regionalny w Polsce, 2011, p. 14).

The Polish regions, due to the low GDP, became during the period of programming 2007–2013 the biggest beneficiary of the regional policy pursued by the European Union (Piech, 2011, p. 208). There are still, however, significant regional disparities, which can be reflected by GDP per capita. Table 1 shows the development of this measure over the years 2006–2009.

Entrepreneurship Between Creativity and Bureaucracy

Table 1: GDP per capita in Poland in current prices (Poland = 100) in the years 2006–2009 by regions (Polska w liczbach = Poland in Numbers, 2012, p. 5; Polska w liczbach = Poland in Numbers, 2011, p. 5; Poland in Numbers, 2010, p. 5; Polska w liczbach = Poland in Numbers, 2009, p. 5).

Voivodeship / Year	GDP per capita in current prices in years			
	2006	2007	2008	2009
Lower Silesian (dolnośląskie)	107.0	108.7	107.6	109.0
Kuyavian-Pomeranian (kujawsko-pomorskie)	87.4	86.8	86.4	84.7
Lublin (lubelskie)	67.6	67.7	69.4	67.2
Lubusz (lubuskie)	89.0	88.6	85.8	85.4
Łódź (łódzkie)	91.8	91.9	93.1	91.3
Lesser Poland (małopolskie)	86.7	85.7	86.3	85.8
Masovian (mazowieckie)	159.7	160.1	157.7	160.1
Opolskie	80.4	82.9	84.8	81.7
Podkarpackie	68.4	67.5	69.0	68.5
Podlaskie (podlaskie)	73.4	74.2	73.0	73.7
Pomeranian (pomorskie)	98.5	98.5	94.9	97.3
Silesian (śląskie)	106.1	106.1	108.0	107.2
Świętokrzyskie	76.0	76.9	80.0	77.6
Warmian-Masurian (warmińsko-mazurskie)	75.6	74.4	74.2	73.8
Greater Poland (wielkopolskie)	105.3	104.5	104.4	106.3
West Pomeranian (zachodniopomorskie)	91.1	89.8	90.7	87.9

Over the years, the Masovian (mazowieckie) voivodeship with Warsaw, the capital of Poland, crucial for development, was the best developed region in Poland. The GDP per capita higher than the average for Poland was also in following voivodeships: Lower Silesian, Silesian, and Greater Poland. Other regions produce a lower level of this indicator than the average value for Poland. This is an alarming phenomenon, given the fact that GDP per capita in Poland in 2009 stood at 60.6% of its equivalent for EU (Polska w liczbach, 2011, p. 4). Therefore, it is important for our country to develop regions and pursue active regional policy.

While examining the key factors of regional development in Poland the Ministry for Regional Development (MRD) pointed to (Rozwój regionalny w Polsce, 2009, pp. 23–24):
1. Resources:
    a. Human and social capital,
    b. Knowledge and innovation, including business competitiveness and innovation,
    c. Financial capital,
    d. Material resources.
2. Institutional factors:
    a. Quality and efficiency of public administration, including conditions for conducting economic activity and business environment,

    b. Institutional capability to manage development, including ability to plan, implement and appraise development policies, strategies, programs, and projects.

At the same time the MRD pointed out determinants decisive for further development of Polish voivodeships and made them necessary to (Rozwój regionalny w Polsce, 2009, p. 24):

- Develop regional specialization, e.g. in order to attract innovative companies,
- Develop knowledge and skills of human capital and to use them in economic processes,
- Boost ability to produce, develop, and diffuse innovations as determinants of contemporary development,
- Prepare the administration to manage development.

Thus, the same Ministry makes the development of Polish voivodeships dependent on innovation of enterprises operating in the region.

Taking above into account, it should be noted that in addition to regional policy, this is the innovation policy which becomes an integral part of regional development. The innovation policy may be defined as a system which consists of government programmes, instruments, mechanisms, and measures for affecting the level of innovation of particular entities, sectors as well as development of innovative structure of the economy (Okoń-Horodyńska, 2007, p. 3). By analysing the above concept, the regional innovative policy may be regarded as a set of instruments, principles, mechanisms, and measures used by entities of regional policy to stimulate innovative processes in the region (Nowakowska, 2011, pp. 102–103). The decentralization introduced in Poland in 1999 created the basis for pursuing active policy aimed at development of particular voivodeships on the basis of innovation. The main objectives of this policy and support areas include stimulating innovative potential of enterprises and SMEs in particular (Nowakowska, 2011, p. 4).

In Poland, each region has the so-called Regional Innovation Strategy (RIS). As a rule, these documents define regional plans of strategic nature within broadly understood innovation. It can be noted, however, that in many aspects the RISs do not take into account the specificity of particular regions (Nowakowska, 2011, p. 188) and set for regional innovation policy similar targets which in particular include:

1. Building a knowledge-based economy,
2. Improve co-operation between R&D centres with business,
3. Support the development of clusters,
4. Revival of business environment,
5. Better access for small and medium-sized firms to external financing (more information about regional innovation strategies can be found at http://www.pi.gov.pl/Polityka/chapter_86578.asp).

All the above mentioned targets will directly or indirectly determine the innovation activity of SMEs which shows the importance of this sector for regional development.

3   INNOVATIVE ENTERPRISES IN POLAND - REGIONAL APPROACH

In Poland the statistics of enterprise innovation are conducted by Central Statistical Office (CSO). The studies cover enterprises employing more than 9 persons, and therefore the so-called micro-enterprises are omitted. The study classifies enterprises according to the number of employees. Out of the surveyed enterprises 95.1% of enterprises in industry and 97.5% of

enterprises in services can be categorized as small and medium-sized enterprises therefore the vast majority of the sample were the SMEs.

Analysis of small and medium-sized enterprises demonstrated that:
- The percentage of medium-sized companies (50–249 employees) conducting innovative activity is two to three times higher than that of small enterprises (10–49 employees),
- The percentage of small and medium-sized enterprises implementing product[2] and process innovations is higher than in the case of organizational and marketing innovations (Działalność innowacyjna przedsiębiorstw w latach 2009–2011, *2012*).

For details, see Table 2.

Table 2: Percentage of innovative enterprises in the years 2009–2011 in Poland by number of employees (Działalność innowacyjna przedsiębiorstw w latach 2009–2011 = Innovation Activities of Enterprises in 2009–2011, 2012, pp. 26, 36, 42; http://www.stat.gov.pl/gus/nauka_technika_PLK_HTML.htm)

Type of innovation	Sector	10–49	50–249	250 and more employees
Product and process innovations	Industry	8.9	30.1	57.8
	The service sector	9.1	19.6	44
Marketing Innovations	Industry	5.3	11.4	29.9
	The service sector	6.5	11.4	30.7
Organizational Innovations	Industry	4.5	13.7	38.8
	The service sector	7.4	14.7	34.5

The CSO report identifies three types of innovation: product/process, marketing, and organizational. Although the Oslo Manual separately addresses product/service innovations and process innovation (Oslo Manual. The Measurement of Scientific and Technological Activities. Guidelines for Collecting and Interpreting Technological Innovation, 2005, pp. 16–17), the use of this classification is justified because often the product innovation is the result of process innovation and to create an innovative product may require the use of innovative machines and processes.

In addition, companies operating in the service sector and industry were separately considered in the study.

In Poland, this is the industry sector that is characterized by a higher percentage of companies implementing product/process innovations. The percentage of companies in the service sector, innovative in terms of product or process, is lower. This may be due to specificity of categories of innovations under consideration.

A comparison of innovation-active enterprises with those which actually introduced product/process innovation provides interesting information. The percentage of innovative enterprises is lower, but only slightly, than percentage of innovation-active enterprises. This means that the majority of innovative actions taken by Polish companies have been successfully completed and the companies have placed on the market product/service, or process innovations.

---

[2] The concept of product innovation includes also service innovation.

Analysis of the structure of innovative companies by regions shows that it is difficult to explicitly determine which voivodeship is dominated by product, service, or process innovation entities. In industry, the biggest percentage of companies which implemented the said type of innovation was found in Podkarpackie, Opolskie, and Lesser Poland voivodeships. On the other hand, in the service sector, the biggest percentage of enterprises which successfully implemented product/process innovations operated in Pomeranian, Masovian, and Silesian voivodeships.

The study confirms the existence of significant differences in the level of innovation among industrial enterprises and enterprises in the service sector at the level of voivodeships in implementation of product/service innovations. The difference between the highest and the lowest value of percentage of innovative industrial enterprises in voivodeships is 9.9 percentage points, while for enterprises in the service sector it is 7.6 percentage points. (Działalność innowacyjna przedsiębiorstw w latach 2009-2011, 2012, pp. 7, 23–29). For details, see Table 3.

Table 3: Percentage of innovative and innovative-active enterprises in product and process innovations in the years 2009–2011 in Poland, regional approach (Działalność innowacyjna przedsiębiorstw w latach 2009–2011 = Innovation Activities of Enterprises in 2009–2011, 2012, pp. 23–24, 29; http://www.stat.gov.pl/gus/nauka_technika_PLK_HTML.htm)

Sector	Industry		Services	
Voivodeship	Innovation- active enterprises	Innovative enterprises	Innovation- active enterprises	Innovative enterprises
Pomeranian (pomorskie)	16.5	16.2	15.3	14.1
Masovian (mazowieckie)	15	13.9	14.4	13.7
Silesian (śląskie)	17	15.2	15.1	13.2
Kuyavian-Pomeranian (kujawsko-pomorskie)	19.1	18.8	11.9	11.9
Greater Poland (wielkopolskie)	18.9	18.5	12.3	11.7
Podkarpackie	22.2	21	12.5	11.4
Lesser Poland (małopolskie)	20.2	19.5	12.1	11.1
Opolskie	20.6	20.1	10.3	10.3
Lubusz (lubuskie)	12.5	12.3	11.2	10.2
Lublin (lubelskie)	20.1	19.3	10.8	9.7
Lower Silesian (dolnośląskie)	16.1	15	9.7	9.6
Warmian-Masurian (warmińsko-mazurskie)	16.1	15.5	9.7	9.4
Podlaskie (podlaskie)	17.1	17.1	9.3	8.9
Łódź (łódzkie)	11.5	11.1	8.5	8.5
Świętokrzyskie	15.9	15.6	7.9	7.7
West Pomeranian (zachodniopomorskie)	14.1	13.2	6.6	6.5

Based on the analysis of Polish enterprises in terms of implementation of organizational and marketing innovations it can be concluded that the percentage of firms introducing innovations under consideration is similar. The differences in this regard between companies in the industrial and service sectors are negligible.

The analysis of innovation structure by regions shows that the biggest percentage of enterprises which have successfully implemented marketing and organizational innovations could be seen in Pomeranian, Masovian, and Greater Poland voivodeships. Similar regional structure could be found among service enterprises which implemented product and process innovations. Unfortunately, the analysis of the structure of industrial innovative companies by regions does not clearly show which voivodeship is dominated by entities innovative in terms of organization or marketing except for the emerging Lesser Poland voivodeship. (Działalność innowacyjna przedsiębiorstw w latach 2009–2011, 2012, pp. 39–45). For details, see Table 4.

Table 4: The percentage of innovative companies in the field of marketing and organizational innovations in the years 2009–2011 in Poland - by regions (Działalność innowacyjna przedsiębiorstw w latach 2009–2011 = Innovation Activities of Enterprises in 2009–2011, 2012, pp. 39, 45; http://www.stat.gov.pl/gus/nauka_technika_PLK_HTML.htm)

Sector	Industry		Services	
Voivodeship	Marketing innovation	Organizational innovation	Marketing innovation	Organizational innovation
Pomeranian (pomorskie)	7.1	7.8	9.7	10.7
Masovian (mazowieckie)	7.6	6.4	10	14.2
Silesian (śląskie)	7.4	10.2	7.9	9.3
Kuyavian-Pomeranian (kujawsko-pomorskie)	8.9	9.1	7.6	4.2
Greater Poland (wielkopolskie)	7	7.7	8.3	11.4
Podkarpackie	9.5	9.5	7.8	4.6
Lesser Poland (małopolskie)	11.6	12.1	7.4	7.9
Opolskie	6.4	9.9	4.8	5.5
Lubusz (lubuskie)	6.1	7.3	4.6	3.8
Lublin (lubelskie)	10.1	8.6	5.2	5
Lower Silesian (dolnośląskie)	7.3	9.4	5.5	7
Warmian-Masurian (warmińsko-mazurskie)	6	9.7	8.3	8.5
Podlaskie (podlaskie)	7.1	5.1	5.9	3.4
Łódź (łódzkie)	9.9	6	6.5	5.4
Świętokrzyskie	7.4	4.9	4.8	4.2
West Pomeranian (zachodniopomorskie)	4.8	6.4	6.6	9.0

Summing up the above it should be noted that it is not possible to indicate the leading voivodeship in the context of the share of innovative companies in all enterprises operating in the region. One voivodeship is characterized by a high percentage of service companies implementing organizational innovations and another by a high share of industrial firms introducing process innovations.

4   SMES AND THEIR IMPACT ON REGIONAL DEVELOPMENT

A region is an open system, dependent on the environment in which it operates. The analysis of regional development cannot ignore the importance of SMEs as an element of the region's environment. The literature cites a number of reasons for the above. This paper will present the most popular concepts.

Firstly, the small and medium-sized enterprises are a manifestation and visible effect of entrepreneurship which since the times of Schumpeter has been considered to be an important factor of economic growth (eg. Schumpeter, 1934). Secondly, they are the givers and takers of innovation contributing to the economic development based on innovation. Thirdly, this type of firms occurs mostly in places where the entrepreneurs/founders live and take advantage of local resources, pay their taxes there and create a climate for further investment, resulting in the development of the region and reducing disparities in (Krawczyk, 2012, pp. 28–29). Fourthly, the small and medium-sized enterprises are active executors of the concepts of sustainable development and corporate social responsibility, which is also a factor for development of the region (eg. COM, 2002, 347; Schaper, 2002, pp. 526–527; Wprowadzenie do tematyki społecznej odpowiedzialności biznesu dla małych i średnich przedsiębiorstw, p. 2). And fifthly, the small and medium-sized enterprises account for a majority of all enterprises which demonstrates the strength and importance of the whole SMEs sector in the context of innovation and impact on regional development (Duarte, 2004, p. 1).

In view of the above one should take innovative SMEs in regional innovative policy and strive to identify barriers they face and find solutions for the support of their innovative activities. To achieve this it is necessary to properly classify and collect information, which will make it possible to come to the heart of the problem and based on the results of data analysis take appropriate actions (Głuszczuk, 2011, p. 99).

5   MEASURING ISSUES OF THE MUTUAL INFLUENCE OF INNOVATIVE SMES AND THE DEVELOPMENT OF REGIONS

The importance of the innovation-based development requires an on-going monitoring of the level of innovation (Giovannini, 2008, p. 106), not only at the national level but also in other disaggregated approaches (*Measuring Innovation* …, 2010). A region or an enterprise may be the subject of disaggregation. In addition, one can explore many aspects within this framework, including development based on innovation. It is argued that the systemic approach to innovation process statistic surveys may become a source of information on firms' linkages with other actors on the innovation scene including also a region (Oslo Manual, 2005, p. 40).

As evidenced by the OECD regional differences in levels of innovation activity can be substantial. Therefore, prior to measurement, it is necessary to identify main characteristics and factors that promote innovation activity and regional development (Oslo Manual, 2005, p. 39). The elements quoted above, that determine growth of regions include resources (human, financial, material, available knowledge and innovation potential) and institutional factors (e.g. the number and scope of operation of business environment institutions, the efficiency of public administration) (Rozwój regionalny w Polsce, 2009, pp. 23–24). Each of these factors can and should be measured in order to show the full picture of innovativeness of regions and enterprises operating in these regions.

In our opinion, due to the above and in order to indicate mutual influence of innovative SMEs and the region on each other it is necessary first to identify and measure the determinants of innovations in SMEs and separately identify and measure elements affecting the development of the region based on innovations. On the one hand, it will show to what extent the regional (innovation) policy decides that SMEs take up and pursue innovation activity and ensures the success of innovation in the regional market. On the other hand, it will show the main sources of innovation in the region and SMEs' help in this respect, and will reflect the effects of the regional innovation policy.

This will also help find common barriers that hamper innovation activity and slow down regional development. It must be remembered that the region and the entities operating in the region, including enterprises, operate in the same environment and use the same resources.

Measurement of business innovation and regional development measure are difficult issues. This is due to:
- Limitations encountered by surveys of innovation and regional development (Kozłowski, 2009, pp. 105–121),
- The impact of factors which are difficult to measure on innovation and regional development (Papon and Barré, 1993, p. 138),
- Continuity of the innovation process (Krawczyk, 2012, p. 55–56).

Since the measurement of innovativeness of enterprises, including small and medium-sized, as well as measurement of regional development based on innovation face many constraints, it is necessary to consider whether it is possible to examine the mutual influence of the region and SMEs sector on each other.

Taking into account the data given in this paper on innovations implemented in the region it should be noted that the data did not allow to clearly identify the Polish voivodeships with the biggest number of innovative firms.

The possibility of verifying to what extent the innovation which is implemented is the sole effort of the enterprise and to what extent the success of innovation was determined by the level of regional development is an additional problem. It is therefore difficult to measure the impact of the region and regional policy on the process of creating innovation by SMEs and whether the innovation succeeds or fails in the market.

We are of the opinion that it is an extremely difficult process to measure the influence of the region and the SMEs sector on each other. It requires colleting extensive range of statistical data, building new measures and constant monitoring because of the changeability of environment. In addition, the occurrence of these constraints and barriers hampering both the innovation activity of SMEs and regional development may distort the obtained measurement.

Nevertheless it is necessary to make attempts to estimate the influence of small and medium-sized enterprises on the region and the region's influence on SMEs. This will allow drawing conclusions which could be implemented when developing regional, innovative or entrepreneurial policy.

6 CONCLUSION

Since 1999, as a result of a three-tier administrative division introduced in Poland, it is a voivodeship which has been regarded as a region. There are sixteen voivodeships in Poland. The Polish regions, due to the low GDP, during the period of programming 2007–2013, have become the biggest beneficiaries of regional policy pursued by the European Union. There are still, however, significant disparities in the development of voivodeships, which can be reflected by GDP per capita or the percentage of innovative SMEs in all enterprises operating in the region.

Similar to the low GDP per capita in particular voivodeships so low is the percentage of innovative small and medium-sized enterprises operating in the Polish regions. This can confirm the existence of a relationship between regional development and innovation of SMEs. According to the studies of Central Statistical Office in Poland ca. 9% of small and 30% of medium-sized industrial enterprises have implemented product/process innovation. This percentage is lower for companies operating in the service sector and SMEs which introduce organizational and marketing innovations. Characteristic for the Polish regions is the existence of significant differences in the level of innovation of industrial enterprises and the service sector at the level of voivodeships, which may be due to low innovation potential of the firms themselves as well as that of the environment in which they operate, the regions in particular.

Therefore one should take actions aimed at understanding and measuring the factors which decide that SMEs take up innovative actions as well as determine the developments of regions. It must be however remembered that innovative small and medium-sized enterprises bring many benefits to the region and the friendly region is conducive to innovation activities. This bilateral relationship between SMEs' innovative activities and regional development is, unfortunately, difficult to grasp, and thus to measure.

Entrepreneurship Between Creativity and Bureaucracy

LARGE AND SMALL BUSINESS IN RUSSIA: INNOVATIVE ACTIVITY AND STRATEGIC PRIORITIES

Svetlana Kuznetsova
Novosibirsk State University, Russia
kuzosvet@mail.ru

ABSTRACT

Industrial companies are the core of the national innovation system. However, large, medium and small enterprises differ significantly in their role in the innovation system, resource potential, strategic priorities and objectives. The paper focuses on a comparative analysis of the strategic priorities of innovative activities of Russian companies of different size. We have identified three types of companies: small innovative companies, large and medium-sized companies with a traditional business model, major innovation-driven companies with an integrated business model. Our analysis of the trajectories of small innovative firms located in Novosibirsk Scientific Center showed that the majority of the companies could be characterized either as Start-up firm or as Specialized supplier. Start-ups are newly established small firms who have recently separated from the major research labs or parent companies. The typical behavior model for such companies is innovative entrepreneurship. Specialized suppliers are small companies that provide significant contributions to complex manufacturing systems in the form of equipment, parts, tools and software. Innovative objectives of such small companies deal with design and production of the specific elements required for large companies. Large and medium-sized companies with a traditional business model are characterized by the existing structure of commodity output and the supply chain. Characteristic type of innovative behavior for such companies includes incremental product and process innovations. Large innovation-oriented companies with an integrated business model have in their structure traditional production units and innovative units. Innovation priorities of major innovation-oriented companies with integrated business model are consistent with the hybrid model of behavior which combines the traditional model with an innovative entrepreneurship.

Keywords: Business model, Innovation, Strategic priorities

1 INTRODUCTION

Industrial companies are the core of the national innovation system. However, large, medium and small enterprises differ significantly in their role in the innovation system, resource potential, strategic priorities and objectives. The paper focuses on a comparative analysis of the strategic priorities of innovative activities of Russian companies of different size.

The complexity of such analysis is due to the low availability of information. This appears as a consequence of imperfect innovation statistics, information closeness of Russian companies, their unwillingness to disclose the innovation side of the business.

In the matching process we used:
- Official data of State Statistics

- The data collected through special study of small innovative firms located in Novosibirsk Scientific Centre[1]
- The data collected through special study of small innovative companies in the project "Competing for the Future Today: a New Innovation Policy for Russia"
- Rating agency "Expert RA" researche
- Inputs for the report of the RSPP "The Competitiveness of Russian Business and its Development in the Near Future"
- Research of the New Economic School (NES) and the Center of Technology and Innovation PricewaterhouseCoopers.

The heterogeneity of data sets underlying this research as well as different approaches to data collection and analysis cause the illegitimacy of comparing the numerical values of specific parameters. Nevertheless we were able to identify some general facts and trends.

2   INNOVATIVE BEHAVIOR AND STRATEGIC PRIORITIES

To characterize the features of innovative behavior, depending on the scale of the business, we have divided companies into three types: small innovative companies, large and medium-sized companies with a traditional business model and major innovation-driven companies with integrated business models (companies with research and production units).

Small innovative companies are extremely important in developed market-oriented countries since they act as main institutions providing effective transfer of the fundamental research to real economy. Our analysis of the trajectories of small innovative firms located in Novosibirsk Scientific Center showed that the majority of the companies could be characterized either as Start-up firms or as specialized suppliers (Kuznetsova, 2010).

Start-ups are newly established small firms who have recently separated from the major research labs or parent companies. Usually at the start of their activities such companies rely heavily on the "mother" organization. This can be in a form of direct financial support or shared infrastructure. The later means that small company is allowed to use on favorable terms space and/or research and production base of the "mother" company or research institute. The typical behavior model for such companies is innovative entrepreneurship - selection and pilot exploration of scientific and technological ideas.

Specialized suppliers are small companies that provide significant contributions to complex manufacturing systems in the form of equipment, parts, tools and software. Innovative objectives of such small companies deal with design and production of the specific elements required for large companies.

Large and medium-sized companies with a traditional business model are characterized by the existing structure of commodity output and supply chain. Strategic focus of such companies on operational efficiency and financial performance certainly affects their innovation priorities. The research of large Russian companies' innovative projects, made by the "Expert RA" agency, showed that the majority of projects aim to increase quality of traditional products or to upgrade them to higher price segments. Generally our large companies'

---

[1] The study was conducted in 2009–2010 by the group of researchers with the participation of the author. The special questionnaire was worked out. The sample consists from 60 firms.

products place on the Russian and international markets tend to take place in the price range between products from China and products from the U.S. and Europe. Almost all the surveyed companies are focused on the Russian market. Almost all presented projects are related to "improving" innovations. Unfortunately "pioneer" projects aiming to establish leadership in high-technology industries or create new markets are missing in the sample (http://www.raexpert.ru/researches/stimulate_innovation/part1).

Thus characteristic type of innovative behavior of large companies with a traditional business model includes incremental product and process innovations.

Major innovation-driven companies with an integrated business model have in their structure traditional production units and innovative units, involved in the development of new high-tech areas. Unfortunately businesses that can be classified as a major innovation-oriented companies with an integrated business model are very few in Russia. The most vivid examples are Rosatom State Nuclear Energy Corporation, Russian Technologies State Corporation, Corporation (AFK) "System", Federal Grid Company UES.

Innovation priorities of major innovation-oriented companies with integrated business models are consistent with the hybrid model of behavior which combines the traditional model with an innovative entrepreneurship.

The typical innovative behavior models of different groups of companies are summarized in Table 1.

Table 1: Models of innovative behavior

Type of company	Characteristics of innovative behavior
Small innovative companies	
-Start-ups	Innovative entrepreneurship - selection and pilot exploration of scientific and technological ideas
- Specialized suppliers	Design and production of the specific components
Large and medium-sized companies	
Large/medium-sized companies with traditional business models	Incremental product and process innovations
Major innovation-driven companies with integrated business models	The hybrid model (traditional model + innovative entrepreneurship)

3 INNOVATIVE ACTIVITY OF LARGE AND SMALL BUSINESSES

According to statistics during the first decade of the XXI century innovative activity of Russian industry remained low: the number of enterprises that carried out innovations is in the range from 9.3 to 10.6% of the total number of enterprises. The highest values of indicators of the innovative activity are typical for Russian high-tech sectors (telecommunication equipment, aircraft and space vehicles, etc.): in 2009 the corresponding value approached the European average and reached 29%.

In an analytical report "Russian innovation index" (Gohberg, 2011) dedicated to an evaluation of the status of the Russian innovation system components it is showed that the innovation activity of an enterprise directly depends on its size (see Table 2).

Table 2: Innovation activity and size of the business

Number of personnel	less than 50	From 50 to 100	From 100 to 200	From 250 to 500	From 1000 to 5000	From 5000 to 10000	More than 10000
The share of innovative companies (%)	1,2	4,6	7,0	12,5	39	70	76,6

Thus, the innovative activity of small businesses in Russia is much lower than that of large ones. However a number of recent studies has shown a positive dynamics of the share of small enterprises implementing technological innovation. Leaders in innovation activities are enterprises in the chemical industry (11.3%) and also enterprises producing electrical, electronic and optical equipment (10.9%).

The causes of low innovation activity of Russian companies are rooted in the sectoral structure of the economy as well as the lack of sufficient incentives for innovations. A low level of competition in the dominant part of Russian markets reduces motivation for their design and implementation. Lack of resources typical for our enterprises also has a negative impact on their innovative activity.

Russian companies are spending on innovations much less than their foreign competitors in the relevant sectors. As a result active enterprises never have enough resources for the innovations.

According to the study of rating agency "Expert RA", before the crisis the share of R&D expenditure in revenues of the largest Russian companies (rating "Expert-400") was about 0.5%, 4-6 times lower than that of foreign companies. In two last years this index had fallen by more than a half - to 0.2% of total revenues.

Leaders in terms of R & D investments in Russia are the machine building companies, but even among them the ratio of R & D costs to revenue do not exceed 2%. In less technologically advanced sectors of the economy the gap is even larger. For example, for Severstal Group the ratio of R&D costs to the company's revenue in 2009 amounted to 0.06%, while the value of the same indicator of metallurgical corporation ArcelorMittal was to 10 times more. According to some estimations, corporate spending on R&D in Russia had been rapidly recovering in 2010. However, the return of innovative activity of large Russian companies to pre-crisis levels would only mean the conservation of the gap with the world's technological leaders.

Entrepreneurs themselves consider underfunding as a leading cause of the sluggish innovative activity of enterprises. According to statistics, 74% of the total expenditure on innovation in the industry as a whole in 2009 were own funds of enterprises. Budget support provided only 3.4% of these costs (Gohberg, 2011). Our study confirms that this trend holds for small innovative firms. 98% of the respondents used own funds to finance innovation. Among other sources of funding the majority of respondents pointed bank loans, public and partners money.

Entrepreneurship Between Creativity and Bureaucracy

In general for the Russian industry the share of innovative products in the total sales amounted 4.6% in 2009. In fairness it should be noted that such a low value of the index is due to the crisis in the economy. In the preceding five years this indicator showed a somewhat higher value. The share of fundamentally new products in total industrial production in Russia is very small, less than one-tenth of a percent. The value of this parameter in the high-tech sector is slightly higher (0.5%). In the total volume of innovative products items which are new only for the producing company or improved products, characterized by a low level of novelty, strongly dominate.

HSE survey found that only 5% of large innovative companies believe that their products are new to the world market, the majority focuses product innovations to national Russian markets.

Innovative activity of large Russian companies is focused primarily on the acquisition of machinery and equipment of foreign manufactures. Even mega-companies employing over 10 thousands people prefer importing key knowledge from abroad. The main reason is the deep technological gap, so the follower strategy is the only leaving alternative (Gonchar, Kuznetsov and Simachov, 2010). The data shows that a high percentage of companies (34.6%) from the group of innovation-active did not carry out any activity relating to the creation of new knowledge (research, development, design). It also indicates that the dominant strategy is a passive technological borrowing. Although most researchers agree that the borrowing and adaptation could become the main sources of rapid catch-up technology development, the experience of the advanced innovative countries testifies that borrowing must be accompanied by the creation of an additional new knowledge. In terms of "the ability of companies to borrow and adapt technologies" Russia was at a 41 place out of 133 in 2009 (http://www.raexpert.ru/researches/stimulate_innovation/part1).

For small enterprises an average value of an index of the share of innovative products in the total goods and services produced is less than the total for the industry. On the whole in the manufacturing industry the share of innovative products is 1.5%. Somewhat better the situation is in the chemical industry (4%) and in the production of electrical and optical equipment (5.4%).

In our study using two basic parameters (level of products' novelty and orientation to the national or international market) we distinguished a group of 26 companies (30% of respondents), which we call "leaders". For such companies, the predominant sources of technological innovation are a privatization of academic results and development of products and processes in rapidly growing sectors (specialized software, scientific instrumentation, biotechnology, electronics, etc). Average assessments of a level of the produced goods/services novelty for the leaders are rather high: 61.5% of respondents believe that their products are new for the Russian market, and 50% - new to the world market. The relatively high level of the novelty of the products of companies - leaders is accompanied by using a strategy "high quality at a high price". In general companies - leaders are following a more proactive approach, they tend to be more open to the outside world and are willing to cooperate with other actors of the innovation system (Kravchenko, Kuznetsova and Usupova, 2011).

4 INCENTIVES AND BARRIERS TO INNOVATION

A number of surveys of Russian companies clearly demonstrate that in general the Russian economic environment does not generate sufficiently strong incentives to increase the innovative activity of companies. However, factors that motivate companies to innovate are essentially determined by their industry and characteristics of the markets. According to companies' executives, only two sectors of the Russian economy (the food industry and the ICT sector) have relatively high incentives for innovation in combination with sufficient resources. In the majority of industries including oil and gas, electronics, automobiles, infrastructure industries a level of incentives for innovative activity is estimated as very low. Innovative activity of firms is negatively affected by such industry factors as existing level of competition, low requirements for innovativeness of products and services in the domestic market, complexity of the access to the global markets, low level of intellectual property protection (http://www.opora.ru/analytics/our-efforts/2010/06/30).

One of the main objectives of our study of small innovative firms located in Novosibirsk Scientific Centre was to identify the main barriers for their development and growth. In the questionnaire we pointed out typical barriers, which were estimated by respondents on 6-grade scale (5 – the most important, 0 - insignificant).

As the most significant barrier respondents indicated the lack of financing for business creation and development. Financing is the key factor for all small business. The majority of new firms are low-budget start-ups launched with personal savings and contributions of friends or relatives. The second barrier is the shortage of qualified staff. The staff limitation becomes more important as a company moves from introduction to growth stage of life cycle. Inadequate laws, a high cost of innovation and an uncertainty of demand for new products were also recognized as significant obstacles to business development (Kravchenko, Kuznetsova and Usupova, 2011).

In a project "Competing for the Future Today: a New Innovation Policy for Russia" the survey of executives of small innovative companies as well as representatives of medium and large businesses was carried out. In the survey managers were asked to name three major obstacles restricting the innovative development of their companies. The representatives of small businesses named as the main obstacles for innovation the lack of available funds within the company, the low availability of external financing and the costs and risks associated with innovation. 18% of respondents consider as the significant obstacle to innovation the lack of qualified personnel. Ranking the barriers for large and medium enterprises shows very similar results (Table 4).

Entrepreneurship Between Creativity and Bureaucracy

Table 4: The most important barriers to the innovative development

	Small business, Novosibirsk (score on a 6-point scale)	Small Business [5] (% of respondents who reported this factor)	Large/Medium Business [5] (% of respondents who reported this factor))
1	Lack of financing (3,2)	Lack of available funds within the company (60%)	Lack of available funds within the company (62%)
2	Shortage of qualified staff (2,8)	Low availability of external financing (50%)	High costs of innovation (33%)
3	Inadequate laws (2,7)	High costs of innovation (40%)	Low availability of external financing (33%)
4	High costs of innovation (2,4)	Uncertain demand for new offerings (24%)	Uncertain demand for new offerings (23%)
5	Uncertain demand for new offerings (2,3)	Shortage of qualified staff (18%)	Shortage of qualified staff (19%)

Thus, we can draw a general conclusion that major barriers to innovative development of Russian companies are financial and demand constraints, imperfect institutional environment and human potential.

5 CONSLUSION

Although major business is at the heart of the Russian innovation system, most of the largest Russian companies focus their innovation on the domestic market by implementing a strategy of passive technology adoption. A contribution of small business in the innovative development of the country is still fairly low but the results of surveys and prominent success stories of small innovative firms show that a cohort of small innovative companies with products that meet world standards of novelty and aiming the global markets is formed.

Cooperation of participants of the national innovation system is crucial for its effective functioning. Increasing the contribution of small business in the innovative development should be supported by a creation of innovative infrastructure, formation of demand for innovative products from the big business and the state.

THE ROLE OF SMES IN NATIONAL ECONOMIES: THE CASE OF SOUTH AFRICA

Spiwe Masarira

masariras@gmail.com

Pumela Msweli
University Of Limpopo, Faculty of Management and Law, South Africa
Pumela.Msweli@ul.ac.za

ABSTRACT
The structure of business in South Africa has changed quite significantly over the past 15 years. Historically dominated by large corporations and their expansion programmes, South Africa's economy and its future growth is now depending on SMEs. In pursuit of economic participation by all, the development of small and medium-sized enterprises (SMEs) has become vital to bring about economic prosperity in South Africa. Although limited in size, SMEs dominate local and international economies in numbers. SMEs encompass a very broad range of firms, from established traditional family businesses employing over a hundred people (medium-sized enterprises), down to the survivalist self-employed from the poorest layers of the population (informal microenterprises). The sector is acknowledged worldwide as an economic powerbase to stimulate economic growth. Small and medium-sized businesses are therefore not merely necessary, but vital in an emerging and growing economy such as that of South Africa. In South Africa, SMEs account for about 91% of the formal business entities, contributing to about 51% of GDP, and providing almost 60% of employment. The South African government has therefore prioritised the advancement of Small, Medium and Micro-sized Enterprises (SMEs) as the catalyst to achieving economic growth, development, job creation, mitigation of poverty, and as an economic empowerment vehicle for previously disadvantaged people. The main challenges affecting SMEs in South Africa include lack of management skills, finance, access to bank credit, lack, access to markets, and skills shortage. The African continent is currently undergoing an unprecedented rate of rapid development. Without economic transformation, however, it is difficult to expect further progress. In this regard, the promotion of SMEs cannot be overlooked.

Keywords: Challenges, Economic growth, SMEs, South Africa

1 INTRODUCTION

SMEs are now appreciated as a necessary complement to the industrial structure of any modern economy in many developed and developing nations of the world. In many countries, the dynamic role of SMEs as engines through which the growth objectives of development can be achieved has long been recognized. This role is especially prevalent in meeting the challenges of unemployment, in ensuring a more equitable income distribution and in providing opportunities for individual skills development. Small and medium-sized businesses are not merely necessary, but vital in an emerging and growing economy such as that of South Africa.

The structure of business in South Africa has changed quite significantly over the past 18 years. While South Africa's economy has historically been dominated by large corporations and their expansion programmes, this is no longer the case. The South African government

has prioritised entrepreneurship and the advancement of Small, Medium and Micro-sized Enterprises (SMEs) as the catalyst to achieving economic growth and development, (Department of Trade and Industry, 2001).

In view of the importance and place of SMEs in an economy, it is imperative that SMEs be given the priority they deserve. In his 2011 State of the Nation address, President Zuma stated that "the small business sector is a critical component of the job creation drive". The purpose of this paper is to highlight the role that SMEs play in the South African economy and to revisit the challenges facing the growth of South African SMEs. Despite voluminous research, however, there is still little clarity on the extent to which South Africa's SMEs contribute to poverty alleviation, economic growth, or international competitiveness.

2   ECONOMY OF SOUTH AFRICA

The economy of South Africa is the largest in Africa. It accounts for 24% of Africa's Gross Domestic Product, and is ranked as an upper-middle income economy by the World Bank, which makes the country one of only four countries in Africa represented in this category (the others being Botswana, Gabon, and Mauritius (Therichest.org, 2012). According to official estimates, a quarter of the population is unemployed (Bloomberg, 2010) and a quarter live on less than US $1.25 a day (UNDP, 2011).

The first South African democratic government inherited from apartheid extreme levels of poverty, inequality in wealth and income and highly skewed access to social services, educational and employment opportunities. Since 1994, South Africa has been faced with the challenges of re-integration into world markets as a global economy, while at the same time positioning itself to realise the high expectations of its populace regarding a successful transition towards a more democratic order. To achieve the objectives of economic growth through competitiveness, employment generation and income redistribution, South Africa's small, micro and medium-sized enterprise (SME) economy has been actively promoted since 1995.

3   THE SOCIO-ECONOMIC PROBLEMS IN SOUTH AFRICA

Every country has its own unique socio-economic problems. The socio-economic problems of South Africa have been exacerbated by the apartheid policies followed by the previous government. In spite of it being over 18 years since the demise of apartheid, poverty, ailing public health system, HIV/AIDS, xenophobia, crime, poor service delivery, and a lack of access to education, housing, and employment opportunities, is still a reality for millions of previously disadvantaged South Africans. According to data provided by the last census in South Africa in 2011, approximately 25% of South Africa's 51 million inhabitants live in informal dwellings, many in corrugated wood or iron shacks facing a range of basic livelihood challenges, including poor access to basic sanitation and water supply, solid waste accumulation, recurrent shack fires, safety and security risks, and a range of health hazards, (Statistics South Africa, Community Survey, 2011). Despite the best intentions of government, and the progressive nature of policies such as Breaking New Ground, limited progress has been made in bringing much needed development and quality of life improvements to this significant portion of South Africa's population. Research has shown that the poverty gap between the rich and the poor is widening, and some municipalities have as many as 85% of their residents living below the breadline (HSRC Review, June 2012).

Despite good economic growth in the past, a major concern for South African economists is the lack of job creation, which results in high unemployment, for example, unemployment Rate in South Africa increased to 25.50 percent in the third quarter of 2012 from 24.90 percent in the second quarter of 2012, (StatsSA, 2012). From these statistics, it is evident that the sustainability and growth of small business are vital topics for research.

To speedily address the above mentioned social-economic problems requires tremendous resources, and the government alone cannot cope. According to Rockey (2003) if it was left to the South African government alone to uplift the previously disadvantaged communities, it will simply take too long. The patience of the marginalized communities is already running out, as is evidenced by the spate of protests regarding poor service delivery by the state. Hence, there is a need for private sector involvement given the magnitude of the socio-economic problems in South Africa. It is in businesses' own interest to help stabilize the social landscape and grow the economy, since their long-term livelihood and success is intrinsically linked to the wellbeing of South Africa and its citizens (CSI Handbook, 2003).

The primary reason for the disappointing socio-economic development since the 1980s may be that policy makers have grossly underestimated the role of SMMEs in the South African economy. In fact, prior to 1994, the year in which the first democratically elected (ANC) government came into power; the previous (National Party) government neglected the small business sector and concentrated trade and economic policy on large conglomerates and parastatal enterprises, (www.brain.co.za).

4   DEFINING SMES

While the importance of the SME sector is acknowledged internationally, defining an SME is a challenging task, as every country has its own definition. In Chile for example, companies are generally classified according to annual turnover; in South Africa, by turnover, gross asset value and the number of employees. In India, any industrial undertaking with fixed assets less than 10 million Rupees is classed as small-scale, (Grayson, 2003). EU Member States traditionally have their own definition of what constitutes an SME, for example the traditional definition in Germany had a limit of 250 employees, while, for example, in Belgium it could have been 100. But now the EU has started to standardize the concept. Its current definition categorizes companies with fewer than 10 employees as "micro", those with fewer than 50 employees as "small", and those with fewer than 250 as "medium", (Berry, 2002). There is no single, uniformly accepted definition of a small firm (Storey, 1994).

The abbreviation "SME" occurs commonly in the European Union (EU) and in international organizations such as the World Bank (WB), the United Nations (UN) and the World Trade Organization (WTO). The term "small and medium businesses" or "SMBs" is predominantly used in the USA. In South Africa the term is "SMME" for small, medium and micro-enterprises, the terms 'SMME' and 'SME' are however used interchangeably in South Africa. Elsewhere in Africa, MSME is used for micro, small and medium enterprises.

4.1   Defining SMEs in South Africa

Like other countries, the issue of what constitutes a small or medium enterprise is a major concern in South Africa. Various authors have usually given different definitions to this category of business. In South Africa, a 'small business' is officially defined in Section 1 of the National Small Business Act (NSB Act) of 1996 as amended by the National Small Business Amendment Act of 2003 and 2004 as: "a separate and distinct business entity,

Entrepreneurship Between Creativity and Bureaucracy

including co-operative enterprises and nongovernmental organizations, managed by one owner or more which, including its branches or subsidiaries, if any, is predominantly carried on in any sector or sub sector of the economy".

The NSB Act further categories small businesses in SA into distinct groups, namely; survivalist, micro, very small, small and medium, hence the use of the term "SMME" for small, medium and micro-enterprises.

Table 1: Categories of SMMEs as per the National Small Business Act (DTI, 2008)

Category of SMME	Description
Survivalist enterprises	Operates in the informal sector of the economy. Mainly undertaken by unemployed persons. Income generated below the poverty line, providing minimum means to keep the unemployed and their families alive. Little capital invested, not much assets. Not much training. Opportunities for growing the business very small.
Micro enterprises	Between one to five employees, usually the owner and family. Informal - no license, formal business premises, labour legislation Turnover below the VAT registration level of R300 000 per year. Basic business skills and training Potential to make the transition to a viable formal small business.
Very small enterprise	Part of the formal economy, use technology Less than 10 paid employees Include self-employed artisans (electricians, plumbers) and professionals.
Small enterprise	Less than 100 employees More established than very small enterprises, formal and registered, fixed business premises. Owner managed, but more complex management structure
Medium enterprise	Up to 200 employees Still mainly owner managed, but decentralised management structure with division of labour Operates from fixed premises with all formal requirements.

According to the Finscope 2010 study, the SME sector has an estimated 5.6 million small businesses operating in South Africa, creating 11.6 million total employment opportunities –

that is six million jobs excluding the small business owners themselves. The sector is however heavily skewed towards micro-enterprises, with 82 percent of South African enterprises being micro or very small (as defined by the National Small Business Act).

5 THE ROLE OF SMES

Interest in the role of SMEs in the development process continues to be in the forefront of policy debates in most countries. SMEs are often described as efficient and prolific job creators, the seeds of big businesses and the fuel of national economic engines. Even in the developed industrial economies, it is the SME sector rather than the multinationals that is the largest employer of workers, (Mullineux, 1997). Fayad (2008) propounds that most of the current multi-million dollar enterprises have their origin in SMEs. Naturally all businesses start as small businesses or even start out of small businesses initiated by individuals. Some of the world's leading Korean companies such as Samsung and LG were once small enterprises. From these examples, it is clear that SMEs are important to the development process and that it would be beneficial for African countries to promote SMEs for further growth.

Any sector creating 50% of the new jobs in any economy needs to be nurtured. A healthy SME sector contributes prominently to the economy through creating more employment opportunities, generating higher production volumes, increasing exports and introducing innovation and entrepreneurship skills. According to Bashir Ahmad Fida (2008), SMEs are the first step towards development in economies towards industrialization. One of the significant characteristics of a flourishing and growing economy is a vibrant and blooming SME sector. SMEs play a pivotal role in the development of a nation. They contribute to socioeconomic development in various ways, by creating employment for a rural and urban growing labour force and providing desirable sustainability and innovation in the economy as a whole.

It is estimated that SMEs employ 22% of the adult population in developing countries (Daniels, 1994; Daniels and Ngwira, 1992; Daniels and Fisseha, 1992; Fisseha, 1992; Fisseha and McPherson, 1991; Gallagher and Robson). UNIDO (1999) estimates that SMEs represent over 90% of private business and contribute to more than 50% of employment and of GDP in most African countries. Aside from these strengths, SMMEs have established a successful track record globally in way of building systemic productive capacities, nurturing entrepreneurship and innovation, and serving as attractive ventures for foreign investment (Raynard and Forstater, 2002). SMEs in developed and less developed countries, as in other countries, are however still facing a number of difficulties and obstacles that are impeding and complicating their operations and growth.

5.1 The role of SMEs in South Africa

The democratically elected Government of South Africa realized as early as 1995 the importance of SMEs to the economy. Trevor Manuel, then Minister of Trade and Industry, clearly articulated on this issue when he said: "With millions of South Africans unemployed and underemployed, the Government has no option but to give its full attention to the task of job creation, and generating sustainable and equitable growth. Small, medium and micro-enterprises represent an important vehicle to address the challenges of job creation, economic growth and equity in our country. We believe that the real engine of sustainable and equitable growth in this country is the private sector. We are committed to doing all we can to help create an environment in which businesses can get on with their job." (Extracts from the

White Paper on National Strategy for the Development and Promotion of Small Business in South Africa).

In South Africa, SMEs account for about 91% of the formal business entities, contributing between 50 and 57% of GDP, providing almost 60% of employment, (Kungolo, 2010). A study by the Competition Commission (2004) estimated that 99.3% of South African businesses were SMEs and that these SMEs accounted for 53.9% of total employment and contributed 34.8% to GDP (NCR, 2011).

SME activity contributes to poverty reduction. SMEs are often located in geographical areas outside of the typical large urban centres. Economic activity outside of the major metropolitan areas leads to job creation helping reduce the poverty of rural areas. Not every SME is in a non-metro area, of course, but both non-metro and metro area SMEs assist with poverty reduction through employment, training and softer social benefits such as Corporate Social Investment.

Aside from these strengths, SMEs have established a successful track record globally in nurturing entrepreneurship and innovation, and serving as attractive ventures for foreign investment (Raynard and Forstater, 2002). From the socio-economic development viewpoint, SMEs provide a variety of benefits (Advani, 1997). SMEs can adapt easily to market conditions and they can withstand adverse economic conditions given their flexible nature. They are more labour intensive than larger firms and they have lower capital costs associated with job creation. They play critical roles to ensure income stability, employment and economic growth (Liedholm and Mead, 1987; Schmitz, 1995).

In a World Bank paper on the subject, four important drivers are identified, which support current thinking around the importance of SMEs in the broader structure of economies:
* SMEs are the engine of growth;
* SMEs are essential for a competitive and efficient market;
* SMEs are critical for poverty reduction; and
* SMEs play a particularly important role in developing countries.

Any sector creating 50% of the new jobs in an economy needs to be nurtured.

SMEs in South Africa play a massively important role. SMEs are better placed to take advantage of the deregulating sector, and are nimbler and hungrier than their corporate peers. This is great news for the general public, as competitiveness increases, and ultimately, the economy is driven to a more efficient and productive space. SMEs are however struggling, and getting very little love from policymakers and corporate giants in South Africa.

According to Tesfayohannes (2000), industrial development based on SMEs is capable of countering three important evils simultaneously, namely: growing unemployment, persistent inequalities and mass migration to cities - all of which are prevalent in South Africa. In support of the above sentiment, Raynard and Forstater (2002) state that for developing countries, such as South Africa, integration into the global economy through economic liberalization and deregulation is seen as the best way to overcome poverty and inequality. According to Luetkenhorst (2004), SMEs are the lifeblood of most economies, because, on average, they represent over 90% of enterprises and account for approximately 50–60% of employment at a national level. Furthermore, he asserts that, with respect to the

developmental contribution of SMEs, there appears to be general consensus, *inter alia,* on the following points:

- SMEs tend to employ more labour-intensive production processes than larger firms.
- Countries with a high share of small enterprises have succeeded in making the income distribution more equitable.
- SMEs support the building up of systemic productive capacities. They also help to absorb productive resources at all levels of the economy and contribute towards the creation of strong economic systems in which small and large enterprises are interlinked.
- SMEs play a pivotal role in transforming agriculture-based economies into industrial-based economies, as they provide opportunities for value-adding processing activities which can generate sustainable livelihoods.
- SMEs are the seedbed for entrepreneurship development, innovation and risk taking behaviour and provide the foundation for long-term growth and the progression towards larger enterprises (Luetkenhorst, 2004).
- The average capital cost of a job created in the SME sector is lower than in the big business sector.
- They provide opportunities for aspiring entrepreneurs, especially those who are unemployed, under-employed or retrenched.
- Workers at the lower end of the continuum often require limited or no skills training; they usually learn their skills on the job.
- Sub-contracting by large enterprises to SMEs lends flexibility to the latter's production processes.

Successful SMEs absorb not only a significant part of the unemployed labour force, but also reduce crime and government expenditure on security and legal services. The sector is one of the most important vehicles through which low-income people can escape poverty. With limited skills and education to compete for formal sector jobs, these men and women find economic opportunities in micro enterprise as business owners and employees. Although their individual social and environmental impacts are small, the cumulative impacts of SMEs are highly significant. As large enterprises have restructured and downsized small, medium and micro enterprises (SMEs) have come to play an increasingly important role in South Africa's economy and development.

Unless South Africa succeeds in promoting SMEs, the country will remain saddled with a significant unemployment problem, resulting in excessive crime in its various manifestations. Furthermore, creating SMEs is one of the most effective ways of economically empowering the previously disadvantaged black population (DTI, 2001). In light of the above mentioned, government should, at national, provincial and local level vigorously promote the development of small businesses.

6   CHALLENGES FACING SMES

Despite the acknowledged importance and contribution of SMEs to economic growth, SMEs across the globe and in South Africa in particular, are still faced with numerous challenges that inhibit entrepreneurial growth. These include: a lack of management skills, finance and obtaining credit, start-up costs, licensing and registration, access to markets and developing relationships with customers, appropriate technology and low production capacity, recognition by large companies, regulatory constraints, complying with all the legislative requirements of the country, government bureaucracy, lacking the necessary information

about foreign markets, little access to international partners, limited international marketing experience, poor quality control, product standardisation, and support for the role that they play in economic development, (WTO, 1998; Ntsika, 1999; DTI, 2002; Gaomab, 2004; ABSA, 2005; SMBDCI, 2005). The SMEs sector does not always get the required support from the concerned government departments, banking sector, financial institutions, and corporate sector, (SMBDCI, 2005).

The increasing penetration of China in the African market has also brought about several negative consequences. Chinese SMEs are likely to bring over their own workers, and thus "new" business does not contribute to local job creation. Secondly, the Chinese do not trust local systems; for example, they do not trust the local banking system, so they are likely to send profits back to China instead of reinvesting in the host countries. Chinese SMEs lack an understanding of African business, as they do not try to integrate into the host countries (Gu, 2009). The most significant consequence of a strong presence of Chinese SMEs is that it forces local firms out of business. The penetration of Chinese companies therefore threatens to undermine the development of South African SMEs.

7   PROMOTION OF SME'S BY THE SA GOVERNMENT

The South African government is fully aware of the importance of SMEs and a framework for SME support and development has been developed. The SME sector of the economy is actively promoted by a number of initiatives, including:

The National Small Business Act of 1996, which defines SMEs and provides for the establishment of the National Small Business Council and the Ntsika Enterprise Promotion Agency (Ntsika), Khula Enterprise Finance which has a mandate to improve the SME sector's access to finance, Skills Development programme, which was launched by the government in 1998 to assist SMEs with two of the challenges that they face, "a lack of management skills" and "developing relationships with customers".

The Integrated Small Business Development Strategy (DTI, 2005) identifies a number of institutions that have important roles in the implementation of the strategy. These agencies (which include both dedicated SME support agencies and institutions with broader and related functions) are as follows: Small Enterprise Development Agency (SEDA), South African Micro-Finance Apex Fund (SAMAF), Khula Enterprise Finance Limited, Umsobomvu Youth Fund (UYF), National Empowerment Fund (NEF), Land Bank, and Mafisa. Some of these have operated more effectively than others, and the Strategy identifies the need to improve coordination both within government and between support agencies in order to improve implementation (the dti, 2005).

8   CONCLUSION

The Department of Trade & Industry (DTI) is of the view that SMEs play a far more important role in developing economies, such as South Africa, than in developed countries, since they make a significant contribution to socio-political stability. Successful SMEs absorb not only a significant part of the unemployed labour force, but also reduce crime and government expenditure on security and legal services. Unless South Africa succeeds in promoting SMEs, the country will remain saddled with the significant unemployment problem, resulting in poverty and excessive crime in its various manifestations. Furthermore, creating SMEs is one of the most effective ways of economically empowering the previously disadvantaged black population (DTI, 2001). In light of the above mentioned, the state, at a

national, provincial and local level should vigorously promote the development of small businesses.

Despite their importance, SMEs face considerable challenges that inhibit their growth. The study revealed that statistics on small business in South Africa is inadequate with no official repository for data on the SME sector. Studies, when they are conducted, are conducted sporadically and statistics derived from numerous sources making it difficult to put together the pieces from different data sources. In order to have effective interventions, it is important to have an understanding of the SME sector, the challenges it faces and the capacity it has to deal with those challenges.

ABSTRACT
In Croatia, as well as in many transition countries, many companies were unprepared for the negative effects that occurred after global economy crises in 2008. In the current harsh economic conditions, entrepreneurs are forced to reconsider their ways of doing business, and to determine its strategic objectives and their importance for survival of businesses. The aim of this paper is to analyze empirical research and to determine which strategic objectives entrepreneurs consider most important for the success of the business. The research was conducted using a questionnaire on a sample of companies from Croatia.

Keywords: Business performance, Entrepreneurship, Management, Strategic objectives

1 INTRODUCTION

A strategy represents a general framework for decision-making process in business enterprises. Today we recognize the global strategy on entrepreneurial or corporate level, which represents the highest level of management and resulting with selected concept of strategic development which includes global goals, identifying strategic business areas, containing the global financial development projection and determines other goals. On the lower level is a business strategy that is relevant to all market segments which produce profits and are located within the individual organizational units. These strategies are designed to substrate global strategy. The task of management is, at this level, to transfer the concept and tasks of global strategy at business level of an appropriate organizational unit. Third classification distinguishes functional strategies that are used for the implementation of the tasks and goals of global business strategy within individual functional areas. Management of organizational units is responsible, under the annual plans, for the execution of strategic plans for the business. These are essentially operational strategies that are common as well as division of authority and responsibilities in the processes related to the technical innovation.

Strategic advantages of enterprises are constantly competing in product improvement, cost reduction, and a higher level of service delivery to customers. Fighting for survival and business growth is continuous and companies compete to their competitive advantage. The business strategy of entrepreneurs should develop and capitalize on these advantages in the market.

2 ANALYSIS OF EMPIRICAL RESEARCH

Scientific objective of this paper is to determine which strategic objectives, according to the entrepreneurs, hold the key to business success. The research wants to contribute to the development of knowledge about the importance of setting up strategic business objectives as a source of competitive advantage, but also as a way of shaping a modern and successful entrepreneur. Empirical research was conducted on a sample of companies in Croatia. The survey questionnaire was sent to 320 companies that have been selected at random. The questionnaire was answered by 123 respondents which makes the return rate of 38.43 percent. The collected data were processed using the statistical program SPSS 20.

The following tables and graphs indicate the structure of the analyzed companies according to baseline characteristics: basic activity, form of ownership, and an analysis of the market in which the company operates.

Table 1 shows the structure of the enterprises considering its core business. Most of the respondents, 35.0 percent, are engaged in wholesale and retail trade. Immediately after the trade activities is the manufacturing industry with 15.4 percent of the surveyed companies. In third place is a construction activity which makes 8.9 percent of the analyzed companies.

Table 1: Structure of enterprises by industry (analysis of the author)

Activity	Number	%
Agriculture, forestry and fishing industry	3	2,4
Manufacturing industry	19	15,4
Electricity, gas, steam and air conditioning industry	1	0,8
Construction industry	11	8,9
Wholesale and retail trade, repair of motor vehicles and motorcycles	43	35,0
Transport and storage industry	4	3,3
Accommodation providers and food service industry	9	7,3
Information and communication industry	7	5,7
Financial and insurance activities	7	5,7
Real estate industry	3	2,4
Professional, scientific and technical activities	7	5,7
Education industry	0	0,0
Human health and social care industry	1	0,8
Arts, entertainment and recreation industry	1	0,8
Other service activities	7	5,7
Total	**123**	**100**

Chart 1 shows the ownership structure of the analyzed enterprises. The analysis shows that enterprises are predominantly private owned where there are no state or mixed ownership. In the sample there is 81 percent of privately domestic owned enterprises, 4 percent of enterprises in the private shareholders, and 14 percent of enterprises in the private foreign ownership.

**Entrepreneurship Between Creativity and Bureaucracy**

Chart 1: The ownership structure of the analyzed enterprises (analysis of the author)

It is interesting to notice, Chart 2, that most of the companies operating in the local market, 51 percent, followed by companies that operate only on the national market, 22 percent, while companies that operate in regional markets constitute almost one fifth of the total number of respondents. Companies that are active in the international market make up 8 percent of the surveyed companies. In this survey question, the local market is defined as the one at the county level, the national market is defined as a market in the state, the regional market is defined as the market of former Yugoslavia and the international market is defined as the market worldwide.

Chart 2: Structure of the companies with regard to the operating markets (analysis of the author)

Table 2 presents data on the characteristics of the sample considering age and sex structure of the respondents, their qualifications, and position within the company. Most of the are represented between the age 36 to 50 years (47.15 percent), 34.95 percent of the respondents were by the age of 35 years, while 17.9 percent of respondents are between the ages of 51 and 65 years. Furthermore, most of the respondents are male (55.3 percent). Given the degree

most of the respondents have a Bachelor degree (58.53 percent), 37.39 percent of respondents have a high school diploma, and 3.3 percent of responder's professional Master's degree. Only 1 responder has PhD, and none of the respondents has a Master's of Science degree. Table 2 also analyzes the structure of respondents according to the length of working life in the company. Most of the respondents have 5-10 years of working experience (37.4 percent), followed by respondents with 2 to 5 years of working experience (28.5 percent), while the proportion of respondents under 2 years of working experience is 15.4 percent. Those responders with 10 to 20 years of work life make 14.6 percent, while only 4.1 percent of respondents have work life in the company more than 20 years. With regard to the position within the company 50.4 percent of respondents were business owners, while the vast majority of respondents belonging to middle and lower level management.

Table 2: Structure of enterprises by industry (analysis of the author)

		Absolute frequency	Percentage of frequency
Age	**Up to 35 years**	43	34,95%
	36-50 years	58	47,2%
	51-65 years	22	17,88%
	Over 65 years	0	0,0%
Sex	**Male**	68	55,3%
	Female	55	44,7%
Education qualifications	**High school**	46	37,39%
	Bachelor Degree	72	58,53%
	Professional master's Degree	4	3,3%
	Master of Science	0	0,0%
	Doctorate of Science	1	0,8%
Working experience	**Up to 2 years**	19	15,4%
	2-5 years	35	28,5%
	5-10 years	46	37,4%
	10-20 years	18	14,6%
	Over 20 years	5	4,1%
Position in company	**Owner**	62	50,4%
	Member of the Supervisory Board	2	1,6%
	Member of the Board	7	5,7%
	Middle level management	39	31,7%
	Lower level management	11	8,9%
	Employee	2	1,6%

The importance of strategic objectives in the company was examined by using Liker scale from 1 to 5. Respondents were asked to estimate how much a particular strategic objective is important for their companies. The score of 1 means that the objective is not important for the company and the score of 5 means that the objective is extremely important for the company. The following charts show the most important strategic objectives for the companies in Croatia.

**Entrepreneurship Between Creativity and Bureaucracy**

Chart 3: The importance of the strategic objective of creating long-term relationships with customers (analysis of the author)

Charts 3, 4 and 5 are showing how the respondents rate the importance of the strategic objectives of the company; "Creating long-term relationships with customers", "Improving the quality of products and services", and "Long-term profitability". With these three objectives most of the respondents felt that these are just the most important strategic objectives for their business enterprise. On average, for the aforementioned strategic objectives, the vast majority of respondents believe that the stated objectives are important or the most important for their business (on average over 60 percent). Through the analysis of these three charts we can conclude that majority of companies nowadays are formed because of the purpose of improving themselves and their communities, because of the creation of long-term relationships with people, and because of the improvement of goods and services in the market. However, the main purpose of almost every company is always the same e.g. profit for owners.

Chart 4: The importance of the strategic objective of improving the quality of products and services (analysis of the author)

**Entrepreneurship Between Creativity and Bureaucracy**

Chart 5: The importance of the strategic objective of long-term profitability (analysis of the author)

The following charts show the less important strategic objectives for the companies in Croatia. On Charts 6 and 7 we see that for the responders the strategic objectives „Increasing challenges" and "Developing our own brand"have very little importance. In both of these strategic objectives very high percentage of respondents think that these objectives are neither important nor unimportant for the company (54.5 and 36.6 percent), i.e., responders do not have formed opinion about these strategic objectives. Furthermore, very small number of responders thinks that these objectives are the most important objectives for their companies (4.1 and 9.8 percent). If we analyze responders who do not matter for these objectives and to whom these objectives represent "not at all important" scale we can see significant percentages (19.5 and 30.9 percent).

Chart 6: The importance of the strategic objective of increasing challenges (analysis of the author)

**Entrepreneurship Between Creativity and Bureaucracy**

Chart 7: The importance of the strategic objective of developing our own brand (analysis of the author)

Table 3 shows descriptive analysis of the importance of strategic objectives for the companies in Croatia. Besides the measures of mean and dispersion ratio this table provides the values of the coefficient of asymmetry. Asymmetry coefficient is used to determine the distribution of deviations from the normal distribution of variables. According to theory the asymmetry coefficients, analyzed between -1 and +1, indicating that the distribution of these variables approaches a normal distribution. Asymmetry coefficients for all strategic objectives are satisfactory. All analyzed strategic objectives are evaluated at least once with value 5, except the strategic objective „Other" which has the largest score of 4. Six strategic objectives are neither once rated as totally irrelevant and these objectives are: long-term profitability, improvement of product quality, reducing costs in relation to competition, increased customer satisfaction, employee development and satisfaction, and increase market share.

Table 3: Descriptive analysis of the importance of strategic objectives for companies in Croatia (analysis of the author)

	N	Min	Max	Mod	Arithmetic mean	Standard deviation	Asymmetry coefficient
Long-term profitability	123	2	5	5	3,98	1,032	-0,422
Improving the quality of products / services	123	2	5	4	4,03	0,932	-0,869
Reducing costs in relation to the competition	123	2	5	4	3,93	0,791	-0,071
Expanding the diversity of products	123	1	5	3	3,28	0,883	-0,375
Increasing consumer satisfaction	123	2	5	4	3,91	0,859	-0,220

3 CONCLUSION

Entrepreneurship and entrepreneurial orientation are closely related to strategic management. Although the top management does not impose, it reflects the strategic direction of the behavior of the various levels of management. Integration of entrepreneurship with strategy has two aspects: a strategy for entrepreneurs and entrepreneurial strategy. Strategy for entrepreneurs addresses the needs of developing entrepreneurial activity, while entrepreneurial strategy involves the use of creativity and entrepreneurial thinking in developing the company's strategy. Adaptation to changing business conditions involves the entrepreneurial aspect of business strategy. Strategy can help the company to resolve internal conflicts between integration, flexibility and innovation.

Through conducted research we recognize that all entrepreneurs do not share same opinion about the importance of certain strategic objectives. Companies in Croatia gave the averaged highest grade to strategic goal of creating long-term relationships with customers (4.07). The importance of this objective for the Croatian company points the value of mode (most frequent score 5). The next objective which importance is evaluated on average high score is the strategic objectives of improving the quality of the product (4.03). Furthermore, the most common score for this objective is also 4. It is also interesting to note that the most common value for the objective of "long-term profitability" is 5. It can be concluded that for the majority of Croatian companies the most important is to achieve strategic objective: creating a long-term relationships with customers, improving the quality of products, and goal of long-term profitability.

ABSTRACT
Small and medium size enterprises (SMEs) represent a very important segment of the Croatian economy as is the case in many other countries. That is the main reason for a growing number of studies about the problems they face. The first identified problem is a necessity for adjustment to a turbulent environment. Another important problem is internal weaknesses of SMEs, including errors on the side of management that stand out. Controlling (field which in many aspects overlaps with management accounting in international discourse) and controllers provide support to management by performing various tasks that are important for SMEs. These are the tasks related to the two management subsystems: Planning and control and Information and reporting. However, in many SMEs where these tasks are indeed performed, they are predominantly done by managers themselves, which leads to their overburdening and an increased number of errors. In this paper the emphasis is on institutional aspects of Controlling. We investigate to what extent is Controlling present in SMEs (in institutional sense) and who performs Controlling tasks related to the management subsystems. Since Controlling is mostly developed in the German-speaking countries and most intensive studies about Controlling are carried out in these countries, some of them served as guidance to our study. The study was conducted in Northwest Croatia. The following hypothesis is set out in the paper: Within SMEs in the Varazdin County Controlling is not present in the institutional sense and tasks in the field of Controlling are performed by managers themselves, with the help of employees in finance or accounting/bookkeeping. The results of our empirical research confirm the hypothesis, which means that Controlling tasks are not performed within SMEs in a manner that would enable increased efficiency of management.

Keywords: Controlling, Management accounting, SMEs

1 INTRODUCTION

There are several reasons that influence the success or failure of an enterprise. Some of the influence comes from the environment, where the company can hardly or not at all affect these reasons. However, recognition of environmental factors is important in order to better adapt to them. Business environment is an extremely dynamic one and it is becoming more and more turbulent every day, where many factors affect the performance of a company and goals and strategy it adopts. Such factors are political, economic, social, technological, legislative and ecological (ethical). The second group of reasons for the failure of many companies consists of internal weaknesses. With small and medium size businesses (SMEs) management's weaknesses and errors stand out immensely. Everyday operating jobs in SMEs do not leave enough time to the management for an active managing, directed towards the future. The situation in SMEs is the one where every business day is not characterized by an

action but by a reaction, and planning (if any) and managing are short-term focused. The search for what causes the problems starts only when the business is already heading in the wrong direction, and then it is often too late. Therefore, SMEs often do not operate in line with their potential. It is clear that in a situation like this, with so many factors that a company should take into account, the risks and the chances are closely linked to each other. Adapting to the situation in the environment and overcoming internal weaknesses are essential to the success of SMEs. The answer to the question "how to achieve it?" is in the use of appropriate tools for planning, control and informing, directed towards both operational and strategic area. In doing so, the management of an SME needs professional help and support provided by Controlling and controllers.

Controlling evolved in the recent decades in large companies as a successful response to the problems of their adaptation to internal and external changes. However, Controlling systems that were developed for the needs of large companies are not directly applicable to SMEs. SME requires measures and procedures different from a large company due to the specifics characterizing it i.e. due to a series of differences in comparison with large enterprises. Because of that, there will be differences in the institutional aspects of Controlling between large enterprises and SMSs, meaning differences in organization and the performers of Controlling tasks. In this paper we investigate to what extent is Controlling present in SMEs (in institutional sense) and who performs Controlling tasks related to the management subsystems.

2 RELATED LITERATURE IDENTIFYING THE KEY TASKS OF CONTROLLING AND CONFIRMING THE NEED FOR CONTROLLING IN SMES

Controlling is an English term used in German-speaking countries[1] and refers to "most tasks that would be considered in international discourse as management accounting tasks" (Becker and Messner, 2005, p. 418). Even more accurately, management accounting issues in German-speaking countries can be categorized to ''Kostenrechnung'' (cost accounting) or ''Interne Unternehmensrechnung'' (internal accounting) and ''Controlling'' motivated by what controllers do (Wagenhofer, 2006, pp. 1–2). Following that, many companies in German-speaking countries have Controlling institutionalized (Osmanagic Bedenik, 2007, p. 47). The situation in Croatia is identical, meaning that many large enterprises have Controlling departments. The first important study in the practice of Controlling in large enterprises in Croatia was conducted by Nidzara Osmanagic Bedenik in year 2001, followed by a new research in 2007 without the change in the research methodology, which enabled a comparative analysis of the development of Controlling through this period. Research conducted in year 2007 showed that 74% of large companies in Croatia had Controlling as an organizational unit (Osmanagic Bedenik, 2007, p. 54). This was a significant increase compared to the data from the year 2001 when 53% of large companies had Controlling as an organizational unit. Altogether, Controlling is a young function in companies in Croatia. Research on the specifics of institutional aspects of Controlling in SMEs in Croatia was up to now to the best of our knowledge not conducted.

Controlling in SMEs varies from Controlling in large enterprises both in institutional aspects (organization and carriers of Controlling tasks) and in terms of Controlling instruments used, and can be defined as "a system of planning, information, control and management of

---

[1] Refers to Germany, Austria and parts of Switzerland.

important ongoing processes in the company adapted to the company" (Spraul and Oeser, 2004, p. 1). One of the characteristics of SMEs is the situation of owner-manager where an entrepreneur manages the company but also does most administrative tasks, especially when the company is smaller. Given this entire burden on the entrepreneur, it is expected that some management tasks will have to be ignored. In such a situation all management tasks are concentrated and performed by one person or a small group of people, and on them the success of the company depends. Many things depend on the management style of this person - the significance of achieving goals, decision-making, informal relationships among employees, control, delegation of responsibility, attitude towards information, and concern for subordinates. Paternalistic management style prevails in SMEs (Ossadnik et al., 2008, p. 5). Delegating responsibility for decision-making is not a characteristic for this style of management, though the subordinates are consulted and their views taken into account. The final decision is always made by the manager. The mere management style in SMEs can represent a possible obstacle to introducing and applying Controlling. It is noteworthy that the managers are aware of positive implications of making more informed decisions.

The increase in efficiency and effectiveness of management is emphasized as the goal of Controlling. In large enterprises controllers are those employees involved in carrying out the Controlling tasks, giving the management their expertise. The controller is a person that supports management in the execution of his duties, an internal consultant to management, "an employee that executes a specific set of tasks for the manager (e.g. preparation of information on costs, monitoring achievement of results, etc.)" (Weber and Schäffer, 2006, p. 1). Controller's mission from International Group of Controlling (IGC) shows that the key activities associated with the controllers are (International Group of Controlling, 2002):
- Planning,
- Informing/reporting,
- Analyzing/monitoring,
- Control.

In general, Controlling is not only associated to the person called the controller. Controlling tasks should be performed by each manager, particularly because this shortens the reaction time to variances in plans (Horvath & Partners, 2006, p. 297). A prerequisite for a successful performance of Controlling tasks by managers is firstly, a clear definition of Controlling tasks that should be done, and secondly ways in which expert support to them is assured. Expert support to managers is one of the activities of controllers. This expert support can come from external advisors, as is particularly the case with the smaller companies.

Controlling activities that are emphasized when implementing planning activities in SMEs are mainly support with planning and managing of planning process. Key tasks of controllers during the planning process are the design and coordination of plans and budgets, while the content of plans and budgets is the responsibility of management. Planning in SMEs is essential for ensuring good management, but in practice it often happens that planning is not carried out at all. In 2004, The Institute for market research Brainstudio conducted a research on behalf of Bank Austria-Creditanstalt on 500 clients about their planning activities. The research showed that among small businesses nearly 50% of them did not have a defined planning process, and among those who carried out planning, half of them turned that job over to tax advisers (UniCredit Bank Austria, 2004).

Tasks of controlling are all activities that enable achieving the objectives of Controlling, thereby contributing to the achievement of company objectives (Ossadnik et al., 2008, p. 18). Whether SMEs will opt for internal or external carriers of Controlling tasks, when introducing Controlling, depends on several factors (Ossadnik et al., 2008, p. 20):

- Company size (micro, small, medium), and by that on the extent of tasks in the field of Controlling,
- Whether the tasks need to be done only occasionally, i.e. are they of limited duration,
- The costs of internal and external experts in Controlling,
- Availability of professionals in the labor market,
- The desire for a neutral advisor.

There is also a possibility to perform Controlling tasks partially from within the company, and partially to engage external experts. In this case one should think about the competences that people, who perform the tasks in the field of Controlling, should have. When asked to specify important characteristics of controllers in SMEs, the respondents who themselves carried out Controlling tasks is SMEs, mentioned the following once (Ruda et al., 2008, pp. 51–53):

- Analytical thinking
- Power to persuade
- Ability to impose authority
- Social competences (ability for team work, ability for conflict solving, ability for consensus realization).

In a survey conducted by Ruda et al. (2008, pp. 50–51) all the respondents identified that reporting and variance analysis are tasks specifically designated as controller's tasks. Additionally, operative planning was identified by 78% of respondents as a controller's task, consulting/coaching by 67%, and regulating tasks, investment analysis and internal accounting by 44% of respondents.

The study by Deloitte Mittelstands-Institute showed that there is a difference in implementation of Controlling tasks between SMEs managed by their owners and managed by professional managers (Deloitte & Tousche, 2008, p. 8). Only 50% of owner-managed companies employ a person specialized for Controlling tasks compared to 90% of professionally managed SMEs. In owner-managed companies the owner-managers perform the Controlling tasks themselves in 32% of the observed cases, in 20% of cases these tasks are also done by other managers in the company, and in 6% they are done by external performers of Controlling tasks. In professionally managed companies, besides controllers, Controlling tasks are performed by different managers within the company in 38% of cases and by external professionals in 4% of the cases.

Both, scientists and experts from the practice, agree that Controlling is not a function reserved exclusively for the large companies. Empirical research confirms that controlling in SMEs provides expert support to managers, thus contributing to their disburdening, to a higher quality of managing and better performance of an enterprise. For example, in the research conducted on SMEs in Osnabrück-Emsland region in Germany, 95% of respondents confirmed that Controlling is important or very important for the success of the enterprise (Ossadnik et al., 2008, pp. 59–60). In most companies the main performers of Controlling tasks were managers (53%), additionally the Controlling tasks were also performed by Controlling departments/controllers (35%) or accounting/bookkeeping department (34%) (Ossadnik et al., 2008, pp. 67–68).

All above mentioned studies confirm that applying Controlling in SMEs is very important for their success and long-term survival on the market.

3 RESEARCH OF CONTROLLING TASKS IN SMEs IN THE VARAZDIN COUNTY

Controlling in Croatia is at a lower stage of development than in the German-speaking countries. Therefore, our research could not be as detailed when we assumed that Controlling is not applied in Croatian SMEs to the extent to which it was done in the German-speaking countries. Our objective was to get the first insight in the institutional aspects of Controlling in SMEs in Croatia. That was done through the investigation of the presence of Controlling department within SMEs and the performers of Controlling tasks in SMEs.

3.1 Hypothesis

The following hypothesis is set out in the paper: Within SMEs in Varazdin County Controlling is not present in the institutional sense, and tasks in the field of Controlling are performed by managers themselves with the help of employees in finance or accounting/ bookkeeping departments.

3.2 Selecting a sample

The study was conducted on SMEs in the Varazdin County, Croatia. To identify companies, the database of the Croatian Chamber of Economy was used[2]. The selection criterion was the fact that the company submitted an annual financial report for the year 2008, which was taken as evidence that the company is active. According to this criterion, there were 63 medium-sized enterprises and 2280 small businesses identified in the Varazdin County. 1359 micro-enterprises were excluded from the sample, because their total annual income is under million Croatian kunas[3] and in most cases there was no information about the e-mail address either. A link to the questionnaire was sent to 675 of the remaining 984 SME's who had an active e-mail address (sample consisted of 68.6% of the identified companies). The response rate was 11.85%, as 80 companies in the sample responded to the questionnaire.

3.3 Research

According to Croatian legislation, at the time of research most of the companies that responded to the questionnaire were classified as micro enterprises (Table 1). Based on that, it cannot be expected that Controlling department is present in high percentage within the investigated companies.

Table 1: Firms according to their size

Category	Total revenues in year 2008 (in Croatian kunas)	Number of firms (N=80)	Percentage
Micro	1-14 million	61	76%
Small	14-54 million	5	6%
Medium	more than 54 million	14	18%
	Total:	80	100%

---

[2] Database available at http://www1.biznet.hr/HgkWeb/do/advsearch.

[3] Around € 130.000 which is insignificant.

Entrepreneurship Between Creativity and Bureaucracy

The structure of the surveyed companies by industry is shown in Table 2.

Table 2: Firms according to industry

Industry	Number of firms (N=80)	Percentage
Services	24	30%
Wholesale	19	24%
Production	19	24%
Construction and architecture	13	16%
Retail	5	6%
Total:	80	100%

SMEs are frequently managed by their owners. The study shows that 60 out of 80 (75%) questioned managers who responded to our questionnaire were also owners or co-owners of the companies. Additionally, there was a question for the remaining 25% of the respondents (case where the respondent is not the owner/co-owner) whether the owners/co-owners are a part of the company management. Final results show that in total, in almost 87% of the companies there is a situation of owner-managers.

Part of general questions consisted of questions about the organizational structure, whether the company is a part of a group of companies and if so in what way. The goal of the organizational structure questions was to determine how the companies built and defined their formal organizational structure, having in mind that the organizational structure affects the existence of Controlling in institutional terms. It is well known that the degree of organization's formalization is directly related to the size and complexity of companies (large and complex enterprises must have more formalized organizational structure than small businesses (Kolaković, 2006, p. 41)). Investigated companies have largely been organized by function (45%) or there was no special way of formal organization (40%) (Figure 1). Therefore, we expected that Controlling would not be significantly present in the institutional sense.

Figure 1: Formal organizational structure

11 companies or 14% of them were a member of a group and in all the cases they operated as a subsidiary.

Moreover, the respondents were asked about the existence of accounting/bookkeeping, finance and Controlling department in the company, and the number of employees in them. The results are shown in Table 3:

- In 54% of companies there is an accounting / bookkeeping department
- 39% of companies have a finance department
- Only 11% of companies have a Controlling department.

Table 3: Number of employees in departments

No. of employees per department	No. of firms: Accounting/ bookkeeping department (N=80)	Pct	No. of firms: finance dept. (N=80)	Pct	No. of firms: controlling dept. (N=80)	Pct
no such department	37	46%	49	61%	71	89%
1	17	21%	18	23%	9	11%
2	4	5%	11	14%	0	0%
3	8	10%	0	0%	0	0%
4	9	11%	0	0%	0	0%
5	0	0%	2	3%	0	0%
more than 5	5	6%	0	0%	0	0%
Total:	**80**	**100%**	**80**	**100%**	**80**	**100%**

Interestingly, Controlling department only exists in 9 companies, among which five are independent companies, and four are subsidiaries. In each of them where the controlling department exists, the department itself only has one employee. Subsidiaries of larger firms are more likely to have a Controlling department, since Controlling in large companies, both in German-speaking countries and in Croatia, is highly present in the institutional sense.

Given that the size of companies is one of the factors influencing the presence of individual departments, in an institutional sense, the analysis of the absence of individual departments associated with company size (micro, small, and medium) is presented in table 4.

Table 4: Absence of certain departments depending on the size of the company

	Absence of accounting dept. (N=37)	Pct	Percentage of the total No. of companies of the same size.	Absence of finance dept. (N=49)	Pct	Percentage of the total No. of companies of the same size.	Absence of Controlling dept. (N=71)	Pct	Percentage of the total No. of companies of the same size.
Micro (N=61)	37	100%	61%	46	94%	75%	61	86%	100%
Small (N=5)	0	0%	0%	0	0%	0%	2	3%	40%
Medium (N=14)	0	0%	0%	3	6%	21%	8	11%	57%
Total:	37	100%	-	49	100%	-	71	100%	-

The analysis shows that all micro-enterprises, 40% of small and 57% of medium businesses do not have a Controlling department. This largely confirmed the first part of the hypothesis that "Within SMEs in Varazdin County Controlling is not present in the institutional sense".

Entrepreneurship Between Creativity and Bureaucracy

The results of our study coincide with the research results from the German-speaking countries, which show that the presence of Controlling in institutional sense rises with the growth of the company. The possibility for further research is to study the frequency of Controlling department presence based on SMEs segmentation according to the total revenue for the whole of Croatia.

The question that followed was about who performs the Controlling tasks within the company. It was expected that besides the management the employees from some of the above mentioned departments are responsible for the Controlling tasks at a large extent. To ease the answer to this question some of the most common tasks of Controlling were mentioned in the questionnaire (business planning, budgeting, control of plan implementation, variance analysis, cost analysis, an analysis of financial ratios etc.).

The results show (Table 5) that the tasks in the field of Controlling in SMEs are generally performed by the management (79% of cases), with the help of accounting professionals, either within the company (21%) or from external accounting services (18%), and to a lesser extent with the help of employees in Controlling (11%) or finance (11%) department. Furthermore, companies rarely use external advisers other than lawyers and bankers (Table 6) and external accounting services (Table 5). Specialized consultants, whose services are often subsidized for SMEs, as is the case with the Consultant Network Project[4] in Croatia, could be a significant source of advice in the Controlling area, especially for the smallest companies.

Table 5: Performers of tasks in the field of controlling

Tasks from the field of controlling are carried out by:	*No. of companies N= 80*	*Percentage*
Management	63	79%
Employees in the accounting/bookkeeping dept.	17	21%
External accounting service	14	18%
Employees in controlling dept.	9	11%
Employees in finance dept.	9	11%
Controlling tasks are not performed in our company	1	1%

---

[4] More about the project available on http://www.hamag.hr/en/consultant-services-co-financing.html.

Table 6: Use of Advisory services

Adviser	No. of companies (N=44)	Pct
Lawyers	23	52%
Bankers	13	30%
Auditors	5	11%
State Agencies	3	7%
Croatian Chamber of Economy	3	7%
Consultants	2	5%
Faculty of Mechanical Engineering	2	5%
Local Authorities	1	2%
Tax advisers	1	2%
Accounting and Finance Associations	1	2%
Ministries	1	2%

The answers confirmed the second part of the hypothesis that "tasks in the field of Controlling are performed by managers themselves with the help of employees in the finance or accounting/ bookkeeping department".

The results clearly show that managers in SMEs in Croatia perform Controlling tasks in a higher percentage than shown in studies from the German-speaking countries. With all these additional tasks they carry a higher overall burden.

4 CONCLUSION

Successful adaptation of SMEs to the situation in the environment and overcoming internal weaknesses are essential to the success of SMEs. These can be achieved through the use of appropriate tools for planning, control and informing directed on both operational and strategic area with a professional help and support provided by Controlling and controllers. Because of specific characteristics of SMEs there are differences in the institutional aspects of Controlling between large enterprises and SMEs, meaning, differences in organization and the performers of Controlling tasks. The existence of either Controlling department or a person called 'controller' is not a necessity for every SME. Managers themselves should perform Controlling tasks to a certain extent because that shortens the reaction time in different business situations. One of the frequent characteristics of SMEs is the situation of owner-manager and the performance of Controlling tasks by managers in such a situation is even more emphasized. What managers need to have is knowledge about the business and expert help from either, controllers within the company or external advisers.

The topics that were investigated on a sample of SMEs from northwest Croatia were the existence of Controlling in the institutional sense and the carriers of Controlling tasks. The results show that Controlling is not heavily present in the institutional sense: no micro enterprise and a very low percentage of small and medium companies have Controlling departments. This topic was additionally investigated according to company size which confirmed that the institutional presence of Controlling rises with the growth of a company. This result coincides with the studies from German-speaking countries. Main performers of Controlling tasks in investigated SMEs are managers themselves. They perform these tasks with the help of the employees from accounting/bookkeeping and finance department since Controlling department is present in just several companies. Therefore it can be concluded that the hypothesis set in the paper was confirmed.

However, it is evident that managers in Croatian SMEs perform Controlling tasks in higher percentage than their German counterparts. To lower the managers' burden, additional expert consultant help should be considered. For SMEs in Croatia, a most efficient combination would be the one with an internal performer of Controlling tasks (besides management those are employees in accounting/bookkeeping or finance department if there is no Controlling department) combined with the external advising services.

lorenaalikaj@yahoo.com

ABSTRACT
Widely is accepted by economic theories that the promoter of a country's economy is the entrepreneurship. Those peoples, with their own ideas, in order to maximize profits, tends to up the ratio of the employment's country. This of course, creates the premise for raising the standard of living of households, but if the national consume remain constant, then the case is an open discussion. By this point of view, the aim of the article is to know the role of the Albanian SMEs into economic growth and also in the standard of living of households. Sure, their challenges or opportunities by Albanian reality mark their success or failure.

Keywords: *Consume, Economic growth, Employment, Welfare*

1 INTORDUCTION

Support and development of SMEs in Albania economy is and should be the main focus of monetary and fiscal policies undertaken by the government. That's because by what the SME means, especially based in the criteria of employees number, about 95% of the Albanian enterprises are classified as SME. Their development automatically leads to the creation of an stable economy situation, when the aim is to be such that over time.

The stimulation of SMEs is necessary because:
1) First, their best performance stimulate the desire of entrepreneurs to recapitalized their profits,
2) This affects the creations of the new business or in the enlargement of those actual,
3) The rate of employment has to be increased and as consequence, the standard of living of Albanian families will be increased,
4) Profits/losses of SMEs, is directly related to individual/individuals highlight their entrepreneurial skills,
5) The commercial cooperation among countries tends to stress their relations benefiting by the comparative advantages that they have,
6) The economic growth of the country, also based on the economic models shows that will be depend on the development of SMEs,
7) Unfavorable situations of SMEs brings political and economic instability in the country,
8) By having in focus the development of SMEs, labor markets will be more efficient by reducing informality,
9) The underground economy will be reduced by the existence of powerful SMEs.

Albania during the last decade has taken considerable steps to improve the business environment. Best practice in this area have come by the on-line business register, reducing in this manner the costs of business registration. On line services for the business are drawing for the first time in the National Strategy of Business in the 2008, but was fully implemented to the end of 2010. Strategy enables transparency and facilities for the business, especially in the payment of taxes via on line procedures. Those procedures avoid the bureaucracy costs undertaken before by business, making the things more easy. During the year 2005 until 2009 the situation seems to be favorable for the entrepreneurs, related to the data on the following Table 1.

Table 1: The employment in the Albanian SMEs and their added value (Eurostat, 2012)

	Number of Enterprises			Employment			Value added		
	Albania		EU27	Albania		EU27	Albania		EU27
	Number	Share	Share	Number	Share	Share	Billion €	Share	Share
Micro	66.166	95,8%	92,0%	109.894	45,9%	29,5%	0,55	24,7%	21,4%
Small	2.386	3,5%	6,7%	45.720	19,1%	20,5%	0,41	18,4%	19,0%
Medium-sized	432	0,6%	1,1%	40.393	16,9%	16,9%	0,31	13,9%	18,1%
SMEs	**68.984**	**99,9%**	**99,8%**	**196.007**	**81,8%**	**67,0%**	**1,27**	**57,0%**	**58,5%**
Large	54	0,1%	0,2%	43.538	18,2%	33,0%	0,96	43,0%	41,5%
Total	**69.038**	**100,0%**	**100,0%**	**239.545**	**100,0%**	**100,0%**	**2,23**	**100,0%**	**100,0%**

The growth of Albanian SMEs for 2008 results more higher than the European average of 0.10%. Moreover, the level of employment ,as a key factor, is greater than the European average with a difference by 22%. Added value of Albanian SMEs seems to be more lower than the average of European countries by 2.63%.

Concerning in the data of table 1, the number of SME in Albania has increased affecting the growth of employment regardless of the value added in the economy turns out to be lower than the average of SMEs in Europe. Thinking about this, brings in mind that the economy game needs pure rules. By this point of view, the role of state is unquestionable.

However, most business from changes in taxes procedures were unprepared, and such initiatives enlivened some specific profession like accountant/economist making them more desirable by the young peoples. They creates the necessary facilities related to the tax business liabilities since they tend to used more than other generation the computer.

Based on tax liabilities, Albania creates facilities with regard to tax rates, which appear to be the lowest rates in the region, but still remain above the regional average. During the 2005-2010 this has probably been one of the main factors that led to the raise of new business, coupled with governmental policies open to foreign investments. Their presence in Albania, especially in the fields of energy and hydro brought the raise of rate employment tending to improve the standard of living's peoples in the communities where they are located.

Regional economic crisis of some countries such as Greece, Italy, Spain sure will influence the development of Albanian SMEs, especially of those who are very strong in cooperation with them (fasone industry). By reducing the costs production in Albania, foreign firms

operate here because the price of the labor factor is more cheap than in Europe. The production is exported to the respective markets. Despite the vertical and horizontal integration that may have the Albanian SMEs, the economic situation of the country where most of the income are coming by the remittances, mainly from Italy and Greece, sure will influence their development. How they influence the economy of the country by itself, that's to be taken in consideration.

2 SITUATION OF SMEs IN ALBANIAN REALITY, THEIR CHALLENGES

By the European crisis, where the Albanian consumption is widely depending by remittances, makes the Albanian SMEs to be in difficulties from the absence of market. It's clearly in the high level of bad debts from banks and sharp decline in demand for products/services in the country. According to the Association of Banks in Albania, the level of bad debts is currently 22.7%, an indicator to be taken in consideration, not lower compared with the levels of macroeconomic variables of the country. Since October 2012, bad loans have increased for the month of November 2012 with a rate of 0.3%. Likewise, according to the Association of Banks in Albania, the level of deposits is increased too. The main factor for this, maybe will be the bad security situation in the country where the number of thefts has risen significantly. Bad credit growth may results because:

a) During this period of time, banks have preferred to give more government debt than to private investors,
b) Despite of the reduction in the norm of interest by Bank of Albania, the rate of investment was not significant,
c) The lack of liquidity, especially in the construction sector by which depends many other business, has reduce the confidence of banks that firms will be able to pay their loans,
d) Moreover, the absence of a pure fiscal court which specifically deals with business issues has deteriorated the situation,
e) That's because frauds and absence of sincerity among partners in business-a growing phenomenon, affects the rise of bad loans and lack of investment by the missing profits.
f) Also, those practices result to be followed by banks, which do not required strict procedures in order to get loans. In many case they accept for collateral the capital of firms (machineries, lands etc) making in these manner the situation of firms more gravely.
g) The absence of a fiscal court, addressed especially to fiscal problems, leads to the crawl of such problems- increasing the opportune cost of business and in many case in the bankruptcy of those.

Government challenges remain such steps that reduce this situation. First steps have been thrown by reducing interest rate, but this is insufficient because no increased in investments is shown. The necessary and indispensable is their combination of fiscal measures like tax amnesty facilities needed to be taken again. Also this is to be done with a strong marketing policy and in combination with the reduction of the number of the taxes that the business must do. According to the Doing Business in Albania Report World Bank, 2012 the time taken by business to pay all the taxes is much greater than the European average.

Despite this, is necessary that the environment of the business be clearly and realistic, where the successful business must be growing in order to contribute for the development of the country. This requires such initiatives to increase the responsibilities of firm's administrators

for the actions that they may undertake. The law exists and well designed, but its implementation in reality leaves much to be desired. Corruption affairs starts with the missing responsibilities in cases of frauds. Strengthening the legal system and the reduction of informality, coupled with government support to entrepreneurs, is a safe way for the country's economic development.

3   THE IMPACT OF SMEs IN THE GROWTH OF ALBANIAN ECONOMY

A country is strong if the standard of living of its citizens is high. Their purchasing power depends very much on their income and the level of employment. Based on the data of World Bank for Albania, shows in the table 2 below, we see the impact of independent variables into the income. In the concentration of the different economic sector where the SMEs are focused, we can generate the following regression equation:

Box-Cox transformation of the response with rounded lambda = 0.5
The 95% CI for lambda is (-0.025, 0.745)
Regression Equation
GNI^0.5 = 4.53653 + 0.25947 Industry (%GDP) + 16.0221 Foreign Investments(DFI) + 0.078089 Export (%GDP) - 0.0564479 Import (%GDP) +
15.7592 Remittance + 0.276107 Services (%GDP)

Table 2: Coefficients of the regression model and their values (own source)

Term	Coefficients	SE coefficient	T-value	P-value
Constant	4.5365	14.7216	0.30815	0.763
Industry(%GDP)	0.2595	0.6217	0.41738	0.648
DFI	16.0221	3.2396	4.94575	0.000
Export(%GDP)	0.0781	0.2476	0.31545	0.758
Import(%GDP)	-0.0564	0.0516	-1.09311	0.296
Remittance	15.7592	3.6368	4.33322	0.001
Services(%GDP)	0.2761	0.1131	2.44108	0.031

The model has a good approach because explains the dependence in 98.67% of cases. Decisive factors in national income, based on p-values less than 0.05 (coefficient of error) are:
  ➢ Remittance
  ➢ DFI (Foreign Direct Investment)
  ➢ Services

Entrepreneurship Between Creativity and Bureaucracy

Table 3: The analysis of model variance (own source)

Source	DF	Seq SS	Adj SS	Adj MS	F	P
Regression	6	4185.09	4185.09	697.515	148.078	0.000000
Industry (%GDP)	1	385.89	0.82	0.821	0.174	0.683771
DFI	1	3012.00	115.22	115.220	24.460	0.000339
Export(%GDP)	1	466.23	0.47	0.469	0.100	0.757849
Import(%GDP)	1	51.52	5.63	5.628	1.195	0.295805
Remittance	1	241.37	88.45	88.447	18.777	0.000973
Services(%GDP)	1	28.07	28.07	28.069	5.959	0.031096
Error	12	56.53	56.53	4.710		
Total	18	4241.61				

According to the Table 3 which stress the analysis of the multiple regression, the standard of living depends on the amount of remittances. Normally, crisis in the neighboring countries, even accelerated, will influence this standard. The model shows that DFI play a primary role in the albanian economy. Big ambitious projects in the fields of energy and water resources seems to be key factors. Furthermore, foreign investors are taking advantage by the environmental opportunities with the opening of private school in the regions where they operate. This because, they need the appropriate staff for the maintenance of their investment. This of course, leads to mutual benefit, both for the community of the region and for the foreign investors, increasing human capital and the quality of the life. By the other side, investors benefits are the revenues of school and the reduction of costs production. Despite this fact, the correlation between Albanian GNI and DFI seem to be at low levels (see charts 1 and 2), and Albanian GNI trend is almost constant in the positive scenario.

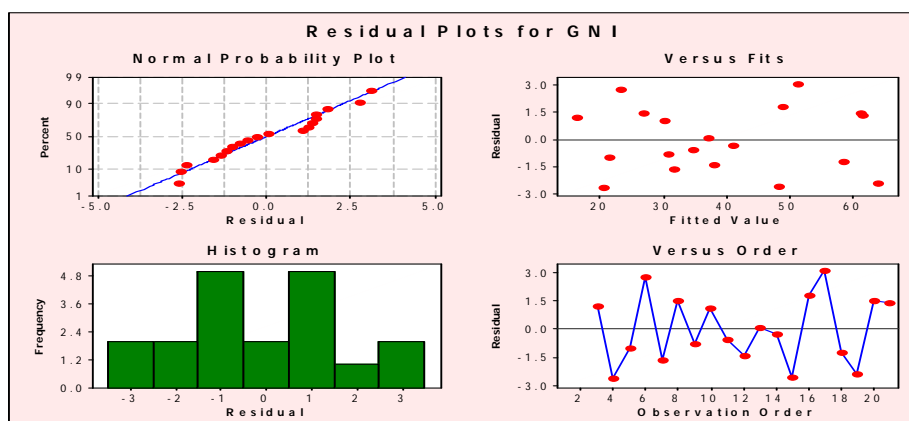

Chart 1: Residual Plots for GNI variable (own source)

Entrepreneurship Between Creativity and Bureaucracy

Chart 2: The Marginal distribution of GNI and Foreign Investments-DFI (own source)

The model suggest that services sector is significant at the level of standard's living citizens. To stimulate SMEs operating in this sector, will be a good factor for the economic growth, but sure without ignoring the other vital sector of the economy. It's the duty of the policymakers to well done the strategies in all sector, especially at those where the demand is higher.

4 CONCLUSION

Despite that Albania does not seems to be affected very much by European crisis, dependence on remittances make the crisis present in the country. In order to does not feel the domino effect occurs with dynamic multipliers, the country needs concrete fiscal and monetary policies which should be taken in the right time.

It's important to select those policies that creates synergies among aggregate economic resources. Otherwise, the economic costs will tend to increase. The econometric model suggests that the foreign investments are very important to the growth of economy, but is necessary and indispensable the government support of Albanian SMEs operating especially in the field of services, tourism sector etc. Support can begin with fiscal facilities as tax reduction and related steps.

ABSTRACT

This study was designed as theoretical and analyzed characteristics of family companies. In additon, we elaborate on management and administration problems of family-owned companies. The concept of ınstıtutıonalization is defined and announced that the causes of the problems of intitutionalization. In this study, how marketing function is being carried out in family businesses and marketing issues of small businesses are examined. A function that is related to marketing - from pricing to advertising, customer relations to distribution – were discussed in detail. As a result we present a few suggestions about marketing decisions taken in the family businesses. We believe that these suggestions will be important for each company which is defined as a small businesses.

Keywords: Family-owned companies, Institutionalization, Institutionalization problems, Marketing management

1 INTRODUCTION TO FAMILY-OWNED COMPANIES AND THEIR CHARACTERISTICS

In the simplest term, family is the smallest social unit of the society, while the enterprise is an institution established to provide goods or services for people. Family owned enterprises are the profit- oriented social organizations that are established by cognate individuals, in order to produce good or service. The description of family includes emotions, relations, unity, solidarity and support. Furthermore, there are vital elements in family. But an enterprise represents another point; in this point, emotion is replaced by reason, relations are replaced by results and unity and solidarity is replaced by competence (ASO).

For many, the most important two factors of life are family and job. Without a job, it will be hard to start a family. Similarly, without a family, the idea of establishing and progressing a job won't be very essential. The family owned companies including both of these elements simultaneously, are different from those public-associated companies; thus it is a different survey matter. There are two reasons that make family enterprises important. Firstly, they have the opportunity of response to love and working desire simultaneously. If these two elements can be managed successfully, not only the family connections develop, but also its life span extends. The second reason is that, almost throughout the world, it is like the locomotive of national economies. Despite the widespread notion, the family controlled companies have a basic role in economic activities of nations, all over the world (Kırım, 2003). Small and medium-scale companies have an economic and social importance both in Turkey and in the world. At the same time, majority of these companies are family owned. The rate of small and medium-scale enterprises in the over-all enterprises is as following; in

the US 97,1%, in Germany 99,8%, in Japan 99,4% and in Turkey 98,8% (Alayoğlu, 2003, p. 13). On the other hand, the rate of the registered family owned companies is 90% in the USA, 80% in Spain, 99% in Italy, 75% in Britain, 90% in Switzerland and 95% in Turkey.

2 FAMILY-OWNED ENTERPRISES AND MANAGEMENT

As the owners of family companies are manage their own jobs, work hard, and buckle down to the work, the decision making process is faster for them. But when the work reach a specific growth, and beside the work itself, some terms such as management and organization, human resources, efficiency, quality, cost accounting, human relations emerge, some particular problems begin, since the family members are not familiar with these terms and even they consider them as luxury. Such companies can't follow technological developments, and they also can't use advertising and marketing activities efficiently. Moreover, they are not able to face some problems in qualified manufacturing. They can't access to qualified employees, quality control specialists and quality control test equipments. In the terms of small and medium-scale enterprises, vocational training has a great importance. Most of the craftsmen working here, are those risen from the ranks. In terms of success, it's very important to know the work and rise from its rank (Soylu, 2003, p. 2). According to a survey including the family owned companies' administrators, the most usual problems for family enterprise owners are those (for the 85% of them): non- institutionalization, reign, high labour turnover rate, specializing problem, lack of grounding, continuation of previous habits and staff training problems.

2.1 Institutionalization and managerial inadequacy

It is placed on the top amongst the causes of family owned companies' failure. The most vulnerable point of such a company is to confuse family and company terms. In these companies, consanguinity comes into prominence instead of skills and performance, and the family's children are employed even though they are inexperienced. Furthermore, these inexperienced children are promoted rapidly and they are granted lifelong jobs without a performance evaluation. Institutionalization is not the bosses' knocking off, however, being a boss is a separate occupation and it should be learned well. The boss' duty is to point the top manager and control the institution directly and indirectly.

2.2 Reign

It emerges when the capital owner is also the administrative. In such a situation, the control agency, which should control the company efficiently, shows weakness and the decisions about the management of the company are taken in a monarchic system. That's why a company should never be surrendered to the ones that have a sense of reign. The boss should stop the 'one man' role and go towards a 'conductorship' role. Just as the most powerful reign regimes will collapse in the end, and such a collapse is inevitable for a company that is not open to an internal control competence.

2.3 High labour turnover rate

It is seen in the enterprises in which the organization scheme, duty explanations, authority and responsibility balance are not determined clearly. There is "we" and "they" segregation between employers and employees. Generally, they don't invest in human. As the owners of the companies assume themselves more experienced, informed and intelligent, they face difficulties in working with managers that exceed them. As they are sensitive to manufacturing and marketing rather than training, reports and all the components of the work,

they have difficulties in seeing the whole system. They don't dominate the company by overcoming this difficulty, and so they need to point a man from the family to the key units.

2.4 Specializing

It will increase the efficiency of the enterprises, as a result of determining specific standards and aims for management. The term 'specializing' is far from other requirements of a significant and professional administration in circumstances such as creating certain standards, realizing quality in management and as a result of this, the company can't provide a specialization and such requirements are practiced by close relatives or formal inheritors. The family owned companies should focus on points such as; creating efficient family politics, separating the inner functions, leaving the job to professionals when it's necessary, searching for newer opportunities and investments, expanding and developing the business in order to provide a specialization in management.

2.5 Lack of information

Most of the failures the companies experience are because of the decisions, which are not based on informing (Oktav et al., 1990). It's another problem that people managing the family owned companies; consider informing as a redundant cost. There are several effects that hinder the owners of the family enterprises from an informing process such as limited financial and administrative facilities as well as the managers' negative attitudes towards this matter and their being unaware of the priorities that will provided by an informing process in a competitive environment.

2.6 Maintaining the past habits that rise from the ranks

The firm culture of a family owned company is created by the family members' emotions, thoughts and culture. In general, it is seen that the mission and vision of the firm is under the influence of the owner family.

2.7 Staff and training problems

Facing difficulties in supplying a sufficient number of and qualified enough labour is notable for small enterprises in almost all sectors. Recently, small and medium-scale enterprises have been in a period, in which people believe in the necessity of qualified staff and human resources. Staff recruiting in Small and Medium Sized Enterprises is still based on very classical methods such as references, newspaper advertisements and recommendations. Although the training programmes developing staffs' knowledge, skills and experiences are costly, recruiting a wrong staff for a specific position may be much more costly.

2.8 Power struggle

It is emerged as a result of interest groups around the candidates for the boss in large companies. And at the same time, in family owned enterprises, this problem will rise when inter parental conflicts are reflected to the work. The professional administration existing in the company may instigate the power struggle insidiously by applying a 'divide and rule policy', in order to have power in the future. Therefore, some precautionary measures should be taken by providing suitable jobs for anyone and instituting them into the right positions in the firm.

3 INSTITUTIONALIZATION PROBLEMS

Institutionalization explains the adaptation process of an institution to the environment it locates and a progress that occurs in institutions over time. In other words, institutionalization

is managing a company in the direction of specific aims and goals, and within the framework of specific principles and values. These aims and goals are so strong and attractive; these principles and values are so firm and linking that the existing administrators of the company feel as if they are obliged to act appropriately. Because these decisions are not effected by the administrators' character and decisions. Furthermore, institutionalization is the process of being systematized and becoming a rule. We can talk about the institutionalization of a company only when its activities are systematized and practices are done in the framework of some specific rules.

The major mission of administrators in a company is to provide a harmony within the organisation. They should determine the prudential priorities of the organization through providing employees' attendance and they also try to make sure that all these priorities are understood by each staff. Otherwise, aim of the organization and the staff is differentiated. As a result of this, the expected fertility and participation will not be achieved. Firstly, in providing the intra-organizational harmony, it's essential to discuss the organisation's existing situation, determine its goals and the requirements that are necessary for achieving these goals. The institution should create the organisation schema; accelerate the working system and work flow; prepare work profiles, procedures, handbooks and instructions about the job; establish an effective reporting system; create work and performance evaluation systems through work studies and analysis; describe the missions and responsibilities and make them written by determining the authorities; make career plans; write any type of information and update so often in order to achieve its goals. In a broader sense, institutionalization is "a process in which, the enterprises have rules, procedures and particular standards rather than individuals". Enterprises include their own working procedures within this process, and as a result, they attain a distinctive identity. Consequently, institutionalization is a process and the basic function of an enterprise that want to continue its existence.

There are some duties, which are necessary for family owned companies' prospective success. They should fulfil the following duties in order to gain an institutional identity (İşseveroğlu, 2001):

➢ First of all, the family members should understand the difference between the concepts of "family" and "company" and provide a balance between them.
➢ It should not be forgotten that, personal fortune management and company management are different concepts.
➢ The administration should employ high quality employees and motivate them to the work through giving them freedom of fulfilling the duties successfully. Moreover, the family members should not consider them as "extraneous" but as a component of the team.
➢ The communication in both family and company should be realized accurately, mutually and intensively. At the same time, conflicts within the family shouldn't be reflected to the work.
➢ Enterprises should use long-term plans instead of short-term ones in order to get better profit.
➢ The administrative positions should be assigned for professionals.

4   MARKETING MANAGEMENT IN FAMILY-OWNED ENTERPRISES

Under current circumstances, it is not possible to be successful or achieve the determined aims for family owned enterprises through traditional management mentality. The globalizing markets, developing technology, social and political structure, legislation, suppliers,

customers, in short all environments the enterprise is in relation with are changing increasingly (Gülen, 2005). But the Small and Medium Sized Enterprises (SME) are not successful enough to keep up with rapid changes in consumers' preferences, which are emerged as a result of technological and socio-economic changes. However, in order to gain a competitive advantage, enterprises should improve production and management processes, increase output quality, provide a customer satisfaction as well as develop some new cost-reducing methods by increasing employees' content, motivation and performances. Marketing plays a central role in fulfilling such business aims and goals (Adu and Singh, 1998, p. 385). In Gillmore, Blankson, Morrison and Lee's studies, they consider marketing problem as one of the most important problems that threat existence of small enterprises. Through the small enterprises in Australia, there are some important problems; for instances, selling and marketing problems (40%), human resources (15%), general management (14%), and manufacturing related problems (9%). In the context of India, management union's survey of 872 SMEs show that, there occurred a 8,1% decline in production between 1998 and 2002 and undoubtedly, it was caused by marketing problems which was at the rate of 70% (Sengupta and Chattopadhyay, 2006, p. 329).

Negative characteristics of SMEs' related to marketing functions can be arranged like this (Tekin, 2009):
> Small and Medium Seize Enterprises do not have a separate marketing department that employs professionals.
> The dominant sense of marketing of SMEs is under-developed.
> They don't make regular marketing research.
> They depend on a limited and narrow market.

On the other hand, small enterprises have some priorities related to marketing:
> Direct marketing,
> Efficiency in personal customer relations,
> Lower selling costs,
> Carrying on business in simple and small markets,
> A high flexibility
> Capability of a rapid decision making,
> Possibility of mass customization production,
> Price, cost and quality options.

4.1 Selling and marketing

Marketing activities in family owned enterprises are determined by top managers' instincts, past experiences, performance and traditional habits. Furthermore, they are run as informal and unplanned activities (Sengupta et al., 2006). The selling orientation of small enterprises represents how a marketing line they have determined. All research companies define three types of sales personnel, within the scope of SMEs' selling orientation and selling literature. These are entrepreneur salesmen, ambitious (who want to make a career) salesmen and service-oriented salesmen. Although these three kinds are very important for companies separately, the entrepreneur salesmen type is the most predominant one. They are seen as the representatives of sale activities in enterprises (Hill, 2001). The observable aspect of marketing in Small and Medium Sized Enterprises is to conduct the strategic marketing decisions simply or to perform the marketing planning tactically. As Simon (1960) argues, decision making within SMEs is a whole, from routine schedules decisions to unscheduled, intuitional and unpredictable ones. But the unscheduled and intuitional decisions have the

features that are belong to SMEs (Simon, 1960). An entrepreneur salesman is a man, who is exaggerator, optimistic, high motivated, vision and intuition holder, creative and who has competence of taking a big responsibility. The entrepreneur personality definition in literature suits the entrepreneur salesmen characters. Jarillo (1988) and Gartner (1989) define the entrepreneur personality as a person who has a high motivation and creativity and also the ones who try to catch opportunities. Generally, the employees that conduct marketing activities In SMEs are the entrepreneur salesmen.

Point view, perception, behaviours and features of company owners or managers are conducted especially with considering the company's size (Gilmore et al, 2001; Carson, 1993). As professional salesmen, brand managers and researches can not be employed in small enterprises generally, the things that affect marketing activities of a small business are personal qualities, perception and especially the predecessor habits of the top manager. That is, the characteristics of SMEs' marketing may be derived from management style, independency, property, the possessed limited resources and scale and scope of activities as well as empirical knowledge of the administrators and the firms.

4.2   Customer relationship management

In developing competitive environment, it is now essential to present high-quality goods and services to customers regularly (Appiah and Satyendra, 1998, p. 385). Because, today's customers are people who get organized better, evaluate alternatives, demand more on subjects like goods and services, question and also who are knowledgeable and aware of their rights. Therefore, in order to meet the requests and needs of the customers that they have in their enterprises, and to prevent them from choosing other alternatives, they give more importance to customer relationship management (Lusch and Laczniak, 1987). Especially for SME, customer orientation is vital to achieve success. Because, generally these kinds of firms do not have enough financial power to develop research, to take competitive advantage, to be able to develop low-cost leadership and effective strategies, and to recruit qualified staff (Pelham and Wilsom, 1996). On the other hand, the peculiar culture and traditions of the family owned enterprises, mutual experiences of the family members in the past, communication, attitude, values and organizational culture provide an advantage to them in how to treat their customers (Uluyol, 2004; Fındıkçı, 2005). Customer accordance emphasizes organizational culture, forms wholeness and does not separate from each other. The information related to the needs of the customer should be considered with organizational culture, beliefs and values that the enterprise have. Having comparatively few employees leads to establish intimate and close relationships. Thus, the employees value their customers more. High motivation of the employees - who are also called internal customers - and their receiving good treatment enables the external customers to be pleased too. This type of informal relationship is quiet common in family owned enterprises. The mobility of small businesses is faster than the big businesses' (Asford and Towers, 2001). So, they can see changing customer demands, wishes and needs in the market beforehand and they can make adjustments suitable for the market and they can make swift decisions about change. A subject, on which it takes months to make a decision in a multinational corporation, can be determined in just one day in a family owned company (Ural, 2004, p. 10) However, the fact that there are not adequate and qualified sales and marketing staff in family owned enterprises, or the fact that customer relationship manager is dealing with other businesses at the same time can cause problems. Loss of customers, which can occur as a result of not being able to offer service to the customers after sale, is one of the disadvantages that family owned enterprises have (Tekin, 2009; p. 362). According to Levitt (1983), the relationship

between the purchaser and seller does not end when the sale is over. Later begins the after-sale service and the real relationship, discount, and privileges that are going to be presented to the customers start at this level. A kind of marriage begins. Relations marketing is already described as a process in which long-termed win-win relationships are developed together with customers, suppliers and distributors. In SME, this kind of sales approach should be adopted and thus they can change customer relationships into competitive power skillfully.

4.3   Pricing and advertising

The success of marketing activities that are carried out in family owned enterprises depend on marketing mix decisions. To know who is going to make this decision and which internal and external factors are effective in decision-making, and also to make environmental analysis are important in choosing the most appropriate marketing mix. It is important for marketing success to determine a suitable price for the features of the market that is being served and for the target group of that market (Tekin, 2009). High price may not be able to provide high sale revenue. There should be a balance between the quality level of the goods and services that are presented and the price. At this level, carrying out institutionalization and distribution of authority openly gains importance. While the founder of the company has prejudices against advertisement and promotional activity efforts, new generation thinks that these kinds of expenses are necessary. Similarly, also in pricing decisions, there can be seen intra-company disagreements. Because pricing affects customer behavior and purchasing decisions closely, it is considerably important. For this reason, pricing the value of goods or services shouldn't be seen as a simple process. The main factors of pricing decisions in enterprises are customers, rivals, costs and laws. All these factors should be regarded as a whole and while deciding on the price, they should be taken into consideration.

Advertisement also has an important place among marketing components. To prepare an advertisement program, to choose an appropriate means of advertising, to determine openly what is going to be told and whom it is going to be told are necessary for an effective advertisement. However, in order to do this, there should be advertisement and presentation department in family owned enterprise and what's more there should be professional advertisers as the head of that department. As it is always pointed out in this study, because the limited facilities of family owned enterprises is not convenient for this, the founder of the company is advertising executive, purchasing executive, public relations specialist and also accountant of the enterprise. At the same time, he is a quality-control specialist, a husband and a father. The fact that all these different functions come together in one person decreases the productivity and this makes it difficult to survive in constantly-changing conditions of market.

4.4   Distribution channels

Inadequacy of human resources in SME (Small and Medium Sized Enterprises) and difference in production systems also affect the type of distribution channel that is going to be chosen (Tekin, 2009). In small enterprises, workshop production is made. In order to satisfy the market demand, they generally make production to order. Since the activities done in small enterprises vary constantly, division of labor and specialization are not in advanced level. In SME, distribution is generally carried out by the efforts of private marketing. In such enterprises where personal selling gains importance, the entrepreneurial salesperson takes the distribution part on himself. Besides, he has the ability to take big responsibility and he is highly-motivated, optimistic, creative, visionary and intuitive. The definitions of entrepreneurial personality in literature also match the features of entrepreneurial salesperson.

Jarillo (1988) and Gartner (1989) define entrepreneurial personality as a highly-motivated person, an opportunity-seeker and a person full of creativity. In SME, generally an entrepreneurial salesperson carries out the marketing and distribution activities. In short, we can say that, generally a direct distribution channel without a mediator is preferred in small enterprises.

4.5 Staff and communication

Choosing the staff that is going to work for family owned enterprise is carried out by considering the kinship, friend recommendation, reliability and whether the person is a member of the family or not, rather than qualifications, education and experience (Uluyol, 2004). Therefore, there are not so many professional, expert, educated and experienced staff in family owned enterprises. Because, the limited financial resources that the family owned enterprises have, are inadequate in providing the wages that are demanded by the professionals. Business and family systems are quite different systems from each other. According to Rosenblatt et al., family and business have rules of their own. In this respect, running the company like a family can cause problems in the relationships between the employee and the administration (Cole, 2000). People who work for a company, without discrimination, should be regarded as a part of that company and everybody should be treated equally considering their knowledge, skills and contribution to the company. In family owned companies, generally feelings lead logic. In family owned companies, the entrepreneur's personality as a ruler is dominant. He prefers giving instructions rather than persuading. And for this reason, problems break out in correspondence and communications (Tekin, 2009).

The owner of a small enterprise should pass to democratic leadership from autocratic leadership. From now on, instead of enforcing his orders, like a ruler, to the employees working in his service; he should regard them as members of a team of which he is in charge. Instead of enforcing his demands, he should try persuading. He should leave aside the "I know the best" thought and let the employees express their opinions on some subjects too. He should encourage employees to reveal the innovative character within them (Dilbaz, 2005, p. 59). What should be done here is that everybody shares and discusses the ideas passing through their minds with others. If they can make decisions together, these ideas can be carried out and developed (Uluyol, 2004). Communication is one of the most important problems that family owned companies encounter today (Fleming, 1997). However, one of the success factors for a family owned company is the communication among family members and with the employees out of family. For an effective management, communication channels should be kept open and the flow of information should be enabled regularly. In family owned enterprises, staff and administration relationships have informal features. And this helps to build sincerity, confidence and close relationship between the employees and the management.

In family owned enterprises, there usually occurs a lack of communication among family members. Because of generation gap, family members may conflict with each other about the necessity of the strategies and activities that will be carried out in the enterprise. The subjects about which the fathers complain most are : sons are in too much of a hurry over taking responsibility, they want to change the old methods, they do not trust the experience and opinions of their fathers, and they want to change the aims of the company. And the subjects about which the sons complain most are : the founder of the company does not give enough authorization, he (the founder) has obsessions with doing business, he resists change and innovation, and fathers still regard them as a little boy. All of these result from different

perspectives and way of thinking of different generations. However, this kind of communication problems can be solved by organizing family gatherings and talking over the problems openly.

4.6 Production

Family owned companies, which struggle with financial problems, have also problems about the transfer and use of appropriate technology. Among the production problems of these enterprises we can mention technology, quality, stock, standardization, production planning, product development, purchasing, choosing workplace and raw material (Tekin, 2009). People encounter important problems particularly in purchasing part. When raw materials and auxiliary materials that are used in production do not come on time, this leads to delay in delivery of ordered goods and loss of customers. In family owned enterprises, the negative attitude of the boss-manager towards change and technology also prevents the production to be made in appropriate standards for the market. Innovation in SME, keeping up with industrial changes and level of acquiring different knowledge are all limited with the boss-manager's perspective and industrial experience (Wang, Wang and Horng, 2009). Contrary to big companies, the limited financial facilities and poor administration infrastructure in small enterprises make them stay behind the times in subjects such as producing innovation and making production with new technologies (Jones and Craven, 2000; Lim and Klobas, 2000). There is no opportunity for the goods, which are produced with old style and methods by companies which cannot keep up with technology, to compete with the goods produced of good quality and for less money by the rival companies working with the newest technology (Uluyol, 2004).

The facts that the production costs are high as a result of inadequate revision and calculation, the indifference of the administrators on this subject, and that they are still using the out of date accounting standards (Ural, 2004), that inadequate capacity decreases the productivity, the ambiguity of the quality level of the goods or services that are going to be produced, and lack of quality-consciousness are all among the problems of production (Tekin, 2009).

5 CONSLUSION AND SUGGESTIONS

Management and marketing problems that occur in family owned enterprises should be handled and solved with system approach and in management system as a whole. Therefore, all the family members should make self-sacrifice and have the thought and intention of providing the continuance of their business and enterprises.

Firstly, a company founder should have a mission and vision. He should be well-informed and experienced in business administration, and he should not only come up through the ranks but also be open to innovations and changes of the era.

Planning should be considered important in family owned enterprises and it should be prepared in accordance with scientific norms. In carrying out the plans, there should be full participation and support of the staff.

In family owned enterprises, formal communication should be considered important, and individual communication ways depending on blood relation should be ignored. In family owned enterprises, everybody should be openly informed about his own duty and responsibility. Company founders should give the staff authorization on some subjects. The employees of the enterprise should be highly-motivated, and they should be encouraged for

coming up with new ideas and solution offers. While recruiting staff for the enterprise, not the acquaintances, relatives or friends of the family, but well-educated, specialist and qualified staff should be recruited. What should be aimed is to increase the level of the wage that is paid to the staff and thus, to decrease labor turnover rate. Stock-control should be considered important, and stock cost should be minimized. The managers of the enterprise should take the stock, the use of capacity and the level of productivity into consideration while calculating production costs. Production costs should be on a level where they can compete with rivals in the market. Qualified staff should be recruited and quality level should be raised so as to create goods and service differentiation with the produced goods and services. While making production planning; market conditions, competition, and customer pleasure and expectations should be taken into consideration.

Here are some suggestions that are going to be made on marketing: In marketing team there should be knowledgeable and experienced people, distribution channels should be used effectively and thus it should enable the goods to reach the customer at the most suitable time, place and price. Customer relations should be considered important and customers should be satisfied. There should be conducted a detailed market research about the goods and services to market. And target customer group in the market and their features should be examined in a detailed way. Family owned enterprises should focus on advertisement and promotional work, and they should clear the way for new generation representatives on this subject. These kinds of promotional activities should not be regarded as unnecessary expenditure. It should be kept in mind that, the will contribute to the positive improvement of the enterprise's name and image. Personal selling should be considered important and for that activity, a qualified sales team should be formed.

The conflict that occurs in family owned enterprises should be prevented by constant meetings held by family members and again within family itself. Everybody should try to understand the other by establishing empathy and should avoid harmful ambition, rage and excessive passion. The problems within family should not be reflected to the enterprise, the aims of family and enterprise should be separated clearly.
