THE ROLE OF ICT ON CULTURAL HERITAGE TOURISM: A CASE STUDY

Abe Akihiro
Iwate Prefectural University, Faculty of Software & Information Science, Japan
abe@iwate-pu.ac.jp

ABSTRACT
The purpose of this study is to discuss the role of ICT in cultural heritage tourism through a case study of the Hiraizumi world heritage site in Japan that was registered in 2011. As it promotes tourism through the world heritage registration, Hiraizumi is operating on the major premise that it will safeguard its cultural heritage while also placing importance on developing systems for accepting a diverse range of tourists using the universal design perspective. When doing so there are limits to facility refurbishment and infrastructure development so the town focused its attention on support for information aspects, or in other words support using ICT. Going forward as individual travel becomes more mainstream the ways in which new value is created in Hiraizumi tourism are likely to include (1) transmission of the value of the cultural heritage in collaboration with researchers and (2) development of tourist areas in which excursions on foot are possible. We discuss the possibilities for utilization of ICT in these measures and the utility of the participatory design approach.

Keywords: Cultural heritage tourism, ICT strategy, Tourism information, Tourism promotion and cultural property protection, World Heritage

1   INTRODUCTION

In June 2011 the cultural heritage of Hiraizumi was registered as UNESCO world cultural heritage under the name "Hiraizumi—Temples, Gardens and Archaeological Sites Representing the Buddhist Pure Land," realizing an ardent wish of the town. The town had fought back after the nomination had been rejected in 2008 and overcame many obstacles to achieve registration including reducing the number of sites covered by the nomination from the initial nine sites to five sites (Chuson-ji, Motsu-ji, Kanjizaio-in Ato, Muryoko-in Ato, and Mt.Kinkeisan), so the excitement of the local people was all the greater when the registration was finally achieved. For Iwate Prefecture and all of the northeastern Japan suffered from the Tohoku earthquake and tsunami of 11 March 2011, the registration proved to be a ray of hope. Through registration as a World Heritage Site, various plans and operations were initiated to promote and vitalize tourism in Iwate prefecture and the Tohoku region centered around Hiraizumi. On the other hand, the gap between the inland areas of the relatively unaffected prefectures and the seriously damaged coastal areas, which still have not restored their facilities, continues unabated.

Hiraizumi is a well-preserved grouping of a wide variety of temples and gardens built on the basis of the Pure Land thought of Buddhism (Figure 1). The temples and gardens attempted to create an ideal world in our world, and developed in a uniquely Japanese way while receiving foreign influences. The expression of the ideal world at Hiraizumi is seen as being without parallel anywhere else. In order to register a site as a World Heritage site, it is necessary for the resource to have a "marked and universal value." In order to prove this, it is necessary to show that the site (1) corresponds to at least one evaluation standard among six stipulated by the Word Heritage Committee, (2) is authentic and complete, and (3) possesses an effective conservation administration system. Hiraizumi was evaluated in categories "interchange" and

Challenges of the Modern World - Contemporary Economy and Globalization

"association" among the six evaluation standards: masterpiece, interchange, testimony, example, landuse and association (http://www.pref.iwate.jp/~hp0907/english/index.html).

Together with the registration of the world heritage, the tourist guide system built through joint research by the town of Hiraizumi and the laboratory of the author commenced operation. Our laboratory is working on education and research related to a practical information system with the issue of community informatization as our theme, and this system was also created in response to a request from the town, which is facing the issue of how to handle the increase in tourists after world heritage registration. In this paper we discuss the role of ICT in cultural heritage tourism based on the case of the initiative undertaken by the author in Hiraizumi.

Figure 1: Hiraizumi world heritage site

2   WORLD HERITAGE REGISTRATION AND TOURISM PROMOTION

2.1   Tourist increases and universal design

In tourist areas there is growing emphasis on the universal design (UD) (http://www.design.ncsu.edu/cud/) or design-for-all approach which takes into account different kinds of people such as elderly people, people with disabilities, and foreigners. The factors behind this include the recognition both internationally and domestically of travel as a right belonging to all people, the aging society, the diversification of tourists and more small group tourism, and efforts to attract foreign tourists. Through laws and regulations concerning UD, the mobility environment for the handicapped and elderly was improved. Not only have areas that are regularly utilized with a high frequency been improved, but also non-everyday environments such as tour destinations are also being upgraded. However, tourism includes a wide variety of factors, and by linking them organically, tours with a high degree of satisfaction can be achieved. In UD, when advances in upgrading and improvements are made, increased demands appear. It is necessary to make improvements as they become possible with the goal of providing tourists with an even higher degree of satisfaction.

In the period from 2005 to 2007 the Hiraizumi region established the UD Tourist Areas Promotion Council and took measures for the UD Promotion Program in preparation for the 2008 world heritage registration. Handling the increase in tourists from both Japan and overseas emerged as one of the major issues but it became apparent that introducing UD would be difficult using only measures such as putting up signs in the locality, facility development, and the provision of guide staff, as a result of problems such as maintenance of the landscape and cost increases. Furthermore, with approaches centered on the distribution of print media, the trash problem is a concern. Therefore, expectations grew regarding introducing supplementary UD in which information is provided using the mobile phones of the tourists themselves, and introduction of a tourist guide system based on UD was

incorporated in the plans (Abe, Maita, Ooshida and Kano, 2007, pp. 247–258).

2.2   Environmental changes in the tourism industry
According to a report by a private market research company familiar with the conditions in the tourism industry, since the commencement of their survey in 2005 the market for travel with accommodation has been continuously declining in Japan. Over half of the market is taken up by middle aged and elderly people over fifty, while at the same time the decline in young tourists exceeds the decline in their population. Lack of interest in tourism is serious. The percent of package tours in 2009 was 12.5%, but in 2011 it had declined to 11%. The percent of individual tours is clearly rising. Furthermore, tourists do not come only to enjoy the famous world heritage sites; increasingly they seek tourism value for their total space and time, including their travel before and after touring the world heritage sites, meals, accommodation, and hands-on experiences.

Even Hiraizumi, which has achieved world heritage registration, must appropriately analyze and take measures to respond to these transformations in the tourism market of a "shift to individual tour" and a "shift from consumption of things to consumption of time." It is said that generally the increase in tourists due to the effect of world heritage registration levels out after a few years, but the tourism promotion implemented by local governments to date has mainly been confined to package travel measures, and has not constituted an approach to the individual tour market which accounts for 90% of tourism.

3   CURRENT STATUS OF ICT UTILIZATION IN HIRAIZUMI TOURISM
Firstly, we provide a commentary on the basic matters related to tourism information. The grouping axes of tourism information are (i) tourist behavior (beforehand, locally, afterwards), (ii) temporal aspects (static and dynamic), and (iii) spatial aspects (surfaces, lines, points), and the relationships between these forms of tourism information transmission and the media can be summarized as in Fig. 2. Next, we mentioned that it is easy to understand tour activity through a consumer activity model. Tourists pay attention to a particular tour destination and tour product. When they are interested they search for the details, make comparisons with similar destinations and products, and examine where they want to go. When they have decided that they want to go on a tour, they make plans, travel to the site, and enjoy it. After the tour they share their observations and experiences with family and friends, and disseminate them. This model is called AISCEAS after the initial letters of each of the activities (attention, interest, search, comparison, examination, action and share) (http://www.mlit.go.jp/sogoseisaku/region/kankojoho/).

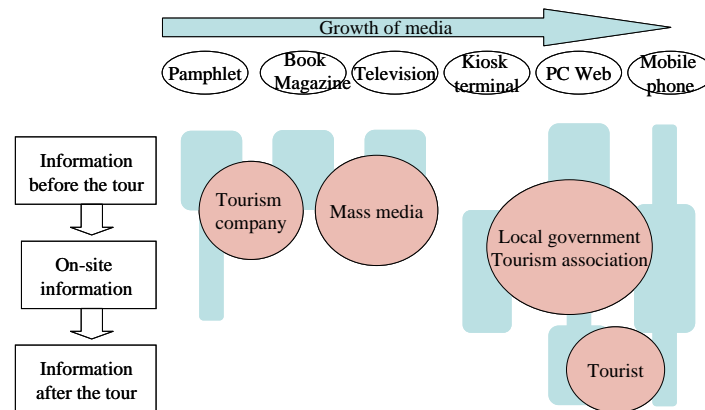
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 2: Tourism information transmission and media
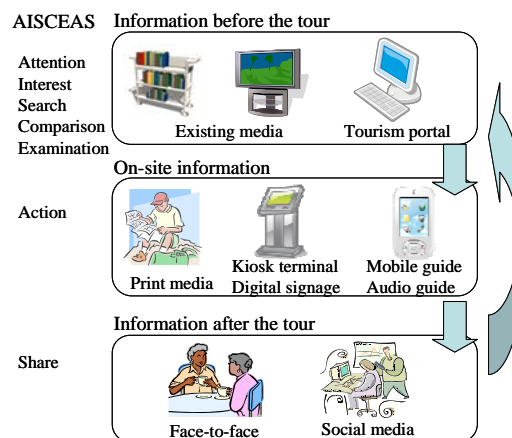

Figure 3: ICT utilization in Hiraizumi tourism

Following that, we summarized the ICT utilization situation regarding Hiraizumi tourism based on AISCEAS model (Fig.3). Information before the tour is provided by multiple government and tourism association portals (http://hiraizumi.or.jp/en/index.html), and on-site information is focused on print media complemented in part by the mobile/audio guide and digital signage. Information after the tour depends entirely on user promotion, and at present there is no organized capability making use of social media.

The distinctive feature of the tourist guide system is that it takes into consideration individual differences in tourism needs (differences in the pace of tourism, information acquisition methods, and the necessary information) based on the UD concept so it can meet the needs of diverse users with one mobile phone (Fig.4) (Ichikawa, Fukuoka, Ooshida, Kano and Abe, 2012, pp. 352–364). Information distribution at tourism spots combines the push type and the pull type. The context help handles the physical characteristics and position of the user, but the physical characteristics use a selection format from the screen, and the position information is compatible with GPS and QR codes.

Functions include commentary, route guidance and quizzes, and these are controlled by the UD support function, so information is provided taking into consideration user characteristics, for example only audio guidance is given to people with visual impairment. The audio

Challenges of the Modern World - Contemporary Economy and Globalization

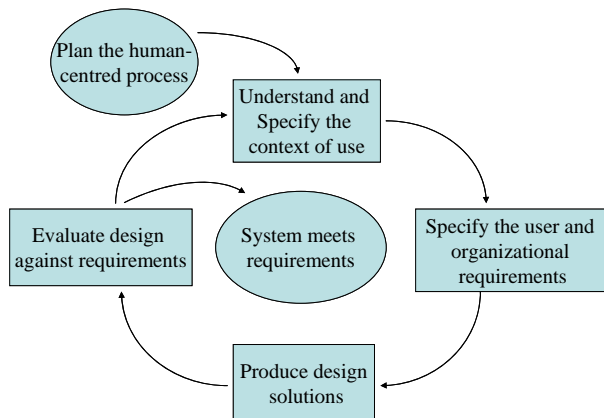
guidance uses speech synthesis, and in the smart phone version the users themselves can change the speaker and change the speed of the audio.
Figure 4: UD mobile guide system


Figure 5: Human-centred design processes

Figure 6: Tourism workshop for participatory design

UD focuses on the spiral up approach in which improvements are made repeatedly based on user participation to make the service better and to disseminate it more widely. The distinctive feature of the planning, development and introduction of this system is that the participatory design approach was adopted in accordance with standard ISO 9241-210 (Figure 5). The designers carried out workshop many times involving walking around the tourism facilities and travel routes together with tourism monitors and local residents, and reflected the results in the system design (Figure 6).

4   NEW TOURISM VALUE CREATION AND THE ROLE OF ICT
Due to the widespread use of social media and smart phones tourism promotion using ICT will probably become a more realistic approach going forward, so based on this perception we discuss the creation of new value and the role of ICT in Hiraizumi tourism.

4.1   Visualization of heritage value through e-Heritage utilization
Most of the cultural heritage of Hiraizumi has been lost. Hiraizumi's value will not be

experienced by simply examining the extant remains. Their recreation and visualization through extended and composite reality technology is anticipated, not only in the academic study of cultural properties, but also in promoting tourism. The strongest demand is for reconstruction and visualization of archaeological sites using augmented reality/mixed reality (AR/MR) technologies. Researchers and technicians tend to focus on the pursuit of reality and historical accuracy but when using these technologies for tourism the care should be taken over the cost-effectiveness of system operation and content copyrights in particular.

If through collaboration between portal sites, the guide system and e-Heritage tourists are able to easily utilize the findings of humanities researchers as knowledge to enable them to decipher the value of the cultural heritage, then surely tourist satisfaction will increase. For example, most people do not know that "the ponds at temples in southeast Asia and India are all square, but the naturally-shaped pond such as at Motsu-ji temple were conceived of by the Japanese as representing the Pure Land, and the furthest limit of that evolution was achieved at Hiraizumi." There should be more dissemination of prior inductive information, not only on-site information.

4.2   Information support for encouraging local stays and excursions
At Hiraizumi up to now, tourists viewed Chuson-ji and Motsu-ji at a quick pace and passed on. I hope for an increase in repeat visits by having tourists stay over in the town with accommodations combined with a soothing experiential program to directly experience the Pure land through such means as preaching by the abbot of the temple. For that purpose, efforts to support time consumption locally by assembling landing-led local information while considering a media mix of existing media and ICT media, and transmitting the information meticulously will be necessary.

For example, it would be useful to present information for enjoying the landscape while walking around the cultural heritage spots to the tourists above each spot and the travel routes using smart phones and other devices. It may be a good idea to make an appeal to the handicapped and the elderly as an easily accessible tour destination focusing on the excellent commonality between Pure Land thought and universal design. In that case, by publishing local UD information beforehand regarding the accessibility of various places to wheelchairs or the availability of care giving facilities, it will be easy to match tourists with the local places. In addition, the inclusion of a function supporting the creation of an excursion schedule gives the traveler additional peace of mind on their journey.

4.3   Big data marketing for individual tour
In order to tie in with an expansion in the individual tour market through involvement with the preceding local stays and excursions, it is important to reevaluate local resources and features, and link with the activities of local residents. When so doing, it is critical that such local circumstances as trends in tourists using accommodations survey data on tour marketing, data on accommodations used according to areas from accommodation reservation sites, and so on be correctly grasped as data, analyzed, and utilized in making policies for promoting tourism. Further, as a new possibility in utilizing data, the approach of grasping general tour excursion trends and information access trends from data utilization trends in tourist guide systems using mobile phones, and linking that to environmental maintenance of tour sites to be enjoyed by walking, is very interesting from the point of view of community development.

5   CONCLUSION

In this paper we discussed the role of ICT in world heritage tourism through a case study of the Hiraizumi world heritage sites. As it promotes tourism through the world heritage registration, Hiraizumi is operating on the major premise that it will safeguard its tangible and intangible cultural heritage while also placing importance on developing systems for accepting a diverse range of tourists using the universal design perspective. For realizing this objective there is a limit to the hardware approach so the town focused its attention on support for information aspects, or in other words support using ICT. When examining the current status of ICT utilization in Hiraizumi tourism and the approach that would be best going forward we analyzed tourist behavior based on the AISCEAS model, a consumer behavior model. Moreover, going forward as individual travel becomes more mainstream the ways in which new value is created in Hiraizumi tourism are likely to include (1) transmission of the value of the cultural heritage in collaboration with humanities researchers and (2) development of tourist areas in which excursions on foot are possible and information transmission, etc., and we discussed the possibilities for utilization of ICT in these measures and the utility of the participatory design approach.

There is no shortcut to realizing these outcomes, and no change to the town's united efforts for continuous community development activities and tourism promotion, just as in the past. In future research we plan to further deepen our discussion about development of systems for accepting tourists and the best approach to information transmission, through analyses of the tourist excursion data of Hiraizumi.

ABSTRACT
The study examines the impact of Tax Reform Policy on Revenue generation of the Federal Government of Nigeria. The primary objective of this paper is to prepare a case study on tax policy reforms in Nigeria, with the specific objectives of examining the main tax reforms in the country, highlighting tax revenue profile and contributions of the three categories of taxes identified as personal, company and custom duties to the total revenue collection. The techniques of data analysis adopted for the empirical study were the Analysis of Variance Method and the Scheffe's Multiple Comparison techniques. In addition, the 'F' test of the analysis of the variance was used to test the hypothesis of no significant difference in the impact on personal, company and custom duty tax revenues of the Federal Government by each of the following tax reform policy objectives; enhancement of the principles of good tax system, improvement in the tax administrative structure, removal of disincentives to tax compliance and promotion of investment opportunities. From the results, it was concluded that each of the tax reform policy objectives had significant impacts on the personal, company and custom duty tax revenues of the federal government of Nigeria. Scheffe's comparison test confirmed that tax revenues from both company and custom duty exceeded personal income tax. It was recommended that for improved tax revenue generation from pursuit of tax reform policy objectives, the training and employment of qualified tax personnel who will be adequately equipped with appropriate materials is necessary. Furthermore, the adoption of strategies for an effective and efficient tax reform alongside with harmonization of government industrial and stabilization polices with those of tax reforms.

Keywords: Revenue, Tax, Tax instruments and Administration, Tax reform

1 INTRODUCTION

Nigeria is a nation with federal political structure that adheres strictly to the same principles of fiscal regime and this system has serious implications on how the tax system is managed. It is characterized by unnecessary complex, distortion and largely inequitable taxation laws that have limited application in the formal sector that dominates the economy. Tax is an essential source of government revenue that defrays the expenditures incurred by government by making it mandatory on tax payers. Tax is a valuable instrument of public finance whose magnitude affects the level of economic activity of an economy and is utilized not only for raising revenue of government to finance its programmes but also regulates the direction of economic performance of the economy. A system of tax vary from one country to the other and because it is a socio/political and economic model representing society's social, political

and economic needs and aspiration at any given time, the Nigerian Tax System is dynamic and is continually changing to meet the needs of the constituents of the society.

Tax is a system of raising money from individual person or corporate body for the purposes of government developmental programmes. It is rather a compulsory contribution imposed by the government on tax payers in return to identifiable benefit of living in a relatively educated, healthy and safe society. Though tax are imposed to regulate the production of certain goods and services, protection of infant or certain key industries as well as means of curbing inflation and meeting up the operational costs of governance. Taxes in Nigeria are imposed to regulate certain economic activities such as to influence economic activities in the country, bridge the inequality gap between the rich and the poor, to curtail consumption of undesirable goods and services, to correct a country's balance of payment and tax is used to attract investors.

In an attempt to realize these and other tax objectives, government encompasses the different types of taxes such as "Pay As You Earn, (PAYE), Value added tax (VAT), Excise duties etc and this paper is on tax Reform policy Objectives of the Federal Government of Nigeria (FGN) and its Impact on Tax Revenues generated.

Statement of the Problem
Many years after the major tax reforms in Nigeria, there has been mounting criticisms over its inability to realize the objectives towards which it was focused. Serious concern has been expressed over the increasing cost of tax administration of the Federal Government of Nigeria in relation to the tax revenue collections as evidenced scholars. This is an indication of high level of inefficiency in the tax operations of the country, which is contrary to the principles of taxation enunciated by Adam Smith. Besides, in contention is whether the objectives of equity, promotion of a viable industrial climate, the reduced tax rate structure, widening of the tax base have resulted in an increase in the tax revenue and it is designed to realize economic stabilization and development and the prevailing distortions in the tax system have jeopardized some of the purpose of the Nigerian tax reform agenda resulting into acrimony within the system.

Objectives of the Study
The main objective of this paper is to assess the impact of tax reforms on revenue generation of the Federal Government of Nigeria. Specific objectives are to;
- identify the tax reform policy instrument objectives of the federal government of Nigeria.
- evaluate with the use of model characterizing the behavior of tax revenue generated from tax reform instrument objectives for the purpose of determining their viability.
- examine the impact of the reforms of the federal government of Nigeria on tax revenues from direct and indirect taxes.

Hypotheses
Ho$_1$: There is no significant difference in the impact which the pursuit of tax reform policy instrument of enhancement of the principles of a good tax system exert on revenues collected by the federal government of Nigeria.

Ho$_2$: There is no significant difference in the impacts, which the pursuit of tax reform policy instrument of improvement of tax administrative machinery exert on revenues

collected from the different forms of taxes [personal, company and custom duty] by the federal government of Nigeria.

Ho3: There is no significant difference in the impacts which the pursuit of tax reform policy instrument on the removal of disincentives to tax payment exert on revenue collected from the different form of taxes [personal, company and custom duty] by the Federal Government of Nigeria.

Ho4: There on significant difference in the impact which the pursuits of tax reform policy instrument of promotion of investment opportunities exert on revenues collected from the different forms of taxes (personal, company and custom duty) by the Federal Government of Nigeria

Ho5: There is no significant different between the impacts which the pursuit of tax reform policy instrument of the Federal Government of Nigeria exert on direct and indirect tax revenues.

Conceptual framework and Review

This section examines the literature on the impact of Tax Reforms policy on Revenue generation of the Federal Government of Nigeria. The federal government had taken far-reaching steps aimed at reforming the nation's tax system before the pre-2002 reform efforts. Among these are: The 1978 Task Force on Tax administration headed by Alhaji Shehu Musa. The major thrusts of the report of the task force are: Introduction of the withholding Tax (WHT) regime, Imposition of 10% special levy on Bank's excess profits and imposition of 21 or 22 percent turnover on building and construction companies. The 1992 Study Group (SG) on Nigeria Tax system and system and administration headed by Professor Emmanuel Edozien, recommended the establishment of Federal Inland Revenue Service (FIRS) as the operational arm of Federal Board Inland Revenue (FBIR) and setting up of Revenue services at the tiers of State and local governments. The 1992 study Group (SG) on Indirect Taxation headed by Dr. Sylvester Ugoh recommended a policy shift from direct taxation to indirect or consumption, now referred to as Value Added Tax (VAT).

The current reform process (improvement or changes) commenced on August 6, 2002, after series of proposals forwarded by individuals, business class, and academia and tax experts to the Federal Ministry of Finance. A Study Group was eventually inaugurated to examine the system and make appropriate recommendations to the government on ways to entrench a better tax policy and improve tax administration in the country. After thorough appraisal of the technical issues evolved in the implementation of its far-reaching recommendations, the Group also suggested a tax environment where tax payer is registered as the "king" and a tax system with a "human face" as a strategic option of achieving the broad policy of its sundry recommendations. The study group submitted its report in July 2003. A private sector driven-group was constituted on January 12, 2004 and was fundamentally based on the issues covered by the study group's report of 2003. The Working Group was mandated in its terms of reference to critically evaluate the recommendations of the study group and propose prioritized set of strategies whose implementation would give effects to reform of the Nigerian tax system, which were grouped into short term, medium term and long term.

Both Groups addressed macro and micro issues in tax policy and administration. Among the macro issues discussed were the drafting of a National Tax Policy, Taxation and Federalism, Tax incentives and Tax administration generally.

Challenges of the Modern World - Contemporary Economy and Globalization

Reasons for Tax Reforms in Nigeria

The Study Group (SG) and Working Group (WG) recommendations and subsequent evaluations saw the need for more inputs from stakeholders in the nation's tax system, hence the convening of the 1st National Tax Retreat, tagged "Tax Reform and Democracy" held in Lagos from 22-24 August, 2005. Stakeholders agreed at the end of the retreat that the following reasons were not only expedient but necessary for the Nigerian tax system:

- Efficient and effective tax administration
- Stimulate the non-oil sector of the economy
- To resolve contentious issues in tax administration
- Redistribute wealth and entrench a more equitable tax system
- Capacity building for administrators and tax payers
- Centralization of revenue agency and computerization reduce effective tax rates simplify tax regime.
- Develop a tax policy for Nigeria.

Other reasons for tax reforms objectives include:

- To diminish the distortions in private savings and investment caused by taxation, by improving its transparency and predictability and shifting its incidence towards expenditure rather than income,
- To achieve greater flexibility so that development expenditure can be maintained in the face of fluctuations in oil revenue, by broadening the statutory base for taxation and its effective coverage,
- To consolidate and modernize the tax system in order to provide the basis for strong revenue growth and flexible fiscal management.

The theoretical underpinning of tax reform is found in the theory of optimal taxation. The work of Newbery and Stern (1987) has been described by Thirsk (1997) as perhaps the best illustration of the modern theory of tax reform. The modern theory of tax reform analyses tax reform within the normative framework provided by the theory of optimal taxation. Given a government revenue objective, an optimal tax reform seeks to maximize an explicit social welfare function that balances vertical equity gains against tax-induced losses in the efficiency of resource allocation. Tax reform revolves around a notion of some movement away from a given state of tax structure, administration or both. Theoretical exposition of optimal taxation normally begins with a set of fundamental assumptions. One of these assumptions is that production takes place in firms under competitive conditions; with profits distributed to consumers. The other fundamental assumptions are that there are no externalities, and that the price-taking consumers maximize utility. Yet another assumption that is of importance relates to the tax instrument under consideration. In case it is commodity tax, it is assumed that all goods can be taxed while under income tax, it is assumed that income can be observed perfectly.

During the year (1991), a committee was set up by the Federal Government to review the nation's tax systems and make appropriate recommendations. One vital recommendation of the committee was the need to introduce value-added tax (VAT). The value-added tax since its inception, has in fact been achieving the objectives of transferring tax incidence to expenditure as most previously untaxed expenditure items have been subject to value-added tax. The tax has also broadened the revenue base of the government as it ranks second to import duties among indirect taxes and it rank third in the scheme of direct and indirect taxes.

Challenges of the Modern World - Contemporary Economy and Globalization

Tax Reforms Policy Instruments Objective

- Provision of qualified personnel to handle all tax matters in Federal, State and Local government levels.
- Use of Tax Consultants to collect Revenues from government ministries and agencies
- Provision of adequate equipments assets and machinery
  - Functional Vehicles to enhance movement of tax officials and other personnel from one direction to the other for easy execution of duties
  - Provision of computers, machinery and other equipment
    - Provision of office accommodation, instead of using rented offices for tax duties.
    - Training and re-training of tax personnel and/or staff in tax offices, workshops, seminars etc.
    - Enhancing the use of labour-intensive production techniques
  - Renovation of all lapidated FIRS office building

Some Economic Effects of Taxation

The emphasis on tax as a way of raising revenue later broadened into the use of tax as a macro economic instrument for attainment of economic stabilization goals which according to the view of Peacock and Shaw (1971) include; Attainment of full employment, increase in national output levels, promotion of price stability and achieving a balance in the balance of payment. Begg et al. (1994) and Balami (2006), posit that economy can be regulated with view to increase or decrease the level of aggregate demand or output through the use of tax as a fiscal policy measure. Thus in the national income /output determination model which presents output measure by Gross domestic Product (GDP) as GDP = C + I + G + (X - M) taxation plays a major role.

Where: C = Consumption Expenditure, I = Investment Expenditure, G = Government Expenditure, X = Exports, M = Imports, (X-M) = Net export

While the left hand side of the equation (GDP) is the supply or output side and the right hand side constitute the demand side of the economy with the individual constituents C, I, G (X – M) as component of aggregate demand (AD). The summation of these components is referred to as aggregate demand that is, AD = C + I + G + (X-M).

Tax can, therefore, be used as an instrument of fiscal policy by which is meant government decision to change the level of government revenue (tax), expenditure or both (Danbury and McDougall, 1980) to influence the economy. In this way tax as an element of fiscal policy becomes a demand management tool which fiscal policy is as it is used to control the level of aggregate demand since it affects the consumption expenditure.

2 METHODOLOGY

In carrying out this study, the following techniques were adopted in analyzing the data collected. Analysis of Variance: This is used to break down the total variation of a dependent variable into different additive components due to various factor levels of an independent variable (source of variation). 'F' Test: This is used to test significance of the different levels of a factor (independent variable) on a dependent variable (in this study it is the tax collections). The 'F' test was used to conduct test on hypotheses (1) to (4) in this study. Scheffer's Multiple Comparison Methods: This is used to compare contrast in typical analysis of the variance problems intended to show how greater or lesser certain variables are in relation to other. In this study, it will be used to test hypothesis 5. **Scheffer' confidence interval:** This indicated the range within which the true value of the contrast will lie at a

specified probability. It can be used as a mutually complementary approach to hypothesis testing involving test of significance.

3   RESULTS, DISCUSSIONS AND FINDINGS

For the test based on 'F' distribution statistic like the 'F' ratio in the analysis of variance and Scheffer's test ratio stated that we reject the null hypothesis (H_o) and accept the alternative hypothesis (H_1) if the computed value 'F' of Scheffer's test ratios exceed the critical value of 'F' at the specified level of significance and degree of freedom, otherwise we accept alternative hypothesis. With respect to the confidence interval for the Scheffer's multiple comparison methods for the contrast of mean decision rule is to accept the null hypothesis (H_o) and reject the alternative hypothesis (H_1) if the null hypothesized value of the contrast (i.e $\psi = 0$) falls within the confidence limit.

In hypothesis (1), the computed 'F' statistic for testing the significance of the impact, which the policy variables of tax reforms such as efficient tax system and equitable tax structure exert on revenues of the Federal Government of Nigeria, indicated 8.2549 and 8.0579 respectively. Both computed 'F' statistic exceed the critical value of 'F' at 0.05 level of significance using 2 and 97 degree of freedom for V_1 and V_2 respectively i.e. 3.957, we reject the null hypotheses and accept the alternative hypothesis. **The decision is that the impact, which the tax reform policy instruments of enhancement of the principles of a good tax system exert on government revenues under personal, company and customs duty taxes, is significantly different.**

Hypothesis (2), the computed 'F' statistic for the testing the significance of the impact which the policy variables of tax reforms such as removal of distortions, expansion of revenue base and ensuring sufficient flexibility exert on revenues of the Federal Government of Nigeria produced 8.0284, 4.3153 and 535.55 respectively. Since all the computed 'F' statistic each exceeded the critical value of 'F' at 0.05 level of significance using 2 and 97 degree of freedom for V_1 and V_2 respectively i.e. 3.957. We reject the null hypothesis and accept the alternative hypothesis. Thus, the decision is **that the impact, which the tax reform policy instruments of improvement of tax administrative machinery exert on government revenues under personal, company and customs duty taxes, is significantly different**. While the computed 'F' statistic for testing the significance of the impact, which the policy variables of tax reforms such as entrenchment of reduced tax rate regime and tax payment compliance exert on revenues of the Federal Government of Nigeria, produced 6.8413 and 4.5247 respectively. Both computed 'F' statistic exceeded the critical value of 'F' at 0.05 level of significance using 2 and 97 degree of freedom for V_1 and V_2 respectively i.e 3.957, we reject the null hypothesis and accept the alternative hypothesis. Consequently, the decision is **that the impact, which the tax reform policy instruments of removal of disincentives to tax payment exert on government revenues under personal, company and customs duty taxes, is significantly different**.

The computed 'F' statistic for testing significance of the impact which the policy variables of tax reforms such as fair allocation of savings to investments, attraction of foreign capital and prevention of capital flight exert on revenues of the Federal Government of Nigeria produced 18.9116, 21.3620 and 17.4158 respectively. Hence the computed 'F' statistic each exceeded the critical value of 'F' at 0.05 level of significance using 2 and 97 degree of freedom for V_1 and V_2 respectively i.e. 3.957. As a result, we reject the null hypothesis and accept the alternative hypothesis. The decision therefore, is **that the impact which the tax reform**

Challenges of the Modern World - Contemporary Economy and Globalization

policy instruments of promotion of investment opportunities exert on government revenues under personal, company and customs duty taxes differs significantly. In hypothesis (5), all the computed Scheffee's test ratio for testing the significance of the contrast of mean involving the impact of tax reforms on revenues from both personal and company taxes when compared with customs duty revenues of the Federal Government on each of the policy variables of tax reforms **analysis N0 (6) to No. (15) in table 2.1 (Data or Table summary)** exceeded the critical value of 'F' (1-0.05); df: 2,97 which is 3.957. Thus, the decision is **that there is a significant difference between the mean impact tax reforms on both revenues from personal and company taxes and those of customs duty**. This decision is also the same when the confidence interval of Scheffee's multiple comparisons is used as a complementary approach to hypothesis testing. The reason is that in each of the intervals constructed as shown in the results the null hypothesized value of the contrast (ψ) i.e 0 $>$ fell outside each confidence interval. The result states that direct and indirect tax revenue collections are similar in the pursuit of tax reform policy instruments of the Federal Government of Nigeria?

Table 1: Analysis of Variance (ANOVA)

Source of Variation	Sum of squares	Degrees of Freedom	Mean Square (MS)	'F' Ratio
	(SS)	(DF)	MS=SS/DF	(MSB/MSW)
Between the means	6,174.27	2	3,087.14	6.53
Within the means	12,768.62	27	472.91	
Total	**18,942.89**	**29**		

The result is reject Ho if computed 'F' test > critical value of 'F' otherwise accept. The computed 'F' test statistic (=6.53) exceeded the critical value of 'F' $_{(0.05, \ df \ 2,27)}$ (ie. 3.35), therefore, we reject the null hypothesis (h_o) and accept the alternative hypothesis (H_1) that the mean revenue collections of the taxes as affected by the tax policy reform are significantly different thus the judgment of the officials are correct.

Findings from the data analysis unveiled important facts embedded in the research data. It was discovered that the pursuit of each tax reform policy objective had significantly different impacts on tax revenue generations of the federal government of Nigeria on personal, company and customs duties. The realization that each categories of tax such as personal, company and customs duties, as target of the tax reform policy objective, earned different levels of tax revenue was confirmed from the various hypotheses tested. This gave the indication that the different administration structures as established under the tax code through which assessment and collection machineries for tax are made possible have different capabilities. Also, explaining the difference in the revenue generation abilities in the different categories of tax is the income and expenditure patterns upon which tax liabilities are based. These patterns are mostly influenced by the macroeconomic environment prevalent in the economy. Thus, in period contraction (expansionary) stabilization policy decisions aggregate spending in the economy are reduced (increased) and this accordingly affect indirect taxes such as customs duties. It was additionally discovered that the mean tax revenue generation from both company and customs duties were higher than personal income tax revenue collections, and are therefore recommended as confirmed from analysis using scheffe's comparison methods.

4   CONCLUSION

This study examined the relationship between tax reforms and revenue generation of the Federal government. It goes further to examine whether tax reforms on various taxes- petroleum profit tax, companies income tax, personal income tax, value added tax, education tax and customs and excise duties and others affect the revenues generated by the federal government. It became obvious from the findings that the pursuit of tax reform policy objectives concerning enhancement of a good tax system, improvement in general tax administrative machinery, removal of disincentives to tax compliance and promotion of investment opportunities increase tax revenues. Besides, it revealed that tax reform policy objectives exert significantly different impacts on tax revenues from the various taxes sources but there are still set backs militating against increased receipts of tax revenues to Nigerian Government among these are:

- Lack of necessary communication technology equipment in the area of information processing, storage and retrieval of data, which would facilitate tax administration in the country.
- Government's inability to provide such working tools have made the work of processing huge volumes of data by manual effort cumbersome and often resulting in tremendous work accumulation.
- The gross inadequacy of well trained staff in tax matters have also contributed to the problem of short falls in revenue projections of the federal government of Nigeria.
- The shortages in both manpower and equipment needs have resulted in the imbalance in capabilities of the different administrative structures for tax assessment and collection machineries.
- Additionally, the inconsistencies in government policies affect tax revenue collections. For instance, while tax policies may be favourable for investments, industrial and other stabilization policy measures may not.
- Tax reforms are not regularly assessed to determine this level of success, ascertain strengths and weaknesses in tax organization and examine the environment in order to articulate better reform strategies.

5   RECOMMENDATIONS

The Federal Government of Nigeria needs improved tax revenue collections in order to satisfy its needs, provide social tax receipts from personal, company, petroleum and custom duty taxes should incorporate the following:

i.   Enhancement of principles of a good tax system as identified by Adam Smith and confirmed by this study.
ii. Improvement in the administrative machinery of taxes through removal of distortions and expansion of the tax base.
iii. Removal of disincentives to tax compliance by lowering the rate regime.
iv. Promotion of investment opportunities by ensuring corrupt-free and efficient administrative machinery with personnel who are adequately trained, well-equipped and motivated.
v.   Tax administration machinery should have an effective redress and refund system so that disputes can be settled easily and corruption checked
vi. Contrary to the erstwhile practice of practice of obsolete tax laws and rates, there should be a continuing review of tax-related issue to align these macroeconomic targets for promoting efficient fiscal policy.
vii. Proper education and training of tax officials along with provision of necessary infrastructure and equipment to carry out their duties is necessary.

viii. Adequate number of qualified tax officials should be employed as it is the gross insufficiency of qualified manpower and equipment that is responsible for contracting tax duties to external consultants at huge costs which defeats the idea of economy as a tax principle and

ix. finally, there should be harmony in the objectives of tax reforms and other industrial and stabilization policies. Furthermore, strategies of tax reforms should be properly articulated for better results.

ABSTRACT
Since its entry in the independence in 1960, Chad elaborated and implemented several national plans of economic and social development. The global objective declared by these plans and programs was always the improvement of the living conditions of the population. This one should pass by the development of the sector agro-sylvo-pastoral which occupies about 80 % of the Chadian population. The creation of the socioeconomic infrastructures allowing the internal and outside opening up of the country, the development of the human resources to increase the efficiency, etc. The realization of these programs should be translated concretely by a better access to the educational services, of health, hygiene, the drinking water, in the food safety, etc. The State is so substituted for the private almost non existent to take the relay of the activities of production has been organized by the colonization. Numerous public and para-public enterprises had widely dominated the modern sector. They had easy access to the credit with the downstream of the State. When they tempted towards the bankruptcy, they benefited from particular subsidies on behalf of the metropolis. The balance assessment of this policy of state control of production units has proved globally negative: bad performance of companies because of the lack of financial autonomy, a plethoric number and an oppressive supervision in the management. To protect the big balances, the State realized it will during a Round Table with the financiers on the "promotion of the private sector" in 1992. This idea was confirmed by the sovereign national conference in 1993. Also, with the globalization of the economy and the liberalization of the State disengaged from certain production units to play the role of regulator, training and realization of big works of social infrastructures and supervision of the management, etc. In spite of this obvious will on behalf of authorities, we noticed an increasing impoverishment of the population during four decades. The socioeconomic indicators were among the lowest as in many countries of Sub-Saharan Africa. To answer these concerns, the Chadian State made again a commitment to create or rehabilitate the new production units, such us Oil Company of Doba and Djarmaya, Juice Company of Doba, Cement Company of Boaré, etc. However, the question would be to know if the errors of past were corrected with this new give? What

Chadians are saying about these new companies? This paper suggests answering these questions by making current inventory fixtures of some of these new production units.

1 INTRODUCTION

The omnipresence of the public sector has for origin Europe. Indeed, the European public sector goes back to the second half of the XIX century (Bizaguet, 1992). One of the most determining motives for the creation of public enterprises was the stimulation of the new activities for the war periods. During the First World War (1914–1918), States, for reasons essentially of national defense, had been led to take in charge important sectors of the economic life (manufacturing of armament, supplies of foods to the stricken populations, etc. From this date, they are going to pursue their interventions in the economy with a steady intensity. That is why will appear industrial and commercial public institutions, semipublic companies.

The economic crisis of 1929 also entailed an extension of the European public sector (Bizaguet, 1992). The economic development required the State's intervention, supported by a vast protectionism and often, a substantial role of the public sector in the field of the production, finances and foreign trade. In Great Britain for example, under the Labor Government of the Party, were nationalized the bank of England, the coals, the electricity, the ground transport, the gas and the steel industry (Altengar Traoubal, 2003). This economic revolution affected the African continent after the waves of the independences of 1960.

So, from 1960, year of its entry in the independence, Chad in like other countries of the African continent, opted for a development policy of the productive system. The objective of this policy of the government of that time was the control of the strategic variables and the accumulation of the resources for the benefit of the State to begin the economic development in general.

The State so substituted itself for the private almost non-existent to take over from activities of production organized by the colonization. Numerous public or Para-public enterprises had widely dominated the modern sector. They had easy access to the credit with the approval of the State. When they aimed towards the bankruptcy, they benefited from subsidies on behalf of the metropolis.

The balance sheet of this policy of State control of companies was realized by the government at the first hours of independence, had proved globally negative: bad performance of companies because of the lack of financial autonomy, a plethoric staff and an oppressive supervision in the management, etc. To protect the big balances in the economy, the government launched in the process of withdrawal presented as an absolute obliged passage. It is in this context that in April, 1992, the State realized its will during a Round Table (Rititingar, 2008) with its partners on the *"promotion of private sector"*. The idea of this Round Table was confirmed by the Sovereign National Conference on 1993.

With the globalization of the economy, the liberalization of the productive sector became a paradigm. State has to leave the open field with the private to dedicate itself more to its role of regulator, training, realization of big works of social infrastructures. It is the policy of the Program of Structural Adjustment. For authorities, this policy should allow the African

companies generally and Chadian in particular, to get up better. From then on, this conception allowed the adoption of the little careful policies: erroneous choice of companies to be privatized and buyers, liquidation of certain companies, etc.

In spite of these efforts to set up a dynamic economic policy to strengthen the social development, we found ourselves in the same situation. In fact, seen the opacity of the Chadian governance, we are reduced to make certain number of reports: poverty of the big mass, the youth unemployment, the inflation (Tonmadjal Nantourmbaye, 1998), etc. From then on, to remedy this delay of the economic and social development, the solution was to emphasize on natural resources not exploited. This vision led to the works of the exploitation of the oil of Doba; in the south of the country in 2003 financed by the World Bank at the level of 4, 2 billion dollars with the construction of an oil pipeline of 1070 km long up to the Cameroonian port of Kribi, the mini refinery of Djarmaya in 2011, financed by 60 % China and 40% by Chadian government (http://tchadonline.com/?p=113856), cement works of Baoré in 2012, financed always by the China at the level of 70 million euros (http://www.leblogfinance.com/2012/02/tchad-la-chine-finance-une-usine-de-ciments-de-70m -deuros.html), the factory of manufacturing of juice of Doba, the list is not exhaustive.

However, the question that we can arise is the one to know if we reached the objectives with this new policy? To answer this concern, we shall hold for this work two of these new production units namely the cement industry of Baoré and the mini – oil production of Djarmaya.

1.1   Methods and Materials
Series of documents from journalistic statements and political speeches, etc. are regularly published on social and economic development of Chad country this day. Forums, Symposium and NGO's (Non-Governmental Organization) reports are available in web sites on Chadian government's commitment to give better condition of living to its people. This position has brought the implementation of many units of production. The works realized on these units have been consulted.

Besides, we interviewed person resources, including the workers of these units. They reacted to the structured and opened questionnaires. We hope that the questions raised in the present report have risen to inquiries deepened within the persons in charge of the management of these units, and they understand how the objective of exploiting these units has to be an advantage for the local populations in general and Chadian State in particular. So that to promote social and economic development in sustainable manner.

1.2   Results and Discussion
The social and economic development of Chad and its impact on Chadians constitute an awkward debate today. It is thus a problem of a sustainable development which we need to investigate various sources of information to make a concise and precise contribution. This means adopting different approaches. That is why, our study has brought a historic evaluation; under a multidisciplinary angle which helps to understand the management of different resources, since the independence of this country through different policies of development, before the implementation of new units of production. These various policies of development have been always considered as an absolute solution to the development of societies but, are sometime deceitful according to certain results.

It is to understand these issues that this study has tried to contribute to the debate. Our question is to know if we give the priority to the local populations by implementing these units? Did we reach the objectives with these new policies of development? What are the impacts of these products on Chadian people? These questions motivated us to exploit different sources of data to achieve this paper, which we hope may not bring all the solutions to the social and economic issues of Chad but, it is whenever a living scientific contribution to the debate.

2 BRIEF HISTORY OF THE NATIONALIZATION AND PRIVATIZATION OF COMPANIES IN CHAD

2.1 Nationalization's context
The concept of nationalization can so mean, in this context, the implicit transfer by colonial powers of the economic units introduced by the colonizers to the new independent governments. So the policies of nationalization then touched most of the African States after the formal independences. According to Alténgar, this economic revolution is conceived in European countries as, "the total and compulsory appropriation by authorities, by repurchasing to the former shareholders or seizure of the professional sectors of companies managed completely by the private sector" (Altengar Traoubal, 2003).

With regard to this definition, there is something wrong with African continent. It is likely in republic of the Chad. Because many companies' shares nationalized are still held by French companies (Rititingar, 2008). Below, we describe in a brief way the different nationalized production units.

2.1.1 From the sosutchad to sonasut
The Sugar Company of the Chad was created in 1965 by the Chadian government and the group SOMDIAA (Organization of Management and Development of the Food-processing industry) and implanted in Banda in 25 km of the city Sarh in the South of the Chad with the headquarter office in N'Djamena the capital.

In 1977, the SOSUTCHAD developed and took the naming of the SONASUT (Sugar National Company of the Chad). It was structured in a following way (Ateib and Djimtebaye, 2011):
− The Department of Production;
− The Department of Material Park;
− The Technical Department;
− The Department of Human Resources;
− The Department of Supply;
− The Department of Finance and Administration.

In 2000, the company was privatized and takes the name of CST (Sugar Company of Chad).

2.1.2 From the cotton franc to cotton chad
Cotton Chad, or cotton Company of the Chad was created in 1972, held 75 % by the Chadian State, 19 % by Dagris, and 6 % by local banks (Bertrand, 1994), which has for mission to supply tools and fertilizer to the planters and to market the cotton-seed. The cotton was already known by populations of Chad before the colonization. Local Populations spun and already weaved the cotton, in particular of narrow cotton bands serving as G-string. In rappel,

the cotton was introduced in Africa by the Arabs and the Portuguese. In 1918, the Belgians begin the industrial crop of the cotton, putting the foundations of the economy of the Chad.

However, the creation of an organized sector of cotton in Chad goes back to French's presence, but does not intervene at once. In 1910, Oubangui- Chari became one of the territories of French Equatorial Africa, with Chad, Middle Congo (now Congo Brazzaville) and Gabon. The first official tests of cotton production were tempted by French people on 1921 and turned out decisive. On 1926, the companies of cotton production settled down in Oubangui- Chari. The campaign of 1927 marked in this territory the real departure of production of this product, encouraged by General French Governor of that period Rapael Antonetti and accompanied by the development of some factories of production in 1928.

Later, during the creation of French Company of Development of Textiles, (CFDT; French Trade Union), a convention imposed the modernization of the factories of seed. A total of 25 factories were settled: Lere, Pala, Gounou-Gaya, Bongor, Moundou, Doba, Gore, Guidari, Kelo, Fort- Chambault (now Sarh), Moissala, Kyabe, Korbol, Am-Tinan, Beinamar, Koumra Bousso, etc. (Armi, 2003).

From 1952 to 1955, the investments realized by colonizers in the mechanisms of pneumatic inhalation and in the creation of waters fed by mechanical pumps, allow to reduce the operations of handling, during the unloading of the trucks of cotton- seed, the canvas covering and the hooping of bullets, what reduces the number of the hired seasonal labors and ends in decrease of factories. That is why we have now in Chad these factories below: Lere, Pala, Gounou-Gaya, Moundou, Doba, Kelo, Sarh, Kyabe and Koumra.

In the middle of 1970, authorities launched the "operation 750 000 tons". During the campaign of 1975–1975, more than 300 000 hectares are sowed by cotton and the production flirts with 175 000 tons. Then, surfaces are gradually divided in two returning to only 124 000 hectares sowed on 1986. After the armed confrontations of 1980s, the progressive return peace in the cotton region production, conjugated to the devaluation of African Franc Community and to the biggest autonomy given in 1993 in Cotton Chad for the fixation of purchase price of the cotton to the planters, allowed a strong increase of the cultivated surface, to reach the 386 300 hectares summit in 1997- 1998, during the most important campaign of the history of Cotton Chad: a total of 263 475 t of cotton seed were collected.

Moreover, the cotton is especially cultivated in the south of this country, in family exploitation, consisted of 5 to 6 farmers and of a surface generally from 1 to 2 hectares. Considered as a "white gold", the cotton was before 2003, one of the main pillars of Chadian economic, whom it gets 60% to 65% from its exports and also makes feed about tree millions of people.

It is subjected to a large number of fiscal receipts and taxes which are directly supported by her, is simply collected for the State. It is therefore, its contribution to the State's budget. Below, the evolution the board of some direct contribution of Cotton Chad to the State's budget.

Table 1: Direct contribution of Cotton Chad to the State's budget (Direction of Taxes and Indirect Rights, 2005, p. 30)

Years	2001	2002	2003	2004
State's Fiscal Receipts	43638	62119	76106	86105
Taxes by Cotton Chad	40061	4321	3562	3150
% Cotton Chad	9, 30	5, 50	4,68	3,01

The board above shows that the contribution of Cotton Chad to the State's fiscal receipts passes from 9, 3 % in 2001 to 3,01% in 2004.

As consequence of this situation, the tax system taken by the State gnaws at the margin of the producers' income.

The functions of Cotton Chad were socioeconomic. In fact, one of its tasks consists in buying the totality of the cotton granulate product by the farmers, to supply them credit, the agricultural products and to pay the cotton to the same price on the whole cotton zone (Rititingar, 2005). The second function is one of the industrial transformation of the cotton seed and the marketing of the fiber.

In this respect, Cotton Chad has to shell the cotton granulates and to sell the fiber and the seed which ensure from it. Finally, she is in charge of planning and has to, for that purpose, fit out and maintain the tracks of evacuations of the cotton seed.

However, this role was disputed and led authorities to a progressive withdrawal of the State on 1999 of the reform of the cotton sector and accomplished the privatization of the Cotton Chad on 2011 which took the name of "New Society".

Furthermore, Cotton Chad was until 2003, the second employer of the country after State with almost 3000 employees (Rititingar, 2005). The main zone of exportation of Chadian cotton is European Union and France in particular, Germany, Belgium, Portugal and Spain. This list of nationalization is not exhaustive: so we can quote the refrigerated slaughterhouses of Farcha, the Cyclo Chad and the Factories of the Cigarette of the Chad of Moundou, the Company of the Textiles Textile of Chad, etc.

2.2 The privatization of companies

The process of privatization engaged by Chad since 1992 affected practically all the public enterprises and Para- publics. Certain States' companies and public institutions were either liquidated, or privatized or restricted to be kept in the wallet of the State considering the

economic weight which they represent. All these companies belong to varied sectors of economy: Food- processing industry, transport, hotel business, banks, etc. The realization of the privatization of these companies was made in a progressive way:

2.2.1 The first step of privatization

Considering the stakes which present every company, the first stage of privatization passed from 1994 to 1997. It consisted in treating the companies that the social incidence seemed to be low and whom the private sector showed an interest for the resumption. In this process, the priority was given to the national private operators certainly, but they latter have no financial and technical capacity to develop the acquired companies among which most are in trouble.

State's participation in favor of most of the companies is situated between 15 to 20%. Financially, the first step of the program of the privatization brought about 1, 07 billion of Francs CFA to the treasury.

Table 2: First Companies Privvatized (Technical Commitee in Charge of Privatization of Companies in Chad, 2008, p. 22)

No	Entreprizes	Year	Activities	Nature of sale	Receipt for the benefit of the Treasury
1	SAPROVET	1994	Commercialization	Shares	21.004.061
2	MCT	1994	Manufacturing Cigar	Shares	3.0960.000
3	PHARMAT	1994	Distribution of pharmaceutical Products	Shares	31.906 000
4	STAR NATIONALE	1995	Commercialization	Shares	114.450.000
5	INT	1996	Publishing	Shares	96 856 560
6	SONAPA	1996	Commercialization	Shares	36 .120.000
7	SOTEC	1996	Careers	Shares	312.766.000
8	LNBTP	1996	Building	Contract of Management	40.000.000
9	BIEP	1996	Studies	Constitution in Society	40.000.000
10	ONHPV	1996	Hydraulic	Shares	345.100.000
	Total				1.069.062.621

2.2.2 The second step of the privatization

The second step of the privatization started in 1999 and concerning companies presenting a major interest for State. That is why State, for the reasons of economic and social order, expressed delayed the operation of these companies to make sure of their privatization. So the difficulties met by the national operators in the first step to develop the acquired companies brought State to change strategies of the priority granted to the national operators. This is the way companies privatized during the second step with exception of the

Refrigerated Slaughterhouse of Farcha were given up to national private operators. All the others were granted to foreign groups called otherwise "hard cores". The second step of privatization allowed mobilizing approximately 10, 6 billion of Franc CFA to the public treasury.

Table 3: Second Step of the Privatization (Technical Comitee in Charge of Privatization of Companies in Chad, 2008, p. 23)

No	Entreprizes	Year	Activities	Nature of salle	Receipt for the benefit of the Treasury
1	BDT	1999	Banks' Transactions	Shares	93240000
2	BTCD	1999	Banks' Transactions	Shares	1512 000 000
3	HOTEL DU CHARI	1999	Hotel	Business Contract of management	No reference
4	AFF	1999	Commercialization	Marketing Contract of management	60 000 000
5	STEE	2000	Supply water and electricity	Contract of concession	No redevance
6	SONASUT	2000	Sugar Production	Shares	2 257 000 000
7	CELTEL	2000	Telephony Cellular	Licence	1230 000 000
8	LIBERTIS	2000	Mobile phone	Licence	950 000 000
9	SNER	2002	Public works	Assets	1 425 000 000
10	HSA	2003	Commercialization	Assets	3 100 000 000

Besides these privatized companies, we may also mention the case of some companies liquidated.

2.2.3 The liquidation

They are reserved for companies non-strategic and which present no potential to the commercial and financial level. It is about companies totally overdrawn and difficult to straighten. They were totally liquidated. This operation (liquidation), consists in selling the asset of the company to discharge its liabilities and at best (in the best case) to generate additional resources for the State. According to one warned of the operation, the absence of an adequate legal framework and the insufficiency of assets to cover the liabilities, make difficult the operation of the privatization (Altengar Traoubal, 2003). This situation obliges the liquidators to leave chargeable to the State the checking liabilities.

It is the case of OFNAR, BATAL, BICIT, and SOTERA. The popularization of their latent liabilities of which has long time delayed, for the lack of financial resources. In spite of this situation, the liquidation of companies brought to the treasury a sum of 843 millions of franc CFA.

Below, the board shows of the liquidated companies.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 4: The liquidated entreprizes (Technical Comitee in Charge of Privatization of Companies in Chad, 2008, p. 23)

No	Name	Statuts	Raison Sociale	Date of de liquidation	Benefit Brought to au Public Treasure
1	STT	SA	Manufacturing of Fabrics	1993	No reference
2	SOTERA	SEM	Commercialization	1990	No reference
3	SHT	EPIC	Hotel	1987	9 458 925
4	CSPC	EPIC	Cotton's regulation price	19992	No reference
5	CRPS	EPA	Sugar's regulation price	1994	No reference
6	OMVSD	Office	Rice development	1991	No reference
7	OFNAR	Office	Road maintenance	1994	135 529 200
8	OPIT	EPIC	Promotion of SMES/SMIS	1994	
9	OFCA	Office	Operation of careers	1989	585 000 000
10	SONACOT	EPIC	Commercialization	1986	113022 161
11	Fonds Pétrolier	EPA	Fuel's price regulation	1994	
12	BATAL	SEM	Banks' transaction	1994	
13	BICIT	SA	Banks' transaction	1994	
14	AIR Tchad	SA	Air transport	1999	
Total					843 009 926

It would be important to mention most of the companies liquidated before the implementation of the Technical Committee in charge of the disengagement of State from companies. Also, after the liquidation of the STT, the production tool (the factory) was put under cocoon. It is in 1986 that a company called "COTEX" Textiles Company of the Chad signed an agreement with State for the resumption of this tool. The terms of the contract not being respected, State broke it. At present, the factory was restructured by the project TEAM -9. Other companies are restructured.

2.2.3 The restructured companies and leave into state's wallet

They are companies whom the privatization does not justify itself for company or strategic names or regarding development. This category of companies are maintained or kept in the wallet of the State. Among them, the Autonomous Box of Amortization (CBA) was

transferred to the Ministry of Finances and the budget where she insures the debt servicing. The National office of the Posts (Post offices and Telecommunications of the Chad) (ONPT) split into two: the one in Chadian Company of the Posts and the Savings (STPE) and the other one in Company of the Telecommunications of the Chad (SOTELTCHAD). The National Box of Social Foresight (CNPS) and the National Box of the Pension of Chad (CNRT) benefited from a big study before restructured beings. The lists of the restructured companies are:

Table 5: The Restructured Entreprizes (Technical Comitee in Charge of Privatization of Companies in Chad, 2008, p. 24)

No	Name	Statuts	Social Raison
1	ONC	EPIC	Social Distribution
2	SODELAC	EPIC	Farming Development
3	LRV	EPIC	Veterinary Research
4	ONAMO	OFFICE	Centralization of emplyoment application
5	CNEAPAA	EPA	Artisanal teaching
6	ONDR	OFFICE	Rural Development
7	OACGV	OFFICE	Patronage Veterans
8	CAA	EPA	Redemption of public debt
9	CNPS	EPA	Social forsight
10	CNRT	EPA	Retirement
11	FIR	EPA	Rural Intervention
12	ONPT	OFFICE	Post Services

3   THE NEW PRODUCTION UNITS

Since July 2003, Chad entered into the club of Petroleum Exporting Country, with the starting of the oil pipeline Doba- Kribi. Since that date, several other production units were realized during five – years term (2006–2011) by authorities. This study will focus on two of them:

3.1   The cement factory of baoré

Vue partielle de la Cimenterie de Baoré (Ph. Arif A.M.)

Figure 1: Partial view of cement factory of Baoré (Arif, 2012)

Challenges of the Modern World - Contemporary Economy and Globalization

Situated in some 40 km of Pala, in the region of Mayo Western Kebbi, more exactly in the village of Bissi Keda, the factory of the cement of Baoré is endowed with ultra sophisticated equipments and with a long modern technology. The factory is in 8 km of the zone of extraction of limestone which is the raw material that must be of use to manufacturing of the cement.

Fruit of Chinese-Chadian cooperation, this project is realized by the Chinese company CAMCE, which capitalizes a robust experience on the subject. It is the big industrial complex which shelters at the same time the installations of the factory and the auxiliary works such as: the buildings of the synthetic office, the housing for the employees and the other equipments necessary for the production of cement.

In terms of capacity, the factory produces 700 tons a day. It is expected to produce 200.000 tons a year (http://www.infotchad.com/details.asp?item_id=2806&) and so within twenty years. The type of the cement produced is the one ordinary Portland that combines materials such as the limestone, the clay and the lateritic. The existence of these raw materials is certainly the main asset which the region of Mayo Western Kebbi for the setting-up of this factory arranges. Considering the lack of electricity in the region, the factory produces within it some electrical energy (an electric central of 19 megawatts) as well as some water by drilling for its needs. It is about the preferential loan of mocked it EXIM BANK (The Export Import Bank of China).

By inaugurating this economic jewel, President Deby was anxious to specify that the cement were started to solve the problems of the social housing environment, which his country faces. It is not intended for the export because it will be enough, eventually, to satisfy, hardly Chadians' needs. For that purpose, the price of bag in the factory exit was fixed to 4.200 franc CFA. This price does not have to exceed 6.500 Franc CFA, even if we have to include the transport costs there.

Figure 2: Cement made in Chad being loaded in Baoré (Brahma, 2012)

The unit is structured as below:
1. A Patronage Council of Administration;
2. General Director;
3. Director of Finance, Materials and Administrative;
4. Technical Director which included the service of production and workshops such as cooking matter, cement, dynamic, quarry, lab, room of ordering, parking service.

In terms of employment, the factory employed about 300 people (Maye Vaidjouma, 2012).

3.2 The refinery of Djarmaya

The refinery of Djarmaya, built by the Chinese and inaugurated during the summer, 2011 is held in 40% by Chadian State and 60% by CNPC (Chinese National Petroleum Company). It was planned that this refinery should shelter a power plant of a capacity 40MW to feed the factory and the city of N'Djamena.

In reminder, the factory is situated in approximately 40km in the North of the city of N'Djamena. It shelters the station of the collection and the waste water treatment. In a different way, the refinery presents four bulks which are:
1) A Unit of Atmospheric distribution;
2) A Unit of Catalytic cracking of the atmospheric residue;
3) A Unit of semi regeneration and the catalytic reforming;
4) A Unit of the hydro reforming of the diesel oil.

According to this concept, this refinery is divided into four sections:
1) A zone of the units of treatment;
2) A zone of transport and storage of oil;
3) A zone of the units of the auxiliary installations;
4) A zone for administration and housing.

4 IMPACT OF NEW PRODUCTION UNITS ON SOCIAL AND ECONOMIC DEVELOPMENT

Considered its painful past marked by various armed conflicts, the management of the public properties in Chad is always mitigated. As consequence, State is perceived as *"a box which is necessary to reach absolutely to draw from it what we need"* (Hazoume and Hazoume, 1998).

This position leads us to examine the impact of these new units on Chadian people. It comes to examine how these factories are functioning so that to impact social and economic development.

4.1 The criteria of appointment of the administrators into new companies.

4.1.1 The political interference

It always emerges that the majority of the leaders in companies are appointed by political kindness and not by the virtue of their qualification or of their skills. These managers once installed, have for only ambition to grant themselves financial means. Not mastering the modus operandi of management of companies, they transfer to these production units the classic methods, sowing then in any wind, the confusion. This should be illustrated by John Marc Ela's statement, that *"the party, real instrument of the power in the hands of bourgeoisie, strengthen the device of State and specify the power"* (Ela, 1990).

We still remind a recent period of the management of former Cotton Chad society, which was slandered all the time. By the way, we often attend a personalization of companies. Consequence, the corruption is set up as rule of conduct. Better, this one is in healthy in spite of texts which repress it. According to the penal code of 1963, any public misappropriation of deniers is a breach and liable to penalty. In reminder, the legislator of that time planned that the diversions are repressed according to their degree. But since 2000, we speak about the special law which repeals the capacities of the previous penal code. It is about the law No004/PR/2000 relative to the misappropriation of public means. Also, it is necessary to add the recent operation introduced by the Ministry of Justice and the Purification which pursues the crooks people who steal the public means.

All these initiatives should lead to a change of behavior but, the ambient reality is quite different thing: *We regret but, but we do not have the choice* stated one of our informer about cement factory of Baoré and to pursue, *how can we become stranger in our own land, we do not know where this cement is going*. What one should mention it is the lack of authorities' commitments to make these new companies be benefic to general people. Surely, the decision that consists of exportations these resources are quiet good but, when they do not bring change to people is another debate.

Many other sources need to be carried out and to see how Chadian people can one day enjoy the products of these new factories, because for now, nothing is ready to stop this desolation and some practices continue to be the art of companies' governance.

4.1.2 The affinities

In the light of what lives, the intrinsic values of the man for a deserved career fly into pieces to give way to slander, to the division, to the suspicion, to the blind regionalism which so compromises the good management of the products of these new companies. In Baoré for instance, where the cement is producing, it is within affinities the purchasing of this product is operated. One has to use corruption to have a chance to buy even one back. This is happening while the cement is regularly producing. Recently, trade men who are selling this product bought from Nigeria empty bags of "Dangote Cement design" which they filled out with cement from Boaré and sold at higher price. This is happening because the one of Nigeria is expensive than that one of Chad. It usually returns that the cement of Baoré is well and truly on the market, in our hardware stores. But, under another shape, at least, in the other packaging's come moreover. How is it made?

He tells that big hats of the power, these untouchable eternals would devote to a practice deserving of big circles Mafioso. Packages "Dangote" are legally   bought in nearby countries, led "legally" to Nguéli then cleared through customs "normally" before being brought   or   to   Baoré,   or   in   places   kept   secret   by   these   villains   economics (http://www.journaldutchad.com/article.php?aid=3499).

Anyway, some people believe that the frames of companies are for the exclusive service of their clan, tribe or family and that the efficiency of a service confronts to the monopoly of this one by the nationals of a region where from this endemic anarchy in the management of the companies. A simple head secretary can at his level promote or dislocate a senior official of State. And the acts of provocation with tribal character are multiple and the uncontested purpose of which is to protect or encourage the disproportionate ambition of some is to hide or to absolve the grave lacks of the others. According to Nestor Malo (2000), *"every director*

appointed at the head of the company, comes with his storekeepers prize". It is about those in that we grant a market to benefit from jars- wines. Also, companies are considered as the place of hiring for the relatives and friends even if they do not meet the criteria of skills. This has for consequence, *"the plethora of the staff which establishes a kind of load to the companie"* (Rititingar, 2008). Even in that case, the good managerial rule to stipulate companies need frames in the widened skills and, each in his post has to understand all the cogs of the system to outclass an always strong competition. Nevertheless, let us not forget the societies governed by the value of ethics of management.

4.2   From the speculation, bad management to the hope

4.2.1   La satisfaction d'une partie des besoins de la nation

Quite as we had mentioned it higher, Chad intends to become an emerging country before 2025. This is why several works are thrown among which one the construction of infrastructures. In spite of the current speculations, one should hope that the expensive imports of cement from Cameroon, Nigeria and Egypt and fuel from Cameroon, Nigeria can be stopped one day. As far as another site of cement says Modo II, in some kilometers in the north of Goz- Beida, in the region of silla is in the course of feasibility studies. This new project if it is concretized will produce 600.000 tons of cement a year, which will be added to 200.000 tons of Baoré and can finally solve the problem of Chadians in this domain.

4.2.2   Towards economic growth with the contribution of new units

According to African economic outlook's report of 2012, Chad Gross Domestic Product (GDP) growth is projected to reach 7% in 2012 (http://www.afdb.org/fr/countries/central-africa/chad/). Though this projection is driven by non-oil sector, there is whenever certain contribution such as the cement of Baoré.

In spite of the difficulties, it will however be necessary to recognize that better late than never. Today the Chadians can circulate with their own fuel. The refinery of Djarmaya produces several petroleum products such as the diesel oil, the lamp petroleum, the high-octane gasoline, the gas in kilo and oil in kilo. Also, several young graduates were now working in the field of the petroleum even if *"to work with Chinese, it is to go to hell. You work a lot to win little. You have a very short break time. They use us from 7 am till 6 pm"* (http://www.journaldutchad.com/article.php?aid=2990) as regretted one of the Chinese's factory employee. The matter is also to make effort to preserve Chadian natural resources from foreign enterprises because we are assisting to what Mamadou Diouf[26] has called the privatization of State and Economics. In reminder, the prices of various petroleum products are fixed as follows:

Fuel:
Super: 480 FCFA;
Gasoil: 525 FCFA;
Jet A1: 615 FCFA;
Lamp Petroleum: 375 FCFA ;

Butane Gaz (Arrete of Ministry of Commerce and Industry, 2012):
Vrac: 649 FCFA per Kg;
Conditioned: 713 FCFA per Kg;
Bottle of 3Kg: 1400 FCFA per Kg;

Bottle of 6Kg: 2900 FCFA per Kg;
Bottle of 12.5Kg: 9500 FCFA per Kg;
Bottle of 25 Kg: 18 200 FCFA per Kg;
Bottle of 32 Kg: 23 200 FCFA per Kg[27].

By inaugurating the factory, the President of the republic has declared in this term: *"you do not fetch any more petroleum products somewhere else and you also go to provide under region with your product"* (http://toumaiactu.mondoblog.org/2011/06/29/tchad-la-raffinerie-de-djarmaya-est-en-marche/). So the fuel was sold to 200 francs CFA the next day the liter was 274 francs CFA and an unprecedented shortage.

5 CONSLUSION

In the euphoria of the indepences, the countries of Africa in south of Shara had to opte for a politics of the industrialization centered on the substitution in the import. The implemented instruments were established essentially by the public investment and by the protection of the economy in a general way.

The theoretical foundations of this politics led in the decade 1960-1970 aimed at the acceleration of the process of their development considered there for the delaying on industrialized countries. After two decades of practice, the results were not as high as expectations because the fundamental needs of the populations were never satisfied. The disparities racked themselves and the poverty were severe in all the society, urban as rural.

This model, conceived to master the strategic variables to allow economies delayed to know a growth and sustainable was not effective. So the permanent desiquilibres employees whom know these countries pushed, during mid 80 year the reflexion towards another model:it is the one of economic reforms in general. The liberalization ,the stabilization, and the privatization of public entrepries are going to be in the center of the evnomic actions to change the sad situation.

This strategy become a paradigm otherwise universal to reduce the economic désiquilibres both for the developed countries and for the developing country. For Chdian government, it has been an obliged way: In the hope to solve these problems, this withdrawal brought nothing of positive to dike the poverty. That is why in the search for the remedies, the goverment multiplied the efforts these last years to put into practice the natural resources of the country not exploited.Ufortunately, the result remains mitigated. The cement of factory of Baoré and the mini refinery of Djarmaya that have being analyzed in this work are far to bring the satisfaction to Chadians. That's why it is convenient to revise the strategies already organized to restore hope to the populations; direct beneficiary of these investments. Because it has been demonstrated that about 55% of 12 millions of Chadians are living in extrem poverty and unemployment is also depht (http://www.jeuneafrique.com/Articles/Dossier/A2672p087.xml0/bad-petrole-inflation-investissementtchad-sursauts-de-croissance.html).

Challenges of the Modern World - Contemporary Economy and Globalization

ENDANGERED FOLK RELIGION IN THE ERA OF GLOBALIZATION

Gouri Sankar Bandyopadhyay
The University of Burdwan, Syamsundar College, India
banerjee.gourisankar@gmail.com

ABSTRACT
Globalization is a cumulative process widely felt by everybody and everywhere in current times. In every walk of our life globalization has been taking place with rapidity sometimes perceptibly and often surreptitiously. It is a blessing but it is not as an unmixed blessing. With unprecedented spread of globalization which manifests through development of world trade, technology, new ideas of post-modernity etc. throughout the present world, folk religion as a whole, is facing day to day an acute crisis than ever. Under pressure of globalization, the people even belonging to the little tradition almost in everywhere have considered scientific and technological progress more and more as the authoritative part of their life ignoring their root kept in the ageless folklore or folk culture. In the so-called global village every aspect of folklore such as folk music, folk dance, folk tale and folk religion are endangered irrespective of countries. In the fast changing world, the principal world religions like Islam, Christianity, Judaism, Buddhism, and Hinduism are not so vulnerable unlike so many regional folk-tribal cults. Due to presence of the seen and unseen forces of globalization, the mass culture or the popular culture which was developed on the basis of a life with an agricultural bias is currently undergoing major changes. In short, the folk cults are rapidly losing its vital force to a large extent. Declining of folk culture is rapidly taking place along with destruction of its age old rural and rudimentary character. Although millions of people in the world still hold to the popular religion, it has no written history, priesthood or no scriptures. In this proposed study the attempt should me made to unfold the truth that impact of the globalization has become a real menace to the folk religion worldwide.

Keywords: Folk religion, Globalization, Mass culture, Vulnerability

1 INTRODUCTION

Our current times may be justifiably termed as 'The Era of Globalization'. Globalization portrays the socio-political, economic and cultural atmosphere of the contemporary world. It is generally said that the current model of world political economy which is generally known as globalization, represents more of a today's business ideology rather than a new intellectual paradigm. Again, it is further argued that 'while some people think of globalization as primary a synonym for global business, it is much more than that. The same forces that allow businesses to operate as if national borders did not exist also allow social activists, labour organizers, journalists, academics and many others to work on a global stage' (http:boloji.com/perspective/223.htm). The people around the world are more connected and interlinked to each other today than ever before in the long history of mankind. We live in an intensely interdependent world in which people all over the globe with their immense diversities and dissimilarities of culture and historical experiences are compressed together in instant communication. This unprecedented phenomenon has been appropriately titled 'Globalization'.

Globalization is a cumulative process widely felt by everybody and everywhere in present times. In every walk of our life globalization has been taking place with rapidity sometimes perceptibly and often surreptitiously. Eriksen states, 'it is doubtless true that globalization is a

pervasive tendency influencing the lives of people everywhere—Amazon rainforest to Japanese cities…Truly global processes affect the conditions of people living in particular localities, creating new opportunities and new forms of vulnerability' (Erikson, 1999). But at the same time, peoples' indigenous culture as well as tradition-bound folklore is under the lethal threat of the forces of globalization in our days throughout the world. Folklore including folk religion has played constantly an important role in handling down social and cultural norms and religious knowledge and wisdom and in keeping the social structure stable. The unbridled expansion of globalization and the monoculture, promoted by the first has continued at an accelerated rate along with the denigration and decline of native folk culture and folkway of life. Indigenous peoples have struggled for centuries to maintain their identity and way of life against the tide of foreign intervention and foreign economic investment and the outsiders that often come with it. Such an identity formation is an inherent human trait. Formation and preservation of identity is people's source of meaning and experiences. Singh analyses, 'Identities are formed and become meaningful at the conscious, subjective of human nature and consciousness on the one hand and on the other through sharing cultural practices common defined by differences of territory, ecology, ethnicity and historical experiences of the people in societies' (Singh, 2003, p. 71). Religion especially folk religions play a very significant role in the formation of identity in society and culture. Daes and Irvine (2004) justifiably observes,

> Indigenous peoples today stand at the crossroads of globalization. In many ways, indigenous peoples challenge the fundamental assumptions of globalization. They do not accept the assumption that humanity will benefit from the construction of a world culture of consumerism. Indigenous peoples are acutely aware, from their own tragic experience over the past 500 years that consumer societies grow and prosper at the expense of other peoples and the environment.

Scholars raise deep concern over the impact of globalization on folklore, which was on the one hand, getting marginalized and on the other getting popularized through new technology rapidly (Reddi, 2002). Through the ages in almost all countries of the world particularly Afro-Asian and Latin and Central American countries, folklore and folk religion played a major role in the formation of a 'public space' or a 'public sphere'. It provided for both legitimization and construction of world view and socio-political order. This public space is being reduced day by day in this global village under the impulse of globalization. This study attempts to unearth how such folklore in general and folk religion in particular has relevance in our times, and how globalization brings changes in the popular cults, beliefs and practices constantly.

2 UNDERSTANDING FOLK RELIGION AND ITS RELEVANCE IN THE GLOBAL VILLAGE—INDIAN EXPERIENCE

Every culture either savage or civilized has its inherent folk elements. However, the idea of including folklore within the framework of the 1972 World Heritage Convention (WHC) was raised during its drafting (Blake). In the year 1988 UNESCO made its Recommendation of the definition of "folklore". Folklore and its most predominant component folk religion was never a relic of the past, but a phenomenon, constantly happening. Charles Francis Porter rightly observed: 'Folklore is a lively fossil which refuses to die.' Again, it is properly stated that folklore and social history are inextricably bound up with each other, and the same ground. Even it is considered as an important tool to articulate the human history of endless class struggle. Folklore signifies the wisdom of people's knowledge. It is an echo of the past but at the same time it is also the vigorous voice of the present. In similar way, folk religion

("*lokayata dharma*") has ever been vital in the life and culture of the vast mass of the peoples belongs to 'Little Tradition' in our present world. The Indic term '*Lokayata*' (folklore) may be taken as the protected depository of the popular religious tradition which reveals the philosophy of the common people and the worldliness. Folk religion may be defined as 'the totality of all those views and practices of religion that exists among the people apart from and alongside the strictly theological and liturgical forms of the official religion' (Yoder, 1974, pp. 1–15). Analyzing the significance of the folk religion Parrinder observed, 'There are millions of the people in the modern world who hold to religions that are pre-literary, that is to say that have no written history and no scriptures' (Parrinder, 1961, p. 17). In other words, folk religions usually had their origin outside the scope of established creeds or leading world religions such as Hinduism, Buddhism, Christianity and Islam. However, Durkheim rightly observes that religion is the basic and fundamental elements to preserve social structure intact.

India has a rich and resourceful folkloristic cultural tradition. Folk arts, cults, creeds, rites, rituals, beliefs, myths, literatures, music etc. are components which enrich age-old folk tradition of this country. In India numerous folk cults and popular religions had their origin and development in pre-Vedic or non-Brahmanical cultural environment. However, irrespective of cultures and races such folk cults developed with regional or local characters are remained neglected and marginal in the mainstream cultural paradigm of the upper classes people through the ages. The folk religions primarily based on the concept of fertility, reproduction has a great antiquity, and origin of these may be traced in the primitive days. In Indian archipelago the number of such folk cults and regional deities is unlimited in true sense. There is almost each village or '*mahalla*' has its own guardian deity who is responsible for the prosperity and wellbeing of the village as a whole. Bhattacharya (1978) says:

> The blessings of the gods are invoked on behalf of the whole village in time of general distress, e.g. epidemic, drought and so on. The most democratic aspects of the cult are that no village god responds to any personal or individual prayer. With the breakdown of the community life of the villages, most of the primitive traits of the cult have been already disappeared, and the few that still remains are holding their own against heavy odds.

Almost in all folk-tribal societies in the world, the folk religions are profoundly associated with few common attributes such as animism, mother goddess worship, phallic worship, worship of the ancestors or the cult of the dead, tree and plant worship, '*vrata*' or women folk rites and so on (Bandyopadhyay, 2007, pp. 5–9). Folk cults are inseparably associated with village life as well as ethnic societies. Popular deities are widely worshipped on different occasions in the life cycle, namely birth, puberty, marriage and death or with the prayers for offspring, bumper crops, rain and overall fertility and fecundity (Bandyopadhyay, 2007, p. 7). Again, the worship of mother goddess or the feminine cult of fertility has a special place in the folk religions of India. A large number mother goddess and female fertility divinity rule dominantly the folk world in this subcontinent. As a whole, these folk cults and folk arts forms associated with it are not the mere expressions of what is just 'ancient', it is a reminder of ancient social discourses and their continuous renewal (Rajeev, 2010, p. 116).

In Indian culture we find at the wide prevalence of the worship of a large number of folk-tribal deities and divinities, having no scriptural sanction. The folk religious beliefs and practices, preserved and prevalent in the popular religious system bear almost no connection with higher and metaphysical aspects of the Brahmanical religion and classical Hinduism. These popular cults found in folk-tribal religious traditions of India have more or less

universal as well as ageless character. Whitehead once observed, 'To the students of comparative religion the study of the weird rites and ceremonies connected with the propitiation of the village deities is interesting because it reveals many points of contact with primitive forms of religion in other lands, and also because it enables the student to see these primitive religious ideas in very different stages of development' (Whitehead, 1921; referenced by Maity, 1989, p. 3).

These 'local' or 'regional' folk deities are generally considered the tutelary or guardian deities in Indian folklore. Bhattacharya (1978, p. 43), further states, 'the village god is responsible for the welfare of the village as a whole—he has no jurisdiction beyond the territorial boundary of the village.' However, with the unprecedented development of science and technology in one hand, and rapid spread of overwhelming globalization on the other, such folk religions have faced a grave crisis than ever. Indeed, 'Indigenous people have their dynamic living cultures and seek their place in the modern world. They are not against development but too long they have been victims of development and now demand to be participants in—and to benefit from—a development is sustainable' (Magga, 1995).

3 INDIGENOUS PEOPLES AND THEIR FOLK RELIGIONS AT THE CROSSROADS OF GLOBALIZATION

There is hardly any doubt that globalization has brought a mixed blessing. In the present world situation, all are equal but some are more than others. They set the tone and determine the pace for the rest. Globalization is a power that can exert cultural and economic pressures in individual and social life all over the world. Dalby observes, 'Globalization was a term used by anthropologists and sociologists to discuss cultural changes well before the widespread use in discussions of economics and business' (Dalby, 2007, p. 36). Globalization in spite of its recurring claims to support diversity is trying endlessly to promote a worldwide monoculture around the globe. Individual distinction of cultures and society are wiped off through a homogenous global culture (Rajeev, 2010, p. 116). Daes and Irvine (2004) assesses the whole situation elaborately,

> Globalization presents us with a profound contradiction, however. It is creating a global market for dissemination of fresh ideas and new voices, while making it easier for one voice to down out all the others. It is providing each of us with finger-tip access to the whole range of human cultural diversity while, at the same time, it is dissolving all cultures into a single supermarket with standard brands. It is making it possible for even the smallest society to earn a livelihood by selling its ideas, rather than selling its lands or forests. But it is also threatening the confidentiality of indigenous peoples' most private and saved knowledge.

This globalism has a very negative impact on indigenous peoples and their folklore especially of developing countries where there are weaker pluralistic cultures is being suffocating tremendously. In reality, 'ninety five percent (95%) of the world's indigenous peoples live in the developing countries, and legislation enacted by these countries is insufficient, by itself, to prevent the piracy of indigenous knowledge by researchers and corporations in industrialized countries' (Daes and Irvine, 2004).

Globalization has accelerated the flows of investment that profoundly affect the livelihoods and way of life of indigenous peoples. In the last three decades nearly 100 countries have strengthened legislation to promote investment in several extractive sectors such as mining, gas and oil. Indeed, 'global flows of goods, ideas, people and capital can seem a threat to

Challenges of the Modern World - Contemporary Economy and Globalization

national culture in many ways. They can lead to abandonment of traditional values and practices and the dismantling of the economic basis on which the survival of indigenous culture depends' (Globalization and Cultural Choice, 2004). It is rightly said that globalization is, in other words, not merely another words for the growing transnational economy. It is true that it is largely driven by technology and economic interests, but it must be kept in mind that it encompasses a wide range of processes that are not in themselves technological or economic (Ornek, 2007, pp. 83–88). The irony is that such globalization cannot be turned back. The hard truth is 'whether we are in favour of globalization or are against it, it is definitely an ever-expanding process…Economics is the most important dimension of globalization, which affects politics, and politics in return affects economics, and both of these affect the cultural dimension of globalization' (Ornek, 2007, pp. 83–88). It is at this point that globalization becomes a problem from the cultural identity perspective. Today throughout the world, in the midst of discussion on globalization, it is increasingly being claimed that globalization brings with it homogeneity and that the identity of countries, in short their cultures, are becoming destroyed (Erikson, 1999).

The present century is considered the 'Age of Globalization' as it is also the age of cultural crisis in a sense. It is the age in which folk religion either undergo change in their indigenous form, or totally disappear. At present times, people even the rural folks in almost everywhere have considered scientific and technological development more and more an essential and authoritative part of their lives. Due to speedy urbanization and industrialization the 'Little tradition' as well as peoples' culture which developed on the basis of a life with an agricultural bias is undergoing major changes. Once the change is that the folk religion is gradually losing its vital force to a large extent (Bandyopadhyay, 2011). The transformation that globalization is going to make in the cultural arena is that the whole world is going to come under the dominance of a macro culture. As a result, the pluralistic micro cultures that retain our cultural identity are on the verge of effacement, and society is becoming subject to domination by all pervading monoculture, skillfully articulated be globalization (Bandyopadhyay, 2011; Spich, 1995, pp. 6–29).

Through globalization the entire world is changing into a single space, single culture and single identity. Traditional folk religion as well as folklore is gradually subverted or eliminated all over the globe. It is argued by the scholars,

> As for the political and cultural dimension of globalization, we are confronted via the world media with an agenda reflecting the downfall of the national state model and with the prevalence in recent times of the terms and fears known as cultural "homogenization" and micro nationalism. In recent years, with the process of globalization, the international media has begun to present the national state model as an old fashioned style of management (Ornek, 2007, pp. 83–88).

Globalization is currently redefining cultural contexts. In a globalized world, folk art forms are being removed from their basic religious ritualistic nature. Comprehensive field survey of the present author of the tradition-bound and religion depended scroll-paintings of Raghurajpur, Orissa in India can show clearly that this old and traditional folk art which is an inseparable part of local popular religious system is suffocating for existence during last few decades. Almost same things are happenings with other religion-bound folk arts throughout the world in our times.

Folk cults and folk art are mutually dependent since days immemorial. Mostly terracotta animal figures such as clay made horses or elephants are offered to any and every village deity irrespective of sex and character all over rural India (Bandyopadhyay, 2011, p. 37). Similarly, various types of folk paintings such as scroll paintings, '*pata*' paintings and '*madhuboni*' paintings with representations of folk gods and goddesses are being worshipped widely by the village peoples throughout country. Now, in the days of globalization when a single macro culture is being imposed directly and indirectly, very survival of all these folk art forms, profoundly associated with popular religions is under question. Besides, the issue of growing commercialization of these folk arts and resultant loss of aesthetic qualities should not be overlooked. It is also argued that the folk art forms presented out of their religious contexts lead to their commercialization and in a market economy the traditional rural artists will be out. With this, the physical and ecological landscape based on ethnically significant history, legends and myths will no longer be there (Rajeev, 2010, p. 117). Again, the harvest rites or agrarian rites and rituals which are also widely prevalent and closely associated with folk way of life and minor religious systems in the countries like India are being disappeared with rapidity. Indigenous peoples justifiably fear that their traditional folklore, ancient cultural practices are endangered by the endless flow of foreign investment in their respective countries. They see 'globalization as a threat to their cultural identities, their control over territory and their centuries-old traditions of knowledge and artistic expressions. They fear that the cultural significance of their territories and knowledge will go unrecognized—or that they will receive inadequate compensation for these cultural assets. In these situations globalization is often blamed' (Globalization and Cultural Choice, 2004). Thus in a global paradigm, emergence of such a hybrid culture has replaced the traditional folk culture in the Third World countries.

4 CONCLUSION

At the end of this discourse, it may be assumed that if it is true that the world is rapidly becoming a global village, and then we have more reason and responsibility than ever to treat others—indigenous peoples accompanied by their traditional folk culture with respect and reciprocity. The proper need of the time is to "respect, preserve and maintain" the traditional knowledge, religion, art and culture of the vast rural folks living around the world, and to ensure that the benefits of globalization and commercial application are shared equitably. Daes and Irvine observe, 'All of us share a heavy historical responsibility for managing the next stages of globalization better than we managed previous stage of the process. In particular, I believe that we must continue to insist that the rules of the international marketplace are not only procedurally neutral, but substantially fair' (Daes and Irvine, 2004). For the benefit of the common people we have to preserve the existence of multiple 'public sphere'. Folklore, in broad sense, in public spaces served as a medium for both legitimization and contesting dominant world views. It could be used either to stress homogeneity or articulate heterogeneity. The reality is folklore played a vital role in the constitution of these discursive spaces and generating opinions. It continues to fill the space between political authority and individual group interests of the mass. It acts as a potent means to generate opinion, achieve consensus and also put questions to the powers that be.

It is rightly assumed that when the global flows lead to cultural exclusion, multicultural policies are highly needed to manage trade, immigration and investments in ways that recognize cultural differences and identities (Globalization and Cultural Choice, 2004). UNESCO (2001) clearly stated:

> Cultural diversity is as necessary for mankind as biodiversity is for nature. In this sense, it is the common heritage of humanity and should be recognized and affirmed for the benefit of present and future generation.

Simultaneously, in these days, indigenous groups are increasingly assertive. Globalization has made it easier for indigenous people to organize, raise funds and network with other groups around the globe, with greater political reach and impact than before. We should mention in this respect that the UNO declared 1995–2004 the International Decade for the World's Indigenous People, and in 2000 the Permanent Forum on Indigenous Issues was created (Globalization and Cultural Choice, 2004).

Now the hypothesis is standing within the frame of the ideology of pluralism, we have to maintain a strong interactive relationship between modernity and tradition, and folk religion can be used as an important tool for this task. Again, the positive qualities of globalization can be utilized to in this respect. We need a global consensus that the aboriginals and indigenous peoples are the owners of their own cultural heritage such as traditional folk religion, folk arts, folk music, folk dance, folk literature and so on. We have to admit unquestionably: 'Development divorced from its human or cultural context is growth without a soul. Economic development in its full flowering is part of a people's culture' (Magga, 1995).

Challenges of the Modern World - Contemporary Economy and Globalization

GLOBALIZATION CAN LEAD TO INCLUSIVE GROWTH IN DEVELOPING COUNTRIES – MYTH OR REALITY

Haimanti Banerji
Indian Institute of Technology Kharagpur, India
haimanti@arp.iitkgp.ernet.in

ABSTRACT

Globalization and the related concerns for poverty and exclusionary development have become a focus of international discussion in recent years. Sometimes, contrary to the commitment of global corporations to act as engines of economic growth trickling down wealth to the rest of society, their policies lock wealth at the top, denying job opportunities to unskilled labour, increasing the number of people dislocated from their traditional livelihoods, decreasing access to food and vital social services to urban poor and reducing scope for participatory planning and community involvement. In India, due to globalization, the spatial structures of cities and the hinterland are changing as new economic production patterns require more horizontal integration between functions in different countries. With shifting of attention to external locations and activities by the major metropolitan cities of the country, a paradigm change from earlier urban spatial patterns is noted. The territories or regions which surround these rapidly globalizing cities are increasingly playing a very insignificant and irrelevant function in their business. However, in a major metropolitan region of eastern India i.e. Kolkata Metropolitan Area, due to a very unique process of internationalization of economic activities, the ''local'' and the ''global'' are deeply intertwined. This paper attempts to highlight that how within KMA, due to a very unique process of internationalization of economic activities, the hinterland especially the new towns are aspiring for world class life style including in the process a large number of local companies. These new centres of development are acting as excellent platform for diverse kind of linkages between global level activities and local business houses.

Keywords: Globalization, Inclusive development, Local ecpnomy

1   INTRODUCTION

Globalization and the related concerns for poverty and exclusionary development have become a focus of international discussion in recent years. The international giants and global corporations are expected to act as engines of economic growth trickling down wealth to the rest of society. It becomes a matter of concern when their policies focus more on the elite class of the society, denying job opportunities to unskilled labour, increasing the number of people dislocated from their traditional livelihoods, decreasing the scope of collaborating with the local companies and reducing scope for participatory planning and community involvement. Striking a balance between the twin forces of globalization and localism has recently become a challenge for planners and policy makers in many Asian cities.

Recent work on cities in East and South-East Asia has highlighted the need to consider contemporary urbanization as ''a complex interplay of processes and agencies operating at different scales'' (Chang et al., 2004) and to view cities as the product of the interpenetration of both local and global influences. Brenner, in particular, has highlighted the role of city – hinterland chemistry and regulatory role of State level institutions and policy makers in facilitating the movement of global capital. He has termed this as 'reterritorialization', a process by which territorial organization at different scales is transformed to enable

accelerated circulation of capital through large scale and networked infrastructure as well as institutions. Swyngedouw's (1997) concept of 'glocalization' also accepts this continuous and unique process of globalization where the ''local'' and the ''global'' are deeply intertwined.

These empirical studies strengthen the viewpoint that rather than seeing the global and the local as two opposed and dichotomous entities, they are better viewed as complementary and acting together to produce new urban landscapes of economic prosperity (Shaw and Satish, 2006).

This paper attemts to explore how the local companies are appropriating and adapting the global and moving towards an inclusive and sustainable socio – economic growth in Kolkata Metrolitan Area , located in eastern India.

2   INDIA AND GLOBALIZATION
In many developing countries, the Government and urban decision makers are often confused by priorities accorded to quick development on one hand and inclusive development through integration of local institution or local economy on the other.

Urban theorists such as Brenner (1999), Gibson- Graham (2002) and Herod (2003) have been vocal against the idea of universalizing of world cities and have tried to establish significant differences in the 'local' experiences of globalization.

The opening up of the Indian economy since 1991 has brought much change in large cities. In this country, due to globalization, new production patterns require more integration and interaction between functions in different countries. With shifting of attention to external locations and activities by the major metropolitan cities of the country, a paradigm change from earlier pattern of settlements and socio – economic profile of people living in the city and hinterland is noted. The territories or regions which surround these rapidly globalizing cities are increasingly playing a very insignificant and irrelevant function in their business.

In India, especially since 2000, there has been increasing demand for office space by the export-oriented IT, BPO (business process outsourcing) and KPO (knowledge process outsourcing) organizations that are coming up in metropolitan cities. But, many of these BPO units are owned and managed by Indians who are serving markets in the US, UK and other developed countries. In addition, the NRI (non – resident Indians) have been creating a demand in high – end residential sector. As a result, in spite of keeping out FDI from the real estate sector, global influences have been playing an important role on local economy and indirectly shaping the built environment. Secondly, there has also been increasing use of global expertise in the planning and design phases of different Software Technology Parks, high – end housing projects, retail and office spaces. Thus though the projects are built locally with local materials, there is a strong global element in their planning, designing and subsequent usage. In majority of cases, international design houses are collaborating with local architects and engineers for these world class projects being developed by the national builders.

It has been observed by analyzing the quantity and type of both global and domestic investments in major urban regions of the country for the period 1991 till 1998 that large cities located in the western and southern parts of the country were doing well in attracting both FDI and domestic investment. (Shaw, 1999). Some Indian cities, for instance, are the

sites of highly successful local organizations that through the last ten years have risen to become global organizations. Local IT companies such as Wipro and Infosys (Bangalore), Satyam (Hyderabad) and TCS (Mumbai) and pharma companies such as Biocon (Bangalore), Ranbaxy (Gurgaon) and Dr. Reddy's (Hyderabad) are examples of such organizations (Shaw and Satish, 2006).

3   METROPOLITAN DEVELOPMENT IN THE AGE OF GLOBALIZATION

Since the paper attempts to explore the extent of global and local influence in recent development of Kolkata Metropolitan Area, the author feels it appropriate to understand the dynamics of metropolitan development in this era of globalization. The common phenomenon found in metropolitan cities across the globe include fragmentation, differentiation, growing inequalities, poverty concentrations, decentralization, polarization and 'spatial mismatch', where problems are found in jurisdictions lacking the resources to solve them (UN Habitat report, 2004). Over the last decade, these processes have taken on new dynamics as stated below since global forces become embedded in local spaces and socio-economic realities.

- The restructured metropolitan economy: Urban economies have undergone significant industrial restructuring during the last four decades, losing manufacturing jobs and gaining in new service functions. This process has changed spatial patterns, leading to clustered employment opportunities on the peripheries of metropolitan areas, while also increasing income disparities within and between industries.
- The globalization of city space: Globalization has contributed to industrial restructuring by offering opportunities for footloose industries to leave cities altogether. But it has also increased the connections and linkages between economic production, consumption and investment across and between cities and countries.
- The restructuring of urban form: Metropolitan areas have expanded to outer cities, edge cities and peripheral settlements, changing the economic and social character of central areas.
- The appearance of the fractal city: Patterns of economic and social differences, identities and inequality are replicated in many communities who make up the metropolitan area.
- Violence and conflict in metropolitan space: These differences and changing patterns of dislocation and relative inequality have led to growing crime and violence, which is managed through increasing numbers of gated communities and other efforts to provide security in insecure metropolitan environments.

It has been primarily understood that in this era of globalization, the metropolitan areas are in the process of restructuring and reconstituting themselves, with new economic activities, newer built spaces, different kinds of people and new forms of cultural expression. It is not surprising that many local institutions and companies are lagging behind and are unable to evolve as quickly.

In India, the seven largest cities, each with a population exceeding 4 million, had been experiencing a construction boom from rapidly growing residential and office real estate as well as from large infrastructure projects such as flyovers, the creation or extension of metro systems, circular rail systems, airports, high-speed road connectors, and shopping malls and entertainment centers. The same is now true for the multicultural and cosmopolitan city of Kolkata, which is the main business, commercial and financial hub of Eastern India. Kolkata Metropolitan Area (KMA) that today extends over 1851 sq. km. is essentially the metropolitan outfit of the city of Kolkata that had housed the capital of India during a major

part of the British colonial rule. KMA has witnessed an economic decline from the late sixties till the late nineties and the city's economic scenario only improved in late nineties when the economic liberalization in India reached Kolkata.

This paper attempts to highlight that how within Kolkata Metropolitan Area, due to a very unique process of internationalization of economic activities, the hinterland especially the new towns are aspiring for world class life style including in the process a large number of local companies. These new centres of development are acting as excellent platform for diverse kind of linkages between global level activities and local business houses.

4   INTRODUCTION TO KOLKATA METROPOLITAN AREA
The metropolis has evolved over a very long period of time although history of planning and development of the metropolis as a single geographical entity is a relatively recent phenomenon. Kolkata Metropolitan Area has two major components:
- The conurbation meaning the continuous stretching in a linear pattern along the east bank and west bank of the river Hooghly with Kolkata and Howrah being the two most prominent cities on east and west bank respectively.
- Rural areas lying as a ring around the conurbation and acting as protective green belt.

5   GLOBAL AND LOCAL PLAYERS IN KMA
Historically speaking, the multinational companies had a relatively late entry in Kolkata as compared to other metropolitan cities in India. This is primarily attributed to the then priority given by the state government to agriculture. As a result, the state's leading industries, faced loss and lower productivity which led to an overall decline in the state's economic performance. There was industrial flight from the state because of loss of workdays due to strikes and lockouts. Increasing unemployment and declining quality of urban areas resulted in a slowdown of migration into the metropolitan area. By the early 1990s the state government realized that a revival of the manufacturing sector and a revival of Kolkata were important to the future of the state. But by then, the image of the city as a destination for industrial investment had fallen to a very low level and was rarely a good choice for industrialists, both domestic and foreign.

However in the following decade, i.e. after 2000, there was a change in the scenario and state patronage was available for setting up IT and ITES. The state government attached high priority to growth of IT & ITES industries in the State and had announced in January, 2001 the Information Technology Policy 2000. The KMA was already prepared for this venture with an abundant supply of skilled and semi – skilled persons to suit these industries and lowest possible cost of operation, cheap abundant power and lowest cost of living.

Some statistics on socio – economic scenario of KMA confirms a gradual structural change with the share of Primary sector falling and those of Secondary and Tertiary sectors increasing in the late nineties. The Tertiary sector witnessed a phenomenal increase of State Development Product (SDP) growth of 11.1 percent per annum between 1993-94 and 2001-02. This rate of growth was found to be even higher than that (9.5 percent per annum) for West Bengal. The corresponding rate of growth for KMA was 3.8 percent between 1985-86 and 1993- 94 (KMA - Vision 2025).

In Kolkata, evidences have proved that, just as global agency influences change in the local, local agency can also influence the global or acquire global stature. The state of West Bengal

has registered a steady growth in the IT sector during recent years dominated by export performance mainly due to inexpensive rentals, a successful private-public partnership model, incentives from the state government and political stability. As a result, this had been a fair playing field for both foreign and local real estate developers. Sector – V at Saltlake within KMA has one of the fastest growing software technology parks in the country to-day, registering a compound annual growth rate of 119 percent during 2002-03. Currently, there are 185 IT companies in Sector-V of Salt Lake employing more than 15,000 IT professionals. However, in Kolkata, in sharp contrast to Bangalore, which is another very successful IT hub of the country, much of the investment is from domestic entrepreneurs. Foreign direct investment has been much more limited and the globalization that has been so rapid in Bangalore and brought with it its own problems has been much more muted here.

Table 1: Industry wise investment in Kolkata during initial phase of globalization (Shaw and Satish, 2006)

Sectors	Cost in (Rs billion)	In percentage
Power, Oil, Gas and Petroleum	44.68	37.37
Chemicals, Paints, Polymers and Plastics	0.20	0.17
Pharmaceuticals and Medical Systems	0.79	0.67
R&D, IT And Software, Call Centers and Electronics	6.01	5.03
Hotels, Recreation, Commercial, Retail and Hospital	15.11	12.63
Automobiles and Auto Ancillaries	0.75	0.63
Metals, Machinery, Engineering, Electrical and Others Manufacturing	4.04	3.38
Food And Breweries	1.29	1.08
Jute, Paper, Leather, Textiles and Garments	5.00	4.18
Roads, Railways and Infrastructure	41.68	34.86
Total	119.55	100.00

The industries that have attracted investment for the period 1994 till 2004, which is considered the changing phase or the phase of initiation of globalization in KMA, are primarily those related to the city's infrastructure. Thus 37% of the total investment has gone to the power sector while another one third of the investment has been on roads, railways and related infrastructure. About 12% has gone into the building of hotels, recreation and commercial facilities. Only 5% of the total investment has so far gone into the IT and ITES sector. However, this too is changing with the recent growth of BPOs in the city especially with the rise of Rajarhat New Town in KMA to an internationally recognized centre for IT and ITES over the last one decade, starting from the mid-nineties.

Today International Giants such as IBM, Accenture, Cognizant, Texas Instruments, Cisco Systems, Intel Asia Electronics Inc, Deloitte, Sun Microsystems, Honeywell, PwC, HSBC Global Resourcing, Capgemini, Atos Origin, Foster Wheeler, Siemens, and Novell have set up their offices in Kolkata. Kolkata based companies such as ITC Infotech, The Interface Pvt. Ltd., RS Software, IKF Technologies, Indus Net Technologies, Metalogic Systems, Ushacomm, WDC, Ontrack Systems, BNKe Solutions, Web Spiders, Intrasoft Technologies etc IBM Global Services India Pvt. Ltd., WIPRO, Tata Consultancy Services (TCS) Ltd, Infosys, Cognizant Technology Solutions (CTS), GE Capital International Services, HCL Technologies Ltd. also have their branch offices and developmental centers here.

Challenges of the Modern World - Contemporary Economy and Globalization

This apart, other big Indian software firms have already made Kolkata their hub of operations for Eastern region of India. Of these Wipro, Infosys, TCS, Tech Mahindra, ITC Infotech, HCL Technologies, MphasiS, Genpact, Tata Interactive Systems, Ramco Systems, Firstsource, CMC Limited, NIIT Technologies, Moser Baer Ltd., Aptech IT, Aegis, Aditya Birla Minacs, Rolta India Ltd are leading the way.

Table 2: Cumulative total investment in Kolkata (in Rs billion) (Shaw and Satish, 2006)

By ownership	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004
Central goverment			0.40	0.40	0.40	0.40	2.92	2.92	25.42	27.04
State goverment									0.50	0.52

Joint Sector	3.22	3.22	13.12	13.12	13.12	13.12	13.12	13.12	13.92	15.62
Total	3.37	3.49	42.94	63.92	64.36	67.46	73.55	82.81	115.67	119.55

Currently more than 200 IT Companies have their offices in different parts of Kolkata and New Town catering to a large section of population in KMA (www.Calcuttaweb.Com). These companies have been most helpful in blurring the divide between global and local. Nevertheless, the primary source of Kolkata's growth, so far, has been largely the domestic private sector as is evident from table 2.0. This growth in IT sector, in turn, has fuelled the demand for office space and technology parks and the subsequent expansion of the city. As noted by Nair (2005), ''Major cities are witnessing a sustained real estate demand that has largely been a result of growth spearheaded by a spurt in the knowledge sector largely comprising the IT and BPO led businesses''.

It has been observed that, both global and local real estate developers dominate the design, layout, and planning of township projects in Kolkata.

The two major growth hubs within Kolkata Metropolitan area are New Town, Rajarhat and Kolkata West International City.

In Rajarhat, where Housing and Infrastructure Development Corporation (HIDCO), a quasi – governmental organization plays the lead in planning and developing the township, due importance has been given to the growing and specialized needs of the IT sector workers.

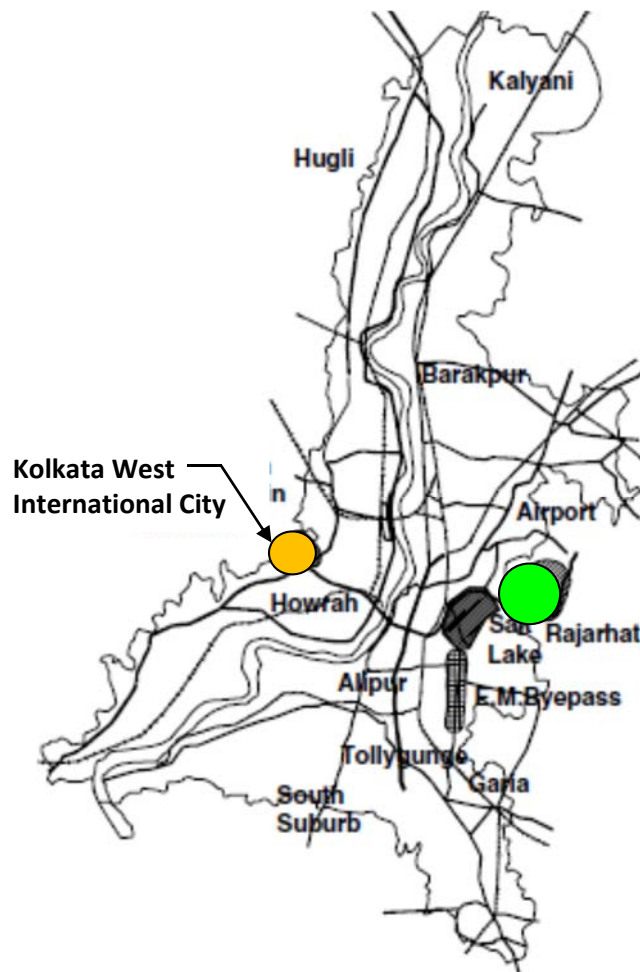
Located adjacent to the Nabadiganta Industrial Township (also known as Salt Lake Electronic City) where the bulk of the IT industry is located, Rajarhat is committed to provide the much needed residential and commercial base for those working in this growing sector.


Figure 1: Kolkata Metropolitan Area

The uniqueness of Rajarhat city region lies in the fact that its growth is primarily banking upon the local talent of workforce, comparatively lower costs of doing business in the state and greatly improved infrastructure such as electricity and water supply rather than on influx of foreign capital. In addition, the township also serves as a center for new regional level community facilities, establish a new business district, provide land for nonpolluting, inoffensive, and nonhazardous industries, and develop an environment friendly and aesthetically attractive urban settlement functionally integrated within the future metropolitan structure. In short, Rajarhat is planned as a self-sufficient urban center, paying heed to the need for a desirable place to live and work in. This is very evident from the Master Plan and land use break up for the township, wherein open spaces have been given top priority as well as the growing needs of commercial space for setting up IT/ITES businesses have been accommodated through successive planning stages.

Initially WEBEL has been the facilitator for development of Information Technology (IT) and IT Enabled Services (ITES) in the state, besides being the nodal agency for development of electronic industries. WEBEL has already distributed 177 acres of land for IT and ITES industries in and around sector V at Salt Lake, Kolkata. For setting up of ITES infrastructure, WEBEL has signed a MoU with HIDCO for 200 acres of land at New Township of Rajarhat

for development of IT and related industries which would provide ample opportunities to both international and local players in the field of both IT and real estate.

A number of foreign investment firms, real estate firms, and housing finance institutions have already made their presence felt in this township. Their focus is on the young upwardly mobile professionals and growing middle class who aspire to live in a "global city." In addition to these, local developers with inputs from international architects and designers have been creating such spaces at par with global standards. City based global real estate consulting and brokerage firms which act as intermediaries between MNCs and local developers have been influencing design standards based on the space requirements of MNCs and thus bringing in a global character to the newly built spaces of Rajarhat and Kolkata. Both foreign (Keppel Land, Ascendas) and domestic (DLF Pvt. Ltd., Unitech, Bengal Shrachi Housing Development Ltd., Bengal Ambuja housing Development Ltd., Bengal Shristi et – cetera) real estate firms have invested in large-scale mixed use development projects in Kolkata. Urbana and Rosedale are two residential project under construction in Kolkata and New Town respectively which is being developed by a group of local devlopers associated with the State Housing Board. Internationally acclaimed Architect Stephen Coates from Singapore is the Principal Architect for both the projects and Bangkok-based landscape design firm Green Architects and Structural Engineer Mr Predrag Eror from Dubai have designed Urbana with their expertise.

Figure 2: Urbana, Kolkata

Figure 3: Rosedale, Rajarhat

However, in the Kolkata West International City (KWIC), the players involved are slightly different in nature. A consortium of foreign investors including Salim group from Singapore takes lead along with Kolkata Metropolitan Development Authority (KMDA) who plays the role of facilitator's. Initiated by the State Government, the State Industrial Development Board, and the departments of Municipal Affairs and Urban Development played an active part in procuring foreign investors in the project. The foreign consortium then had to team up with another Indian partner in a joint venture company that was then entrusted with the task of planning and developing the KWIC whereas the state government was responsible for land

assemblage and leasing. The KWIC is therefore unique in the way foreign direct investment is being wooed and utilized in the development of urban areas in and around Kolkata.

6 CONSLUSION

As emphasized by Ong and Roy in 2007, (cited, Chen, Wang, Kundu, 2009), the globalization in Asian countries is always heterogeneous in nature in which local actors and institutions, particularly the state and city governments, local developers, and urban middle class, are actively involved. Similar situation is observed in Kolkata Metropolitan Area as well. Following are major reasons for this unique type of development in KMA in last two decades:

a) Creation of a generation - next middle class:

They cover a wide range of professionals such as employees of multinational corporations, international business solicitors, accountants, engineers et – cetera. These people receiving a global standard pay package have a considerably high disposable income due to the comparitive lower cost of living in this metropolitan area especially the cost of owning a property is much lower compared to other metropolitan areas of the country like Delhi and Mumbai. An ongoing study at Indian Statistical Institute (ISI) by Buddhadeb Ghosh (Hindustan Times, Kolkata, 2009), points out that Kolkata has the highest per capita purchasing power among all metros. This has a direct impact on the demand for goods and services including quality residential, educational, health, transportation and recreational facilites. This opens new opportunities for a diverse range of local entrepreneurs. This new category of middle class people is vital for global capital not only as cheap skilled labour, but also because they facilitate the penetration of global capital to the developing world. They are not only in the "middle" between capital and labour, but also between global and local (Xiang, 2002).

b) Active role of State Government:

The active support from state Government have been instrumental in making KMA a preferred destination for investment both by foreign and local companies especially IT&ITES. Following policies deserve special mention:
- Setting up of an independent IT Department headed by a Minister in 2000 after the State declared its IT policy.
- Declaring IT service as emergency service as hospitals and making strikes or any other legal action illegal for such enterprises.
- Exempting ITES units from laws governing working hours in establishments – these units were allowed to work for 24 hours in three shifts round the year.
- Setting up institutions like WEBEL (West Bengal Electronics Industry development Corportion) which act as single window support centre for all foreign and local IT investors in the state. It interacts with other government bodies such as Bharat Sanchar Nigam Ltd (for fast-line connectivity), West Bengal State Electricity Board (for power connections) and the local municipality (for building clearances) to reduce the company's exposure to bureaucratic problems.

Challenges of the Modern World - Contemporary Economy and Globalization

SAVING THE EURO: CREATING SOCIAL REGIONAL CURRENCIES, TAXES ON FINANCIAL TRANSACTIONS, AND MINIMUM INCOME PROGRAMS

Leonardo Fernando Cruz Basso
Universidade Presbiteriana Mackenzie (PPGAE-Mackenzie), Brazil
leonardobasso@mackenzie.br
leonardofernandbasso@terra.com.br

ABSTRACT
This paper proposes the creation of regional currencies, which we call social currencies (pesetas, dracmas, liras; deutsche mark) with the finality of financing minimum income programs and microfinance programs in Europe. The backing for this currency will be Euros collected based on the creation of taxes on regional financial transactions. Depending on the tax rate the amount of money collected can be substantial and can be used to buy to buy government bonds of countries with severe funding problems.

Keywords: *Basic income, Minimum income, Quantity theory of money, Social currencies, Taxes on regional financial transactions, Tobin tax*

1   INTRODUCTION

In all the proposals that we have read so far to solve the European crisis, not one submitted what we believe to be an essential element: the creation of regional currencies, which we call social currencies; the name could be better but what we have in mind with this name is that this currency includes an essential social component, which is job creation; there is nothing new with alternative currencies that circulate side by side with the national currencies of countries with monetary problems, and this has already occurred in Brazil with the creation of social currencies of restricted circulation, as well as in Argentina, when the population lost its confidence in a currency subjected to ongoing and significant devaluations.

These currencies should reflect three features: the first is that the exchange rate should devalue against the euro, as one of the latter's problems is that it prevents competition by countries with less productivity, as we have already argued in an article (Basso, 2005) on exchange rate parities (criticizing the Brazilian real/US dollar exchange rate which was at the origin of the real plan); the second is that these currencies are of a transitory nature and will become extinct when economic conditions improve in European countries; the third is that as opposed to what happened in countries that created social currencies (where creation and emissions were private) creating and issuing will be under the control of central banks in order to prevent counterfeiting and unrestricted emissions.

The backing for this currency will be Euros collected based on the creation of taxes on regional financial transactions. We put forth a similar proposal in a previous article but our concern in that text was to collect funds in order to put in place a minimum income program for those people affected by unemployment; currently the focus is another, as the social currency is intended to reactivate the economy as well as to fund a minimum income. The second essential component in our proposal is the creation of a minimum income for those affected by unemployment; this minimum income would be funded by social regional currencies, issued in accordance with each country's needs; this would not be inflationary for two reasons: recent events in the United States have raised a query on the expertise of

defenders of the quantity theory of money (significant emissions do not result in significant inflation); frugal emissions give rise to product increases (consumer goods in this case).

The second essential component in the proposal is the introduction of regional financial transaction taxes, because we have found that countries such as England will veto the creation of a Tobin tax for the whole of Europe; this tax, as found when implementing the CPMF (provisional contribution on financial transactions) tax in Brazil, has an excellent collection potential depending on the tax rate, and may provide funds to partially remedy problems with budgetary deficits, reducing the debt/GDP ratio to satisfactory levels. The Brazilian experience shows that there is nothing destabilizing about enforcing this tax.

Implementing this tax should form part of a broader proposal to regulate financial resources in European countries (the most appropriate expression would be regulation of financial resources), as the very much commented solution for the social welfare state did not occur.

2 DIAGNOSIS

Replacing national currencies by Euros was one of the European Union's relevant events, as it allowed countries to prepare a group of policies to preserve the currency's stability, while at the same time avoiding the detrimental effects of solving problems at the expense of neighbors. Nonetheless, the fact that there are economies with different productive bases (such as Germany, one of the world's most powerful economies, and Greece, which depends on its agricultural base) leads to productivity being widely different and affecting competitiveness in a number of fields in different nations. This fact has led nations to use the public sector to solve short-term problems, forgetting that only a competitive productive base will be a definite solution for their problems. Recurring public deficits to drive the economy will always charge a price if they are not followed in the long run by an increase in the government's tax basis, as has occurred now; moreover, this increase can take place only if the economies are able to compete to create revenues. This is equal to wishful thinking if the economies do not work in improving productivity, which can only take place by changing the productive base and with recurring investments.

3 THE PROPOSAL

Let us assume that a country has income that can be spent by consumers, equal to 100 Brazilian Reais per annum.

Let us also suppose that circulating this income through banks could result in the public sector collecting 10 Brazilian Reais per annum as contributions on financial transactions (a simplified version of the Tobin tax). This contribution is nothing more than the provisional contribution on financial transactions (CPMF) that existed in Brazil's and Argentina's tax systems; the provisional contribution on financial transactions could be converted into a permanent contribution on financial transactions (we will preserve the same acronym to name the permanent contribution).

Let us assume that in order to back all of this anti-hunger currency, from now on named citizenship currency, the CPMF would be adopted, and the most that the government could print in this currency would be 10 Brazilian Reais, in other words, a monetary unit of the citizenship currency would be equal to one unit of Brazilian currency, the real.

Table 1 illustrates what would happen, proving that no currency would be created. As the poorer people do not have bank counts, this plan is certainly an income reallocater.

We will describe in detail the process's complete steps. To begin with, the Government will issue the equivalent of 10 Reais in citizenship currency and transfer (1) to the impoverished (although this is an important discussion topic, it is not in our scope here to discuss which of the poor will have priority treatment; the issue is complex, as an individual with a scarce income may be in worse condition than an individual not connected to the market economy, such as an Indian or an inhabitant of the Amazon region who makes a living from natural resources).

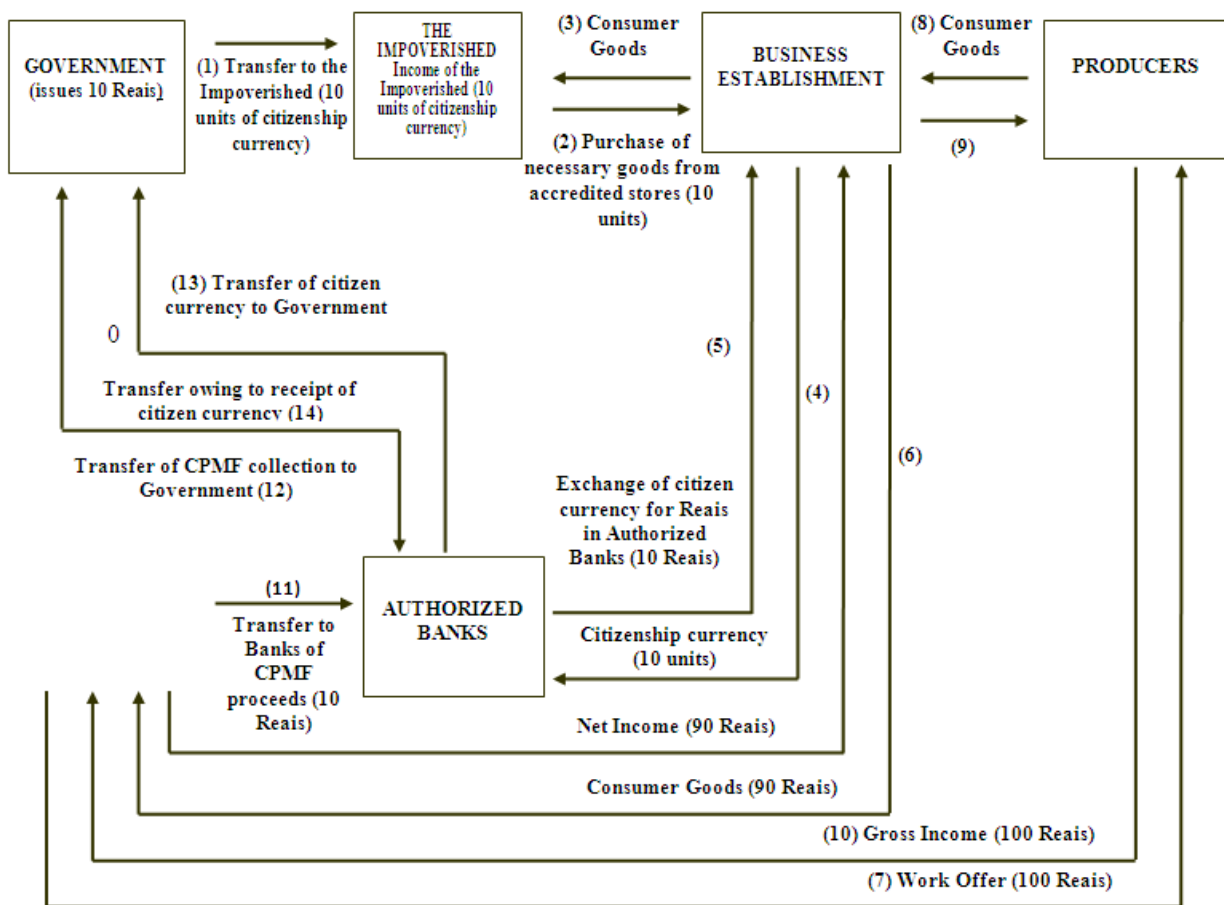
The sum transferred in this first plan should be equal to the sum collected through the permanent contribution on financial transactions (CPMF).


Figure 1: Issuing and Circulating Social (Citizenship) Currency (Basso)

In order to simplify, we will assume that one unit of citizenship currency is equal to one real. To start with, this currency could be spent on food only (this assumption will discarded further on, with an argument in favor of expenditures with consumer goods, whether or not durable, or even any other kind of goods).

The unemployed having in hand a sum due to them will go to stores that sell food, (2) which would retain the food currency while at the same time transferring consumer goods to the

unemployed (3). These stores will exchange the citizenship currency for CPMF tax collection in financial institutions (4) and (5).

The population with income, which at the start had 100 Reais in income, now has available 90 Reais with this income's financial transactions and the taxation on it (CPMF). The population uses up the 90 Reais in consumer goods in the retail stores (6).

The population's income originates from the provision of work to producers totaling 100 Reais (7), who produce consumer goods totaling 100 Reais. The reader, who was brought up under the principles of a classic economy, might inquire why we omitted the creation of value in production, one of the greatest discoveries of classic economists. This was done in order to simplify the reasoning, but no producer would produce if the value going into the productive process is the same resulting from the same process.

Producers sell consumer goods totaling 100 Reais to retail stores (8) and receive 100 Reais, (9) which is used to pay for the work by the population with income (10).

The banks will be in charge of retaining the CPMF funds due by the population (11).

They transfer to the Government the citizenship currency obtained from the retailers (13) at the same time that they transfer the CPMF funds to the government (12) and receive 10 Reais for transferring to it the citizenship currency (14).

Under the proposed plan, the only two unilateral transfers take place between the Government and the impoverished, and the population and the banks.

For all other transfers the path has two ways, i.e.: money is transferred from one point to another in the system, at the same time that goods or work are involved in the opposite direction.

Money issued by the Government, which is equal to creating legal tender, is offset by withdrawing income from the population through the CPMF.

It could be argued that as the money was issued before taxation, there is a likelihood that this plan is inflationary, but in truth taxation occurs during the same time span as issuing, so offsetting exists.

Albeit the currency emission is prior to taxation of the population, increased expenditure due to the excess currency (equal to 110 Reais) giving rise to a price increase, would be offset by a subsequent downturn in demand for money (equal to 100 Reais), leading to a decline in prices.

This first plan is extremely stringent, forcing retail stores to go to the banks to exchange citizenship currency for CPMF funds. This would avoid the creation of legal tender.

A milder alternative may be visualized in the structure of the "barter market" in Buenos Aires. This market, not really a barter market, arose as a result of the crisis that has overcome Argentina, where the unemployed need to exchange what they produce over a period (flow of wealth produced) and even a part of their acquired wealth (stock of acquired wealth) in order

to meet their basic needs (an expression with a connotation broader than satisfying hunger). Each participant in this market receives a number of credits, depending on what he/she has to offer.

With these credits in hand, the person will search for the goods required, validating with payment (using credits) the private labor embodied in other goods.

As the credits are widely accepted and can validate private labor, they serve as a general equivalent and are therefore legal tender. The difference of what occurs in this market and the use of citizenship currency in the first plan is that now validation is broader, including not only wealth produced over the period but inventories from previous periods, which raises the question of what would happen with the citizenship currency's value in connection with the Argentine peso (or the real if the plan were to be introduced into Brazil).

In Argentina's case, the "barter market" has already replied.

One credit unit is worth two pesos, confirming in fact what economists who believe in productivity as the exchange rate's determining factor have already demanded for a long time: The peso's devaluation vis-à-vis the US dollar.

We would not run the risk of increasing the discount, producing inflation in the citizenship currency.

Not if the number of credits (i.e.: the citizenship currency) can be kept under control and regularly exchanged in banks, in accordance with a discount specified by the market. If the goods could be exported, the discount would make the goods produced for bartering more attractive than those in the formal economy, quoted in Argentine pesos. A third more daring plan consists in the creation of a citizenship currency and allowing loans to be made in this currency, provided that they were granted under micro-credit programs, to expand the supply of food. We can use Milton Friedman's argument to demonstrate why this plan is not inflationary.

4 SEVERAL COMMENTS ON THE QUANTITY THEORY OF MONEY
The simplest version of the quantity theory of money may be expressed as:
In which:

$$M.v = P.Y$$

M = stock of means of payment, i.e.: paper money in the public's possession plus its sight deposits in commercial banks.
v = the currency's velocity of circulation
P = a price index, and in the case of the entire economy, the product's implicit deflator
Y = index for real product

This equation may be converted into a dynamic equation representing variations in time.

The variables may be named:

$$\frac{\Delta M}{\Delta t} . \frac{1}{M} = \widehat{M}$$

$$\frac{\Delta P}{\Delta t} \cdot \frac{1}{P} - \hat{P}$$

$$\frac{\Delta Y}{\Delta t} \cdot \frac{1}{Y} = \hat{Y}$$

$$\frac{\Delta v}{\Delta t} \cdot \frac{1}{v} = \hat{v}$$

And considering a constant velocity of circulation, we will have the equation:

$$\hat{M} + \hat{v} = \hat{P} + \hat{Y}$$
$$\hat{M} - \hat{P} + \hat{Y}$$

Based on the scenario expressing the relation between gross domestic product and the amount of currency required to achieve this, we can devise at least five theories.

Three theories are devised based on the additional assumption that the velocity of circulation is constant and that the cause of inflation is an increase in the volume of money in the economy (the currency is the root of price rises).

The first of these, which we might name short-term Friedmanian, provides that the additional stock of currency will be divided between a price rise and an increase in real product. Acting prudently, the volume of currency may be increased in the same proportion as real product estimated growth. This increase may be provided by social (beneficial) currency. We might argue that short-term growth will not imply inflationary pressures if expenditures come together with increases in the gross formation of fixed capital, creating additional goods and services.

The second theory, which we might name Keynesian recessionary, upholds that an increase in supply will impact real growth only, as in depressed economies the monetary stimulus will not produce inflation as the first reason is to recover the economy from a depression (or recession). There is a parallel between this theory and what is currently happening in Europe and the United States, with massive currency emissions to recover both continents from a recession. As upheld by the Keynesian theory, expressive currency emissions may not impact on product should the process occur known as the liquidity trap. Even when unrestricted currency is available, families will not spend should they feel a threat of losing their jobs during a recession, and businessmen will not invest if they do not foresee generous times ahead to sell the goods resulting from their investments.

The third theory applies to situations in which the economy uses a significant enough portion of productive capacity and is close to full employment. In this situation, increases in the supply of currency will result in price rises as it is not possible to increase product.

A fourth version of the quantity theory assumes that the chief cause of price rises is a currency increase, but changes the velocity of circulation. This seems to be the expectation by the US, expressive increases in the volume of currency are not being converted into inflation, due to a change in the currency's velocity of circulation in a direction opposed to the increase in the volume of currency.

Under the same scenario, there are two more theories that change this cause and effect relation. We might name them Marxist and Keynesian.

In both of them, increases in the volume of currency arise from price rises and greater quantities.

Keynesian theories explain prices with mark-up theories. Once mark-ups and quantities for production are decided, products (gross domestic products) will be determined (prices multiplied by amounts). Products determine the volume of currency to realize them. Should the amount of currency be sufficient to make products, the velocity of circulation will not change. Should the amount of currency prove insufficient, the velocity of circulation will rise. Should the amount of currency be excessive, this will affect the currency's velocity of circulation. What distinguishes Marxists from Keynesians is the micro-economic theory that explains price levels, with Marxists adopting the labor theory of value and Keynesians using the surplus theory based on goods (Sraffa) or the utility value theory.

In summary, there are several theories advocating that an increase in the amount of currency is not inflationary, and these theories support the creation of social (beneficial) currency.

5   THE TOBIN TAX
The funds for a stricter plan of creating a social currency (without issuing any amount of currency) would originate from a Tobin tax.

There are a number of versions of a tax on financial transactions, implying various amounts in proceeds. One version involves taxation of foreign exchange markets (Kapoor, 2004). Our purpose here is not to discuss the best form of taxation on currency transactions, but to argue in favor of a successful one, the CPMF's effectiveness in Brazil with a relevant collection of funds. The CPMF is a tax applied to any financial transaction within the country. The volume of funds collected may be significant depending on the tax rate, with the advantage of not requiring international agreements to be enforced. As England did not enact the Tobin tax, the solution is found in domestic CPMFs. This tax is certainly regressive, as its rate is incident on all income brackets. I uphold that this tax is of a nature that supplants the disadvantage of a regressive nature, with its implicit dimension of solidarity; all of a country's inhabitants should be granted the means of eliminating hunger, and this is a task for all of a country's inhabitants.

6   THE USE OF MONEY
Tobin's initial proposal was to reduce the volatility of international capital flows, considered in the past to be destabilizing (Basso, Pinho and Silva, 2001).

We now know that capital flows are much more difficult to control when the prospects of returns are spectacular. We give an example: one of the explanations for the sub-prime crisis in the United States sustains that the huge deficits in the US balance of payments caused the crisis. The huge deficits led to incoming funds by means of the capital account, which led to growing investments, consumer spending, and indebtedness by families at levels not compatible with a balanced position.

We can foresee expenditures of the Tobin tax in numerous activities, depending on the problem we wish to grasp.

a. implementation of a minimum income program: countries suffer the impact of crises in different manners; Spain is undergoing extremely high unemployment rates; in this case the proceeds would be allocated to minimum income programs;

b. incentives to change the energy matrix: some forms of energy are deemed to be too expensive; an example is solar energy; some countries such as China are able to produce equipment for using this form of energy much more cheaply than those produced in western countries; the funds would be employed to subsidize acquisition of this equipment, still considered expensive; these funds could also be employed to produce this equipment in western countries at prices subsidized by the Tobin tax;

c. micro-credits to organize small businesses: minimum income is effective over consumer activity; an alternative is to encourage the formation of gross investment capital by small entrepreneurs, with a view to job creation;

d. changes in transport infrastructure: this is an extremely necessary use of funds in emerging countries such as Brazil (and other Latin American countries), which ignored railway transportation.

I will explain with an example. Table 1 reflects a series of revenues that we deem relevant to fund railroad transportation (taken from an end-of-course paper by Karine Bincoletto (2010). The first column shows current revenues for two metropolitan regions in the state of São Paulo (Campinas and São Paulo). As these are two very populous regions, the sums would be employed to fund the railroad system in these regions. The percentage in question will be 1%.

The second column reflects taxation on motor vehicles. As vehicles contribute to degrade air quality, the percentage in question will be 10%.

The third column refers to revenues from the state of São Paulo's value-added tax (ICMS tax). As the railroad system produces positive externalities, 1% of the entire state's revenues will be allocated to build the system in two regions. The fourth column shows a Brazilian version of the Tobin tax (CPMF – provisional contribution on financial transactions). In Brazil the tax rate was high (0.38%) and we allocated 21% to build the railroad system, which represents the state of São Paulo's share in Brazil's population.

An alternative step was the idea of using a portion of the state of São Paulo's IPVA (motor vehicle tax) revenues to reactivate railways. The idea is to allocate 10% of this tax to build the São Paulo – Campinas railroad. As for the ICMS tax collected in the state of São Paulo, 1% of its value will be employed in the construction. With regard to the ICMS tax, a sum was calculated to be allocated to the state of São Paulo if the criterion were based on population. And by means of the figures found, it is possible to calculate how many kilometers could be built by means of these three methods.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Percentage of sums from sources of funding – (data in Brazilian Reais for 2008; Bincoletto and Simone, 2010)

	CURRENT REVENUES*	IPVA**	ICMS***	CPMF****
TOTAL	42,463,513,954	8,789,600,000	77,202,300,000	36,483,000,000
PERCENTAGE	424,635,140	878,960,000	772,023,000	7,661,430,000

* 1% of current revenues by the municipalities in the metropolitan region of São Paulo and Campinas for 2008; ** 10% of the sum collected by the state of São Paulo for 2009; *** 1% of the sum with regard to the state of São Paulo for 2009; **** sum equal to 21% of the total CPMF, the state of São Paulo's percentage share in the country' population.)

Table 2 demonstrates costs per km of three kinds of railway transportation, monorail, light rail vehicle, and high-speed train.

Table 2: Costs per km for the three railway modals (Bincoletto and Simone, 2010)

COST PER KM	
MONORAIL	R$ 75 MILLION
LRT	R$ 66 MILLION
HST	R$ 67.7 MILLION

Lastly, table 3 gives an approximate idea of how many kilometers could be built, and was obtained by dividing the contribution from each source (current revenues, ICMS, IPVA CPMF) by the cost per km for each kind of railway transportation (as an example, with 1% of current revenues we could build 6.4 km annually for a light rail vehicle, 6.3 km for a high-speed train, and 3.3 km for a monorail.

Table 3: Estimate of kilometers built for each kind of railway transportation (Bincoletto and Simone, 2010)

	MUNICIPAL CURRENT REVENUES	IPVA	ICMS	CPMF
LRT	6.4 KM	13.3 KM	11.8 KM	116.1 KM
HST	6.3 KM	13.0 KM	11.4 KM	113.2 KM
MONORAIL	5.7 KM	11.7 KM	10.3 KM	102.1 KM

These sums evidence that the option for rebuilding the railroad system is more political than financial, as funding can be obtained.

Use of the four sources of funding (in amounts that could be supported by the municipalities and the state government) would allow building 147.6 km of light rail vehicle tracks, 143.9 km of high-speed train tracks, and 129.8 km of monorails.

As we have upheld that the production of commodities embodies in the system's own concept the likelihood of crises, because all goods need to perform their *salto mortale*, we consider it prudent to include other forms for the system to function, apart from the production of commodities. To reduce the burden on public budgets, this great effort to rebuild the railway

system could employ the work of the prison population in the state of São Paulo, which would earn less but on the other hand would have their sentences reduced, and could work as employees of public-private railroad systems.

There are other serious structural problems in Brazil, such as the system for gathering and treating sewage, which does not cover significant portions of the inhabitants of Brazilian cities and gives rise to a loss in environmental quality, as the waste is dumped in rivers; This is a problem that requires an urgent solution and the proposal outlined here could contribute with part of the funds (Basso, Pinho and Silva, 2001).

7 CONCLUSION

If there are funds to rescue and save banks (salvage financial capital), there should be funds to save persons. As the socialism that we know has killed individual liberties and created brutal dictatorships (the Soviet Union, Cambodia, east European countries) that took the lives of millions of people, and capitalism has proved to be a perverse system that has created millions of unemployed and progressively degrades the environment, the need arises to think and propose alternatives to partly replace the production of commodities, that as Marx showed brings in its conception the likelihood crisis. The plan outlined is a proposal in this direction.

ABSTRACT
The research is based on the consideration of social networks in terms of network games. We formalize interpersonal relations using the methods of structural and social analysis combined with game theoretic approach. Specifically, we formalize social power of an agent and use it to quantify payoffs. Based on reasoning over values of power we show how individuals reach stability with their peers in network games.

Keywords: Network games, Social power, Network stability

1   INTRODUCTION

The framework of the research is based on the problem of modeling the effects of network games on social reasoning based on the game theoretical approach.

A social network is considered as an n-person nonzero sum game. Basically, each agent is characterized by structural metrics (i.e., centralities) and by social characteristics, such as measure of trust to other players.

Since game theoretic methodologies are well adapted for socio-economic modeling, the representation of a social network in a game form can provide beneficial effects (Jackson, 2008). Game theoretic methods can be used for the formalization of agents and their relations in social networks. Each agent can be considered as a player and agent's benefits or losses can be represented as a player's payoffs. In fact, each player attempts to maximize or minimize its payoff by strategizing (Barron, 2007). Since each player chooses the extent of trust to another player, we consider a player's choice of the level of trust as a strategy. Application of game theory in social networks optimizes the balance of interaction among individuals. For example, game theory provides a network with stability or equilibrium (Barron, 2007).

The main idea of the research is to adapt the formalization of the interdependencies among structural and social factors for the game theoretic representation and analysis of gaining stability for the social network game.

2   BACKGROUND

The basic mathematical formalization of social networks is based on principals and methods of graph theory and game theory. Specifically, Jackson (2008) characterized the dynamic behavior of network agents using different approaches, such as Markov chains, multiple equilibrium, local public goods model (Bramoulle and Kranton, 2006), games in normal forms, and dominant strategies. Jackson (2008) began his book with the description of the fundamental analysis of social and economic networks. It includes an explanation of networks representation and measuring with graph theoretic methodologies. Next, the author gave the

analysis of network models including static random-graph models and hybrid models. On each step of the analysis, Jackson (2008) gave a detailed explanation of different network properties and measures, such as socio-economic externalities, network stability, clustering, distance-based utility, and network efficiency. The analysis of social and economic network processes is combined with mathematical and logical formalization of network components. In addition to structural analysis, Jackson (2008) characterized social and economic networks in terms of game theory. It includes the description of basic game theoretic measures, properties, and methods. Defining stability and equilibrium as the basic characteristics of a game, Jackson (2008) provides the analysis of practical application of these measures in socio-economic network modeling. Jackson (2008) gave a general analysis of social and economic networks using the classic apparatus of game theory. The combination of social, economic, graph theoretic, and game theoretic principles is described in a comprehensive manner. Another advantage of the book is that each step of a theoretic analysis is supported by practical exercises for the deeper understanding.

Another way to formalize social networks is to use game theoretic methodologies. Game theory is originally adapted for the analysis of social-economic problems. The analysis of game theoretic concepts is done by Barron (2007). According to Barron (2007) games are invariable part of all interpersonal relations. People's daily life is related to the participation in different social and economic games. For example, a person can be a member of a university community playing the social role of professor or student. Also it can be a member of a family playing the social role of father or grandfather. The formalization of interpersonal games is described in Barron (2007). The book is based on the sequential analysis of game theoretic concepts. First, it includes the description of classic matrix two-person games. This part includes the formalization of mixed strategies, dominant strategies and the explanation of graphical solutions in two-person games. The explanation of theoretical aspects is provided with specific examples. For example, Barron (2007) described how the game of Russian roulette can be formalized using a game theoretic approach. Barron (2007) included the analysis of matrix games combined with linear programming and simplex method. Representation of practical application of game theory is done by the explanation of the model of economic growth. The next part of the book is related to two-person and n-person nonzero games. The analysis is based on the consideration of bimatrix games and nonlinear programming methods. N-person nonzero sum games are characterized in two aspects: (a) games with complete information and (b) games with incomplete information. Next, Barron (2007) described the concept of Nash equilibrium including its definition, formalization and practical application. Barron (2007) analyzed how to gain Nash equilibrium considering the specific economic problems. The final part of the book includes the description of cooperative games. The analysis of cooperative games is based on the consideration of specific examples with different types of solutions (i.e., graphical solutions, logical reasoning, and mathematic calculus). In general, the book is written in a comprehensive manner. All theoretical concepts are explained by the consideration of specific problems.

One of the advanced studies related to game theory was done by Camerer, Ho and Chong (2001). They investigated the specific branch of game theory – behavioral game theory. It is based on the analysis of how agents are thinking and learning during the games. According to Camerer et al. (2001), there are three goals of the research. The first goal is to formalize the rationality of the interpersonal relations. It implies the consideration of a specific index. The values of this index correspond to the levels of rationality of agent's interactions. Rationality is a measurement of an agent's way of thinking (Camerer et al., 2001). It implies the

measurement of a probability that agent will act in a predicted way. The second goal of the research is to develop a mechanism for the gaining of equilibrium in games. The mechanism is based on the specific algorithm proposed by Camerer et al. (2001). Based on reinforcement and belief learning, the algorithm shows a high accuracy in six of seven testing games. Also, research includes the estimation of the given algorithm. The third goal of the research is to analyze changes the nature of player's behavior using the combination of the proposed algorithm and rationality index.

An important factor of network games is trust. Trust can be considered in the context of interdependencies between social power and game playing strategies (Solomon, 1960). This study is based on the idea that interpersonal trust and interpersonal power are closely related to each other through the term of social power relationships. Solomon (1960) considers a nonzero-sum game, where each player can be in one of three states (absolute power, partial power, and equal power) and can choose one of three strategies to play (a) conditional cooperation, (b) unconditional cooperation, and (c) noncooperation. The main challenge for Solomon's research is to investigate the influence of power relationships and game strategies on the interpersonal trust. Solomon (1960) considered the interdependence between trust and suspicion. If agent B is suspected by agent A in some kind of negative or unpredicted behavior, then the level of trust from agent A to agent B will be decreased corresponding to the level of suspicion. Solomon (1960) associates social power with interpersonal power. Interpersonal power is based on the idea of an agent's ability to motivate other agents to act in the desired way.

Another research related to the analysis of interdependencies between trust, social networks, and game theory is performed by Berg, Dickhaut, and McCabe (1995). This research is based on two principles of the interpretation of trust. First, trust is considered as an agent's property that encapsulates the accumulation of an agent's reputation in a set of games. Reputation is a multi-factor parameter of interpersonal relations. It includes social and economic factors. The second interpretation of trust is related to the strategizing processes. According to Berg et al. (1995), trust is a strategy that is characterized by the stability of trust variations in a sequence of games. For example, agent A is characterized by a stable trust with respect to agent B if the level of trust does not deviate from the average level of trust between agent A and agent B in a sequence of n games. The research is related to the economic interpretation of trust. Specifically, Berg et al. (1995) analyzed trust in terms of investment games, which are well-formalized in terms of game theory. Games are considered in two aspects. The first aspect implies the consideration of games where players do not have a social history, which is a property of a social network that characterizes players' ability to exchange information regarding the use of trust. This means that agents remember how they trusted each other in a set of games. Therefore, the games with social history are characterized by an agent's ability to analyze the relations (i.e., trust) with other agents in the past and make decisions regarding the future strategies based on this analysis. Another type of game considered by Berg et al. (1995) implies the analysis of games with an absence of social history. This means that an agent cannot keep information regarding the exchange of trust between other agents. According to Berg et al. (1995), social history is an important characteristic of games because it strengthens the correlation between trust and reciprocity. Reciprocity is considered as an agent's ability to interact with other agents using the knowledge about the interpersonal trust. In general, the given research includes a good explanation of interdependencies between trust and reciprocity in terms of game theoretic methodologies.

Challenges of the Modern World - Contemporary Economy and Globalization

3   METHODOOGIES

3.1   Game Theory

Game theory is a study that is based on the idea of rationalization of players' activities (Straffin, 1993). Essentially, a game is based on three concepts: players, strategies, and payoffs.

Strategy is at the core of game theory, and each player has its own set of strategies. Basically, strategy is a player's plan on how to act. Strategy can have different natures, but the core of any strategy is an opportunity for the player to choose how to act. For instance, a player can choose how much money it can lend to other players or it can choose the level of trust to other players. In fact, this process of making a choice is a strategizing process.

Depending on the set of the chosen strategies, each player gets a payoff. Payoff is a result of a player's activity according to the chosen strategy (Barron, 2007). The main player's goal in the game is to maximize or minimize its payoff. Agents' payoffs are usually represented in matrix form. An abstract payoff matrix is represented in Figure 1.

		Player X	
		K	L
Player Y	M	a,b	c,c
	N	h,h	b,a

Figure 1: An Abstract Payoff Matrix of Two-Person Game

According to Figure 1, there are two players: player X and player Y. Each player has two strategies. K and L are the strategies of player X. M and N are the strategies of player Y. Depending on the chosen strategy, agents get corresponding payoffs: a, b, c or h. For example, if agent Y chooses strategy M and player X chooses strategy K, then players Y and X will get a and b payoffs respectively. The process of payoffs maximization or minimization is the main purpose of strategizing.

3.2   Types of Games

Game theory includes different types of games. The basic classification is represented in Figure 2.
Figure 2: Types of Games

Cooperative games are the games where agents are united in coalitions. The coalition goals have a higher priority than the individual agents' goals. It means that a group of agents try to maximize or minimize its payoff due to the coordinated work of its agents. Deep analysis of cooperative games is done by Nash (1953). It includes the consideration of players' cooperation in terms of classical two-person games.

Agents can have a different level of interest regarding the coalition purposes. Trivially, an agent is not interested in the group's goals, and it tries to maximize or minimize its individual payoff. In this case, a coalition payoff is an overall result of all individual agents' payoffs. However, this trivial type of cooperative games does not correspond to the real socio-economic situations. The most common approach is to consider a cooperative game where each agent has a specific role. It implies the distribution of agents' roles within the corresponding cooperation. It means that payoff maximization or minimization is not a required purpose of the agent's strategizing, because the primary agent's purpose is to maximize or minimize a total coalition payoff.

Non-cooperative games are based on the maximization or minimization of the individual agents' payoffs. Agents follow their own interests and do not form any groups in such kinds of games. In fact, a non-cooperative game is a game where each cooperation consists of one agent. The description of non-cooperative games is also done by Nash (1953).

Symmetric game is a classical game theory approach. It is based on the idea that, if we swap the position of the player A with the position of another player B, then player A will get the same payoff as it could get without swapping. An example of symmetric game is a prisoner's dilemma (Plous, 1993). However, the majority of games are asymmetric, because players are individualistic. Each player has its own view regarding the game and different strategizing. Accordingly, each agent has a specific payoff matrix.

Games with perfect information are the games where each agent knows the history of strategizing and payoffs of all opponents in the set of games. Mostly, socio-economic modeling is based on the games with imperfect information. The main reason is that it is almost impossible to provide absolute information awareness to all players about each other. Games with perfect information mostly used to model well-formalized problems. One of the good approaches related to the analysis of games with perfect and imperfect information is done by Harris (1985).

Simultaneous and sequential games are characterized by the agent's knowledge about the opponent's strategy choice (Gal-Or, 1985). In simultaneous games, an agent does not know about the decisions of other agents. It means that an agent has to choose the strategy without any knowledge about the opponent's strategizing. Simultaneous games are closely related to the games with imperfect information, because an agent does not know the history of opponents' strategizing and payoffs. Conformably, sequential games are based on the idea that each agent is knowledgeable in the strategizing and payoffs of other agents. An agent makes a decision how to act only when the opponent's decision is done. It does not mean that an agent is informed about all decisions and payoffs of other agents, but it means that an agent can be partly or fully informed about the current state of the game.

Zero-sum and non-zero sum games are based on the relations between increasing and decreasing of agents payoffs. In zero-sum games, a gained amount of an agent's payoff is

Challenges of the Modern World - Contemporary Economy and Globalization

equal to the amount of opponent's lost payoff (Barron, 2007). Zero-sum games characterize two-person games where the payoff u_A of agent A is opposite to the payoff u_B of agent B (i.e., $u_A=(-u_B)$). In non-zero sum games, the amounts of an agent's payoffs are not opposite (Barron, 2007). An overwhelming majority of non-zero sum games are the games with two or more players. Accordingly, depending on the number of players, there are one-player and many-player games.

3.3   Nash Equilibrium

Nash equilibrium is one of the central components of game theory. Nash Equilibrium invention is based on the conceptions that were discovered by Neumann & Morgenstern (1947) for zero-sum games. However, the unified formalization of Nash equilibrium for non-zero sum games was done by Nash (1951).

Nash equilibrium is a specific state of a game (i.e., set of strategies and payoffs of all agents) when player cannot improve its own payoff unilaterally without the consideration of strategies and payoffs of other agents. If an agent tries to improve its payoff, then all other agents should reconsider their strategies and make a decision regarding their new strategies. It is required that each agent takes into consideration the strategies of all other agents to keep the game in Nash equilibrium. Nash equilibrium does not guarantee that each player maximizes or minimizes its payoff (Barron, 2007). Nash equilibrium gaining is not a problem of payoffs maximization or minimization. The basic idea of Nash equilibrium is that it ensures to each agent a minimum payoff. Each agent knows a priori (i.e., before the beginning of the game) that it will always get a fixed amount of payoff regardless of the game's results. For example, we can consider an abstract two-person game with players A and B. No matter which strategies will be chosen by agent A during the set of games, agent A will always get an amount of payoff that is more than or equal to the guaranteed one.

According to Barron (2007), Nash equilibrium of n-person non-zero sum games is a set of strategies that is represented in equation 1.

$$q^* = (q_1^*, \dots, q_n^*) \, \epsilon \, Q_1 \times \dots \times Q_N \tag{1}$$

The optimized combination of strategies (equation 1) corresponds to the set of payoffs $\{u_i(q)\}$, where i is an agent's number (Barron, 2007).

According to Barron (2007), Nash equilibrium of n-person game can be gained if inequality represented in equation 2 is satisfied.

$$u_i(q_1^*, \dots, q_{i-1}^*, q_i^*, q_{i+1}^*, \dots, q_N^*) \geq (q_1^*, \dots, q_{i-1}^*, q_i, q_{i+1}^*, \dots, q_N^*) \; where \;\; q_i \, \epsilon \, Q_i \tag{2}$$

There is no universal mechanism of Nash equilibrium gaining. Every specific game has its specific features. Nash equilibrium of many games usually can be gained using the combination of mathematical calculus and logical reasoning.

3.4   Network Games

Network games are a combined approach that is based on the structural analysis of socio-economic networks and game theory. Players and their interrelations form a network that can be represented as a graph. Network games are based on the extended analysis of players' interdependencies. Such approach implies the symbiosis of graph theory and game theory

methodologies for the purpose of more adequate analysis of socio-economic relations. According to Jackson (2008), network game investigations are based on four basic factors: player's degree d, player's probabilistic property $\sigma(d)$, utility function u_d, and agent's strategy x_i.

A player's degree is a structural measure. It corresponds to interdependencies between agents in terms of graph theory. A player's degree is an estimated number of an agent's relations with other agents. In fact, it corresponds to the number of directly connected nodes of graph, where each node is a player. An agent's property $\sigma(d)$ is a probabilistic characteristic of an agent i with degree d. It is a probability that a neighbor of agent i will choose a specific strategy (Jackson, 2008). The values of $\sigma(d)$ are in the range [0, 1]. According to Jackson (2008), agent's utility u_d is its payoff based on the current degree d, probabilistic property $\sigma(d)$ and the chosen strategy x_i. Jackson (2008) considers network games in terms of manipulations with these three basic factors (i.e., d, u_d, and $\sigma(d)$) for the purposes of network stabilization and Nash equilibrium gaining.

Another network games analysis is done by Galeotti, Goyal, Jackson, Vega-Redondo and Yariv (2010). It is based on the idea that a player's payoff depends on the structural state of its neighbors. Galeotti et al. (2010) also considered network games in terms of combined methodologies of structural analysis and game theory. Galeotti et al. (2010) gave a mathematical interpretation of such kinds of interrelated methodologies. They consider network games with incomplete information about network structure. The formalization of agents' payoffs is based on the correlated analysis of three basic aspects: (a) structural centralities, (b) information incompleteness, and (c) network externalities.

4   APPROACH

4.1   Game Theoretic Approach
The analysis of social network games in terms of game theory is based on the idea of finding stability or equilibrium for combinations of players' strategies.

In terms of given research, stability is considered as the state of network games when the specific combination of player's strategies can ensure a certain condition of the network game. Equilibrium is considered as Nash equilibrium.

The proposed work is based on the idea to consider n-person nonzero sum games. These games can be divided into two types.

The first type is the games with deterministic payoffs, where agent's payoff is a value of social power, and strategy is a value of trust.

We propose the formalization of social power in equation 3.

$$SP_A = \frac{\sum_{i=1}^{N-1} T_{i,A}}{N-1} \times SC_A + \frac{\sum_{i=1}^{N-1}(T_{A,i} \times SC_i - T_{i,A} \times SC_A)}{N-1} \tag{3}$$

Here,
N is a number of agents;
$T_{i,A}$ is a trust from agent i to agent A ($T_{i,A}$ represents values in the range [0, 1]);
$T_{A,i}$ is a trust from agent A to agent I ($T_{A,i}$ represents values in the range [0, 1]);

Challenges of the Modern World - Contemporary Economy and Globalization

SC_A is a structural centrality of agent A;
SC_i is a structural centrality of agent i.

We propose to calculate the values of structural centralities based on the equation 4.

$$SC = AVG\ (DC + BC + CC) \tag{4}$$

where $SC \in [0, 1]$;
DC is a degree centrality (Freeman, 1979);
BC is a betweenness centrality (Anthonisse, 1971; Freeman, 1977);
CC is a closeness centrality (Beauchamp, 1965; Sabidussi, 1966).
The second type is games with probabilistic payoffs, where agent's payoff is a probability to get a specific value of social power and strategy is a value trust.

4.2   Network Games with Deterministic Payoffs

Two basic concepts of the game that have to be determined are agents' strategies ($q=\{q_1, q_2, \dots, q_n\}$) and agents' payoffs ($u_i(q)$, where i=1, …, N).
In the context of the given research, trust is considered as a strategy. A player's strategy construction is a choice process of how to trust other agents. Each agent can choose the level of trust from the range [0, 1]. The given freedom of social choice (i.e., freedom to choose the level of trust) is at the core of strategizing.

An agent's payoff is its social power, and it can be represented by equation 5:

$$u_A = f\ (q_{A,i}, \dots, q_{A,N-1}, q_{i,A}, \dots, q_{N-1, A}), \tag{5}$$

where i is the number of agents that are different from agent A (i.e., $i = 1, \dots, N-1$).
We consider u_A as a function of trusts from agent A to all other agents and from all other agents to agent A. An agent's payoff is equal to value of its SP (equation 3):

$$u_A = SP_A \tag{6}$$

The fact that social power is an equation of two variables (i.e., T and SC) is not an issue in the context of the proposed formalization of social network games, because a player can choose only the level of trust during the game, but not the value of structural centrality. Structural centrality is a structural measure and it does not depend on the player's strategizing. A player cannot choose its structural centrality. Since it is a network structural characteristic it becomes a parameter in the payoff function and its value can vary from one game to another. A player can manipulate only by its social choice (i.e., level of trust), and this manipulation affects social power and structural centrality because of their functional interdependency (i.e., SP=f(T,SC)).

According to Barron (2007), Nash equilibrium ($q_1^*, q_2^*, \dots, q_n^*$) for n-person nonzero sum games can be gained if three conditions are simultaneously satisfied:

1. $\frac{\partial u_i(q_i, \dots, q_n)}{\partial q_i} = 0, i = 1, 2, \dots, n.$

2. $q \mapsto u_i(q_1^*, \dots, q_{i-1}^*, q, q_{i+1}^*, \dots, q_n^*) for\ q \in Q_i.$

Challenges of the Modern World - Contemporary Economy and Globalization

3. $\quad \frac{\partial^2 u_i(q_i,\dots,q_n)}{\partial^2 q_i} < 0, i = 1, 2, \dots, n.$

Figure 3: The Conditions for Nash Equilibrium Gaining

The calculus methodology in Figure 3 can be applied for the social network games with deterministic payoffs. We consider the game with two players for the simplification of the Nash equilibrium computation. The methodology of Nash equilibrium gaining is scalable, and the decision for two players can be applied for n-players.

There is a two-person non-zero sum game, where equation 3 (i.e., SP) is applied for the payoff's computation and stability and equilibrium gaining.

Player 1

$u_1(q_1, q_2) = q_2 \times SC_1 + (q_1 \times SC_2 - q_2 \times SC_1)$

Verification of (a)-condition:

$\frac{\partial u_1}{\partial q_1} = 0 + SC_2 - 0;$

According to (a) and (b)-condition, the solution cannot be approached by the method of derivation. $SC_2 = 0$ (if (a)-condition is applied)

Verification of (c)-condition:

$\frac{\partial^2 u_1}{\partial^2 q_1} = 0 \Rightarrow$ (c)-condition is not satisfied.

Player 2

$u_2(q_1, q_2) = q_1 \times SC_2 + (q_2 \times SC_1 - q_1 \times SC_2)$

Verification of (a)-condition:

$\frac{\partial u_2}{\partial q_2} = 0 + SC_1 - 0;$

According to (a) and (b)-condition, the solution cannot be approached by the method of derivation. $SC_1 = 0$ (if (a)-condition is applied)

Verification of (c)-condition:

$\frac{\partial^2 u_2}{\partial^2 q_2} = 0 \Rightarrow$ (c)-condition is not satisfied.

Figure 4: Nash Equilibrium Computations for a Two-Person Non-Zero Sum Game with Deterministic Payoffs

According to Figure 4, n-person non-zero sum games based on the equation 3 can gain the state of stability. A network game stands in a stable condition if all players have the same level of trust to each other (equation 7).

$$q_1 = q_2 = \dots = q_n, \qquad\qquad (7)$$

where "n" is a number of players.

The desired aim of the research to gain the stability of social network games is reached. According to Barron (2007), the conditions in Figure 4 are sufficient, but, in practice, they are not necessary. Nash equilibrium can be gained even if the conditions in Figure 4 are not satisfied. Therefore, the future work is related to the analysis of the Nash equilibrium that can be gained by a different approach that is based on n-person non-zero sum games with probabilistic payoffs.

4   CONSLUSION

The overwhelming majority of social systems have a dynamic nature. It makes the problem of network games formalization complicated. The condition, behavior, and resources of agents are changing over time depending on the agents' goals and intentions. Therefore, there is a problem with finding a way to synthesize the knowledge about such systems and build a

framework to formalize strategic interactions between agents. One of the modern methods of formalization to solve this problem is to use an interdisciplinary approach that attempts to combine models, mathematical and logical apparatuses and theories of social network analysis, game theory, sociology, graph theory, organizational studies, and beyond.

The formalization of social power as a multi-factor model of an agent's importance, and authority in a social network gives an opportunity to manipulate social networks using game theoretic methods. Specifically, we considered dynamic social networks as the sequences of network games, where players' payoffs are represented by the values of social power, and strategies are represented by the levels of trust to other agents. The formalization of network games based on the invented equation of social power made it possible to approach the stability of network games with deterministic payoffs. It implies the practical importance of the research, because the given theoretical approach can be applied in the monitoring and control of real socio-economic systems.

The future work may be done in the analysis of network games with deterministic and probabilistic payoffs. We approached the stability of games with deterministic payoffs, but another challenge is to gain Nash equilibrium for the games with the various natures of payoffs.

ABSTRACT
The aim of this paper was to define the development opportunities of Port of Rijeka as the most important Croatian port. Port of Rijeka has the most convenient natural exit toward the sea and it is a center of Primorje-Gorski Kotar County through which pass branch Vb of the Pan-European Corridor V and the branch Xa of the Pan-European corridor X. One has conducted analysis of the geotraffic position of Port of Rijeka, its traffic and financial analysis (safety indicators and activity ratios). Base for the financial analysis was annual report (balance sheet, income statement and cash flow statement) for 2011 year.

Keywords: *Activity ratios, Geotraffic position, Leverage, Liquidity, Port of Rijeka*

1 INTRODUCTION

Port of Rijeka is the most important port in the Republic of Croatia, and also the biggest port on the Adriatic sea. Among all Croatian ports Port of Rijeka has the most convenient natural exit toward the sea. Its position on the Northern Sea route enables her role of important transit port for the Central and Middle East Europe.

Important characteristic of Port of Rijeka is its closeness to the capitals of neighbour countries (Austria, Bosnia and Herzegovina, Czech Republic, Hungary, Serbia, Slovakia,..) while most of them are from countries with the large overseas goods exchange. As Croatia is entering in the European Union on the 1 July of 2013 Port of Rijeka will finally have equal market conditions as her major concurrents and it will have possibility to enter in the new business transactions.

In aim to define development opportunities of Port of Rijeka one will conduct the analysis of the geotraffic position, analysis of traffic (dry cargo, liquid cargo, container traffic) and the financial analysis through activity ratios and safety indicators.

2 GEOTRAFFIC POSITION OF THE PORT OF RIJEKA

The role of the ports, as a hub of land and sea transportation routes as well as the transshipment places of cargo from one vehicle to another vehicle, significantly expands and diversifies. For business and development opportunities of ports are vital transverse Pan-European corridors that ensure to the ports uniform and modern way to plug in the connection between Central Europe and Middle East Europe (Kesic, Jakomin and Jugovic, 2010, pp. 94–98).

Challenges of the Modern World - Contemporary Economy and Globalization

The port of Rijeka is a port of national interest opened to national and international public traffic; it is conveniently oriented toward the world's seaborn routes. City of Rijeka provides the shortest connection either inland or sea way between Central and Middle East Europe to overseas destinations. The North Adriatic traffic direction is the shortest way by which Europe is connected with the Mediterranean, Suez Canal and the Strait of Gibraltar with the world seaports (Kos, Brcic and Karmelic, 2010, p. 190).

Figure 1: Traffic connections of Port of Rijeka
(http://www.lukarijeka.hr/en/port_handbook/traffic_connections/traffic_connections_/default.
aspx)

The essential factors of the Port of Rijeka geotraffic position are the physical characteristics of its location and its connection with the hinterland (Dundovic, Hlaca, 2007, p. 51). Unique disadvantage of its geotraffic position is that majority of road and rail connections are passing through the center of the town as Port of Rijeka is situated practically in the center of City of Rijeka. There are three Pan-European corridors passing through Croatia: the B and C branches of corridor V, corridor VII and corridor X.

The major traffic corridors for the Port of Rijeka are branch B of corridor V and corridor X (www.lukarijeka.hr). Highways connect Rijeka through Slovenia with Austria (Salzburg) and Italy (Trieste); and with Hungary through Zagreb. The route Rijeka-Zagreb represents the base for a traffic process, giving that two essential traffic directions relevant for Rijeka, both road and railway, intersect in Zagreb (Kos, Brcic and Karmelic, 2010, p. 191):
1. From Ukraine and Slovakian Republic through Budapest and Varazdin: this is the branch Vb of the Pan-European Corridor V, connecting the Baltic countries, as well as

the countries of Central and Eastern Europe with the Adriatic and the Mediterranean (Budapest-Zagreb-Karlovac-Rijeka-Trieste),

2. From Austria, the Czech Republic and Germany through Graz and Maribor (Slovenia): the branch Xa of the Pan-European corridor X, connecting South-Western and Central Europe with central Adriatic (Graz-Maribor-Zagreb). The corridor Trieste-Ljubljana-Zagreb-Belgrade-Skopje-Athens/Sofia-Istanbul connects Western and North-Western Europe with the Middle East.

Table 1: Distance between Port of Rijeka and selected European metropolis (http://www.lukarijeka.hr/hr/port_handbook/polozaj/default.aspx)

CITY	ROAD DISTANCE (km)	RAIL DISTANCE (km)
Zagreb	145	228
Budapest	504	592
Bratislava	550	686
Wien	490	572
Prague	810	844
Belgrade	569	669
Sarajevo	456	490

Existing road network of Port of Rijeka is quite good, but its expansion is expected in the near future. That is specially related to the construction of the XI. Pan-European corridor Baltik-Jadran which should ensure the connection between Baltic and Adriatic by modern intermodal transportation system (Milos, 2010, p. 18).

Quality of rail network of Port of Rijeka is not at the appropriate level (bad conditions of railroads, lack of wagons). In addition to the existing inefficient railway Rijeka-Zagreb, there are no direct railway connections between Rijeka and Croatian railways in Istria and further with the ports of Koper and Trieste, as well as no direct railway connections with the port of Ploce (Dundovic, Vilke and Santic, 2010, p. 168). Railway Rijeka-Zagreb is of vital role importance for Port of Rijeka.

One more advantage of geotraffic position of Port of Rijeka is closeness to the Airport of Rijeka that is distant just 30,4 kilometers.

The strategic commitment of each port is to ensure the best possible connection with the hinterland, spreading the gravitational area and ensuring a larger amount of the cargo (Kos, Brcic and Karmelic, 2010, p. 200).

Further development of traffic routes to Rijeka is an important factor of involvment of Republic of Croatia in the European integrations. For better utilization of prosperous geotraffic position of Port of Rijeka it is necessary to modernize the railway Rijeka-Zagreb in the near future and also to build multipurpose Danube-Sava canal. Favorable geotraffic position is not sufficient to create a significant port hub. Key role in exploiting the advantages of geotraffic position have measures of traffic and economic policy. Advantage of position of Port of Rijeka is not just natural exit toward the sea, even more important is its closeness to the capitals of neighbour countries (Table 1).

3   ANALYSIS OF TRAFFIC IN THE PORT OF RIJEKA FROM 2006-2011

The majority of the freight transport refers to the Port of Rijeka and the port of Ploce that have become the main Croatian cargo ports, achieving almost 90% of total freight traffic (Hadzic, 2012, p. 126). Sufficient terminal depths (18 m) are ensuring acceptance of larger container vessels (Kos, Brcic and Karmelic, 2010, p. 190).

The transport of final products prevails for the market in Croatia, and specially it refers to the Port of Rijeka. Having observed traffic and possibility of its growth it is important to mention that 13 operators provide container service in the Port of Rijeka (Kos, Brcic and Karmelic, 2010, p. 197).

Table 2: Traffic in Port of Rijeka in 2009 and 2010 in million tons (Zelenika, R., Mrvcic, A. and Pavlic Skender, H., 2011 , p. 13; Baric, S., Devcic, I. and Valencic, M., 2008, p. 168; http://www.portauthority.hr/docs/portauthorityHR/documents/64/Original.pdf)

TYPE OF CARGO	2006	2007	2008	2009	2010	2011
General cargo	1.572	2.155	2.373	2.112	2.317	2.233
Bulk cargo	3.199	3.142	3.377	2.873	2.050	2.023
Wood	236,44	325,55	276,06	220,98	243,95	245,182
Total dry cargo	**5.010**	**5.624**	**6.027**	**5.207**	**4.559**	**4.502**
Total liquid cargo	**5.877**	**7.588**	**6.364**	**6.030**	**5.623**	**4.887**
Container traffic (TEU)	94.390	145,04	168,76	130,74	137,05	150,68
Total traffic (dry + liquid)	**10.887**	**13.212**	**12.391**	**11.238**	**10.183**	**9.390**

Significant decrease of bulk cargo traffic in 2010 is a result of lower traffic of grains that was caused by lower grain output as a consequence of bad weather conditions and often overflooding. The same trend is continued in 2011.

If it is observed container traffic it can be seen in the table 2 that its value in 2011 (150,68) is 59,63% higher than in 2006. After the crisis impact in 2009, container traffic has again raising trend. Such growth of container traffic is a result of high quality of services, feeder services, the new transshipment capacity and the introduction of direct services (Tomasevic, Jadrijevic and Dundovic, 2011, p. 474).

The major role in the further development of the Port of Rijeka has Rijeka Gateway project which aim is to expand the port capacities, specially that is refered to the container terminal. The aim is to invest in equipment at the Brajdica terminal, to achieve a full automation of unloading, storage and container shipping process and to increase the container capacity to 600 thousands of TEU (Peric Hadzic, 2012, p. 132).

A key disadvantage of Port of Rijeka are not particularly favorable topographical conditions to build a large port. Lack of flat terrain on the coast may be recovered by silting but it requires a significant investment of financial resources (Strazicic, 1993, p. 38).

It is important to mention that major concurrents of Port of Rijeka are coming from European Union and that 'Schengen Regime' had negative effect on the port of Rijeka. The entry of Croatia into the European Union will certainly result in the container traffic increase in the port of Rijeka, which is evident in the port of Koper, since it has been increasing each year, specially after the entry of Slovenia in the European Union. Due to that it can be expected that

container traffic will grow at the Port of Rijeka due to its friendly relations to Bosnia and Herzegovina, Hungary and Serbia. After the entry of Croatia in the European Union Port of Rijeka will finally have equal market conditions as well as the major concurrents and that is opening new business opportunities.

4   FINANCIAL ANALYSIS OF PORT OF RIJEKA

Financial analysis was conducted on base of two groups of indicators: safety indicators (liquidity and leverage) and activity ratios. The base for analysis of safety indicators and activity ratios for Port of Rijeka was annual report (balance sheet, income statement and cash flow statement) for 2011 year. In 2011 Port of Rijeka had achieved high net income as a result of sale of proprietary share to the strategic partner on Container terminal of Port of Rijeka.

4.1   Safety indicators

Liquidity ratios are used to determine a company's ability to pay off its short-term liabilities (Brealey et al., 2007, p. 460).

Table 3: Liquidity ratios of Port of Rijeka (authors calculation based on financial statements from 31.12.2011. taken from Zagreb stock exchange)

COEFFICIENT	VALUE
Current ratio	1,36
Quick ratio	1,33
Coefficient of current liquidity	0,0053
Working capital (bill HRK)	33,98
Long term liquidity ratio	0,9153

Note: HRK – currency of Croatia (kuna). 1 EUR ≈ 7.55 HRK

Current ratio shows a company's ability to pay short-term obligations from current assets (Zager et al., 2008, p. 248). As its value is 1,36 it can be concluded that Port of Rijeka is able to cover the liabilities just 1,36 times larger than the one that it has.

Quick ratio measures a company's ability to ensure certain amount of money in short period, and it is calculated from relation of current assets minus inventories divided by current liabilities. Its value (1,33) is acceptable and it indicates that Port of Rijeka is well managing its inventories.

Coefficient of current liquidity that is calculated from relation money equivalents and current liabilities is more required than the quick ratio. It value should be more than 1 as company could settle its current liabilities that run out on charge. The value in this case of 0,0053 represents that Port of Rijeka can cover just 0,53% of its current liabilities.

Working capital is specific ratio as it provides information in absolutely amount. As Port of Rijeka has positive value of working capital it is able to finance current business activities.

Long term liquidity ratio that is calculated as relation of long term assets to capital plus long term liabilities should be less then 1. In table 3 it can be seen that its value (0,91) is very close to critical value.

Leverage ratios relate to the structure of sources of assets and show how big amount of assets is financed from own sources and how much from external sources. Based on them it can be defined how much company is in charge and if there is possibility for new debt and shows whether the company is able to manage its current liabilities (Brealey et al., 2007, p. 459).

Table 4: Leverage ratios of Port of Rijeka (authors calculation based on financial statements from 31.12.2011. taken from Zagreb stock exchange)

COEFFICIENT	VALUE
Financial leverage	71,42%
Coefficient of funding	0,40
Debt ratio	0,29
Times interest earned	11,54
Indebtedness factor	1,41
Cover rate I	0,96
Cover rate II	1,09

One of major leverage ratios is financial leverage that puts in relation balance capital and total asset. It defines if it is worth to use external sources of funding until business activity realizes the rate of return higher then the weighted average interest rate at which it pays interest on loan capital (Orsag, 2003, p. 514). Leverage effect defines that the rise of another's funding increases profitability of investment is greater than the interest rate on the borrowed capital. Average value of financial leverage shows that Port of Rijeka can finance 89,80% of its assets by own capital and the rest from external sources.

Coefficient of funding puts in relation total liabilities and owner's capital, due to that, total liabilities of Port of Rijeka constitute 40% of its capital.

Time interest earned defines how many times company can cover interest expense from gross income. Observing value of time interest earned it can be seen big difference on individually level that observed company can settle 11,54 times its liabilities based on interest expense.

Indebtedness factor (total liabilities against net income plus amortization) reflects how many periods necessary to company to settle its liabilities. Due to data presented in table 4 it can be defined that Port of Rijeka needs 1,41 year to pay all liabilities if the level of income is equal to this from 31.12.2011.

Debt ratio reflects how many times total liabilities are bigger than total assets. It is desirable for company and especially for investors that its value is lower. As its value is 0,29 for observed company it can be concluded that Port of Rijeka does not have large debts.

Cover rate 1 shows rate between capital and long term assets, while cover rate 2 puts in relation capital enlarged for long term liabilities to long term assets. Value of cover rate 1 and cover rate 2 is acceptable if it is above of value of industrial average or that is higher in relation to other companies from same services. When its value is growing then company's liquidity is increasing while indebtedness is decreasing.

Challenges of the Modern World - Contemporary Economy and Globalization

4.2   Activity ratios

Each company tend to use its asset more effectively and financial analysts measure that through activity ratios. Based on them it can be concluded how many units of revenue are produced from each unit of total or part of asset. Those ratios are informing us about the rapidity of asset circulation during the business activities (Brealey et al., 2007, p. 462).

Crucial activity ratio is total asset turnover ratio that is calculated as a relation of total revenues and total asset. As its value is 0,52 it can be defined that Port of Rijeka through one year inverts its total asset 0,52 times through total revenues. Current asset turnover ratio reflects that Port of Rijeka through one year inverts its current assets 2,55 times through total revenues.

Table 5: Activity ratios Port of Rijeka (authors calculation based on financial statements from 31.12.2011 taken from Zagreb stock exchange)

COEFFICIENT	VALUE
Total asset turnover ratio	0,52
Current asset turnover ratio	2,55
Receivables turnover ratio	5,90
Inventory turnover ratio	24,48
Accounts receivable collection period	61,8

It is preferable that value of receivables turnover ratio is higher than value of concurrents. If company can charge its receivables it has enough money for launching new businesses, that final influence on increase of value of total asset turnover ratio and current asset turnover ratio. Its value for observed company is more than satisfactory.

Inventory turnover ratio represents how many times has company ordered inventories from its suppliers. If its value is much higher than the value of industry average it can be concluded that company has certain problems during the purchase of inventories. Opposite that, if the value of inventory turnover ratio is lower than the value of industry average it is possible to have problems in business transactios with the clients.

Value of accounts receivable collection period (61,8) shows that Port of Rijeka needs 61,8 days to charge its receivables.

5   CONCLUSION

The port of Rijeka is a port of national interest opened to national and international public traffic; it is conveniently oriented toward the world's seaborn routes.

Advantage of position of Port of Rijeka is not just natural exit toward the sea, even more important is its closeness to the capitals of neighbour countries. For better utilization of prosperous geotraffic position of Port of Rijeka it is necessary to modernize the railway Rijeka-Zagreb in the near future and also to build multipurpose Danube-Sava canal. Favorable geotraffic position is not sufficient to create a significant port hub.

Financial analysis was carried out through analysis of safety indicators and activity ratios. Values of all observed coefficients, except the value of long term liquidity ratio which is very close to the critical value and the value of coefficient of current liquidity that defines that Port

of Rijeka can cover just 0,53% of its current liabilities, are at the satisfactory level. But it is important to mention that Port of Rijeka achieved high net income in 2011 as a result of sale of proprietary share to the strategic partner on Container terminal of Port of Rijeka and that might influenced values of some observed coefficients.

Port of Rijeka has great potential to generate traffic with the shippers from the Far East who are interested that shipments to Eastern and Central Europe go without transshipment in the Mediterranean as it would result with lower transportation costs. When shipment is going across the Mediterranean then it is the longest maritime route which causes realization of lower transportation impact per unit of cargo, and that reflects in the final price of the product at the European market.

Port of Rijeka has great potentional for growth in the upcoming years due to possibilities of improvement of traffic connections and to fact that Republic of Croatia is entering in the European Union on July of 2013. After the entry of Republic of Croatia in the European Union, Port of Rijeka will finally have equal market conditions as well as the major concurrents and that is opening new business opportunities. Also, it is expected the container traffic increase as other neighbour ports have achieved increase in container traffic after the entrance in the European Union.

The comparative advantages Port of Rijeka related to the other North Adriatic ports are following:
- depth of terminals is going up to 18 meters, which enable acceptance of largest container ships (mother vessels),
- very good existing road connections to the rest of Europe (V. and X. Pan-European corridor) and in the near future it is expected connection to the XI. Pan-European corridor (Baltic-Adriatic) and
- distance from Rijeka airport is only 30.4 kilometers.

The main disadvantages of Port of Rijeka are related to its location in the main center of Rijeka and unsatisfactory road network (bad conditions of railroads, lack of wagons, no direct railway connections between Rijeka and Croatian railways in Istria and further with the ports of Koper and Trieste, as well as no direct railway connections with the port of Ploce).

The future of Port of Rijeka is to develop its role as a transit port for Central and Eastern Europe.

Challenges of the Modern World - Contemporary Economy and Globalization

TRADE-OFF THEORY VS. PECKING ORDER THEORY – EMPIRICAL EVIDENCE FROM THE BALTIC COUNTRIES[1]

Irina Berzkalne

ABSTRACT
Capital structure is of particular importance in estimating the company value; an accurately estimated and selected equity and debt ratio can maximize the company value and minimizes the cost of capital; therefore, this issue is especially significant in the changing conditions of economic development. The main purpose of this study is to simultaneously evaluate the pecking order and trade-off theories of capital structure and determine which one performs better for a sample of companies from the Baltic states. Analysis is conducted on a sample of 75 listed companies (Baltic Stock Exchange) over the period from 1998 to 2011. The authors test theories using panel data and regression analysis. The empirical results show that listed companies in Latvia, compared to the other countries, can be characterized by the lowest debt ratio, however an increase in the average debt ratio can be observed, therefore the gap has been reduced in the recent years. The study did not find evidence supporting pecking order theory, but results show that companies adjust their debt levels according to target debt.

Keywords: *Capital structure, Debt ratio, Leverage, Pecking order theory, Trade-off theory*

1   INTRODUCTION

Capital structure is of particular importance in estimating the company value; an accurately estimated and selected equity and debt ratio can minimize the cost of capital and maximize the company value, and, consequently, the value for shareholders.

The starting point for the subject of capital structure is the irrelevance proposition of Modigliani and Miller (1958, 1963). Since then, enormous number of papers were published on optimal capital structure and capital structure theories. Although in recent decades many compliance tests have been carried out in various countries and various industries, there are still many unanswered questions and problems.

In capital structure literature, two capital structure theories prevail – the trade-off theory and the pecking oder theory. Pecking order theory states that companies prioritize their sources of financing – at first they prefer to use internal funds, then to borrow, and at last to issue equity as a last resort; consequently there is no clear target debt-equity mix (Myers and Majluf, 1984). Trade-off theory argues that company chooses debt and equity mix by balancing the benefits and costs of debt. If company increases its leverage, the tax benefits of debt increase, as well. At the same time, the costs of debt also rise (Kraus and Litzenberger, 1973). The

---

pecking order theory expects a negative relationship and the trade-off theory expects a positive relationship between profitability and leverage.

The **aim of the research** is to simultaneously evaluate the pecking order and trade-off theories of capital structure and determine which one performs better for a sample of companies from the Baltic states.

The **tasks of the paper** are as follows:

- To overview the results of previous research made in this field;
- To evaluate the pecking order and trade-off theories on a sample of 75 listed companies;
- To determine which theory performs better for a sample of companies from the Baltic states.

The **research methods** used in the paper include the following qualitative and quantitative methods: the monographic method, descriptive statistics, regression analysis, graphical method. The research is based on published papers on the pecking order and trade-off theories, as well as information provided by the Baltic Stock Exchange (financial statements). Analysis is conducted on a sample of 75 listed companies (Baltic Stock Exchange) over the period from 1998 to 2011.

2   LITERATURE REVIEW

The pecking order theory states that companies prioritize their sources of financing – at first they prefer to use internal funds, then to borrow, and at last to issue equity as a last resort. The reason of such hierarchy is the information asymmetry, since managers know more about the company performance and future prospects than outsiders. Managers are unlikely to issue company shares when they believe that shares are undervalued, however they are more inclined to issue shares when they believe they are overvalued. Shareholders are aware of this and they may interpret a share issue as a signal that management thinks the shares are overvalued, and, in reponse, shareholders might increase the cost of equity. There is no clear target debt-equity mix. The pecking order theory does not deny that taxes and financial distress can be important factors, however they are less important than manager's preference for internal over external funds and for debt financing over new issues of common stock.

The trade-off theory states than an enterprise chooses debt and equity mix by balancing the benefits and costs of debt. If the enterprise increases its leverage, the tax benefits of debt increase, as well. At the same time, the costs of debt also rise. The original version of the trade-off theory grew out of the debate over the Modigliani-Miller theorem. Kraus and Litzenberger (1973) formally introduced the tax advantage of debt and bankruptcy penalties into a state preferance framework. The trade-off theory predicts that target debt ratios will vary from enterprise to enterprise. Companies with safe, tangible assets and plenty of taxable income ought to have high target ratios. Unprofitable companies with risky, intangible assets ought to rely primarily on equity financing.

According to Myers (1984), a company that follows the trade-off theory sets a target debt-to-value ratio and then gradually moves towards the target. The target is determined by balancing debt tax shields against costs of bankruptcy. Frank and Goyal (2005) break Myers' definition into two parts:

Challenges of the Modern World - Contemporary Economy and Globalization

- Definition 1 – the static trade-off theory – a company is said to follow the static trade-off theory if the leverage is determined by a single period trade-off between the tax benefits of debt and the costs of bankruptcy.
- Definition 2 – target adjustment behaviour – a company is said to exhibit target adjustment behaviour if the company has a target level of leverage and if deviations from that target are gradually removed over time.

Previous empirical research of evaluating the efficiency of both the pecking order and trade-off theories has provided mixed results.

Shyam-Sunder and Myers (1999) find that the pecking order is an excellent descriptor of corporate capital structure and the target adjustment model performs good as well. When both models are tested together, the pecking order results change hardly at all, however performance of target adjustment model decreases.

Frank and Goyal (2002) test the pecking order theory on publicly traded American enterprises from 1971 to 1998. According to the results, net equity issues track the financing deficit more closely than do net debt issues.While large enterprises show some aspects of pecking order behavior, the evidence is not robust.

Byoun and Rhim (2003) conclude that enterprises adjust their debt levels according to target debt ratios, as well as the pecking order.

De Medeiros and Daher (2005) tested the pecking order theory in Brazilian companies. It was concluded that in its weak form the theory is applicable to Brazilian companies, but not in the strong form.

The study done by Sanchez-Vidal and Martin-Ugedo (2005) used a panel data analysis of Spanish companies. The results show that the pecking order theory holds for most subsamples analyzed, particularly for the small and medium-sized companies and for the high-growth and highly leveraged companies.

Seppa (2008) investigated 260 Estonian non-financial enterprises, using financial statements of 2002/2003 or 2003/2004 and found the support for pecking order theory, however in the long run the evidence supporting this remains weak. The results provide no or very weak support that the trade-off theory is followed in the long-run.

Cotei and Farhat (2009) find that managers tend to adjust toward target leverage but this does not prevent them from deviating from this target to take advantage of the equity market conditions and the information asymmetry problem.

Mukherjee and Mahakud (2012) conclude that the trade-off theory and pecking order theories are not mutually exclusive. The companies do have certain target ratio and the costs and benefits of debt as well as asymmetric information costs play a significant role for the determination of optimal leverage ratio for Indian manufacturing companies.

Mazen (2012) used a French panel data to examine the validity of the static trade-off theory and the pecking order theory. This study can not formally reject either one of the two theories, however it confirms the importance of considerations provided by the static trade-off theory.

Challenges of the Modern World - Contemporary Economy and Globalization

Amaral et al. (2012) used a sample of non-financial Brazilian copmanies from 2000 to 2010. The study concluded that the companies follow the pecking order theory, however, no evidence was detected, which states the trade-off theory.

Though many research studies had been undertaken in the field of the pecking order and trade-off theories, the results are still unclear. Some studies support the pecking order theory or the trade-off theory, while other studies both of them or none at all.

3   SAMPLE DESCRIPTION

The data used is taken from the NASDAQ OMX Baltic (financial statements). The financial companies were excluded, because their characteristics are different due to the specific balance sheet structure. Data used are from the period of 1998–2011. Chart 1 shows the allocation of companies used in this study.
Chart 1: Baltic listed companies (NASDAQ OMX Baltic) on 18.11.2012

Companies represent different industries. Most represented industries are consumer goods (27 companies or 36%) and industrials (12 companies or 16%).

Table 1 provides descriptive statistics of the companies included in the study:
- Average debt ratio in Latvian listed companies increased from 10.8% in 1998 to 20.2% in 2011, however debt ratio of Estonian and Lithuanian companies fluctuated in a narrower range. Debt ratio of Estonian companies varied from 20.0% to 35.4% (average 28.8%) and debt ratio of Lithuanian companies changed even less - from 23.9% to 29.8% (average 26.6%);
- The median debt ratio also differs. In Latvia from 1998 to 2004 median debt ratio was mostly less than 10% (except 2003), however, it increased in the following years. Companies in Estonia show much higher median debt ratio; the smallest median debt ratio observed in 1999 (19.5%) and the highest in 2003 (46.0%). In Lithuania the median debt ratio fluctuated less so – from 20.9% (2002) to 30.7% (2008);
- Maximum debt ratio in two cases exceed 100% - this is due to negative equity (Latvia and Lithuania, 2010).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Descriptive statistics of the debt ratio for a sample of companies from Baltic countries, 1998–2011 (Data calculated by the authors of the paper, using NASDAQ OMX Baltic data)

Year	Latvia			Estonia			Lithuania		
	Average	Median	Max	Average	Median	Max	Average	Median	Max
1998	10.8	8.7	25.7	28.0	26.9	40.1	23.9**	23.9**	23.9**
1999	14.5	0.3	45.7	20.0	19.5	30.4	28.8**	28.8**	28.8**
2000	15.7	7.7	46.6	24.5	24.5	39.3	26.2**	26.2**	26.2**
2001	11.7	4.5	54.8	27.0	28.3	45.4	27.1**	27.1**	27.1**
2002	13.1	6.8	54.6	34.1	41.4	54.7	25.1	20.9	77.8
2003	13.5	11.7	33.6	35.4	46.0	59.9	24.9	25.1	70.5
2004	15.7	9.1	60.8	34.5	44.4	65.6	26.8	25.9	88.3
2005	15.5	14.6	60.4	32.1	32.7	55.4	27.9	24.8	80.2
2006	18.3	13.7	64.8	26.8	28.6	57.7	26.0	27.6	58.9
2007	23.0	14.2	75.1	24.5	19.3	55.8	25.6	23.5	57.2
2008	22.7	17.2	73.6	29.3	27.7	59.0	29.8	30.7	61.3
2009	23.3	20.3	78.5	31.3	32.6	60.7	28.9	25.8	69.2
2010	23.3	15.0	153.5*	28.2	27.3	57.1	26.8	21.7	138.3*
2011	20.2	17.2	61.9	27.5	26.8	53.3	24.4	23.5	68.1

Max debt ratio exceeds 100% due to negative equity.
**Only one Lithuanian company included in the sample (1998–2001).*

Chart 2 provides information on the average debt ratio for Baltic listed companies from 1998 to 2011. If one compares the three Baltic countries, then the average debt ratio was the smallest for Latvian listed companies for all period in question. The average debt ratio for Lithuanian and Estonian listed companies was similar, except for the period from 2002 to 2005, when the average debt ratio for companies in Estonia was considerably higher than for companies in Lithuania. It can be pointed out that, in Latvia, one can observe an increase in the average debt ratio – three years moving average increased from 13.7% to 22.3% (for example, the same average for companies in Estonia increased by five percentage points from 24.2% to 29.0%). At the end of the period in question, the average debt ratio in listed companies in Latvia is close to the average ratios in other Baltic countries.
Chart 2: Baltic listed companies – debt ratio, 1998–2011 (Data calculated by the authors of the paper, using NASDAQ OMX Baltic data)

Challenges of the Modern World - Contemporary Economy and Globalization

In general, listed companies in Latvia can be characterized by the lowest debt ratio, however, an increase in the average debt ratio can be observed as well, therefore the gap has been reduced in the recent years. The average debt ratio for companies in Lithuania and Estonia was similar for the most number of periods and it fluctuated and increased less than in Latvian companies.

4   METHODOLOGY

In this study, in order to test the pecking order and the trade-off theory, the methodology by Shyam-Sunder and Myers (1999) is used.

For the pecking order theory Shyam-Sunder and Myers propose time-series hypothesis. The funds flow deficit is:

$$DEF_t = DIV_t + X_t + \Delta W_t + R_t - C_t, \qquad [1]$$

where
DIV_t – dividend payments,
X_t – capital expenditures,
ΔW_t – net increase in working capital,
R_t – current portion of long-term debt at start of period,
C_t – operating cash flows, after interest and taxes.
Then tested the following regression:

$$\Delta D_{it} = \beta_0 + \beta_1 DEF_{it} + e_{it,} \qquad [2]$$

where ΔD_{it} is the amount of debt issued (or retired if DEF is negative). The pecking order coefficient is β_1 and is expected to be 1. β_0 is the regression intercept and e_{it} is the error term. As pointed out by the authors, this does not include equity issues or repurchases, since the pecking order theory predicts that the enterprise will only issue or retire equity as a last resort. They admit that this equation cannot be generally correct, but it is a good description of financing.

For the trade-off theory they propose the following target adjustment model and regression specification:

$$\Delta D_{it} = \beta_0 + \beta_1 (D_{it}^* - D_{it-1}) + e_{it} \qquad [3]$$

D_{it}^* is the target debt level for enterprise i at time t. β_1 is target-adjustment coefficient. The hypothesis to be tested is $\beta_1 > 0$ (indicates adjustment towards the target) and also $\beta_1 < 1$ (implies positive adjustment costs). Target debt level is unobservable, the authors use three-year moving average. β_0 is the regression intercept and e_{it} is the error term.

This methodology has already been extensively used and modified. For example, the test of the pecking order theory is used by Amaral et al. (2012), Mazen (2012), Cotei and Farhat (2009), Byoun and Rhim (2003), Frank and Goyal (2002) and the test of the trade-off theory is used by Mazen (2012), Cotei and Farhat (2009), Byoun and Rhim (2003).

5   ANALYSIS OF RESULTS

Table 2 summarizes the results on the pecking order theory in the Baltic countries. Aim of the test was to state whether the companies follow pecking order theory.

Table 2: Results of the pecking order theory regression in the Baltic countries, 1999–2011
(Data calculated by the authors of the paper, using NASDAQ OMX Baltic data)

Year	Adjusted R Square	Regression Significance	Regression Coefficient	
			DEF	Sign.
1999	0.41*	0.04	1.03*	0.04
2000	0.84*	0.00	0.64*	0.00
2001	0.08	0.15	0.25	0.15
2002	0.99*	0.00	0.74*	0.00
2003	-0.01	0.45	0.02	0.45
2004	0.42*	0.00	-0.07*	0.00
2005	0.08*	0.01	-1.14	0.01
2006	0.88*	0.00	0.73*	0.00
2007	0.06*	0.02	0.08*	0.02
2008	0.51*	0.00	0.22*	0.00
2009	0.40*	0.00	0.12*	0.00
2010	0.21*	0.00	-0.06*	0.00
2011	-0.01	0.82	-0.02	0.82

*An asterisk indicates significance at the 5% confidence level.

In ten out of the thirteen periods analysed, regression is significant, however the adjusted R square varies from 0.06 to 0.99. Only in three periods the adjusted R square is more than 0.80 (2000, 2002, 2006) and the corresponding regression coefficient values are 0.64, 0.74 and 0.73 (significance 0.00). Therefore there is not enough evidence that the companies in the Baltic countries follow the pecking order theory.

In Table 3, the data are summarized for each country. In the case of Latvia, for eleven periods the regression is significant, however in seven periods the regression coefficient is negative or close to 0 (this coefficient should be 1 if the companies follow the pecking order theory). Similar situation is in Estonia – regression is significant in ten periods, in seven periods adjusted R square is more than 0.80, however the regression coefficient is not 1, but, just like in Latvia, in most cases close to 0 or negative. In Lithuania only data from 2003 are available for pecking order theory analysis. In five periods out of nine, regression is significant. Even though the regression coefficient is not 1, it is not negative (common occurence in Latvian and Estonian data).

Overall, even though there is no evidence that the Baltic countries support the pecking order theory, there is a conclusion of another kind - Lithuanian financing patterns differ from Latvia and Estonia, since Lithuanian DEF coefficient is only positive.

Challenges of the Modern World - Contemporary Economy and Globalization

*An asterisk indicates significance at the 5% confidence level.

The results on the trade-off theory in the Baltic countries are shown in Table 4 below. The analysis is done for different periods of time: 1999–2010 (all periods included in the study) and this period divided into 1999–2007 and 2008–2010 due to the economic crisis – company financial data changed considerably due to the business cycle; and if one data set (1999–2010) were to be used, it could distort the results and conclusions.

The adjusted R square in the regression is good (0.66) and in accordance to F-Anova test all regressions are significant. In all cases the regression coefficient is between 0 and 1 (in accordance to the theory).

Table 4: Results of the trade-off theory regression in the Baltic countries, 1999–2010 (Data calculated by the authors of the paper, using NASDAQ OMX Baltic data)

Period		1999-2007	2008-2010	1999-2010
Adjusted R Square		0.66*	0.46*	0.62*
Regression Significance		0.00	0.00	0.00
Regression Coefficient	Coefficient	0.88*	0.56*	0.82*
	Significance	0.00	0.00	0.00

*An asterisk indicates significance at the 5% confidence level.

In table 5 summarizes the data for each country. In Latvia, regression for period of 2008-2010 is not significant (adjusted R square negative, significance level is higher than 0.05). For the whole period in question, the regression coefficient is 0.65. In Estonia regression results are significant for all three periods and the coefficient is 0.88. Overall, it can be concluded that all three Baltic countries show similiar financing behaviour in terms of target adjustment. All three regressions are significant and the regression coefficients are 0.65 (Latvia), 0.88 (Estonia) and 0.67 (Lithuania). Since these coefficients are positive and less than 1, it indicates adjustment towards the target and implies positive adjustment costs.

Table 5: Results of the trade-off theory regression in Latvia, Estonia and Lithuania, 1999–2010 (Data calculated by the authors of the paper, using NASDAQ OMX Baltic data)

Period		1999-2007	2008-2010	1999-2010
Latvia				
Adjusted R Square		0.67*	-0.003	0.34*
Regression Significance		0.00	0.36	0.00
Regression Coefficient	Coefficient	1.26*	0.03	0.65*
	Significance	0.00	0.36	0.00
Estonia				
Adjusted R Square		0.67*	0.62*	0.67*
Regression Significance		0.00	0.00	0.00
Regression Coefficient	Coefficient	0.88*	1.05*	0.88*
	Significance	0.00	0.00	0.00
Lithuania				
Adjusted R Square		0.62*	0.47*	0.52*
Regression Significance		0.00	0.00	0.00
Regression Coefficient	Coefficient	0.89*	0.57*	0.67*
	Significance	0.00	0.00	0.00

*An asterisk indicates significance at the 5% confidence level.

To sum up, while there is no evidence that the Baltic countries support the pecking order theory, all three Baltic countries show similar financing behaviour in terms of target adjustment.

The authors propose for companies from the Baltic countries to continue adjust their debt ratios and follow the trade-off theory, because:
- Debt is cheaper than equity, therefore, company reduces financial costs;

Challenges of the Modern World - Contemporary Economy and Globalization

- Tax shield – company deducts interest paid on debt from their tax liability and the company gains the so-called tax shield, which also increases company value;
- Theory implies a concrete optimal capital structure, however company can end up with a very high debt ratio if followed the pecking order theory, since equity issuance is as a last resort.

6   CONCLUSIONS

The research evaluates the pecking order and trade-off theories of capital structure and determines which one performs better for a sample of companies in the Baltic countries. Analysis is conducted using descriptive statistics and regression analysis. The study finds that:

- Though many research studies have been undertaken in the field of the pecking order and trade-off theories, the results are still unclear. Some studies support the pecking order theory or the trade-off theory, while other studies both of them or none at all.
- Listed companies in Latvia can be characterized by the lowest debt ratio, however, an increase in the average debt ratio can be observed as well, therefore the gap has been reduced in the recent years. The average debt ratio for companies in Lithuania and Estonia was similar for the most number of periods and it fluctuated and increased less than in Latvian companies.
- Even though there is no evidence that the Baltic countries support the pecking order theory, there is a conclusion of another kind - Lithuanian financing patterns differ from Latvia and Estonia, since Lithuanian DEF coefficient is only positive.
- All three Baltic countries show similiar financing behaviour in terms of target adjustment. All three regressions are significant and the regression coefficients are
- debt ratios and follow the trade-off theory.

ABSTRACT
Strategy as an organizational projection advocates structuring around clearly defined objectives which create market efficiency. It achieves a balance between business and environment, for the purpose of general well being (shareholders, employees, customers and the community). National work classification classifies 21 activities, which can be sorted into four sectors (primary, secondary, tertiary and quaternary). Each of them has its own special characteristics which are becoming a key component of differentiation of the sector in comparison to others. Therefore it can be assumed that the strategy of companies within each sector is set in accordance with the specificities of sector, and that there are components that differentiate strategy of a certain sector against strategies of other sectors. Objective of this work is to find specific components for the development of strategies for each sector and key components of cross-sector differentiation when setting up strategies among different sectors. The focus will be directed to the analysis of the strategical guidelines inside the different sectors, and to the comparasion of the economic and strategical growth of a sector. The research was conducted by the telephone poll with the 80 companies located in the Republic of Croatia, 20 for each sector. The first goal of this paper is to establish the level of strategical guidelines development of this croatian companies, by verifying their success in fulfilling the norms of development and used strategies. The second goal is to establish the common elements of strategy between a certain company and other companies from the same sector, meaning to verify if the companies inside the same sector form their strategies in a similar manner. This will be used to determine the key points of the cross-sector differentiation, and to present the strategical specificals of each sector.

Keywords: Differentiation, Sectors, Strategy

1 INTRODUCTION

Business strategy is fundamental for an organization sucess in the highly-developed markets, therefore the development and execution of strategy represent the pivot of the business enterprise management and reflect the demands of the contemporary market values. Such market-oriented strategical planning becomes the managemental process of maintaining and augmenting the bond between the organisation's goals and the market possibilities, with the primary focus on the accumulation of profit, growth, and the achievement of the sustainable competatible advantage. Misdirected strategical decisions may jeopardize the organisation's existance. Growing competition forces a company to create a clearer business strategy which will differentiate it from the rest of the market. Many global companies, unlike domestic ones, have recognized the new marketing conditions and clearly defined the direction of their business operations.

Challenges of the Modern World - Contemporary Economy and Globalization

Strategical decisions are seldom uniform, due to their derivation from the appraisal of values which mainly depend of the people's oppinions, perceptions and suppositions, therefore eliminating the possibility of the unique approach to the strategical decision-making, applicable to every situation, organization or person. Theorists propose the strategical process model based on the analitical and rational approach to the questions (Stacey, 1997, p. 8) „How did we get here? Where we want to go? How to get there?". Definitions of strategy are numerous, but the one most quoted in the scientific circles is the Chandler's definition from the study Strategy and Structure which states: „Strategy represents setting of the company's fundamental long-term goals and tasks, declaration of the activities directions and the allocation of resources neccesary to achieve these goals." It is a successful, creative and innovative process that demands managing the opposites (Stacey, 1997, pp. 101–112) Strategy represents the reflection of the organization's growth and the allocation of the limited resources (Abell and Hammond, 1979, p. 14). Strategy is also considered to be an inspiration throughout which we seek to achieve the finite, usually long-term goal (Meler, 2005, p. 163). The goal is defined by planning decisions which represent interactions of company and its environment, but also by factors of economical and non-economical gains of the stock-holders, employees, buyers and community. Still, due to constant changes of the internal and external elements, it is neccesary to track those changes and accordingly modify existing strategy. For the strategical control to be effective, the key variables which effect the strategy efficiancy must be properly recognized inside and outside of a company (Ranko, Delić and Škrtić, 1999, p. 178). The control activities encompass the control of achieved results in comparison to the set goals. If the control shows stagnation or regress, it is necessary to form a new strategy which will incourage the company progress throughout changes in the current business and the employees enivorment and so yield the profit gain. This initiative is called SPRINT (Dolye and Bridgewater, 1988, p. 189).

Considering previously stated components, necessary for the achievment of the high-quality strategy that would warrant the business success, we can conclude that the different companies have different response to the external and internal factors which guide the company strategy in a certain direction. A question arise: do the external factors have such notable effect that the companies inside the same sector, for which can be supposed that they have the similar external influence, guide their strategies in a similar directions.

2 CROSS-SECTOR DIFFERENTIATION IN THE STRATEGY DETERMINATION

By analyzing the strategical guidelines of numerous companies, one can notice a certain differences in the company directing and determination of focus on the key segments related to their growth and development. Companies may be grouped into the segments, inside of which exists the similar strategy-setting differentiation, which draws the conclusion that the companies from the same sector have the same strategical guidelines, therefore being differentiated from the companies from the different sectors, in regard of key elements for the future development. Many common elements are noted, suggesting that the strategical guidance of a company has a significant effect on its further growth and developm.

Therefore it is neccesary to group the business activities inside the similar segments to point out their strategical specification. The national classification of business activities from 2007. divides the activities into 21 groups (NKD, 2007, 2008, p. 36), such as agriculture, forrestry and fishing, up to the activities of the foreign organizations and entities. To narrow down this segregation to the less elements, we could divide the mentioned activities into the four

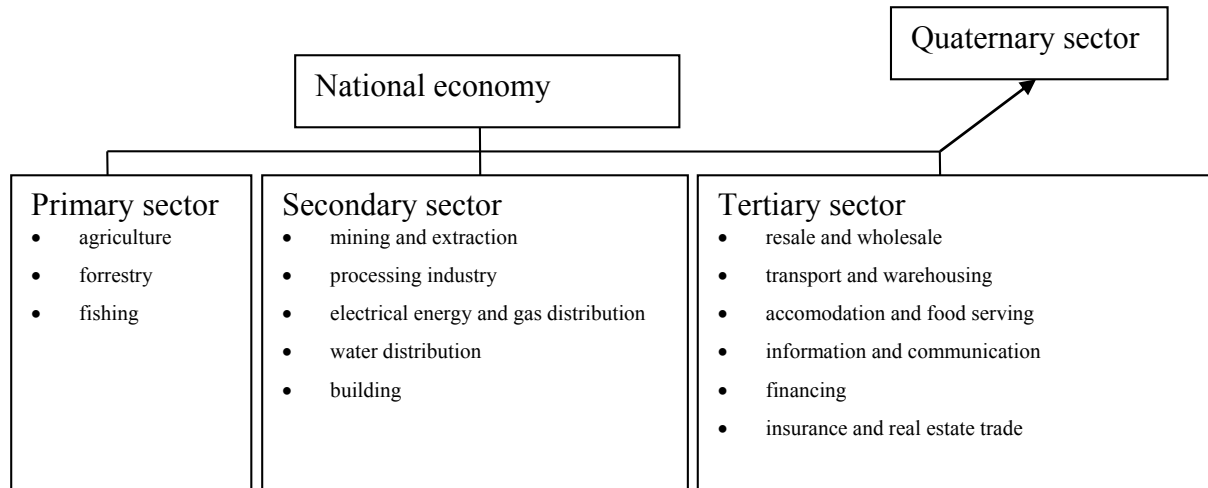
sectors. Set into the primary, secondary, tertiary and quaternary sector, the activities are divided as agricultural, industrial and services. The primary sector activities are the one where a man finds the objects of his work in nature and by his work separates and adapts them for the further processing and consumption. The secondary economical sector comprises of the processing activities, so it often called the processing sector. The tertiary activities are services, which can be defined as untangible, immaterial, undividable activities, and currently employ most of the work force. The quaternary activities are specific services which as basic goal have the common welfare, not an individual personal gain. This division will be now shown graphically.


Chart 1: The structure of national economy (author)

Each of this sectors has its own specific aspects, which are the key components of the sectors differentiation. So it can be assumed that a individual company strategy inside a certain sector follows the specifical aspects of that sector. Based on the stated facts, we can draw a conclusion that there are the key components which are specific for the same-sector companies strategies, and at the same time differentiate the strategy in relation to the other sectors strategies.

2.1 Hypothesis

The goal of this paper is to find the specific components for the strategy development of each sector, and the key components of the cross-sector differentiations used in a setting of a cross-sector strategy. The focus will be directed to the analysis of the strategical guidelines inside the different sectors, and to the comparasion of the economic and strategical growth of a sector. The research was conducted by the telephone poll with the 80 companies located in the Republic of Croatia, 20 for each sector. The first goal of this paper is to establish the level of strategical guidelines development of this croatian companies, by verifing their success in fulfilling the norms of development and used strategies. The second goal is to establish the common elements of strategy between a certain company and other companies from the same sector, meaning to verify if the companies inside the same sector form their strategies in a similar manner. This will be used to determine the key points of the cross-sector differentiation, and to present the strategical specificals of each sector. Based on the previously presented data regarding the specific aspects of each sector, we can postulate the following two key hypothesis of this paper:

H 1. Each of this sectors has its own specifical aspects which are the key components of the sector differentiation in regard to other sectors. It can be assumed that the company strategy inside each sector is following the specific guidelines of its sector.

H 2. It can also be assumed that there are components which differentiate the strategy of a certain sector in relation to the strategies of other sectors.

Analysis tried to identify the companies strategies, and to determine their develompment and execution processes. The identification of the company strategy was conducted by analyzing the company's reactions to the market changes and other external influences. In addition to previous data, it was also analyzed which level of commitment is given to company's own development in search of new markets and entering new business activities. That was established by determining the level of attention given to research of internal and external environments and ability to express its own competitive advantages to achieve the recognisable and competitive strategy (Thompson, Strickland and Gamble, 2006). While analyzing the strategy guidelines, some of the questions also related to its execution.

The second part of the poll analyze the vision and mission which many authors consider to be the most important elements of the strategical management, the stepping stone of the strategical management which provides the cultural cohesion that enables a company to function as a single collective (Buble, 2005, p. 90). This ensures the business directioning and the goal setting. Therefore, it was analyzed whether are the vision and mission focused on key factors such as customers, employees, owners and the communities within which the company operates as well as markets, technology, concern for survival, growth and increased profits. For comparison of vision, mission and goals of the companies, the analysis of directional statements was used and the analysis was based on the previously marked components.

Since McCarthy pointed out the neccesity of accenting the 4P components (product, price, posting and promotion) as the elements inside the strategy which warrant the profitabilty (Kotler and Keller, 2008, p. 19), the sizable part of the poll is directed towards its analysis. Research probed the level of commitment a manager shows to the market, market segmentation and the product development, and the ability to handle data while making decisions. The significant part of the poll analyze benchmarking, which assures the safe way to forming a high-quality strategy, especially if executed with a special consideration to the Porter's „five forces" competitive advantages (Renko, Delić and Škrtić, 1999, p. 127). And analysis of the internal factors combined with the analysis of the external factors provides the creation of the information basis which will be foundation for the strategy development.

2.2   Methods of analysis

According to the previously stated data regarding the specific aspects of each sector, it is safe to assume that such specificality can be projected into the strategical guidelines of a certain company. Conclusion is that the quality of strategy development increases with each sector, which implies the significant difference of qualities of primary and quaternary sector in favour of quaternary sector.

Following the postulated assumptions regarding the cross-sectors differentiation in regards of the company strategy determination, next chapter will demonstrate the specifity of each sector, according to the analysis and comparasion of several companies selected by random choice. Out of each sector 20 companies have been selected. Their strategies are separately

Challenges of the Modern World - Contemporary Economy and Globalization

analyzed, thus providing the data about their specifical aspects, guidelines and the quality of production. This data was then used for inter-sector comparasion, which gave us a clearer image of the sector directioning. Final analysis compared the gathered data in regard to specificity of each sector, seeking to prove existance or non-existance of the cross-sectors differentiation in the strategy development, highlighting the key components which cause the sectors differentiation.

The research was conducted by telephone poll, where the top management executives from each company stated their own positions on the strategical guidelines and the strategy-forming modes. Method of research was the Likert scale, which measured and ranked the managers' response to statements. Level of concurrance for the certain statement served to demontrate the level of compliance to the certain issue, and to classify the strength of different sectors. The data collected through the survey questionnaire was analyzed using descriptive analysis and ANOVA test. In the text below the results of a complete analysis are presented. Designated indicators were adopted on the basis of the arithmetic mean of agreement, disagreement or lack of familiarity with specific component of company leadership.

3   RESULTS OF RESEARCH

Gathered data indicate that there is a differentiation in implementation of strategies among companies of different sectors. As assumed, the specifics of each sector are reported by emphasizing the focus on essential components of strategy. In all sectors a significant emphasis was placed on quality of product or service, but businesses of primary and quaternary sectors stress out that the price is not a factor that is pointed out through strategy because it is imposed by the market. Similar data was obtained by analyzing the distribution and promotions within same sectors because the leadership believes that the market is sufficiently regulated to function by itself and requires no further emphasis of these components. It is also clear that the primary sector companies do not pay great attention to development of strategies stressing 4P components as do the other sectors. The key to their strategy is a quality product that automatically creates demand. The following graph clearly shows that the strongest focus on the components of 4P is placed by companies of the secondary and tertiary sectors, with the lowest focus on price. Previously analyzed issue is further shown graphically in order to emphasize differentiation.
Chart 2: Cross-section differentiation when reflection on the components of 4P (author)

By analyzing the cross-sector differentiation, with strategic focus on product, by ANOVA test it is confirmed that a statistically significant difference exists between the arithmetic means of the samples (p-value is $3{,}4 \cdot 10^{-6}$), ie strategy of placing focus on the product is significantly different between sectors. Separately, by comparing quaternary sector with other sectors it can be concluded that there is a statistically significant difference between the arithmetic means of quaternary sector and other sectors in the attitude towards the importance of the product as a component of the 4P (with recieved p of 0,000335 and 0,05 in contrast to secondary and tertiary sectors). It can therefore be concluded that companies of quaternary sector do not show a strong need to emphasize product as companies of secondary and tertiary sectors do because of the specificity of the product or because of the products integration on the market.

Differential analysis on the formation of prices by using ANOVA test shows significant differentiation between sectors (p-value of $5{,}23 \cdot 10^{-12}$). However a separate analysis of sectors revealed no significant differentiation between primary and quaternary sectors (p = 0.5671) and the secondary and tertiary sectors (p = 0.102284), from which it can be concluded that the above sectors create price strategy in a similar way, ie the companies of secondary and tertiary sectors strongly emphasize price as a key strategic element. These assertions can be further substantiated by descriptive analysis shown below.

Table 1: Descriptive analysis of strategic focus on product and price (author)

Groups	*Product*				*Price*			
	Count	*Sum*	*Average*	*Variance*	*Count*	*Sum*	*Average*	*Variance*
Primary	20	92	4,6	0,673684	20	32	1,6	0,884211
Secondary	20	100	5	0	20	80	4	1,052632
Tertiary	20	100	5	0	20	68	3,4	1,515789
Quaternary	20	70	3,5	2,894737	20	28	1,4	1,515789

By analyzing strategic orientation on distribution, by using ANOVA test, results show a statistically significant differentiation between the analysis in each sector, and the overall cross-sector analysis (p= $1{,}37 \cdot 10^{-16}$). However, the most interesting is the analysis of focus on the promotion where a significant difference has been noted between the arithmetical means of samples (p= $1{,}93 \cdot 10^{-10}$), which indicates that there is a strong cross-sector differentiation in focus on promotion, although it was noted that between the primary and quartiary sectors there is no significant differentiation (p=0,05103). Thus we can conclude that the primary and quaternary sectors do not pay great attention to the promotion of the product, while secondary and tertiary sectors believe that the promotion is one of key components of their strategy. The above statement is shown in the following table.

Table 2: Descriptive analysis of strategic focus on distribution *and promotion (author)*

Groups	*Distribtion*				*Promotion*			
	Count	*Sum*	*Average*	*Variance*	*Count*	*Sum*	*Average*	*Variance*
Primary	20	30	1,5	0,789474	20	52	2,6	2,357895
Secondary	20	84	4,2	1,010526	20	100	5	0
Tertiary	20	96	4,8	0,378947	20	100	5	0
Quaternary	20	46	2,3	2,221053	20	72	3,6	2,568421

Challenges of the Modern World - Contemporary Economy and Globalization

After analysis of key components of the strategy, managers received the question whether they are using benchmarking. Following data has been collected.
Chart 3: The data collected on the use of benchmarking (author)

And by using descriptive analysis the following indicators were obtained.

Table 3: Analysis of the implementation of benchmarking through different sectors (author)

Groups	Count	Sum	Average	Variance
Primary	20	38	1,9	1,884211
Secondary	20	88	4,4	1,305263
Tertiary	20	86	4,3	1,8
Quaternary	20	78	3,9	2,305263

From previously mentioned it can be observed that companies in all sectors except for the primary use benchmarking, which has indicated the differentiation between sectors through ANOVA test (p= $9,12 \cdot 10^{-8}$), separate analysis between sectors determined that the primary sector has influenced the reported differentiation ($p = 2,5 \cdot 10^{-7}$), while among other sectors there is no statistically significant differentiation (eg. $p = 0,801$ between secondary and tertiary sectors, $p = 0,25$ between secondary and quaternary sectors, $p = 0,38$ between the tertiary and quaternary.).

In the analysis of key threats or five key forces according to Porter, managers in all sectors have expressed the view that the impact of existing competitors in the market is the strongest external force that has impact on the company, even though their impact is significantly lower on companies in primary and quaternary sectors than on companies in secondary and tertiary sectors. The reason for this is the specific markets and job descriptions in which competition does not have such a significant stake on the success of company operations. It is important to emphasize that managers of the primary and quaternary sectors point out that there is no concern about customers and substitution products for exactly the same reasons as stated above. However companies of the quaternary sector show a strong influence of the suppliers on its business, much stronger than companies of other sectors, particularly the primary sector.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 4: Key threats of companies are (author)

From chart shown above it is clearly evident that the impact of external forces is different on company's business between sectors, and it has strong implications for the creation of the company's strategy in the sector. The existence of a strong differentiation has also been proven with ANOVA analysis which at analysis of threats on the market ($p = 1{,}63 \cdot 10^{-5}$), analysis of the threat of new competitors ($p = 0{,}000528$), customers threats ($p = 6{,}15 \cdot 10^{-14}$), suppliers threats ($p = 2{,}63 \cdot 10^{-19}$) and threats from substitute products ($p = 2{,}12 \cdot 10^{-13}$) indicates a statistically significant difference between sectors.

Interesting results were obtained from a part of a survey that analyzed which are key components that are part of and were used in creation of the vision and mission. Managers were offered options to choose from and it is concluded that most managers believe that employees, concern for the survival, growth of the market and products are key components of strategic goals, vision and mission. It was also found that managers of primary sector consider that philosophy and self-concept are not an important component of the vision and mission, and a large percentage of them in the vision and mission statement do not include nor users nor concern for public opinion, which could be explained by the fact that companies in this sector produce intermediate products for the market which seeks them thus reducing the need for a strong attracting of buyers from the market. Regarding the quaternary sector it can be noticed that they place a strong focus on all the components except the technology that is not considered an important strategic factor. It is important to note that companies of secondary and tertiary sectors emphasize that all of these components are very important for the development of their strategy, and it can be said that there is no significant differentiation in this segment among them.

The analysis results are listed in the following graph.

Challenges of the Modern World - Contemporary Economy and Globalization

Chart 5: Key components of the vision and mission (author)

As a final component it is necessary to emphasize that the primary sector managers have suggested that strategic guidelines to subordinates are not transferred at all levels, which is a large obstacle for implementation of a strategy and a potential reason for the delay of the entire sector.

The last question asked the managers whether they think that their strategy is distinctive and competitive on the market. Gathered data is shown in the following table.

Table 4: Analysis of strategy competitiviti (author)

Groups	Count	Sum	Average	Variance
Primary	20	30	1,5	0,789474
Secondary	20	86	4,3	1,8
Tertiary	20	74	3,7	2,642105
Quaternary	20	80	4	2,315789

From the above data it can be viewed that the managers of primary sector companies are aware of the fact that their strategy is not competitive on the market and for this they are very different from the managers of companies from other sectors (in comparison with the secondary sector $p = 2,21 \cdot 10^{-9}$, with tertiary sector $p = 5 \cdot 10^{-6}$ and quaternary sector $p = 1,92 \cdot 10^{-7}$ which shows a clear differentiation). Thus it can be assumed that the under-developed strategy is a key reason for the stagnation of development of primary sector in comparison other sectors.

4 CONCLUSION

Each sector has its own specificities, both in business and in formulation of strategies. Analysis of sectoral specifications has shown numerous specifics. Although managers within all sectors are aware of the fact that only the product, its quality, price and access to buyers can point out the competitive advantage on the market, each of them puts the focus on the specific components that are of bigger importance to them.

Challenges of the Modern World - Contemporary Economy and Globalization

In the turbulent times in which companies are currently positioning on the market a stronger focus is placed on the market, growth of the company and its survival. Main reason is the size, number and strength of competitors on the global market, to which the company is trying to counteract. Therefore, when setting up strategy employees must be a key factor in development of the company, and by stimulating them a significant progress can be achieved.

By stressing the fundamental values, beliefs, aspirations and ethical priorities of company, it becomes more important in the perception of key stakeholders, and thus it can achieve greater incentive in all its target groups for further work and effort with purpose of progress and development of company. By analyzing companies through various sectors, one can observe the existence of certain rules when setting up a strategy, but in parallel with this there is a huge difference in orientation of strategy among companies within different sectors. That form of orientation can be strictly linked to the sector within which the company is located. Thus we conclude that the strategy can be precisely directed, and that it is possible to set a narrower range of segments that a high-quality strategy should have, in relation to a particular sector, thus helping companies within a sector with a better strategic guiding.

ABSTRACT
Income distribution in Thailand has become the central issue due to the unequal distribution between modern and agricultural sector especially in the poorest Northeast which has the greatest number of agricultural household among regions. The hypothesis on inequality which has been discussed widely is the Kuznets inverted U- curve hypothesis that income inequality increases in the early stage of economic development and decreases in the later stage. The inequality trend in the medium-term showed the downward trend after the peak of inequality in 1992. This could implya development of Thai economy. However, income distribution and regional inequality are stillproblematic. Furthermore,although agricultural sector has an important role for Thai economy, the agricultural wage is still low, 2.61 and 1.69 times lower than the service and production sectors respectively.This research mainly focuses on the resultsof field survey in Mahasarakham and Kalasin provinces in the Northeast of Thailand. It is important toknow theopinionsof the people in the most unequal region.As field survey, people still would like to be supported from the government in terms of income more than other aspects but it is difficult to distribute enough support thoroughly. On the contrary, many people are satisfied with their living and not affected by the limitation of income. Moreover, gathering the group to support members could help to improve their living and without waiting only government's support.

Keywords:Income distribution, Income Inequality, Thai Economic and Social Development

1 INTRODUCTION

Income distribution has become the central issue in Thailand.The unequal distribution between modern and agricultural sector still occurs.The governmenthave tried to increasethe wage accompany with the continuous operation of the income security project to small farmers whom income is low. However, the povery in the Northeast where cantains the greatest number of agricultural household is still higher than in other regions. Although agricultural sector has an important role for Thai economy, the agricultural wage is about 2.61 and 1.69 times lower than the service and production sectors respectively. Furthermore, Agriculture is the second lowest of average income per labour amongs all production sector (Chansarn, 2009).

There was an official reportof the National Statistical Office (NSO) that conducted an opinion survey on what people need from the government by regions in 2010 (Table 1).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Opinion survey on what people needfrom the government by regions in 2010
(National Statistical Office (NSO) , 2010)

Region	Issue that should be prioritized	%
Bangkok	1. Poverty problem	39.4
	2. People's Debt problem	35.6
	3. Price of consumer goods	35.3
Central	1. Price of consumer goods	37.1
	2. Poverty problem	37
	3. People's Debt problem	35.2
North	1. Price guarantee for agricultural produce	41.9
	2. People's Debt problem	34.3
	3. Oil price control	32.8
Northeast	1. People's Debt problem	46.7
	2. Price guarantee for agricultural produce	40.6
	3. Poverty problem	32.4
South	1. Price guarantee for agricultural produce	34.6
	2. Price of consumer goods	33.6
	3. People's Debt problem	28.3

Another important point is the satisfaction of people on their living. This research is analyzed in order to know that people in the Northeast which have faced high inequality problem is satisfied their living or not as well as to understand their way of thinking.

2   INCOME DISTRIBUTION IN THAILAND

2.1   Overview of Income Distribution in Thailand
During the past 2 decades, income distribution inThailand had some small improved. Gini coefficient which is an inequality index were about 0.49 to 0.54 in 1998 to 2009. Inequality in 2009 is 0.493. It reflects that most of benefit of economic growth and development fall among some small group especially the rich group. The 10 percent richest group shared 38.41percent while the 10 percent poorest group shared only 1.69 percent of total income (NESDB, 2011).

As estimated regional income inequality, Northeast is the region which highest income inequality for many years. Although, the inequality of the whole country was improved, inequality of the Northeast is still higher than those of other regions.

2.2   The Medium Term Trend of Inequality in Thailand
The hypothesis on inequality trend which has been referred and discussed widely is The Kuznets hypothesis of Simon Kuznets since the 1950s that income inequality increases in the early stage of economic development and decreases in the later stage. This could occur when people in the agricultural sector which relatively low per capita of income shift to industrial sector which has higher per capita of income. The income gap between two sectors and the higher income is incentive for labour to move to the industrial one. Consequently, the expansion of industrial size with more unequal of income distribution occurs in the first period of development. However, in the later stage when the industrialization is adjusted, income inequality decrease, and narrow the income gap. This idea can be illustrated as Kuznets inverted U- curve which the inequality index such as Gini coefficient on y axis and

Challenges of the Modern World - Contemporary Economy and Globalization

economic development, time or per capita income on x axis. The explanation of Kuznets hypothesis can be applied not only for the case of industrialization but also for other cases when the new industry emerges such as the emergence of technological innovation or IT economy as in the developed countries. The Kuznets hypothesis has been cited and discussed in many researches on income inequality and development.

In the case of Thailand, the question that whether Thailand has already passed the turning point of the Kuznet inverted U-Curve has been discussed until the present time. There is important research of Ikemoto and Uehara (2000) that analysed income inequality and Kuznets hypothesis in Thailand include the period of the rapid economic growth of Thailand that started in the latter half of the 1980s when income inequality increased very rapidly and while the industrial sector absorbed underemployed labour force in rural areas in the early 1990s. The results of this research shows that the inequality do not show clear and consistent downward trends in the mid-1990s. However, the Kuznets' curve does not necessarily appear only once but can appear several times when new high-productivity industries appear as an N-Shape.

The medium term trend of inequality in Thailand was analysed by authors as well as consider the Kuznets curve hypothesis. We also predicted the turning point by regression. The result showed that Thailand reached the turning point in the 1990s.

Moreover, as a result of Gini coefficient estimation for the medium term trend of inequality, Thailand reached the peak of inequality in 1992 with the Gini coefficient at 0.543. This also match with the period of our prediction.

It can be seen from the figure 1 below that illustrated from the Gini coefficient from 1989 to 2009 with the Peak year and Bottom year of the Gini index. From this figure, it shows the downward trend of inequality after the peak inequality of 1992 although there was some fluctuation like N-shape but the peaktrend was diminish. This could imply the development of Thai economy. However, the income distribution and regional inequality are still problem.
Chart1: Trend of inequality, 1998-2009 (Authors' Estimate)

3   FIELD SURVEY ANALYSIS

This part is based on field survey in Mahasarakham and Kalasin Provinces in the Northeast of Thailandin order to understand the real situation in the actual area as well as satisfaction of

people despite the high inequality. The survey was conducted by interviewing 43 intervieweeswhich consist of farmer about 55 percent, and people in other occupations which some of them do agriculture as well.

The questions can be categorized into 3 main focuses.
1. Opinion on income, occupation and income gap between Bangkok and Northeast
2. Satisfaction of current living
3. Opinion on support of the government

3.1 Opinion on income, occupation and income gap between Bangkok and Northeast

The objective of this part is to knowwhat people think about their income, occupation and the difference of income between Northeast and Bangkok, there are only 18.6 percent think their income is higher than other people in their province, and 81.4 percent think it is not. For the question "Does your occupation provide you with higher income than other occupations in the same province?", 16.3 percent answered "yes" and 83.7 percent answered "no". The group that answered "yes" consists of both farmer and non-farmer. However, most of respondents agree that agriculturists generally earn less income than other occupations.For the question, "Is average income of your province higher than other province in the Northeast?", 16.3 percent answered "yes" and 83.7 percent answered "no". In their point of view that whether the income gap between Northeast and Bangkok is increasing or not, 83.7 percent think the income gap between Northeast and Bangkok is increasing, and 16.3 think it is not increasing. (Chart 2).
Chart 2: Opinion on income, occupation and income gap between Bangkok and Northeast (Field survey, 2012)

Note:
1. Do you think your income is higher than other people in your province?
2. Does your occupation provide you with higher income than otheroccupations in the same province?
3. Is average income of your province higher than other provincein the Northeast?
4. Do you think the income gap between Northeast and Bangkokis increasing?

3.2 Satisfaction of current living

This section was asked in order to know that how people feel about their overall living, satisfied or unsatisfied among the high inequality situation.The questionwas whether they are sastisfied their current living or not. The answer of interviewees was inverse to the high

inequality problem. There are up to79% of interviewees answered that they are satisfied, and 20.9% are unsatisfied (Chart 3).Both answers are fromthe respondents who are farmers and non-farmers.
Chart 3: Sastisfaction of current living (Field survey, 2012)

For theinterviewees who answered "satisfied", there are 52.9 percent whose household have income more than expense (shown in the Table 2). The interesting point is the interviewees who answered "satisfied"also consist of people whose household have income less than expense 47.1 percent. It is because most of them feel that their current living is better than in the past. Therefore, they feel satisfied.There are 94.1 and 97.1 percent of "satisfied" group think that their current living is better comparing to 10 and 5 years ago.

In the group of people who answer "unsatisfied" , in term of income condition, 77.8 percent of people who are unsatisfied their current living have income less than expense. However, 44.4 percent of unsatisfied group thinktheir current living is better than in 10 and 5 years ago, and believe that their future will be better.

Table 2:Satisfaction of current living of interviewees by conditions (Field survey, 2012)

		Satisfied (100)	Unsatisfied (100)
Income	>Expense	52.9	22.2
	<Expense	47.1	77.8
Current living compare to 10 years ago	better	94.1	44.4
	same	-	33.3
	worse	5.9	22.2
Current living compare to 5 years ago	better	97.1	44.4
	same	-	33.3
	worse	2.9	22.2
Think that their future will be	better	97.1	44.4
	same	-	44.4
	worse	2.9	-
	Not sure	-	11.1

3.3   Support of the government

In every period, each government attempted to create many policies to provide high benefit to low income people. However, it is difficult to distribute enough support to allpeople

thoroughly, and sometimes the benefit could not reach to low income people due to many reasons such as misapplication of policies.

The policies which were launchedto elevate people's well-being not only in term of income but also quality of life. The policy which used and mentioned widely is the Universal Coverage Scheme or 30 baht for all health care which provide the access to necessary health services for only 30 baht(1 US$). This publicservice could reduce health expenditure and improve quality of life for low income people. However, as field survey, some inconvenience could occur because of the equity and quality of service. There are also policies focused to support the farmer group such as dept moratorium to farmers for 3 years and price guarantee for agricultural produces.

3.3.1   Enough support or not to improve the living

As survey, when asked that "Do you think you have received enoughsupports from the government, and those government policies are efficient enough to improve your living?''There are 27.9 percent of respondents think those are enough while 72.1 percent think those are not enough(Chart 4).
Chart4: Supports of the government and its efficiency(Field survey, 2012)

3.3.2   Issue of Political conflict

The issue of political conflict can affectthe economic and social development as well as impact on people's income and income distribution throughthe policy instability.In this part, we would like to know that whether they think the political conflict affected their work and life or not. The result is shown in the Chart 5. There are 51.2 percent answered "yes", they think the conflict lead to the change to new government, discontinued policies and affect to the economy that make their living more difficult, and higher cost of living. There are 48.8 percent answered "No" because they do not pay much attention on the conflict but rely on self sufficiency.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart5: Political conflict affected the work and life in interviewees' opinion (Field survey, 2012)

3.3.3 Policies which people need from the government

The Chart 6 shows the policies which interviewees think the government should launch to assist people. The policies which interviewees need the government to operate for peopleare as follows:

> 1. Income, expense, and debt problem2.Agricultural related policies3.Electricity and water supply 4.Market for product distribution 5. Support the local group and knowledge exchange for self-sufficiency 6.Funds 7.Quality of life support such as health service and education 8.Job creating and job training 9.Same standard welfare to all peopleand 10 represents the opinion from people whonot expect the government support.

The policy which most requested is policy tosupport higher income level, reduce the cost of living and solve debt problem, 26.09 percentof all requested policiies. The second one is the agricultural related policies,21.74 percent which the policy for agricultural produce's price guarantee was included.These results are consistent with the surveyon what people need from the government in the Northeast of the National Statistical Office in the Table 1.

Besides, not only support of the government, people in the local community have created the group to support member and exchange their knowledge for better living.
Chart 6: Policies which people need from the government in interviewees' opinion (Field survey, 2012)

Note: 1. Income, expense, and debt problem2.Agricultural related policies3.Electricity and water supply 4.Market for product distribution 5. Support the local group and knowledge exchange for self-sufficiency 6.Funds 7.Quality of life support such as health service and education 8.Job creating and job training 9.Same standard welfare to all people and 10 represents the opinion that not expect from the government support

4   CONCLUSION

Income distribution is one of the most important problem on economic and social development which difficult to eliminate within the short period. Although Thailand has already passed the turning point of the Kuznet's curve and the medium term trend of inequality showed some downward trend, the income distribution and regional inequality are still problem. It is important to receive the information from the people in the most unequal region in order to know their opinion in many aspects including satisfaction of living.

When asked interviewees to evaluate their income status, about 81.4 percent think they have lower income than other people even in the same province. There are 83.7 percent think their occupation does not provide them higher income than other occupations. Some people in non-farmer group also included in this answer. Furthermore, 83.7 percent of respondents also think the income gap between Bangkok and Northeast is increasing.

The interesting result is the answer of satisfaction of people on their living. The answer of intervieweeswas inverse to the high inequality problem. There are up to 79 percent of interviewees answered that they are satisfied, and only 20.9 percent are unsatisfied. Both answers are from the respondents who are farmers and non-farmers. It is because most of them feel that their current living is better than in the past.These could be imply that income level is not always the good indicator of life satisfaction.

The policy which most requested is policy tosupport higher income level, reduce the cost of living and solve debt problem, 26.09 percentof all requested policiies. The second one is the agricultural related policies which is21.74 percent.

Although, people still would like to be supported in term of income, percentage of interviewees who are satisfied their living is quite high. Futhermore, Gathering the group to support members could help to improve their livingand without waiting only government's support.

UNIVERSITY EDUCATION TOWARDS MARKET REGULATION - AN ATTEMPT TO RE-THINK ABOUT THE BENEFITS AND PROBLEMS ARISING FROM THAT

Przemyslaw Chmielecki
Nicolaus Copernicus University Toruń, Poland
pchmielecki87@gmail.com

ABSTRACT

The problem scratched in this text relates to the adaptation the university to marketed social reality. There is no doubt that this issue requires a wider reflection and discussion - not only academic. It is not only the impact of market-based solutions to the university, but also the problem of the majestic ethos of the institution, recruitment, social competence expected by employers in the face of the "final product" – university graduates. It is also important to distinguish within higher education in quality of education (university and higher vocational education). Not without significance are, still present in the background of discussions, considerations of institutional autonomy and freedom in the internal structure. In this article, two theses are presented in accordance with enclosed arguments. The first - the idea of the university in its assumptions presents a vision of the university, which is not possible to implement in the real world. The second argument points out that the problem of marketisation of the university is a multidimensional issue that cannot be assessed solely on the basis of negative consequences. Considerations are meta-theoretical and empirical creating in interdisciplinary perspective covering the philosophical, sociological and economic point of view.

Keywords: Administrative autonomy and education, Market regulations, The economy and the labor market, The university

1 INTRODUCTION

Immanuel Kant's in his work *Idea for a Universal History from a Cosmopolitan Point of View* stated that "all natural capacities of a creature are destined to evolve completely to their natural end" (Kant, 2005, p. 32). Let this thought will be my motto in following considerations. I think it captures the essence of the goal set by the university itself. This objective is extremely important, burdened with a lot of responsibility, hence the institution of the university taking this challenge needs to be extraordinary.

In this article I want to look at the undergo university to market regulations. I am *a priori* put forward two thesis: (1) **the idea of the university in its assumptions presents a vision of the university, which is not possible to implement in the real world**, (2) **the problem of marketization of the university is multidimensional and cannot be assessed solely on the basis of negative consequences**. Perhaps my proposal could be considered a cliché, but as a matter of appropriately matching arguments I will try to show that the position outlined in the thesis will not be accepted from obvious.

The structure of the sequence shows a reflection on the classic idea of a university, a paradigm shift in higher education, strategies of connecting the mission of the university with requirements of the economy and the consequences turned out from that. The whole is finished with a summary and my own proposal of combine the university with market regulations. Portions requiring special emphasis will be at work in bold.

2   CLASSIC IDEA OF THE UNIVERSITY

University since its inception has a special place in the social structure and culture. Kazimierz Twardowski (1992, p. 462) emphasizes that it has to perform the momentous task expressed as: "(...) the acquisition of scientific truths and probabilities and to foster the skills of their investigation". Founder of the Lvov-Warsaw School compares university to the lighthouse, which illuminates the way ships on a stormy sea, becoming a guiding star for navigating the unknown waters of sailors (Twardowski, 1992, pp. 464–465). It is therefore identified with compass, lodestar or gyroscope, so that a man knows which path in life should follow. The human being must in fact be independent and responsible for itself and others, rather than lifting the surface and depends on current water mimicry.

Pope John Paul II as a long-term academic scientist and researcher expressed the essence of the university as an **earnest search for the truth** and selfless passing her young, and those who learn the rules of strict reasoning to act in a righteous and better serve the human community (John Paul II, 1990).

In strong relation with this is connected **the freedom and autonomy of the university**, which is also an inherent feature of the university ethos. This "academic freedom" is a guarantee provided for all involved in teaching and research, allowing on the chosen field of knowledge seek truth according to the methods of the relevant area and share the results of this research through teaching and publication with respect for individual rights and social in the light of truth and the common good (Rynkiewicz, 2009–2010, p. 164). It is important that the scientist dealing with issues of interest will move in the area of his competence, being convinced of discovering truth, or support it. This freedom cannot be unlimited, unquestionable and absolute, because in this case it would wear the yoke of utopia (Tołłoczko, 1996, p. 241). You also cannot lose sight of the fact that the implications of responsibility for the matter of freedom. In the face of foregoing considerations should be given the validity of separation the university freedom in two dimensions. The first is carried out in the performance of its functions by the university - that is inner autonomy based from the academic tradition. The second is the lack of freedom in the form of external pressures on the professionalism and demands of the labor market (Denek, 2004, p. 62).

Didactic task of the university is to **develop theoretical thinking**. It prepares for the role of the not-humble researcher, opens young man intellectual horizons instead of locking it in tight schedules of professional roles and to follow the algorithms written by others. University differs from vocational schools that do not prepare specialists (sometimes in name only) with a narrow range of knowledge and skills. It provides wide, well established knowledge base, which supplemented with specialized practical preparation (outside of the university) can take a variety of professional roles, and if necessary, quickly change according to the situation on the labor market (Brzeziński, 2004, pp. 51–60).

An important category is **openness of the university**. It takes place at three levels: (1) **openness of the university** "from the inside" refers to exceeding the learning model, readiness for its extension, refinement of research tools, (2) openness to the truth generates more autonomy and helps avoid narrowing the horizon for immediate action for the economy, but to serve the purpose inherently cognitive, human - personal, (3) openness of the university university "from the outside" demands for cultural pluralism, freedom of research and publication, open dialogue and free development of the human creative spirit (Krąpiec, 1982,

p. 337).

At the university is constantly cultivated the value of truth, freedom, tolerance, and the timeless nature of transnational science, social service, connectivity of research and teaching, dissemination of knowledge, social and professional relationships, and self-reliance and responsibility (Lewowicki, 2004, p. 45). Thus, **the university is a place endowed with dignity and honor**. His esteem manifests itself in costumes, titles, symbols, formulas, promises, forms, diplomas, academic ceremonies, etc. Very important is also the directory of values regulating the activities of professors and students. In this area indicate, among other things: truth, freedom, tolerance, the transnational nature of science, social service, research and teaching, dissemination of knowledge, social or professional ties in academia, self-management, responsibility (Lewowicki, 2004, p. 45).

3   MARKET TRANSFORMATION AND THE UNIVERSITY

It is obvious that the labor market is one of the main recipients of the effects of the education system. **Nowadays the higher education paradigm has changed** – with the increase of demand for higher education it has become necessary but not sufficient for success in the labor market. The reason for this lies in the increase percentage of students entailing the phenomenon of inflation diplomas. It is also observable mismatch between the technical ("hard") and non-technical ("soft" - emotional, social) skills (Szafraniec, 2011, p. 137).

At present, **the overlap between education and work has become a reality** because of the education system participants enter the labor market, as well as members of the labor market participate in education in order to increase their own competence (Fedorowicz and Sitek, 2010, p. 241). However, it is possible to indulge in educational activities and work in different proportions. According to the statistics contained in the Polish government report according to increasing age decreases participation in formal education in favor of work (Fedorowicz and Sitek, 2010, p. 259).

Empirical data defend the thesis that in most economies of the OECD countries there is a strong demand for high skills and the labor market is paying for them a high price in the form of payment (Fedorowicz and Sitek, 2010, p. 252). On this basis, one can conclude that the value of higher education has a stable position with an upward trend. The problem of unemployment due among other things to the fact of **mismatch skills acquired while learning to the needs of the employers**. Conclusion that the unemployment rate is largely the result of incompatibility of demand and supply of labor is derived unanimously by many theorists and practitioners (Fedorowicz and Sitek, 2010, p. 244). Thus, the process of education and its contents are anachronistic (Boni, 2008, p. 142). Moreover, the present is another problem – **education did not adequately prepare to enter the labor market and perform tasks specific to a particular job** (Fedorowicz and Sitek, 2010, p. 267). In the eyes of employers often employees with appropriate university degree cannot perform the tasks assigned to the position. Therefore formal education still does not prejudge anything, it not translates into having the desired practical skills. Higher education was accused of improper professional practice, the dominance of theory over practice, the lack of exchange of information with the industry, lowering the level of preparedness of students and low flexibility in adapting to the needs of employers. **The employer is therefore forced to bear all the costs (money, time, efficiency, etc.) of self-training some employee to work** (Fedorowicz and Sitek, 2010, p. 267).

Idealism idea of a university is an obstacle in the way of its materialization. Allan Bloom in his widely discussed book *Closing of the American Mind* makes clear the idea that the fundamental problem of the modern university is completely blur the notion of truth in the direction of truth relativism, or even denial of the existence of absolute truth. There is therefore no point in continuing virtue of the pursuit of truth (Polakowski, 2007, p. 44).

4   COMBINING UNIVERSITY EDUCATION AND MARKET REQUIREMENTS

After the reform of Wilhelm von Humboldt clearly constituted the view, that the task of the university is only conducting research and implementation of educational obligation. The university is sometimes portrayed as "ivory tower" in which academics are locked deaf to the needs of society and practice, because they only deal with the enigmatic understood desire to discover the truth. Kazimierz Sowa argues that such notion has nothing to do with the academic tradition, because the mission of university merge three timeless elements: research, teaching, social service (Sowa, 2009, p. 14, 18). The university is also responsible for the shape of the social elite. It provides not only scientists, but also a large group of educated people. Obviously university is not involved in the organization of the labor market, but nevertheless it has a partial influence on the determination of the elite level (Przyszłość uniwersytetu, 2011, p. 235). M. A. Krąpiec argues that engagement the university with the economy is a process quite common and natural. It allows for the implementation of short-term social objectives conducive to fill jobs, growth of national prosperity and increase its importance in comparison with other countries (Krąpiec, 1982, p. 322).

In the history of the university connection its theoretical mission with social institutions practice took many different forms. It is worth to point to examples of three basic models of the European University: German, French and British.

German university model is generally identified with the figure of Immanuel Kant and Wilhelm von Humboldt. During Kant's curriculum the university was neither like modern educational and research nor vocational oriented higher education institution. It was in fact something of a loose connected scholars. Old state university was consisted of four faculties broken into two stages. Lower faculty - philosophical - have an introductory character. Higher faculties - theology, law and medicine - prepared priests, government officials and medical doctors for the public (Żelazny, 2003, p. 13). As emphasized Mirosław Żelazny "direct aim of three higher faculties are therefore not the phenomena and laws of nature studied by theoretical mind, but referring to the idea of freedom moral values of practical mind. In this sense, all three faculties are subject to state authority in the field of law, while the scholars and graduates, as experts formed a "scientific police", prevail which forms of truths in a particular country are acceptable and which should be considered as religious heresy, worship of lawlessness and charlatanism" (Żelazny, 2003, p. 27). Thus, in accordance with the ideals of Kant, the university community should be a good servant of the republic form and dependent in part to the state (Żelazny, 2003, p. 18). Königsberg philosopher postulated that the university has become a high-school with high authority which provides the opportunity to decide what in the realities of the state will be considered to be right and true. The task of create science, and its empirical verification has been supplanted outside the university. It was not until the seventeenth century scholar could present the research results within the walls of their Alma Mater under the guise of the philosophical faculty, which allow the possibility of free discussion on all matters (Żelazny, 2003, pp. 36–37).

In 1810, when Wilhelm von Humboldt was appointed Director of the Religion and Education

Section of the Ministry of Internal Affairs of Prussia he presented the revolutionary program organization of the university as an institution which creates, teaches and verifies science. This syncretic offer combined into one all research institutions in Berlin (Żelazny, 2003, p. 36). It is worth noting that the research work, in this sense, has moral significance. Humboldt postulated that on university professor can proclaim *ex cathedra* own claims, as well as approved the concept of the university independent of any religious, but subjected to state sovereignty as a financing entity (Antonowicz, 2005, p. 30). Humboldt concept clearly emphasized the unity of knowledge, professors and students, research and education. The unity of knowledge expressed in the notion that the branches of science are combined in general knowledge. Therefore they should not be separate. Unity of students and professors assumed that the teachers do not have a monopoly on truth, because it is not product but process. The unity of teaching and research involved common research, as the best way of teaching (Hejwosz, 2010, pp. 75–76). At that time, the division was formed on *Naturwissenschaften* (learn mathematics and science) and *Geistwissenschaften* (Humanities on spiritual development) (Żelazny, 2003, p. 37). In this dimension the social function of the university is closely linked to the needs of the state, because it takes the practical task of leading youth (Antonowicz, 2005, p. 31).

English universities for a long time preserved its medieval structure independent units (college) in economical, didactical and organizational way (Bartnicka and Szybiak, 2001, p. 148). The creation of the British model is associated with a Cardinal John Henry Newman lecture proclaimed during the public debate about the idea of the university in 1852. In this concept priority for university constitute its educative and education role (Antonowicz, 2005, pp. 29-30). Its aim was to broaden horizons, to made transformation of the mind, habits of thinking and to enter into social and civic interactions (Hejwosz, 2010, p. 78). Academic knowledge should meet high quality standards and should be cleaned from utilitarian-vocational connotations and serve the common good. Conducting research was the domain of external, not associated with the university institutions (Antonowicz, 2005, pp. 29–30).

Establishment of **French universities** is associated with their renewal by Napoleon. Due to the centralization of higher education area has been deprived of autonomy for the direct control of statist apparatus under the auspices of the Minister of Education (Antonowicz, 2005, p. 28). French universities had a high school special nature of a training according to the needs of the state. Research did not belong to the tasks of the university (Hejwosz, 2010, p. 75).

5 BENEFITS OF COMPOUNDING MARKET REGULATIONS AND THE UNIVERSITY

The university cannot be naive dreamy look to the future, but consciously look for the link between education and future careers of their students (Kościelniak and Makowski, 2011, p. 11). **The ability to predict the direction of changes in the labor market can better target educational activities to the needs of the labor market in the coming years** (Fedorowicz and Sitek, 2010, p. 279). The question is how to do it in practice? It is because of the openness on the relationship of the university to the labor market and business will be possible to develop common solutions. An example may be the Netherlands, where for 23 sectors of the economy have been created so-called expertise centers where are prepared, in cooperation with the social partners, relevant recommendations for the evolution of vocational education. Based on this are developed and implemented education programs (Fedorowicz and Sitek, 2010, p. 269).

Connection science and business has its justification in the advisory voice of the other on all vocational matters with whom graduates will face after receive a diploma (Przyszłość uniwersytetu, 2011, p. 240). Such action aims at, *inter alia*, **reduce the danger of unemployment among university graduates**. Is currently being developed in Europe the model of flexible labor market called *flexicurity*. It pay attention on seven factors: job security supplemented by labor mobility, developed a system of continuing education and lifelong willingness to learn, spatial mobility, unconventional forms of employment, flexible labor laws and wages, cost-effectiveness work for the tax and social security, effective system of recruitment and participation (Boni, 2009, p. 99). Currently, it is recommended to increase pressure on the qualifications as an essential condition for success in the labor market (Boni, 2009, p. 112). Not without significance is the willingness to permanent training, switching theoretical knowledge into practical skills and increase their vocational mobility (Boni, 2009, p. 113).

Additional advantages of joining university and business would be the **dynamic development of some branches of knowledge, and building strong research institutes for business**. According to the entrepreneurial approach developed will be that, what potentially could bring a profit. This is the main goal for the type of entrepreneurial university. Mirosława Pluta-Olearnik identifies four orientations of that type of university: economic (emphasis on efficiency), market (taking care of the relationship with the labor market, business networking), innovative (demonstrates the usefulness of college), managerial (managing university-enterprise) (Pluta-Olearnik, 2009, pp. 23–26). Currently, for university management are necessarily specialists in management because it requires sophisticated knowledge, experience, knowledge of the tools and *know-how* (Przyszłość uniwersytetu, 2011, p. 240). **The functioning market model of the university promotes the growth of potential of the country, both internationally and in the dimension of the quality of internal capital.**

6 PROBLEMS ARISING FROM COMBINING UNIVERSITY AND MARKET REQUIREMENTS

On the entrepreneurial university knowledge has become a commodity sold to the student-customer. It can be bought, sold - sometimes several times to different social groups (students from various fields of study, lectures open to the public). However transmitted data, cannot be too complicated or abstract, because they are directed to an indefinite, mass audience that does not pass any selection by the university. It is rather fragmented "information mush" easy to absorb. Also, academic staff must adapt to a new audience fighting for their attention. Thus, for the exchange of outstanding university professors to teach semi-skilled *quasi*-experts of a practical area of life (Bauman, 2011, pp. 48–54). Learning stripped of metaphysical change in the driving force of industrial society of curvature mercantilism-utilitarian (Alarcon, 2010, pp. 9–10). Research shows that the education system has lost its function of granting the status. The value of academic diploma in graduates saturated market drops sharply (Szafraniec, 2011, p. 90).

Therefore **there has been shallowing level of university education resulting from the increase in the number of students**. More and more noticeable is the need to change course categorical of educational *boom* from the quantitative to the qualitative (Boni, 2008, p. 74).

Łukasz Stefaniak notes that the model of higher education, which is currently being implemented, is rooted in the concept of utopia, presupposes that the increase in the level of

education will translate into an increased sense of happiness. In addition, **limiting the development of science only to the areas which could be useful for state leads to an apparent depletion of a holistic dimension of science and produce ignoramuses with a master's degree** (Stefaniak, 2010, pp. 136–137). In this situation increase the risk of closure in rigid and narrow limits of intellectual implying weakness in the adaptation of the new working conditions. Current task posed in front of the university is to identify information that is relevant, useful, and displacement of the unnecessary and complicating student's lives. That spam filtering cannot be censorship and the transfer of knowledge relevant and useful - indoctrination (Drelich, 2007, p. 55).

Adaptation to the requirements of the politics, market trends, means giving yourself off course. Through the implementation of the Bologna model Humboldt's ideal of coexistence research and teaching is abandoned for the promotion of pragmatic education. Research will be conducted on behalf of the business agencies or private entities (Kwiek, 2011, p. 88). In the case of massifi university must respond dynamically to the changing wishes of the state, students, graduates, labor market research. The University was thus faced with a dilemma to reconcile sometimes conflicting expectations of various stakeholders (Kwiek, 2011, pp. 77, 84). His chief task has now become literally understood adaptation and adaptation to changing social and economic reality (Kwiek, 2011, p. 75).

Moreover, in the university to accommodate the political and economic requirements exposes the problem that Piotr Hübner (1994, p. 144) says: "(...) **science is not production, but it is an art** - this obvious truth does not reach the decision-makers, and even more to a regular employees of department dealing with the design standards and formulating decisions".

In the global economic sphere people are referred to as "human capital", which is the use of investing, arranging, or "resources", which must be properly managed (Szkudlarek, 2002, p. 90). In fact we are dealing with the **dehumanization of man**.

7 CONCLUSION

Linking university education organized by the classical vision of *Alma Mater* with the requirements of the labor market (in wider sense economy) is similar to the dispute between the opposition qualities: on the one hand general – detail, and on the other hand theory - practice. Those approaches does not need to be competitive, but may be complementary. In accordance with Jerzy Woźnicki I would point out the need to develop a strategy evolution of the higher education institution taking into account the external volatility (in the political, economic, social dimension), impact assessment of non-permanent environment of universities, develop own strategy and internal changes inside studies system, organization and management, quality assurance. This strategy should be associated with an appropriately adjusted market categories: **market - but academic, competition - but also cooperation, customer - consumer, diversified, not always having a right, management - and representation of the environment, profit - but not as a primary objective** (Woźnicki, 1996, p. 48).

In addition, it would be erroneous assessment of the quality and relevance of university trying to combine with the requirements of the economy solely through the prism of bitter negativity or carefree euphoria. The prospect of this cooperation brings both interesting opportunities and threats. The strategy seems to be simple - should seek to maximize the benefits and leveling threats in the Aristotelian principle of the golden mean.

In my opinion, the ideal solution would be a fragmentation of the education system on the introducing part taking care of growing the humanistic part in people and the part of the practical and vocational preparing to perform certain duties. This solution essentially synthesized university with market requirements while maintaining esteem and universities in pursuit of social expectations. Universities as a special kind of education should take care of their own individuality in fulfilling the task of training the elite intellectual culture and multiply at a high level. They guard the value of science and maintaining the standards of intellectual, methodological and ethical issues. In addition, the university needed a contemporary masters and guides who will lead students and also academic staff as students partners (Szymanski, 2004, p. 79). Perhaps a second area of education will be carried out outside the university, because this institution is not (and will not for a long time) ready to represent the level of specialized professional institutions.

ABSTRACT
Although there are many different quality services and features in nowadays tourism, new business ideas emerge on daily basis. Even during the global crisis period people tend to travel at least during the summer or winter vacation. There are numerous factors that influence the final choice of the preferred tourist destination like travel distance, sights attractiveness, nightlife possibilities, reputation of the destination, shopping possibilities, the cost of travel and the price level at the destination. Analytic Hierarchy Process (AHP Method) is well known decision-making tool that represents strong support in any business sector or private life. Making final decision represents very complicated process if there are many available or possible alternatives or if indecision appears. Suggested way of the categorization and classification in tourism with AHP Method as decision-making tool both improves tourist offer and drastically simplifies the ideal destination selection process for travellers. Most common factors - criteria that influence the choice of travel destination were obtained by survey.

Keywords: AHP Method, Categorization in Tourism, Saaty's Scale, Travel Agency Offer

1 INTRODUCTION

Any idea or component that can improve tourism sector must be taken seriously since tourism income represents an important source for expansion and modernization of infrastructure in a country (Bhatia, 2006, p. 41) as well as it is a great employment generator. Tourism nowadays offers a variety of options, actions, discounts and possibilities. The purpose of the paper is to simplify the decision making process and to adapt the whole process of choosing destination to customer needs. Most customers already have their intended destination, still there are many who prefer to look at the offer and choose the perfect or ideal one. There are many factors which stimulate the desire to travel: art, music, architecture, engineering achievements and many other areas of activity have tourist appeal (Goeldner, 2009, p. 280). These factors form following categories or types of tourism: ethnic tourism, cultural tourism, recreational tourism, historical tourism, environmental tourism, business and conference tourism, health tourism, event and nightlife tourism, yet it is hard to uniquely define tourism categories because distinctions between the categories are not always clear (Wall, 2006, p. 27) and they vary depending on the author. There are also many factors that limit people and narrow their choice of destinations like lack of free time, very distant routes or financial limitations - especially in times of crisis. For this reason and further due to constant

competition increase and because of more new services emerging on daily basis, any novelty or addition in the tourist offer is often crucial for success.

2   CRITERIA FOR THE DECISION

Regarding the categories of tourism and motivators that encourage people to travel, certain patterns and experiences form most common criteria that influence both selection and final choice of travel destination. The survey was made in order to answer the question: "Which criteria are crucial in the process of choosing travel destination for vacation?". Business and obligatory trips are excluded from this study because in these specific cases people do not choose where to travel.

2.1   The Survey

To get most common criteria that influence the process of choosing travel destination people were asked to indicate three (3) most important criteria for making the decision when planning to travel.

Question from the survey:
1.   *Name three (3) main criteria for choosing where to travel for vacation?*
Survey was conducted via email and responses were collected from 179 random and anonymous persons. Five most common criteria were highlighted as shown in Chart 1. There are total of thirteen different criteria indicated with frequencies as follows:
1. Cost of travel - (97)
2. Nightlife possibilities - (81)
3. Sights attractiveness - (99)
4. Travel distance - (88)
5. Shopping possibilities - (28)
6. Place reputation ("Brand" places) – (67)
7. Local prices level – (27)
8. Exploring exotic cultures – (13)
9. Swimming possibility – (9)
10. Usual local weather conditions – (4)
11. Religious contents or events – (7)
12. Way of transportation – (14)
13. Skiing possibility – (3)

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 1: Survey results: all mentioned criteria and their frequencies

Besides the fact that sights attractiveness, cost of travel, total distance, nightlife possibilities and place reputation emerged as most important ones, some specific situations exclude the need of even mentioning some criteria. During summer vacation for example, when most people want to travel to a seaside, there is no need to mention swimming possibility because that is usually expected or "a must have option". Same thing happens in winter period when people go skiing.

2.2   Criteria: survey vs. business and personal experience

Mentioned survey does not have scientific support that is strong enough to make one general model out of obtained information, but that is also not the purpose of the paper. The purpose of the paper is to offer Analytic Hierarchy Process (AHP Method) as a tool for making best choice. Criteria can be defined or found in many different ways. It is important to emphasize that travel agencies can define criteria they find important by themselves. It is also advisable to give customers the possibility of specifying the criteria that they consider relevant or indicate as important. This small survey only helped this study to get some most common ones. After relevant criteria are defined, the process of making final and best choice goes to the next step.

3   TRAVEL   AGENCY   OFFER: ALTERNATIVES   AND   THEIR   CATEGORIZATION USING DEFINED CRITERIA

Chosen criteria are further used for categorization of each destination which is included in travel agency offer, or in other words to evaluate each criterion of offered destination. This is made by rating each criterion by different numerical value out of chosen range, and each

Challenges of the Modern World - Contemporary Economy and Globalization

numerical value stands for certain characteristic. Example of destination categorization and criterion evaluation is shown in Table 1.

Table 1: Example: Categorization of travel agency offer and evaluation of each criterion

	SIGHTS	COST	DISTANCE	NIGHTLIFE	REPUTATION
Destination A	0,25	0,50	1	1	1
Destination B	1	0,75	0,75	0,50	0,75
Destination C	0,75	0,75	0,50	0,25	0,25
Destination D	0,50	1	0,25	0,25	0,25

Evaluation of each criterion is described with the example below:

Chosen range for evaluation: rating with 4 levels of evaluation
Sights attractiveness:
0,25 – very few sights
0,50 – average
0,75 – more than average
1,00 – place is well known as cultural sights centre

Cost of travel:
0,25 – very expensive
0,50 – average
0,75 – affordable
1,00 – low-cost

Distance:
0,25 – far-off
0,50 – average
0,75 – close
1,00 – "neighborhood"

Nightlife possibilities:
0,25 – no options
0,50 – average
0,75 – many options
1,00 – nightlife centre

Place reputation:
0,25 – not a famous place
0,50 – average
0,75 – well known place
1,00 – highly attractive and famous place

Since there are customers who find some usually negative criterion values as positive ones, this categorization and evaluation must be easily adjustable to a customer needs. For example, people who prefer luxury do not find attractive something that is low-cost, or ones who are trying to rest in a quite place do not find nightlife centre attractive.

4 IMPORTANCE OF CRITERIA IN THE SERVICE OF FINDING BEST CHOICE

After previous step has been properly done, customer assigns certain level of importance to each mentioned criterion depending on his personal preferences. The rest of the process is based on earlier mentioned AHP method, which was developed by Thomas L. Saaty, American mathematician. In using the AHP to model a problem, one needs a hierarchic or a network structure to represent that model, as well as pair wise comparisons to establish relations within the structure (Saaty, 2012, p. 3). Therefore all criteria have to be compared with each other with purpose to get an order of importance for each customer. The comparison is made using Saaty's scale (Table 2).

Table 2: Saaty's Scale Of Absolute Numbers (Saaty, 2006, p. 3)

Intensity of Importance	Definition	Explanation
1	Equal importance	Two activities contribute equally to the objective
3	Moderate importance	Experience and judgment slightly favor one activity over another
5	Strong importance	Experience and judgment strongly favor one activity over another
7	Very strong importance	One activity is favored very strongly over another, its dominance is demonstrated in practice
9	Extreme importance	The evidence favoring one activity over another is of the highest possible order of affirmation
2 – Weak, 4 – Moderate plus, 6 – Strong plus, 8 – Very, very strong (Intermediate values) Intensities 1.1, 1.2, 1.3 etc. can be used for elements that are very close in importance.		

Using the table above customer is asked to specify which criterion dominates over another. As mentioned earlier, comparison is preformed pair wise. Example of collected information on criteria importance is show in Table 3.

Table 3: Example of customer possible preferences (criteria comparison)

	SIGHTS	COST	DISTANCE	NIGHTLIFE	REPUTATION
SIGHTS	1	5	7	9	3
COST	1/5	1	5	9	3
DISTANCE	1/7	1/5	1	3	1/5
NIGHTLIFE	1/9	1/9	1/3	1	1/7
REPUTATION	1/3	1/3	5	7	1

If criterion A has moderate importance over criterion B for example, it will be shown with number 5 (as specified in Saaty's scale). Reciprocal value (1/5) is immediately assigned as importance of criterion B over criterion A.

Results shown in table above indicate that place reputation for example has strong importance over distance, very strong importance over nightlife possibilities, yet both sights attractiveness and cost of travel have moderate importance over that criterion. In other words, whole number stands for domination while fraction stands for subordination of one criterion over another.

Challenges of the Modern World - Contemporary Economy and Globalization

The process of finding the exact importance of each criterion continues by calculating fractions and column sums further as shown in Table 4.

Table 4: Calculated fractions and column sums (base for normalized matrix)

SIGHTS	COST	DISTANCE	NIGHTLIFE	REPUTATION
1	5	7	9	3
0,20	1	5	9	3
0,14	0,20	1	3	0,20
0,11	0,11	0,33	1	0,14
0,33	0,33	5	7	1
1,78	**6,64**	**18,33**	**29**	**7,36**

*Hint: column SIGHTS elements (numbers 1; 0,20; 0,14; 0,11; 0,33) are all divided by 1,78, column COST elements (numbers 5; 1; 0,20; 0,11; 0,33) are all divided by 6,64 etc.

Each element obtained using Saaty's scale is further divided by its column sum to get normalized matrix as shown in Table 5.

Table 5: Criteria importance

0,5618	0,7530	0,3819	0,3103	0,4077	**0,48**
0,1124	0,1506	0,2728	0,3103	0,4077	**0,25**
0,0787	0,0301	0,0546	0,1035	0,0272	**0,06**
0,0618	0,0166	0,0180	0,0345	0,0190	**0,03**
0,1854	0,0497	0,2728	0,2414	0,1359	**0,18**
					∑=1

Importance (weight) of each criterion is finally calculated as row average. Example shows that observed customer indicates sight attractiveness as most relevant criterion when deciding where to travel. This criterion has importance intensity of 48%. Cost of travel has 25%, traveling distance only 6%, nightlife possibilities even less (3%) and place reputation has 18% of importance.

5 FINAL RESULT – PERSONALIZED EVALUATION

Since offered destinations are already rated (Table 1.), the only thing left to do is to calculate new evaluation of each destination customized and adjusted to customer requirements. Process is finalized by multiplying each rate by percentage assigned to each criterion (Table 6).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 6: Final result based on customer requirements

	SIGHTS	COST	DISTANCE	NIGHTLIFE	REPUTATION
Destination A	0,25	0,50	1	1	1
Destination B	1	0,75	0,75	0,50	0,75
Destination C	0,75	0,75	0,50	0,25	0,25
Destination D	0,50	1	0,25	0,25	0,25
Customized evaluation of each destination based on customer preferences					
Destination A	0,12	0,125	0,06	0,03	0,18
Destination B	0,48	0,1875	0,045	0,015	0,135
Destination C	0,36	0,1875	0,03	0,0075	0,045
Destination D	0,24	0,25	0,015	0,0075	0,045
Final standings (row sum)					

Destination B	0,8625
Destination C	0,63
Destination D	0,5575
Destination A	0,515

Initial evaluation (Table 1. row sums) shows results as follows:
Destination A: 3,75
Destination B: 3,75
Destination C: 2,50
Destination D: 2,25

Whole process is based on new way of travel agency offer categorization. If initial categorization is properly done, all customers can get their "perfect destination" after indicating their importance of each criterion over another. It surely means that best calculated destination indeed perfectly suits customer requirements, although human factor with subconscious can impact on customer final choice. This tool only offers one way to meet customer needs with purpose to refresh and innovate travel agencies range of services, which is extremely important since innovation provides "first mover advantage" (Hall, 2008, p. 33).

6 CONCLUSION
Travel agencies nowadays already have great competition with on-line services development, (Booking.com for example) therefore any refreshment in approach to customers can be crucial for their business success. Although mathematical result does not always assure customer's satisfaction, described method separates attractive options from unattractive ones due to customer's preferences clearly. This study represents an easy way to offer something different without any expenses in time of global crisis.

CENTRES OF THE ECONOMY IN THE ASIA-PACIFIC REGION: CITIES IN THE SHADOW OF TOKYO AND BEIJING

Gyorgy Csomos
Faculty of Engineering, University of Debrecen, Hungary
csomos@eng.unideb.hu

ABSTRACT

In studies concerning metropolises, it is Tokyo, and to some extent Hong Kong, Osaka, Seoul and Sydney that are generally mentioned as major economic centres in the Asia-Pacific region. Recent years, however, have seen radical changes in global economy (among other things the global economic crises emerging in 2008), and, as a result, the position of cities, which has been thought to be constant, has changed considerably. It is well documented that the major cities of developing countries – primarily China, India and most of the Southeast Asian economies – have closed the gap to the traditional centres, and in several cases they have also seized regional control and command functions. The aim of this paper is to examine how the position of cities in the Asia-Pacific region changed in the period from 2006 to 2011. In the second part of the paper we will compare the functions of Tokyo and Beijing as the most significant control and command centres in the region.

Keywords: Beijing, Command and control functions, Global economy, Headquerters, Tokyo

1 INTRODUCTION

Since the 1970s, an increasing number of socio-economic studies have been conducted to demonstrate changes in the global economy via the economic parameters of cities (Friedmann, 1986; Beaverstock et al., 1999; Sassen, 2006). A popular orientation of research is represented by analyses that focus on the control and command functions of cities, where the spatial concentration of multinational companies (MNCs) is regarded as an important indicator (Godfrey and Zhou, 1999; Alderson and Beckfield, 2004; Allen, 2010; Derudder et al., 2010; Taylor and Csomós, 2012). Due to the situation of the global economy over this period, the initial studies looked at the cities of the developed world, particularly the United States, Western Europe and Japan (Hall, 1966; Jacobs, 1969; Hymer, 1972; Heenan, 1977; Friedmann, 1986). Then, from the middle of the 1980s – primarily owing to the growing economic strength of China – the Asia-Pacific region gradually gained and new economic nodal points emerged in addition to the major Japanese cities (Tokyo, Osaka and Nagoya).

This process can be tracked in the current orientations of research. According to the world city hierarchy defined by Friedmann (1986), Tokyo (primary core city), Sydney (secondary core city) and Singapore (semi-peripherial primary city) dominated in Asia-Pacific, while the other cities of the region continued to play rather peripheral roles. The studies of the following decade were largely dominated by Sassen's work (1991), The Global City (Taylor, 2004). According to Sassen (1991, p. 4), changes in the functioning of cities have had a massive impact upon both international economic activity and urban form: cities concentrate control over vast resources, while finance specialized service industries have restricted the urban social and economic order. Thus a new type of city has appeared. It is the global city. Leading examples now are New York, London, Tokyo, Frankfurt, and Paris. Among global cities, Asia-Pacific was essentially represented only by Tokyo, though Sassen (1991, p. 174) pointed out that Hong Kong has been a key intersection of different worlds, forever a strategic exchange node for firms from China to the rest of the world and from the rest of the world to

China, as well as among all the overseas Chinese communities. Beaverstock et al. (1999) ranked 122 cities of the world on the basis of the spatial concentration of advanced producer services (GaWC inventory). Their studies concluded that Tokyo, Hong Kong and Singapore belonged to the group of alpha world cities, Sydney and Seoul were beta world cities, while gamma world cities also included two Chinese cities: Beijing and Shanghai. In fact, similar results were yielded by the other research work of the period: Asia-Pacific was connected to the global economy primarily via Tokyo, Hong Kong and Singapore, while other (mostly gateway) cities (e.g. Bangkok, Beijing, Jakarta, Kuala Lumpur, Mumbai, Shanghai, Shenzhen, Taipei City) took regional roles (Friedmann, 1995; Beaverstock et al., 2000; Taylor et al., 2002; Sim et al., 2003; Taylor et al., 2004).

The first years after the turn of the millennium saw the emergence of several studies calling attention to the fact that the major cities of the Asia-Pacificn region were striving for dominant roles in the sectors formerly mainly dominated by European, Japanese and North American cities (Gu and Tang, 2002; Taylor et al., 2002; Yulong and Hamnett, 2002; Hutton, 2004; Taylor, 2011; Yeung, 2011). Hanssens et al. (2011) examined the sectoral network connectivities of 307 cities across the world in 2000 and then in 2008, in the sectors of accountancy, advertising, financial services, law and management consultancy. According to these results, the largest growths in connectivity were shown by the Chinese cities, primarily Beijing and Shanghai, as well as Seoul, Mumbai, Kuala Lumpur, Hong Kong and Singapore in certain sectors. Therefore, the dominance of the major cities of Asia-Pacific increased in those sectors (advanced producer services) that had formerly been characteristic mainly of global cities (Sassen, 1991) and alpha world cities (Beaverstock et al., 1999).

The financial and subsequent economic global crisis which emerged in 2008 has impacted on national economies to a differing extent, and rearranged the global positions of the cities (Rose and Spiegel, 2012). According to UN-HABITAT (2011), recently the Top40 global cities ranking is headed by New York and London followed by the major cities of Asia-Pacific: Hong Kong, Singapore, Beijing, Shanghai and Tokyo. The analysis claims that just within ten years a change will occur: New York and London will be able to maintain their leading positions, but Shanghai and Beijing will close up to the 3rd and 4th place, while Mumbai will occupy the 7th place behind Hong Kong and Singapore, but ahead of Tokyo. Recently, the global and regional strengthening of China – and parallelly Chinese cities – is clearly documented by a number of current studies (Logan, 2002; Yulong and Hamnett, 2002; Zhao et al., 2003; Lin, 2004; Wu, 2005; Li et al., 2012).

Our analysis examines the command and control functions of the cities of the Asia-Pacific region, and we then use this as the basis for a type of city ranking. Although Godfrey and Zhou (1999) have argued that headquarter functions are a poor way of measuring the 'global urban hierarchy' – particularly in under-estimating the importance of 'third world cities' – and they suggest more emphasis be given to regional headquarters that reflect strategic location decisions rather than simply where a company first started. However, while accepting the above-mentioned criticism, we think that changes in the control and command functions well reflect changes in the processes of the global economy (Taylor and Csomós, 2011).

Challenges of the Modern World - Contemporary Economy and Globalization

2   DATA ORGANIZATION AND METHODOLOGY

2.1   Multinational Enterprises

For the purpose of the comparative analysis, the Forbes „The Global 2000" 2006 and 2011 rankings have been used. Forbes ranks the world's 2000 largest public companies with respect to four typical parameters of these companies: revenue, assets, profit and market value (in our later calculations, we have also used these parameters). Concerning the underlying ratios, the most dynamic growth (6.1% on average) has taken place in the Asia-Pacific region, primarily fuelled by the sky-rocketing Chinese economy (Lee and Hong, 2012).

In the years under review, Japan had the largest number of Forbes companies, though compared to 2006 this number dropped by nearly 19%, while China witnessed a 160% increase. In 2006, Japan topped the rankings for all four of the economic parameters used to measure the companies, yet by 2011 China came to the fore with respect to both profits and assets. These two economies clearly stand out against the other countries of Asia-Pacific, with South Korea and India (although obviously with by no means negligible performances in international terms) lagging far behind.

2.2   GICS sectors

The Forbes 2000 companies have been categorized on the basis of the Global Industry Classification Standard (GICS) developed by Morgan Stanley Capital International (MSCI) and Standard & Poor's. GICS consists of 154 sub-industries, 68 industries, 24 industry groups and 10 sectors. From the perspective of the analysis, a major advantage of the application of the analysis is that until 2010 Forbes also preferred to use the GICS industrial group classification, and then from 2011 they switched to a more detailed classification, relying instead on the characteristics of different sectors, which obviously results in a sector-based categorization (Taylor and Csomós, 2012).

By 2011, the number of Forbes companies increased in all the GICS sectors, with the exception of telecommunications services, where it decreased by one. In 2006 and 2011 the financial and industrial sectors accounted for more than half of the companies. On the other hand, the relatively high proportion of companies operating in the financial sector suggests that more than 30% of these companies were not performing productive operations in either year.

2.3   Metropolitan Areas

We do not treat headquarter (HQ) cities as independent units, but have grouped them into more extensive metropolitan zones. The metropolitan zones have primarily been identified on the basis of the definitions of the national statistical offices concerned. For instance, Tokyo in the analysis effectively corresponds to the Tokyo Urban Employment Area, including – among others – the cities of Chiba, Kawasaki and Yokohama. The other chapters of the analysis interpret HQ cities as being identical to the HQ metropolitan areas. Both in 2006 and 2011, Japan had the largest number of HQ cities, but in the reviewed period the number of HQ cities in China increased by more than 400%.

2.4   Methodolgy

As has been mentioned above, the weights of the individual cities have been determined considering four typical parameters of companies, relying on the following method:

Challenges of the Modern World - Contemporary Economy and Globalization

Companies operating in HQ cities have been classified into the appropriate GICS sectors, broken down into the individual cities. In the majority of the cities, the companies have been interested in only one sector, while in larger cities there have been several sectors involving several companies (in both years under review, Tokyo was the only city where companies operated in all the ten GICS sectors).

The weights of the cities have been determined for 2011 and 2006, in a breakdown for the GICS sectors, for each of the parameters.

$$Weight_{city,sector,year} = \frac{WR_{city,sector,year} + WA_{city,sector,year} + WP_{city,sector,year} + WMV_{city,sector,year}}{4}$$

Where:
- WR$_{city, sector, year}$ = the percentage of revenues in a given headquarter city in a given GICS sector a given year
- WA$_{city, sector, year}$ = the percentage of assets in a given headquarter city in a given GICS sector a given year
- WP$_{city, sector, year}$ = the percentage of profits in a given headquarter city in a given GICS sector a given year
- WMV$_{city, sector, year}$ = the percentage of market value in a given headquarter city in a given GICS sector a given year

3 CITIES AS CENTRES OF THE ECONOMY IN THE ASIA-PACIFIC REGION

Recently, Asia-Pacific is the hottest area of global economy (Lee and Heshmati, 2009), where the rate of economic growth in several countries of the region has remained up at double digits in spite of the global economic crisis (Lee and Hong, 2012). There is sharp competition between the world's second and third largest economic powers, i.e. China and Japan (Chen and Hsiao, 2008), while the economic performance of several developed countries (Singapore, South Korea) and emerging economies (India, Indonesia, Malaysia, Thailand) of the region is enhancing by leaps and bounds. This is a fairly complex environment that sets even cities with regional command and control functions to be in continuous movement. While in North America the leading position of New York or that of London and Paris in Europe is not challenged by any other city (Taylor et al., 2009; Csomós and Derudder, 2012), in Asia-Pacific the formerly dominant Tokyo has been closely approximated (and furthermore overtaken in some areas) by Beijing (Lee et al., 2012).

As is shown by Table 1, the HQ cities ranking – irrespective of the changes in the sectors – continues to be topped by Tokyo, although its weight dropped by nearly 40% in the period under review. In 2011, Beijing came second, ahead of Seoul and approaching Tokyo. Seoul fell back to fourth, while the third place in the 2011 rankings was occupied by Hong Kong. From Table 6, it is clear that the Japanese cities in general lost a lot of their weight; in total the value of Tokyo, Osaka, Toyota, Nagoya and Kyoto shrank by half. Nevertheless, growth was not solely a characteristic of Chinese cities, though it is undoubted that the change turned out to be the most spectacular in the case of Beijing and Hong Kong. Smaller increases were achieved by Indian cities (Mumbai and Delhi), as well as by Singapore, Kuala Lumpur and Bangkok.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Top10 headquarter cities by total weight, 2006/2011

Rank	City	Country	Weight 2006	City	Country	Weight 2011
1	Tokyo	Japan	37.71	Tokyo	Japan	23.15
2	Seoul	South Korea	8.43	Beijing	China	18.68
3	Beijing	China	6.45	Hong Kong	Hong Kong/China	8.11
4	Osaka	Japan	5.90	Seoul	South Korea	7.16
5	Hong Kong	Hong Kong/China	5.66	Melbourne	Australia	3.88
6	Melbourne	Australia	4.06	Sydney	Australia	3.57
7	Sydney	Australia	3.55	Mumbai	India	3.28
8	Taipei City	Taiwan	3.21	Osaka	Japan	2.70
9	Toyota	Japan	2.71	Taipei City	Taiwan	2.55
10	Singapore	Singapore	1.94	Shanghai	China	2.49

Tokyo, Beijing, Hong Kong and Seoul are the cities of the region with dominant command and control functions, and in 2011 together they made up 57% of Asia-Pacific's overall weight. Table 2 demonstrates that considering the weights of headquarter cities the largest growth – as has been mentioned above – was realized in Beijing and Hong Kong. Beside Chinese cities, Indian cities were also rising markedly, in particular Mumbai, Delhi, Kolkata and Hyderabad. At the same time, in parallel with the general increase of the weight of the region the capital cities (Kuala Lumpur, Bangkok, Manila and Jakarta) of the Southeast Asian economies were growing to varied extents.

Table 2: Top10 headquarter cities with positive change of weight, 2011/2006

Rank	City	Country	Change of weight 11-06
1	Beijing	China	12.23
2	Hong Kong	Hong Kong/China	2.46
3	Shanghai	China	1.85
4	Mumbai	India	1.40
5	Shenzhen	China	1.33
6	Delhi	India	0.45
7	Singapore	Singapore	0.42
8	Kuala Lumpur	Malaysia	0.41
9	Perth	Australia	0.35
10	Guangzhou	China	0.33

In contrast, the weights of Japanese cities were significantly shrinking, with just three cities showing any increase in the period under review (+0.17 in total), whereas 53 cities suffered some drop (-22.87 in total). Table 3 reflects that apart from the Japanese headquarter cities it was primarily the cities of Taiwan that lost some of their value in 2006, with the largest decrease occurring with the capital, Taipei City.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Top10 headquarter cities with negative change of weight, 2011/2006

Rank	City	Country	Change of weight 11-06
1	Tokyo	Japan	-14.56
2	Osaka	Japan	-3.20
3	Toyota	Japan	-1.47
4	Seoul	South Korea	-1.27
5	Taipei City	Taiwan	-0.66
6	Nagoya	Japan	-0.54
7	Kyoto	Japan	-0.35
8	Hsinchu City	Taiwan	-0.30
9	Kariya	Japan	-0.28
10	Hiroshima	Japan	-0.27

In 2006, the sector featuring the largest volume was Tokyo's financial sector, where 41 companies were operating, i.e. 7% of all the Forbes companies in Asia-Pacific (Table 4). The weight of this sector is well exemplified by the fact that its value was in itself larger than the aggregate weight of Seoul, which ranked second among the cities. Half of the ten sectors with the largest weights belonged to Tokyo in 2006. Half of the ten sectors with the largest weights belonged to Tokyo in 2006. Toyota was the only city that was able to enter the Top10 with only one company (Toyota Motor Corporation) in a single sector (Consumer Discretionary).

Table 4: Top10 headquarter cities with the largest weight in different GICS sectors, 2006/2011

Rank	City	Country	GICS sector	Weight 2006	City	Country	GICS sector	Weight 2011
1	Tokyo	Japan	Financials	12.88	Beijing	China	Financials	11.33
2	Tokyo	Japan	Industrials	8.25	Tokyo	Japan	Financials	8.07
3	Tokyo	Japan	Consumer Discretionary	4.24	Tokyo	Japan	Industrials	4.80
4	Beijing	China	Energy	2.97	Beijing	China	Energy	4.41
5	Tokyo	Japan	Materials	2.95	Sydney	Australia	Financials	2.75
6	Toyota	Japan	Consumer Discretionary	2.71	Hong Kong	Hong Kong/China	Financials	2.34
7	Tokyo	Japan	Information Technology	2.61	Hong Kong	Hong Kong/China	Industrials	2.30
8	Sydney	Australia	Financials	2.53	Tokyo	Japan	Consumer Discretionary	2.25
9	Seoul	South Korea	Financials	2.18	Seoul	South Korea	Financials	1.99
10	Beijing	China	Financials	2.14	Seoul	South Korea	Information Technology	1.94

By 2011, considerable changes had occurred: the weight of Tokyo's financial sector dropped by more than 30%, while the weight of its industrial sector, which still ranked second in 2006, decreased by 40%. In contrast, by 2011 Beijing's financial sector had risen to first place, which was primarily due to the outstanding performance of giant banks (Industrial and Commercial Bank of China – ICBC and China Construction Bank). The strengthening of China's financial sector is indicated by the fact that in 2011 – beside Beijing – Hong Kong's financial sector also entered the Top10. Beijing's energy sector was kept in fourth place by the rapid growth of two oil industry giants: the company with the fifth largest turnover in the world, the Sinopec and the third most valuable firm, the PetroChina.

Hong Kong succeeded in improving its positions, and entered the Top10 in two sectors (financial and industrial) at the same time. According to Sassen (1991, p. 174) Hong Kong could only lose its historic role if all investor interest in China would cease, or if Shanghai could replicate the combination of resources represented by Hong Kong. Both of these conditions are unlikely in the near future. On the basis of our analysis, this should be accepted as true (not only with regard to Hong Kong, but also to Beijing) in spite of the fact that according to Walcott and Pannell (2006, p. 200) Shanghai is China's largest and greatest commercial and industrial city.

4   DECLINING TOKYO AND RISING BEIJING?

The previous chapters have clearly shown that the major command and control centre of the Asia-Pacific region is still Tokyo, though with a diminishing weight, while Beijing has emerged as its most significant competitor. When looking at only changes in the weights of the two cities, it could be forecast that in the foreseeable future Beijing would come ahead of Tokyo, and rise to the level of New York and London in global economic control (in practice by taking over the role of Tokyo). However, when examining the structure of the various industrial sectors of the cities, the overall picture is much more complex, and the above assumption seems to be less well-grounded. From among the examined Asia-Pacific cities, Tokyo has the most well-balanced economic structure, it is only the Japanese capital, where all the 10 GICS sectors can be found (and beside Tokyo, even globally only New York, London and Paris belong to this group of cities). In contrast, the global companies concentrated in Beijing are involved just in eight sectors, and the Consumer Staples and Health Care sectors are in fact not present. Table 5 reflects that in the period from 2006 to 2011 the weights of all the sectors in Tokyo diminished, and the financial and industrial sectors primarily impacted by the economic crisis have lost the most. On the other hand, in Beijing only the Telecommunication Services sector suffered some minimum decrease, while in the other sectors various growth rates could be recorded. In the period under review, the most dynamically developing sector of the Chinese capital was Financials. The growth rate itself in 2006–2011 (+9.19) was larger than the absolute weight of the Financials sector in Tokyo in 2011; if in Beijing only this sector were present, then it would be the second most significant city in the Asia-Pacific region. If the examined trends do not change, meaning that the weights of Tokyo's sectors will further decrease, while the drastic increase in the weight of Beijing's Financials sector continues, then it can be suggested that the Chinese capital will become the leading command and control centre of the Asia-Pacific region in the foreseeable future.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 5: Changes of Tokyo's and Beijing's aggregate weights in different GISC sectors, 2006/2011

GICS Sectors	Weight, Tokyo, 2006	Weight, Tokyo, 2011	Change of weight, Tokyo	Weight, Beijing, 2006	Weight, Beijing, 2011	Change of weight, Beijing
Consumer Discretionary	4.24	2.25	**-1.98**	0.00	0.05	**0.05**
Consumer Staples	2.10	1.36	**-0.73**	0.00	0.00	**0.00**
Energy	1.03	0.91	**-0.12**	2.97	4.41	**1.44**
Financials	12.88	8.07	**-4.81**	2.14	11.33	**9.19**
Health Care	0.79	0.70	**-0.09**	0.00	0.00	**0.00**
Industrials	8.25	4.80	**-3.44**	0.19	1.19	**1.00**
Information Technology	2.61	1.77	**-0.84**	0.00	0.17	**0.17**
Materials	2.95	1.27	**-1.68**	0.37	0.82	**0.45**
Telecommunications Services	1.87	1.43	**-0.45**	0.54	0.36	**-0.19**
Utilities	1.00	0.58	**-0.42**	0.23	0.37	**0.14**

At the same time, it is this very, relatively out-of-balance economic structure that threatens the regional and global position of Beijing the most. To the combined weight of the Chinese capital (raising the city to the second rank among the cities of the region), the Financials sector has a nearly 50% contribution, while in the case of Tokyo this rate is only 35%. In Beijing, the weight of the second-ranking Energy sector is only one-third of the weight of Financials, and its growth dynamics are even smaller, while in the other sectors they are in fact negligible, at least in comparison with the Financials (as it is shown in Table 5). In 2011, the Nobel Prize winner economist, Paul Krugman explained his opinion in The New York Times: today, China is walking the way similar to that of Japan in the late 1980s, or the United States in the middle of the 2000s, because one of the major sources of GDP growth is the overheated investment boom into the real estate sector (the volume of real estate investment has roughly doubled as a share of Chinese GDP since 2000). Nevertheless, a burst of the real estate bubble may easily lead to an economic crisis, which is clearly exemplified by Japan's lost decade or the financial crisis starting in 2007 from the United States and plunging the global economy into depression for years. Such a hypothetical financial crisis would cause serious damage to the Chinese banking system, primarily in its centre, Beijing. With its financial sector shaken (not to mention its impacts on the other sectors), the Chinese capital would indeed lose its currently dominant position in the region, undoubtedly leaving Tokyo alone at the helm.

5   CONSLUSION

When the command and control functions of the cities in the Asia-Pacific region are studied, a major process of rearrangement can be identified. The leading cities of Japan, especially Tokyo, Osaka and Nagoya, are continuously losing weight, whereas cities in China (Beijing, Hong Kong, Shanghai, Shenzhen and Guangzhou), India (Mumbai, Delhi and Kolkata) and Southeast Asia (Bangkok, Jakarta, Kuala Lumpur and Manila) are strengthening. Obviously, the studies conducted in recent years have never questioned this fact, but it is important to emphasize that in terms of control and command functions they do not simply experience relative growth. The major cities of the developing world are occupying leading economic control positions, and seizing the positions of traditional control and command centres, e.g. Tokyo, Seoul and Osaka.

All these changes are extremely important, and raise a question which is in no way purely theoretical: should we reconsider our well-grounded concept of the global city; can the formerly established order change? Naturally, opinions tend to diverge on this issue, for

instance Wu and Ma (2006, p. 192) argued: When the attention is shifted towards the ''frontier of globalization,'' where many cities in developing countries or newly industrializing economies are competing for global city status, the indicators of global functions such as the number of MNC headquarters become less important—because through understanding globalization as a process, what matters is the essence and scale of their transformation rather than their absolute status in the world city hierarchy. The question is not whether these cities are global cities – as obviously they are not when compared such cities as New York, London and Tokyo – in the sense of their status in the global urban hierarchy.

At the same time it should be emphasized – and it has been confirmed by our analysis – that in the Asia-Pacific region Tokyo's leading role in economic control is no longer unchallenged, because it has been approached by Beijing. The dynamic growth of the Chinese economy (in 2010, China became the world's second largest economy, right behind the United States) suggests that primarily Beijing, Hong Kong, Shanghai and Shenzhen will in the future acquire further command and control functions to strengthen their roles in economic control. Alvstam et al. (2009, p. 206) claims that Chinese companies have started to become more active on the international market, with interest in buying foreign competitors or potential technology partners, and this process fundamentally contributes to the regional and global strengthening of Chinese cities. The most spectacular example is the acquisition of IBM's personal computer business (ThinkPad) line in 2005 by Lenovo Group, or the takeover of Volvo Cars in 2010 by Zhejiang Geely Holding Group. These acquisitions are not unique examples – though are decidedly the most significant ones –, and according to The Wall Street Journal (2011) this process is accelerating in parallel with the financial crisis of the European Union. The economic crisis has made European companies targets for potential acquisition moves, and therefore in recent years Chinese companies have taken over control over more than 100 smaller and larger European companies (the Rhodium Group predicts Chinese companies will invest more than 1 trillion USD overseas between 2011 and 2020).

As the first step of this process, in 2012 the combined market value of the Forbes financial companies in the Chinese capital became the highest in the world, moving ahead of the relevant values of the companies in the traditional financial centres of New York, London and Tokyo.

ABSTRACT
In this paper, first a brief review has been made about the importance of innovation for economic growth and development. Then the positions and values of the global innovation index for the top 25 most innovative economies, Serbia and selected seven European countries from its surroundings for in the period 2009-2011 have been displayed. We studied the relationship between innovation output and innovation inputs, on the example of a selected group of countries, on one hand, and a selected group of countries in the European Union, through the box plot and correlation analysis.

Keywords: Innovation, Innovation efficiency, Innovation inputs, Innovation results

1 INTRODUCTION

A larger share of new products, services and processes is one of the key assumptions of generating economic growth and improving competitiveness of the country, regardless of the level of its economic development. Growth in innovation potential, on the one hand and improving its competitiveness, on the other hand, is the long term requirement for economic and social progress of all countries regardless of the level of economic development. (Cvetanović, Mladenović and Nikolić, 2011)

Score of the achieved level of innovation and competitiveness of countries is based on a larger number of data. This study used data from the Global Innovation Index Report 2011 - 2012 and Global Competitiveness Index Report 2012-2013. We analyzed data on innovation and competitive performance of Serbia and selected group of seven countries in its immediate surroundings.

The interest of economic theory for understanding the importance of innovation in generating economic growth, has been present in continuity from the sixties of the previous century and promotion of neoclassical growth model of Robert Solow, up until the present day. (Solow, 1956, 1957) It has increasingly being considered that differences in the innovation of the economy are a key reason for the manifestation of the differences in economic performance of national economies.(Link and Siegel, 2003) The articulation of this view in economics is particularly contributed to the emergence of new (endogenous) growth theory in late ninth and early tenth decade of the twentieth century (Romer, 1986, 1987, 1990).

Challenges of the Modern World - Contemporary Economy and Globalization

In this paper, innovativeness of the economy is quantified based on data from Global Innovation Index (The Global Innovation Index, Geneva, 2012).

Global Innovation Index is based on two sub-indices: Innovation inputs and Innovation outputs.

Innovation inputs consist of five columns that display elements, ie. potentials for innovative activities of national economy: (1) Institutions, (2) Human capacity, (3) Infrastructure (4) Market sophistication, and (5) Business sophistication.

Innovation outputs consist of two columns that show the actual results of innovation: (6) Scientific outputs and (7) Creative outputs. Each column is divided into sub columns and each sub-column consists of individual indicators.

Using the model shown in Figure 1, the country will be measured in accordance with their Innovation inputs and outputs, which together determine the overall value of GII and place the country on a ranking list made under the criteria of innovation.

Hungary	48.12	25	36	47

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 2: Rankings of the top 25 most innovative economies in the world

Table 2 shows the position and the value of the Global Innovation Index for Serbia and the group of selected countries in Europe in the period 2009–2011.

Table 2: Rankings of Serbia and selected countries (The Global Innovation Index 2011, Accelerating Growth and Development, INSEAD)

Country	Value (0-100)	Rank in 2011	2010	2009
Hungary	48.12	25	36	47
Slovenia	45.07	30	26	36
Bulgaria	38.42	42	49	74
Poland	38.02	43	47	56
Croatia	37.98	44	45	62
Romania	36.83	50	52	69
Serbia	36.31	55	101	92
Greece	34.18	63	46	54
Macedonia	33.47	67	77	89
Georgia	31.87	73	84	98
Bosnia and Herzegovina	30.84	76	116	n / a
Albania	30.45	80	81	121

There has been a major qualitative shift for Serbia in the criterion of Global Innovation Index in 2011 compared to previous years. In fact, from 101st place in 2010 Serbia ranked according to this criterion on the 55th place in 2011, surpassing Greece, a long-time member of the European Union. However, even under the condition that there is no doubt about the statistics incompatibility in the data on the basis of which the Global Innovation Index is composed, the fact is that countries from the surrounding, Hungary, Croatia, Romania are significantly ahead of Serbia according to the criterion of Global Innovation Index in 2011.

From the countries bordering Serbia only as Bosnia and Herzegovina and Macedonia are behind it in the Global Innovation Index. (Cvetanović, Despotović and Nedić, 2012.)

The question timely arises as to what extent innovation input size determines the value of innovation output. Depending on the answer to such a question we can provide useful information to policymakers in which direction is most appropriate to work on incentives and other government measures to improve innovation of the economy. In order to get the answer to the question of dependencies in values that make innovation inputs and innovation output components, we will use the statistical analysis of a very well known, so called XY diagram. This is a common way to show the connection (direction and degree of quantitative variation agreement) between two variables.

Figure 3, shows the scatter diagram of the relationship between the variables of Innovation inputs and outputs.
Figure 3: Diagram of dispersion of the link between innovation inputs and outputs (data on a sample of 125 countries)

A graphical representation of data pairs innovation inputs and innovation outputs shows a strong correlation between the variation of the observed variables. Customizing the linear form of interdependence and analysis of components in the specified model{/0} also suggests{/0} {/0} previously stated, perceived visual{/0} statement.{/0} In fact, linear regression function has the following form: y = - 2.678 + 0.766 X, with statistics of R 2 = 0.714 and R = 0.845.The value of the coefficient of determination indicates the presence of 71.4% variation in variable innovation output is explained by variations in innovation inputs, while the remaining 28.6% is a result of the influence of other factors not included in this model. Strong correlation is confirmed by the correlation coefficient 0.845. Testing the hypothesis of linear interdependence of variables over the corresponding regression coefficient obtains the value of the test statistics at 17.527. With probability 0.05 level of significance of the test and the test threshold at 1.9794, we also conclude that there is a statistically significant linear correlation between the variables of innovation inputs and innovation outputs.

Figure 4 scatter diagram shows the relationship between the variables of Global Innovation Index and Innovation Efficiency Index.

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 4: Scatter diagram for the relationship of Global Innovation Index and Innovation efficiency index

A graphical representation of data pairs for the Global Innovation Index and Innovation Efficiency Index shows a very weak correlation between the variations of the observed variables. Customizing the linear form of interdependence and analysis of components in the specified model also suggests previously stated, perceived visual statement. In fact, linear regression function has the following form: y = 0.546 +0.004 X, with statistics of R 2 = 0.102 and R = 0.319. The value of the coefficient of determination indicates that only 10.2% of the variation in variable Innovation efficiency index is explained by variations of the Global Innovation Index, while the remaining 89.8% is a result of the influence of other factors not included in this model. Weak correlation is confirmed by the correlation coefficient 0.319. Testing the hypothesis of linear interdependence of variables through appropriate regression coefficient obtains value of the test statistics at 3.237. With probability level of significance of the test at 0.05 and the test threshold at 1.9794, we also conclude that there is a statistically significant linear correlation between the variables Global Innovation Index and Innovation Efficiency Index.

3   CLUSTER ANALYSIS

By cluster analysis, the observed set of elements is divided into subsets, so that in the same cluster we group the elements that are similar in some sense. In this case the method used was agglomerative hierarchical clustering.

Figure 5 shows the cluster analysis conducted between clusters for which we used data for the Global Innovation Index, innovation index of efficiency, input and output sub-index with the corresponding columns of The Global Innovation Index 2011-2012. X axis gives the diversity level between the countries analyzed.

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 5: The dendrogram of the cluster analysis conducted for the European and global innovation leaders

In the process of grouping selected European innovation leaders according to the degree of efficiency innovative bottom-up agglomerative hierarchical clustering method was used. In the initial step, each country is treated as a separate cluster. Their merging in pairs of clusters is based on the similarity in terms of the observed values of the variables which is the result of all subsequent clustering iterations until all observed entities are consolidated within one cluster. If we take diversity level of 600 as a possible cross-section in dendrogram, three clusters of the observed countries are clearly identified. The largest group consists of 8 countries, or 53% of the total number of observed countries. The second group includes Norway, Austria and France. The third group relates to Luxembourg and Ireland.

If we consider the world's innovation leader and take the cross section at diversity level of 1250, it is possible to clearly identify two dominant clusters in the presented dendrogram. A striking feature of the first cluster is that its two sub cluster elements are created at a much higher level of diversity than is the case with countries that belong to another cluster. The countries included in the cluster are characterized by a much higher degree of variations in level of innovation effectiveness than is the case with countries within the other cluster. Also, in comparison with clusters that are formed for European leaders, the grouping for the world's

leaders in clearly segregated clusters was achieved at a much higher level of diversity, which suggests the expressive degree of variability in the innovative effectiveness worldwide.

Figure 6 shows the dendrogram of the cluster analysis implemented for Serbia and selected group of 11 European countries, the diversity is given on the Y axis.
Figure 6: The dendrogram of the cluster analysis implemented for Serbia and selected group of countries

Cluster analysis applied to Serbia and a selected group of countries follows a similar trend for grouping as countries in the category of European innovation leaders. On the dendrogram presented, it can be seen that from the innovative aspect of the degree of efficiency, at the first level of grouping, Serbia is most similar to Greece and then to Croatia, Poland, Bulgaria and Romania. On the other hand, there is the biggest difference compared to Hungary and Slovenia. Overall, at the diversity level of 900 we can identify two clusters, i.e. Hungary and Slovenia on one side against all other countries covered by the analysis.

4 COMPARATIVE ANALYSIS OF INNOVATION FOR SERBIA AND NEIGHBORING COUNTRIES IN 2011

Table 3 gives the value of key innovation performances of Serbia and selected group of countries in 2011.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Key innovation performances of Serbia and selected group of countries in 2011(The Global Innovation Index 2011, Accelerating Growth and Development, INSEAD)

	GII	Innovation efficiency index	Innovation Inputs Index	Innovation Output Index
Albania	30.45	0.59	38.29	22.62
Bosnia and Herzegovina	30.84	0.47	42.10	19:58
Bulgaria	38.42	0.74	44.20	32.64
Croatia	37.98	0.69	45.00	30.96
Grece	34.18	0.61	42.48	25.89
Macedonia	33.47	0.66	40.37	26.57
Romania	36.83	0.76	41.80	31.86
Serbia	36.31	0.86	39.09	33.53
Average	34.81		41.67	27.96
Figure 7: Innovation Inputs Index and Global Innovation Index, Serbia and neighbours

On the figure in given diagrams, we analyzed Serbia's position in relation to the surrounding by sub columns of innovation inputs.

A representation of data pairs of variables Innovation input and innovation output of selected countries, shows a very weak correlation between the variation of the observed variables. Customizing the linear form of interdependence and analysis of components in the specified model also suggests previously stated, perceived visual statement. In fact, linear regression function has the following form: y = 3.315 +0.591 * X, with statistics of R 2 = 0.073 and R = 0.27.The value of the coefficient of determination indicates that only 7.3% of the variation in Innovation output variable is explained by the variations in Innovation input variable, while the remaining 92.7% is a result of the influence of other factors not included in this model. Weak correlation is confirmed by the correlation coefficient 0.27. Its value indicates the existence of low grade direct (straight line extending from the lower left to the upper right corner of the graph), linear correlation between the observed variables in the countries included in the sample. The slope of the line (b 1 = 0.591) indicates that an increase in

Challenges of the Modern World - Contemporary Economy and Globalization

innovation inputs of one unit of measurement leads to an increase in innovation output of 0.591 (corresponding to the units of measurement used to express the innovation output variable).Testing the hypothesis of linear interdependence of variables over the corresponding regression coefficient obtains the value of the test statistics at 0.688. With a probability level of significance of the test 0.05 and 2.4469 test threshold it is also concluded that there was no statistically significant linear correlation between the observed variables - Innovation input and Innovation output.

In order to obtain a more realistic picture of the correlation between innovation inputs and outputs we will investigate the correlation.

Table 4: Innovation Inputs Index and Innovation Output Index of selected countries of the European Union in 2011 (The Global Innovation Index 2011, Accelerating Growth and Development, INSEAD)

	Innovation Input	**Innovation output**
Austria	5.00	3.42
Belgium	4.95	3.68
Cyprus	4.37	2.84
Denmark	5.46	3.99
Estonia	4.71	2.81
Finland	5.42	3.90
France	4.94	3.45
Germany	5.09	3.56
Ireland	4.95	3.59
Luxembourg	4.70	4.06
Slovenia	4.52	3.07
Sweden	5.54	4.16
UK	5.17	3.68
Figure 8: Scatter diagram for the connection between global innovation index and innovation efficiency (data on a sample of thirteen EU countries)

Empirical data X (innovation input) and Y (innovation output) is adapted to linear form of dependencies. By gaining a linear regression function which has the form   with stats and R =

0.770.The value of the coefficient of determination indicates that 59.3% of the variations in Y is explained by variations in X, and interpreted in the presented regression model. The rest 40.7% of the variation is the result of the effects of other factors. Correlation coefficient 0.770 indicates that there is a strong direct linear relationship between X and Y. Testing the hypothesis of linear interdependence of variables through appropriate regression coefficient obtains value of the test statistics at 4.266.With a probability level of significance of the test at 0.05 and 2.2010 test threshold , it is concluded that there is a statistically significant linear correlation between X and Y. Thus, given the values obtained with the proposed model, it can be concluded that the model is valid for statistical inference, and implementation of correct predictions and projections of Y.

5   CONSLUSION
Serbia and surrounding countries have innovation performance quality at a much lower level compared to other EU countries. One of the reasons for delayed transition of Serbian economy is its low innovativeness.

In considering the relationship between Innovation Input and Innovation Output Index for Serbia and a select group of countries, it was found that there was no statistically significant effect of innovation input on innovation results.

Considering the relationship between Innovation Input Index and Innovation Output Index for reference European countries revealed a very strong direct linear correlation, and statistically important impact (linear correlation) of inputs to innovation results.

ABSTRACT
The early entrance to the job market has, among other consequences, a negative effect on the health status of the individual. In 2008, nearly a sixth of the Brazilian population claimed to have started working before the age of 10 and over a third reported to have started working between 10 and 15 years old. This paper aims to investigate the effect of early entrance to the job market on the current health status of the individual. The database provided by the National Survey by Household Sampling (PNAD) for 2008 was used to reach the objective of this paper. The analysis was conducted at national and regional extent using Ordered Logit method. It was evident that delaying entrance to the job market impacts positively on the current state of health. Moreover, it was found that the educational level and personal income increase the likelihood of the individual presenting a better state of health. Distinct effects of these variables on health status were also found when we took into account the regional context. The Southeast and South showed the most severe impacts of child labor on health, as well as the best results in terms of the impact of education and personal income on health status. In contrast, the North and Northeast regions showed the greatest gender disparities related to health status.

Keywords: Brazil, Child labor, Health status, Ordered logit

1   INTRODUCTION

According to the International Labor Organization (OIT, 2012), 215 million children work at present, of which about 50% act in derogatory activities. The early entrance of the child to the labor market coerced either by the family or not, prevents them from attending school or, even, from receiving some kind of care (OIT, 2012). Child labor ravages all the continents, including the European one. In Latin America, a few studies which investigate the causes of child labor as well as its consequences, mainly for Brazil, are highlighted.

In Brazil, in 2008, 13 % of the population admitted to have begun to work before the 10 years old, which makes worrying the impact of child labor upon the future of those children and consequently upon the process of the economic development of the country (IBGE, 2008). In this sense, Kassouf et al. (2001) and Nicolella et al. (2008) claim that child labor inhibits the development of the child and, afterwards, of the grown-up individual, owing to, among other consequences, the impossibility of attending school. For Vietnam, for instance, Beegle et al. (2009) have found evidence that child labor negatively impacts on school performance.

Although, a great part of the works does not stress the effect of the early entrance to the job market upon health, the different ages in which a child goes into the job market possess distinct impacts on the health status of the adult person. In other words, it is expected that children who began to work before the 10 years old are more harmed in relation to the ones who enter between 10 and 15 years, for example. In Brazil, in 2008, 39% of the population admitted to have gone into the job market between 10 and 15 years old (IBGE, 2008).

The regional matter is also very important in the surveying of the relationship between child labor and health status, since in regions, as the Brazilian Northeast, the percent of individuals who claimed to have entered the job market before the 10 years old is of 16% (IBGE, 2008). In the Central-Western region, about 15% of the population claimed to have begun in the job market before the 10 years, while in the Southeast region, more developed economically– mainly as far as the industry is concerned – about 10% so stated. In the other regions, North and South, that percent is intermediary, respectively, 13% and 14%. It is advisable to highlight that other factors are also unequal, such as education, income and race and gender question.

Therefore, given that context, the present work intends to investigate the relationship between the individual's age of entrance to the job market and his current health status. Strictly speaking, it aims to survey from the construction of age ranges the effect of the delay upon the age of entrance to the job market on the health status.

In addition to that piece of information, this work counts, forthwith, with the literature review which is concerned with this theme. Afterwards, both the methodology and the main results obtained are presented. At last, the final remarks are presented.

2 GENERAL OVERVIEW OF THE LITERATURE ABOUT THE IMPACT OF CHILD LABOR ON HEALTH STATUS.

The literature which is concerned with the theme, although scarce, enables us to characterize in a concrete form, the research theme. Some works stand out for the theoretical discussion and others for the empirical application.

The investigation about the health status of the grown-up individual or even of the child is not recent[1], though; its association with child labor is so. A few pioneering works made use of theoretical models to estimate the health demand. Grossman (1972, 1975) and Wagstaff (1986, 1993) stood out for their pioneering activity in the construction and debate of such models. In Brazil, recently, Oliveira and Gonçalves (2012) investigated, specifically, the health demand from models for countable data in which the variable to be explained was the number of consultations. Although, the theoretical model aims to survey the health status, does not embrace the effect of the early entry in the job market, central aim of the study.

Some studies prioritize to identify the impact of child labor upon other variables such as personal performance. Among those works, the ones proposed by Kassouf and Santos (2010) stand out, who investigate the impact of child labor upon the future performances of the Brazilians and by Haas et al. (2011), who seeks to investigate[2] the impact of the child's health on the performances of the same ones when they become adults (between 25 and 50 years) for

---

[1] For a short literature review about the theme, see Dorman (2008).

[2] The data utilized were obtained from different sources, as *Social Security Administration*.

the 1990's. Furthermore, Fonseca (2011) turns his attention to the theoretical aspects of the relationship between health and employment.

In the international literature, there are two works which discuss the research trouble investigated in this work for Vietnam – O'Donnell et al. (2005) and Beegle et al. (2009). The first work is intended to investigate the impact of child labor on the health status in the short and long term, controlling for other control variables as education. The authors utilized the *Vietnam Living Standards Survey* to perform their surveys. Among the methods used; the Two Stage Least Squares (2SLS), the *Seemingly Unrelated Regression* (SUR) and Bivariate *Probit* stand out. O'Donnell et al. (2005) measured the health from the following variables: in the short term, body mass index; and, in the long term, recurrent diseases. The authors highlighted a weak relationship, in the short term, between the child labor and health, found when utilizing the 2SLS method in differences and robust in the long term.

Beegle et al. (2009), on the other hand, making use of the same data base, found no negative evidence of child labor upon the health status. Health was measured in two manners, diseases and number of sick days and in none of them, the negative effect upon the child labor was found.

Giuffrida et al. (2005) sought to investigate the correlation between poverty and health in Brazil as well as the relationship between health and child labor. In addition, the authors surveyed the determinants of the access and utilization of the medical assistance as well of the income. The authors made use of the data base of the Brazilian Institute of Geography and Statistics (IBGE), National Household Survey (PNAD) of the year of 1998 and innovated as regards the other works for using a distinct methodology – *Structural Equation Models – SEM*.

In the results found by Giuffrida et al. (2005), the positive impact of education, of income, of the public availability of water and of the presence of sewerage in the home on the health status. The authors also found that there is a positive relationship between dwelling the urban area and utilization of the medical assistance. Giuffrida et al. (2005) complemented the survey in stating that this result is in accordance with the literature and agree with the expected one, for in the urban areas there is increased possibility of access, since the availability is greater. Child labor, on the other hand, negatively influenced health status, as expected.

Kassouf et al. (2001) investigated the impact of the entrance of children to the job market on the health status when adult in Brazil. The authors utilized the data of the IBGE Standard of Living Survey of 1996–1997. Among the chief results, one can highlight that the early entrance to job market is associated with poor levels of schooling and income. In addition, the percent of individuals who possess an inadequate health status is directly associated with the ones who began to work before the 15 years of age. Besides, they call the attention to the fact that the impact of the early entrance to the job market may not be realized when the children become youngsters or young adults, but in reality, afterwards.

Nicolella et al. (2008) address that point in investigating the impact of child labor upon the health of the children in the farm sector. This work stands out in relation to the others for making use of the cohort techniques to join together these two data bases of the PNAD of IBGE - of 1998 and 2003. In short, the authors aimed to identify the children who were in the age range of 5 to15 years in 1998 and of 10 to 20 years in 2003.

The work by Nicolella et al. (2008) proposes to correct the endogeneity problem existing among the variables health status and if the child worked in the farm sector. For that purpose, the authors made use of the *Probit* method with instrumental variables and found that the sector in which the child works does not possess significant impact upon his health status, but, when surveyed the children of the urban area, child labor decreased the probability for them to present a very good health status by 0.128 percent point.

In short, the international literature, mainly as far as Brazil is concerned, is still incipient, with few studies with the purpose of relating child labor with health. Therefore, this work seeks to add to that literature the discussion between the early entrance to job market and the current health of the grown-up.

3   METHODOLOGICAL ASPECTS

The problem of research here suggested – effect of the entrance of children to job market upon the current health status – requires the use of methods which consider the binary or categorical dependent variable, since health status is hierarchized from very bad to very good[3]. Therefore, the method which best fits this sort of variable, utilized in this work, Ordered *Logit*.

Cameron and Trivedi (2005) present that method for a model ordered with m alternatives. The same one is estimated by the Maximum Likelihood, in which the log of the function of likelihood is given by:

$$\ln L = \sum_{j=0}^{m} \sum_{y=i} \ln\left[F\left(\alpha_j - x_i^{'}\beta\right) - F\left(\alpha_{j-1} - x_i^{'}\beta\right)\right]$$

It is proper to stand out that though if one surveys the signs of the coefficients, the association among the variables is given by the estimative of the marginal effects which indicate the effect of a given regressor upon the regress and the calculation of the marginal effects is given by:

$$\frac{\partial \Pr\left(y_i = j\right)}{\partial x_i} = \left[F''\left(\alpha_j - x_i^{'}\beta\right) - F'\left(\alpha_{j-1} - x_i^{'}\beta\right)\right]\beta$$

The Ordered *Logit* seeks to estimate the probabilities related with the greatest category, in this case, the fifth, referent to the health status very good. Furthermore, it was intended to verify the statistical significance of the variables separately as well jointly.

3.1   Variables

The data utilized in this work are coming from PNAD for the year of 2008. It was chosen to utilize the year of 2008 for presenting, in a direct form, in the questionnaire, a question about the individual's health status. It is worth highlighting that such a report is done by the individual interviewed, which can generate measure problems, given the subjective character of the question and/or of the answer.

---

[3] The categorizing is given by: (1) very bad, (2) bad, (3) regular, (4) good and (5) very good.

The dependent variable – health status– is reported in five categories: very bad, bad, regular, good and very good. Since the method utilized is the Ordered *Logit*, the original categories were kept. The early entrance to the job market was measured from the creation of age ranges which point to the age in which the individual began to work. Two variables with distinct age ranges with the objective of captivate the unique impact upon the health status were constructed.

The first range consists in the age range between 4 and 9 years, while the second is concerned with the age range between 10 and 15 years. Although, one expects that both affect negatively the individual's health status, it is presupposed that the first age range degrades more health than the second one, since the chances for the child to study and develop professionally in the future decrease. The effect of that variable called, in most times, child labor, is confirmed by the literature as seen previously.

The variables selected for the survey of the determination of the health status were observed in papers with similar objectives. The previous section presents, in a short manner, those papers. However, it is noteworthy that Giuffrida et al. (2005) point to the relevance of surveying the association between health and age, education, race, among other factors. And, complementarily, O'Donnell et al. (2005) point to the gender as a determining factor in the resulting level of health. In addition to those variables, it was sought to capture other important effects such as the area in which the individual lives: rural or urban.

With the objective of measuring the impact of the age upon the health status, it was chosen for inserting a variable *age* into the model, corresponding to the current age of the individual. Age possesses a significant and negative impact upon health status, mainly, when the individual is at advanced age. That probably results from the possibility of occurring chronic diseases.

Nicolella et al. (2008), as already seen, discuss the health status, as a manner of accumulating human capital. The authors argue that the fact of a child not to work raises the probability that she possesses a more promising future, with higher levels of schooling and consequently of income. Starting from that presupposed, inserting more two control variables was chosen: years of study and personal income. The first one was constructed from the variable made available by the PNAD, *years of study*, and it is expected that it has a positive impact upon the health status. The second one was collected in the same source and as well as the previous one, a positive impact is expected.

In fact, the relationship of the variables years of study and *personal income* with the *health status* is founded on the same foundations. That means that both the variables are correlated so that the greater the level of income more years of study possess the integrants of the home and vice-versa. It is expected that a higher level of income enables a more adequate feeding, greater access to medical and hospital services and a greater level of schooling. Besides, education also raises the income. So, it is expected that a higher level of income as well as of schooling has as a consequence better levels of health. It is realized, in that way, that there is a relationship of endogeneity between the level of income and schooling, but it is supposed that this relationship does not affect the estimates.

At last, dummies variables which represent the gender, race and the fact of an individual being or not in the urban area, were inserted. The objective in that case is controlling possible

problems of omission of variables. The variable of gender takes over the value equal to 1 when is of the male gender. It is expected that being of the male gender has a positive impact upon the level of health, given the positive association with higher levels of income and consequently better levels of health.

The variable race takes over the value equal to 1 when the individual is black and has as an objective to captivate indirectly the racial differentiation in the income and educational level which impact on the individual's health status. Negative association between being a black and the health status is expected, since, in a lot of works, the racial prejudice is stressed.

The variable *urban* takes over value equal to 1 for individuals situated in the urban area. The objective is captivate the different health statuses prevailing between the urban and rural areas, grounded on a number of aspects, such as the health service offer as well as the income and schooling levels.

With the purpose of captivate different bias and not only intercept, or in other words, distinct impacts of the explicative variables about the individual's health status, estimating the following function (relationship) per region as well as at the national level was opted for:

$$health\_status = f(child, age, education, sex, race, urban, income)$$

in which health status is concerned with the categorical variable (ordered logit model), child is represented by two variables – age ranges, age represents the current age of the individual, *education* represents the amount of years of study, *gender*, a *dummy* with value equal to 1 for man, race, also d*ummy* with value equal to 1 for black, *urban, dummy* with value equal to 1 for individuals who dwell in the urban area and income, represented by the napierian logarithm of personal income.

4   RESULTS AND DISCUSSION

The model was estimated both at the nationwide and regional level, since the number of observations is high, which characterizes a good representation of the sample. It is stressed that it was chose to consider a complex sample. The econometric[4] model presented a good adjustment[5], as can be observed in the coherence of the estimated coefficients. The tests indicated that the variable health status is liable to be subdivided into five categories. In addition, the comparison among the probabilities estimated for each category and the percents of them in the samples enables to survey the model's adjustment. In general, the difference between these was inferior to 0.02 (or 2%), indicating, therefore, a good adjustment. The results found are corroborated by the literature. The evidence stands out that the early entrance to job market affects both negatively and significantly the health status of the grown-up. Kassouf et al. (2001) also found that relationship for Brazil. Beegle et al. (2009) did not find that statistically significant relationship, while O'Donnell et al. (2005) found a negative and significant relationship between child labor and health. The other results, when surveyed by the literature, also presented similar relationships, although distinct magnitudes.

---

[4] It was no presented in the work, but for references, please send an e-mail: fsilva.f@hotmail.com.

[5] One sought to consider the problem of endogeneity by estimating a *Probit* with instrumental variables, but, the results were very similar, except some signs for some regions.

Challenges of the Modern World - Contemporary Economy and Globalization

The range of the effect of the variables upon the health status is measured from the calculation of the marginal effects. Those effects, presented in Table 1, in general, were similar among the regions. It was found that the rise in one year of age decreased by 0.5 percent point (*p.p.*) the probability for the individual to present very good health status. The impact of the age upon the health status attenuates in the Southeast and South regions, pointing out that the older people present greater probability of showing a worse health status. Giuffrida et al. (2005) found, overall, a depreciation of health with age, but, indicating that the magnitude of that effect ranges with the gender, its being more perverse for the female.

The division into age ranges in which the individuals began to work presented robust results, such an impact being both significant and distinct. Such a survey enables us to infer that for all the geographical regions and for the country as a whole, the insertion in job market before the 10 years of age presents more severe effect on the health status than the entrance between the 10 and the 14 years of age. For Brazil, the entrance to job market before the 10 years of age decreases by 4.8 p.p. the chances for the individual, in 2008, to present a very good health status. But the entrance between 10 and 14 years of age decreases by 1.7 p.p. such chances.

Regionally, it is realized that the South and Southeast regions stand out for superior effects of the early entrance to job market on the health status. Specifically, for the Southeast region, the entrance to job market under 10 years of age decreases the chances for the individual to present a very good health status by 5.2 p.p., while the entrance between 10 and 14 years of age decreases by 2.2 p.p. such a probability.

As far as the early entrance in the job market is concerned, in general, the results confirmed those found by Nicolella et al. (2008) and Kassouf et al. (2001). More severe impacts in the South and Southeast with relation to the North and Northeast and Northeast were highlighted. Partially, such an effect is due to the percent of persons who declared to have at least good health. For the first two regions, that percent is superior to 77% of the sample, while for the two latter regions, such a percent is inferior. It is worth pointing out that, methodologically, the marginal effects are calculated having as a reference the greatest category of the dependent variable, or in other words, considering the very good health status.

*, ** and *** denote significance at 10%, 5% and 1% respectively.

With relation to the educational level, it was found, as expected and pointed by the literature, a positive association with the health status. Therefore, a higher schooling level increases the chances for the individual to present a very good health status. For the country as a whole, the increase of one year of study increases raises by 1.4 p.p. such chances. From among the regional discrepancies, the one which takes places between the Northeast and South region stands out, in which, in the former region, the increase is of the magnitude of 0.7 p.p., while in the latter is of 1.7 p.p..

Personal income impacted positively on the health status, indicating that, for the country as a whole, for instance, the increase of a unit in the income brings about a rise by 1 p.p. in the probability for the individual to present a very good health status. In that sense, the increase by R$ 100 (local currency) in the personal income, and everything else constant, increases by about 4.6 p.p the chances for the individual to have a health status considered very good.

The effect of the personal income upon the health status possesses distinct impacts on the regions of the country. The North and Northeast regions proved less sensitive than the other regions, pointing out that the income increase by R$ 100,00 (local currency) for the North, for example, increases by 2.3 p.p. the chances for the individual to have the health status considered very good, while in the Southeast is of only 5.5 p.p. the increase of that probability.

Gender showed itself as a significant factor in determining the chances for one to have a health status considered very good, which possibly, can be explained by its correlation with the income level. Giuffrida et al. (2005) point to the distinction in health status coming from gender, but, as previously stressed, estimated the models separately, which is not done in this

paper. Nicolella et al. (2008) also corroborate such result – males present increased probability of having a better health status.

In fact, for the country as a whole, being of the male gender increases by 4.5 p.p. the probability for the individual to present a very good health status. It is noteworthy to highlight, in that sense, the regional discrepancies verified. For instance, for the Central-West region, being a male increases by 5.3 p.p such a probability while in the South region, that increase is of 3.6 p.p.. Such a fact, likely, is recurrent from the greatest insertion of the female into the job market as well as from the greater acceptance of the society of her role.

In the Central-West region, from among the individuals employed in 2008, 41% corresponded to females, while in the South of the country, that percent was of 43%. The situation becomes worse when surveying in which income ranges are situated the female workers of each region. In the Central-West region, for example, 46% of the females employed stated to receive up to one minimum wage (in 2008), while in the South, 38% did so.

The ethnic issue, discussed from the variable *Black*, indicated that being of the black color decreases the probability for the individual to present a very good health status. Nicolella et al. (2008) presented a similar result – being a white increases the probability of having a good health status due to the closeness to hospitals, since they dwell in neighborhoods with more access to health. In general, the marginal effects were not statistically significant, except for the country as a whole and for the Southeast and Central-West regions, though weakly significant. For Brazil, the fact of being a black decreases by 0.7 p.p. the changes for having health status considered very good and, respectively, for the former and latter region, such a decrease is of the order of 1.0 and 1.4 p.p.

Living in urban or rural as a determinant of the health status only was significant for the Northeast and South regions. It is noteworthy to stand out that for the South region, the parameter was weakly significant at 10%. The results pointed out distinct impacts. For the first region, the fact for the individual to be situated in the urban area decreases by 2.2 p.p. the chances of presenting very good health status, while in the south region, there is an increase of 1.8 p.p. Nicolella et al. (2008) also did not find any significance in the distinction in the dichotomy urban/rural when the models with those dummies variables were estimated. On the other hand, Giuffrida et al. (2009) argued that living in the urban area increases the access to medical care and, therefore, they expected and found a positive relationship with health status. Therefore, for the South region, that variable is only weakly significant, its result is in agreement with that of Giuffrida et al. (2009).

The interpretation of the results discussed up to now and of the already existing literature points out that the implementation of a public policy, which delays the children's entrance to job market would be interesting. An initial strategy for minimization of the problem could occur via intensification in the inspection of the Family Allowance Program. So, an increase would occur in the probability for the individual to present a better health status coming from the delay in the entrance to job market as well as an increase in schooling level. Besides, the Child Labor Eradication Program (PETI), also implemented by the federal government, which involves the state and local spheres and which seeks to decrease the participation of the children in job market from the income transfer, would also act as a mitigation mechanisms of child labor.

5   CONCLUSION

The objective of the work was that of surveying the negative impact of child labor upon the health status of the grown-up. The descriptive survey of the data founded in a successful manner on the interpretation of the results from the use of the econometric models.

In general, it follows that child labor decreases the probability for the individual to present a good health status when grown up, but that the age in which the child is inserted into job market is also important in the determining of health status. So, though one cannot fight in a definitive way child labor, for matters which goes beyond the scope of this paper, a policy of delay of the entrance of the child to job market would be important.

Furthermore, the results pointed out that the greatest educational level as well as of *per capita income*, affect positively the probability of having a better health status. The regional results pointed out that homogeneous policies will not obtain homogeneous results. This took place because the early entrance to job market as well as other variables affect, in a distinct way, the health status of the individual.

The utilization of the year 2008 only, instead of recurring to the cohort technique, stands out itself as a limitation of the paper. In addition, the endogeneity problem was not taken into account in the models estimated. The subjective character of the variable which measures the health status of the individual can also be dealt as another limitation of paper. For future research, the joint carrying out of that study with the estimate of the earnings equation relating the current health status with earnings level is suggested.

ABSTRACT
Albania has taken steps towards bringing its legislation into line with the EU standards by approving a new public procurement law. The new law takes into account the principles of non-discrimination and equal treatment, transparency, and legal protection of interests of bidders on public contracts. Direct tendering has been abolished except in cases of extreme urgency and for the purchase of electricity, and criteria to identify abnormally low bids have been introduced. The new e-procurement regulations approved by the GOA in October 2007-2009 paved the way to the e-procurement system implementation at the central and local government level. This study aims to examine perceptions of politics among public sector employees as a possible mediator between the supervisor's leadership style and formal and informal aspects of employees' performance (Organizational Citizenship Behavior – OCB).In this paper we are trying to analyze the role of leaders in Albanian conditions. We are focus in three elements: Productivity, Adaptively of the leader roles, Infectivity on job time. These three elements are analyzed with indicators like that: Performance in job descriptions and monitory of leader's styles, organizational climates and innovative behavior.

1   INTRODUCTION

The Public Procurement Advocate was established as an independent institution reporting to parliament. However, it has no particular executive powers and its functions duplicate the monitoring tasks of the PPA (C. S. George) Decisions on appeals are taken by the same unit of the PPA that is responsible for interpreting the law and giving advice to contracting authorities. Current procedures for handling complaints still do not meet recognized international standards. Overall, the improvements in the public procurement legislation are advancing while the proper enforcement of the law is still a work in progress (Hardt, 2009; Rieker, 2009). Most banks today offer unsecured lines of credit targeted to small business owners.

If yours is an established company, you may be able to apply for a credit line amount of between $10,000 and $50,000 by completing a simple one-page application, with no business financial statements or tax returns required. Institutionally, the successful implementation of the Northern Dimension Countries relies on using flexible coordination mechanisms. Within the EU, the Northern Dimension is part of the Union's external relations but cuts across all its three pillars: the funding instruments stem from the first pillar of the single market, the objectives come at least partly from the second pillar of external relations and some of the problems relate to the third pillar of justice and home affairs, including management of border regimes (C. S. George).

1.1   The purpose of this study

In this study we have aimed at the assessment of the strategic management level in Albanian companies. The study focuses companies and industries selected in the Albania environment. The purpose of the study is to analyze the business environment of the selected industries, how much do these industries know the environment in which they operate and how capable are they to get oriented in this environment. The study is conducted in the period on 2006-2012 years. Object of study were 230 companies located in Tirana, from which 150 small and medium companies and 80 big companies. The survey data was collected from questionnaire forms filled in by these companies. Two classification criteria were used in selecting the companies: the size of the firm and the nature of the industry the firm belong to.

The study is divided into three parts, where the strategic management level of these companies is studied based on each selection criteria. The first part of the survey examines and evaluates the strategic management level by considering the size of the firm. The second part analysis the strategic management level in a specific industry. The total number of 230 companies is divided into 5 industries: chemical industry, food, services, construction and engineering. The third and the final part studies the experience, knowledge, scale and intensity of competitors, predictability and diversity of business environment in selected industries, as well as attitudes or behavior of companies towards the future in this industry.

2   LITERATURE REVIEW AND HYPOTHESES

The performance evaluation is a process related to the identification, evaluation and development of the performance of all the employees in the organization, in order to achieve effectively the objectives, and in the same time the process is in the behalf of the employees. It helps the employees in knowing, receiving feedback and offering work and career services (Lansbury, 1988). They are often held back by lack of productive capacity, difficulties in diversifying their economy, poor infrastructure and export conditions. The Communication "Trade, growth and development", redefines how the EU's trade and development policy will work for the development of those poorer countries - in particular, Least Developed Countries (LDCs) - ensuring they can increasingly enjoy its benefits.

We discuss the most important digressions in turn. Given that both management and regulators are interested in the risk profile of financial firms, they have a shared interest in accurate measurement and, consecutively, management of risk. We then briefly outline measurement methods, primarily to discuss the most important hurdles that have to be taken before a firm-wide risk management system can be implemented adequately.

Challenges of the Modern World - Contemporary Economy and Globalization

2.1   An historical sight of the evolution system in Albania

During the last decade the Albanian Public Administration is going under a reformation process, a process related with the political, economical and social changes. At the beginning of the '90 the role of the Albanian state was modernized, and was stimulated to economic improvement and to conceal social injustice (Robins, 2002).

The new role of the state determined new obligations for the public, central and local administration. During this period the administration was nearly totally politicized and there were no clear divisions between the political and techno-professional functions. During this period the model of the political control was inappropriate and out of logic and it was still in the development phase.

During 1996-1999 the politicization of the administration ended and the administration was based on merits. The division between the political and techno-professional was clear. Several laws were approves; law no. 8095 in 21.03.96, "For the Civil Service in the Albanian Republic", The Decision of the Minister's Council no.657 in 16.09.96 "For ethic rules in the public service", law no. 8549 in 11.11.1999 "The status of the civil employee". All this laws were approved during this period. The administration had the possibility to implement a different system, in the human resources management in all the central and local institutions (Dhima, 2003).

After DAP, the Institution of Training for the Public Administration was funded in order to give response to all the circumstances, opportunities and to the new challenges. In 2000 was published the Instruction from the Council of Ministers no. 2 in 07.07.2000 "For the evaluation system of the individual annual achievements of the civil employees". In 2002-2006 the position of the General Secretary in each ministry was consolidated as a inter-mediator between the political and managerial levels. The performance evaluation was designed to evaluate the employees based on their work and the individual work descriptions in four levels (Ibrahimi, 2002).

2.1.1   Monetary policy and Albanian budget deficit

One of the key aspects of economic policy in Albania has been the tight fiscal and monetary policy. The budget deficit has been declined from 9 percent of GDP in 2000 to 6.6 percent in 2002. In addition, Bank of Albania has played a conservative interests rate policy by keeping its key interest rate well above CPI. Figure 2shows that in 1996 and especially 1997 the economy lost its momentum, reflected also in the increase of CPI (end of period) by 22.7 percent.

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 1: In 1996 and especially 1997 the economy lost its momentum, reflected also in the increase of CPI

3   METHODOLOGY OF THE STUDY

In this study we have intended to evaluate the level of strategic management in Albanian companies. The study focuses on the companies and industries selected in the Albanian environment. It intends to analyze the business environment in the selected industries, how much do these industries know the environment in which they operate and how much capable are they to get oriented in this environment. The study is conducted in the period May-December 2009. Object of study were 200 companies located in Tirana, from which 150 small and medium companies and 50 big companies. The survey data was collected from questionnaire forms filled in by these companies. Two classification criteria were used in selecting the companies: the size of the firm and the nature of industry the firm belong to.

The study is divided into three parts, where the strategic management level of these companies is studied based on each selection criteria. The first part of the survey examines and evaluates the strategic management level by considering the size of the firm. Results are classified in four thematic units as follows:

- Vision, mission and objectives of a firm, (Indicator 1)
- The use of analytical methods and formulation of strategy, (Indicator 2)
- Types of business strategies and reasons of their success or failure, (Indicator 3)
- Responsibility in Strategic Management, (Indicator 4)

Figure 2: Types of business strategies and reasons of their success or failure, indicators of development (Dumi, JERM 2012, p. 66)

Challenges of the Modern World - Contemporary Economy and Globalization

3.1 Analyzing data and regression analyze

The performance evaluation is mainly characterized by qualitative indicators and there are only a few quantitative indicators. According to the data collected from the questionnaires the employees asses the importance of the performance evaluation in 100%, they concretize it with the objectivity in the evaluation. To the question "Is the performance evaluation objective in your institution?"- 30% answered positively, 44% avoided the answer and 26% of them think that it is dictated from the subjectivity of the leaders. According to the questionnaire the major part of the questioned employees think that the performance evaluation takes to conflicts between the subordinate and the superiors. This is also another factor that contests rewarding according to the performance.

3.2 Design the study, methodology and approach *of the study*

The Multifactor Leadership Questionnaire (MLQ) was distributed to employees of a public security organization in Albania, asking them to evaluate their supervisor's style of leadership. Employees were also asked to report their perceptions of organizational politics using the scale developed by the leaders in Albania Region. In addition, supervisors provided objective evaluations of the levels of their employees' in-role performance and OCB. The intra-structure of the leadership variable was examined by exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) with structural equation modeling. Two alternative models were examined: first, a model of mediation and second, a direct model with no mediation (Dumi, 2012).

3.3 Public Administration and its involved

Even though generally the employees of the Public Administration were evaluated very good and good, still there is work that needs to be done regarding the personal qualification. The personal qualification often is referred to the trainings that the employees of the public administration, which is very important. Until nowadays only a small part of the employees are involved in doctorate studies. The employees are still far from career commitments, and this is why only a few of them represent scientific publications for their sector (Dumi, 2012).
Figure 3: In 1996 and especially 1997 the economy lost its momentum, reflected also in the increase of CPI

And this is why we pretend that the performance evaluation does not justify its objectives because it is based only in the commitment related to the job. To create the conviction for this problem a hypotheses came out:
H1: The performance evaluation in the public administration is objective.

Challenges of the Modern World - Contemporary Economy and Globalization

The question "Is the performance evaluation objective?" was analyzed in details and the answers were evaluated from 1-10 points each, nine of the questioned persons were leaders and employees.

The respective evaluations are presented below:

Four indicators of development of the business modeling	(Indicator 1) Performance, mission, vision	(Indicator 2) Formulation strategy	(Indicator 3) Business strategy	(Indicator 4) Responsibility of business	(Indicator without choice)
First choice	4.6	8.6	7.2	9.6	
Second choice	4.34	7.45	5.27	6.56	4.89

We join both choices in one and keep the identity by underlining (for ex. the second choice)

values	<u>4.23</u>	<u>4.45</u>	<u>5.79</u>	<u>6.55</u>	<u>7.67</u>	7.89	7	8	9
Ranks	1	2	3	4	5	6	7	8	9

We calculate the sum of the first choice and the average

$R_{1o} = 6+7+8+9$

$M_R = \frac{n1(n1+n2+1)}{2} = \frac{4(4+5+1)}{2} = 20$

We calculate the quadratic average derivation of the Man Whitney criteria

$S_{R1} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{4.5(4+5+1)}{12}} = 4.8$

We calculate the factual value Zf and is compared with Zk that is the statistic value at a critic level.

$Zf = (R_{1m} - M_R)/S_{R1} = (30-20)/4.8 = 2$

$Zf > Zk ; 2>1.76$

This calculation shows that the hypothesis is not valid.

In the performance evaluation the subjectivism has high levels. It is important to find other parameters for the evaluation, and this is a commitment of this article in the future.

3.3.1 Findings *by regression analyze*

The research resulted in mixed findings that only partially support the mediating effect of organizational politics on the relationship between leadership, in-role performance and OCB. A direct relationship between leadership and performance (in-role and OCB) was also found.

We calculate the sum of the second choice and the average

$R_{1o} = 1+2+3+4+5$

$M_{R \, per \, r=1 \, to \, 5} = \frac{n1(n1+n2+1)}{2} = \frac{5(4+5+1)}{2} = 25$

In principle, three types of strategies can be distinguished. Banks can try to shift un-diversifiable risks to their borrowers, e.g., by making variable-rate loans and mortgages. - Banks can try to shift un-diversifiable risks to their lenders, e.g., by financing fixed-interest loans with fixed-interest obligations of similar maturities. Banks can try to shift un-diversifiable risks to third parties, e.g., through interest rate swaps or other derivative instruments. These strategies can of course be used in combination as well as separately. For

Challenges of the Modern World - Contemporary Economy and Globalization

the purpose of the analysis though it is easier to look at each of them in isolation (Dessler, 2002)

We calculate the quadratic average derivation of the V criteria of Vodrich model

$$S_{R1} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{4.5(4+5+1)}{12}} = 4.8$$

$$S_{R1\ to\ 6} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{5*6(I1+I2+I3+I4+I5)}{12}} = S_{R1} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{4.5(4+5+1)}{12}} = 4.8$$

$$S_{R1N} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{4.5(4+5+1)}{12}} = 4.8 *20 = 96$$

VSRIN =96 In the performance evaluation the subjectivism has high levels The performance evaluation is determined as an evaluation of the past and actual performance of an employee that works in accordance with the performance standards of the organization.
The evaluation process includes (Vodrich and Dessler, 2008):
- Setting the work standards.
- Evaluating the actual performance according to the standards.
- Gives the feedback at the employee in order to motivate him to diminish its feeblenesses.

H2.Governments should also act to improve awareness among entrepreneurs of the range of financing options available to them from officials, private investors and banks.

General Business Development: The ambition and comprehensive macroeconomic program undertaken by Albanian Government after 1997 yielded quick results in macroeconomic stability followed also by increasing real GDP at satisfactory rates. Over the period 1998-2002, contribution of private sector in GDP growth is obvious. In the Report this is demonstrated by increasing share of service sector (where dominate private firms) to GDP formation, as well as in increasing the number of employment in private enterprises compared with those in public enterprises especially in construction and trade sectors. Private sector's contribution to GDP became more important

4 DISSCUSSION BY ANALYZE OF THIS PAPER RESEARCH
This study empirically examines the impact of debt management policies on borrowing costs incurred by state governments when issuing debt in the municipal bond market. Based on positive political theory and the benefit principle of taxation, it is proposed that states that adhere to best practice debt management policies transmit signals to the credit ratings, investment community and taxpayers that the government should meet its obligations in a timely manner, resulting in lower debt costs. [1]The donors concurred with this assessment.

IDA, starting with the 1998 CAS, considered governance and institution building as one of the central planks of its intervention and identified the need to adopt and implement reforms to build an accountable and transparent state as the most important challenge facing the Government of Albania. The performance evaluation is a process that makes the employees

---

[1] Donors and government investments, IDA.

reflect, discuss and change their working methods. During the process the individuals can change their working methods and there may be changes even in their behavior. At the institutional level the process enables the systematic collection of data about the individual's performance. The performance evaluation of the employees has two objectives:

First administrative objectives of this paper research
It gives information in setting the salary, promotions, firing, and assures the necessary documentation to verify decisions in juridical processes.

$$S_{R1 \text{ to } 6} = \sqrt{\frac{n1n2(n1+n2+1)}{12}} = \sqrt{\frac{5*6(I1+I2+I3+I4+I5)}{12}}$$

This analyze is optimal in our condition and its is necessary to progress in the second hypotheses of this research.

The mistake of regression analyze varied: 25 <SRI< 96

Second, and maybe the main objective is the objective of the development. The information can be used to diagnose the needs for trainings, career planning etc. the feedback and the training based on the information of the evaluation assures the fundaments for constant performance improvement (Robins and Couter, 1999).
Figure 4: Commercial banks, the main source of finance for SMEs

4.1 Conclusions and Recommendations

The assistance and training was also expanded to cover financial operations o f the water works o f the participating towns. Participating towns, local authorities, and the PIU all demonstrated sound commitment and in implementing the project in a timely fashion.[2] A comprehensive approach to provision of water supplies is required to address competition for scarce water resources. We recommend these conclusions:
Albanian actors will be reality these points:

- A dynamic local government leadership for protection the health of people
- A coherent strategy acted upon with determination
- A healthy climate of cooperation with business
- Local government's investment initiatives to jumpstart the stagnant economy

---

[2] Municipal Water and Wastewater Project, March 2003.

- Creative use EU funds to implement local policy.

Albania, in the last 5 years, has followed a tight fiscal and monetary policy. The budget deficit has declined from 9 percent of GDP in 2000 to 6.6 percent in 2002. In addition, the Central Bank of Albania has played an active interests rate policy by keeping its key interests rate well above CPI. Inflation pressures were kept under control in 1998 and CPI has moved in the narrow band of -1 to 4 percent in recent years. Interest rates applied by commercial bank for credits in Lek have decreased in the last 3 years.

The results from this article show that the performance evaluation is a very important element in the Public Administration, and it effects the improvement of the work in the state and central bodies.

- The performance evaluation conditions the emplacement and the implementation of the standards as referential points. Emplacing standards would increase the responsibility for each post in the Public Administration and will help in monitoring the performance of the institution.
- Despite the continuous improvements after 1990, there are still lacks and gaps in the performance evaluation and this harms the public opinion for the Public Administration.
- One of the lacks is the considerable subjectivism during the performance evaluation, which was proved by the contemporary methods, with the Man Whitney method for the minor choices where Zf is larger than Zk, and this showed that the hypothesis about the objectivity of the performance evaluation is not available.

ABSTRACT
In this study we have aimed at the assessment of the strategic management level in Albania. The study focuses companies and industries selected in the Albanian environment. The purpose of the study is to analyze the business environment of the selected industries, how much do these industries know the environment in which they operate and how capable are they to get oriented in this environment. The study is conducted in the period 2012.The survey data was collected from questionnaire forms filled in by these companies. Two classification criteria were used in selecting the companies: the size of the firm and the nature of the industry the firm belong to. The study is divided into three parts, where the strategic management level of these companies is studied based on each selection criteria. The first part of the survey examines and evaluates the strategic management level by considering the size of the firm. Diversity in management practices as we go around the world has been recognized in U.S management literature for more than 30 years. The term "comparative management" has been used since the 1960s to 2011. However, it has taken much longer for the U.S academic community to accept that not only practices but also the validity of theories may stop at national borders and I wonder whether even today everybody would agree with this statement. The results show that behavioral differentiation affects perceptions of effectiveness. Contrary to the hypothesis, the effects of the four measures of behavioral differentiation on perceptions of effectiveness are not all positive and not all significant. It is interesting that behavioral differentiation affects subordinates and peers perceptions of effectiveness negatively and superiors perceptions of effectiveness positively in management steeps.

Keywords: General management theory, Leadership, Leadership performances, Nature of organizational work, Transfer of roles, Validity of theories

1 INTRODUCTION

Albania, one of the smallest countries in Eastern Europe, has experienced a period of transition marked by sharp economic swings and periods of civil strife. The early phases of decentralization witnessed the transfer of political autonomy, limited administrative and fiscal authority to local governments, inadequate legislation outlining central/local responsibilities, scarce financial resources and developing ITC projects to manage touristic services. In January 2006, the government promulgated a national Strategy for the Decentralization and the Local Autonomy which included laws to strengthen the autonomy of local governments and increase their capacity to manage local infrastructure and services. The Albania Government has in its focus issues related to tourism. The concept of behavioral complexity implies that a more holistic examination of a manager's leadership performance should be conduced than is done in more traditional leadership research approaches. Future leadership

research needs to take serious Van Fleet and Yukl's (1986) assertion that upward and lateral influence can be as important as downward influence to the accomplishment of an organization's mission (Bass, 1990, p. 908). in addition, future leadership research should not only use "more sophisticated evaluations of the interactional processes of leaders…with subordinates…peers and superiors" (Bass, 1990, p. 880), but also more sophisticated evaluations of the interactional processes of leaders as members of cross-functional, cross-departmental, cross-company, and cross-national teams. This paper revisits the role of targeted transfers in poor countries in the light of the new theories on the social costs of uninsured risks and unmitigated inequalities. Recognizing that the policy implications depend crucially on whether there is good empirical evidence to support the theoretical arguments, the bulk of the first half of the paper discusses the evidence.

Katz and Khan (1978) considered "the influential increment over and above mechanical compliance with the routine directives of the organization" to be the essence of leadership. Their definition does not limit the study of leadership to superior-subordinates relationships. Managers can exert leadership in their interactions with different types of followers, including peers and superiors. The changing nature of organizational work (Kanter, 1989; Conger, 1993) requires us to take a broader perspective of leader-follower relationships.

1.1 Implications for management theory

Cultural differences between nations can be, to some extent, described using first four and now five, bipolar dimensions. The position of a country on these dimensions allows us to make some predictions on the way their society operates, including their management processes and the kind of theories applicable to their management. As the word culture plays such an important role in my theory, let me give you my definition, which differs from some other very respectable definitions. Culture to me is the collective programming of the mind which distinguishes one group or category of people from another. In the part of my work I am referring to now, the category of people is the nation. Culture is a construct that means it is "not directly accessible to observation but inferable from verbal statements and other behaviors and useful in predicting still other observable and measurable verbal and nonverbal behavior".

Revisiting the equity-efficiency trade-off
The presumption that there is an aggregate trade off between the twin goals of economic growth and lower inequality can be questioned for a number of reasons including the following: Unless a person can initially assure that her basal metabolic rate (BMR) — the food energy intake needed to support bodily functions at rest — is reached there can be no productive activity of any sort. This "threshold effect" can mean that an economy generates massive involuntary unemployment under one distribution of assets, while a more equitable distribution yields full employment and high output (Dasgupta and Ray, 1986).

It should not be reified; it is an auxiliary concept that should be used as long as it proves useful but bypassed where we can predict behaviors without it. The first dimension is labeled Power Distance, and it can be defined as the degree of inequality among people which the population of a country considers as normal: from relatively equal (that is small power distance) to extremely unequal (large power distance). All societies are unequal, but some are more unequal than others.

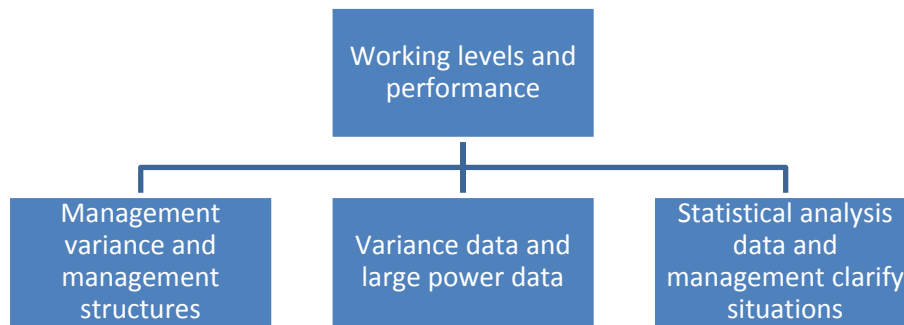
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 1: Four dimensions of PD management levels (Kantter, 1989)

These arguments are fine in theory, but what does the evidence suggest? Compilations of aggregate data on growth and distribution suggest that countries with higher initial inequality tend to experience lower rates of growth controlling for other factors including initial income, openness to trade and the rate of inflation.

Indeed, if inequality is sufficiently high, countries that would have good growth prospects at low inequality may well realize little or no overall growth or progress in reducing poverty. It has been estimated that about one fifth of the date-country combinations in a data set for developing countries were cases in which inequality was so high as to stifle pro-poor growth (Ravallion, 1997b). The some applies to the dimensions I introduced. They are constructs too that should not be reified. They do not "exist"; they are tools for analysis which may or may not clarify a situation. In my statistical analysis of empirical data the first four dimensions together explain 49 percent of the variance in the data. The other 51 percent remain specific to individual countries. The first four dimensions were initially detected through a comparison of the values of similar people (employees and managers) in 64 national subsidiaries of the IBM Corporation. People working for the same multinational, but in different countries, represent very well-matched samples from the populations of their countries, similar in all respects except nationality.

2   LITERATURE REVIEW AND HYPOTHESES

An article I published in Organizational Dynamics in 1980 entitled, "Do American Theories Apply Abroad?" created more controversy than I expected. The article argued, with empirical support, that generally accepted U.S theories like those of Maslow, Herzberg, McClelland, Vroom, only very partly apply outside the borders of their country of origin-assuming they do apply within those borders. Among the requests for reprints, a larger number were from Canada than from the United States. The choice of control variables in identifying the relationship is also open to question.

For example, past tests of the effect of inequality on growth have controlled for the human capital stock, yet reducing investment in human capital is presumably one of the ways that inequality matters to growth. The validity of the common assumption that initial inequality has a linear effect on aggregate growth is also questionable: Banerjee and Duflo (1999) find evidence that changes in income inequality are bad for growth, whichever way the changes go. Then policies that prevent rising inequality are good for growth, but those that reduce current inequality are not.

Given the concerns about tests using country-level data, it is promising that these theories also have some testable implications for micro data. The following are examples:• Farm yields (output per acre) in poor countries tend to be lower the larger the landholding; Binswanger et al. (1995).

2.1 American management theories and the different dimensions

In comparison to other countries, the U.S. culture profile presents itself as below average, highly individualistic, fairly masculine, and short-term oriented. The Germans show a stronger uncertainty avoidance and less extreme individualism: the Japanese are different on all dimensions, least on power distance; the French show larger power distance and uncertainty avoidance, but are less individualistic and somewhat feminine; the Dutch resemble the Americans on the first three dimensions, but score extremely feminine and relatively long-term oriented; Hong Kong Chinese combine large power distance with weak uncertainty avoidance, collectivism, and are very long-term oriented. There is empirical support for another link between inequality and growth, via the incidence of under-nutriton. This is likely to lower aggregate productivity. For example, it has been found that undernourished farm workers in poor countries tend to be less productive (Strauss, 1986; Deolalikar, 1988). Also, malnutrition in children is thought to have adverse long-term consequences for their learning and hence future incomes; supportive evidence can be found in Bhargava (1999) (for Kenya), Glewwe et al. (2001).

H1: The concept of management and development of leader theories.
H2: Smith and Mill used "management" to describe a process and "managers" for the persons involved, "management" in the American sense which has since been taken back by the British-refers not only to the process but also to the managers as a class of people?
H3: Local management is part of this infrastructure; it cannot be imported in package form. Assuming that with so-called modern management techniques and theories outsiders can develop a country has proven a deplorable arrogance.

2.1.1 Cultural constraints in management theories

 Employees and managers are human. Employers as humans, was "discovered" in the 1930s with the human relations school. Managers as humans was introduced in the late 40s by Herbert Simon's "bounded rationality", elaborated in Richard C and James March's Behavioral theory of the firm (1963 and recently republished in a second edition) my argument is that management scientists, theorists and writers are human too: they grew up in a particular society in a particular period and their ideas cannot help but reflect the constraints of their environment.

Whether it is the poor who incur the largest costs of uninsured risk is not as obvious as is often claimed by casual observers. Jalan and Ravallion (2001b) tested for portfolio and other behavioral responses to idiosyncratic risk in the same rural areas of southwest China. They confirmed other findings that wealth is held in unproductive liquid forms to protect against idiosyncratic income risk. However, consistently with expectations from their theoretical model, they found that neither the poorest quintile nor the richest appear to hold liquid wealth because of income risk; it is the middle-income groups that do so. It appears that the rich in this setting do not need to hold precautionary liquid wealth, and the poor cannot afford to do so. The idea that the validity of a theory is constrained by national borders is more obvious in Europe, with all its borders, than in a huge borderless country like the U.S. Already in the sixteenth century Michel de Montaigne, a Frenchman, wrote a statement which was made

famous by Blaise Pascal about a century later: " Vérite endeça des Pyrenées erreur au-delá " - There are truths on this side of the Pyrenées which are falsehoods on the other. According to the comprehensive 10-volume Oxford English Dictionary (1971) the words "manage", "management" and "manager" appeared in the English language in the 21th century. The oldest recorded use of the word "manager" is in Shakespeare's Love's, dating from 1558, in which Don Adriano "a fantastical Spaniard", exclaims (Act I, scene 188).Finding that transfers based on indicators of current poverty can bring long-term benefits, given factor market imperfections does not mean that they are the best policy option for this purpose. Policies to increase factor mobility can also have a role. Incentives to attract private capital into poorly endowed areas, and/or encourage labor migration out of them, could well be more poverty reducing than targeted transfers. There has been very little work on these policy choices, and one often hears overstated claims by advocates.

2.2 The science of economics and general Smith concepts

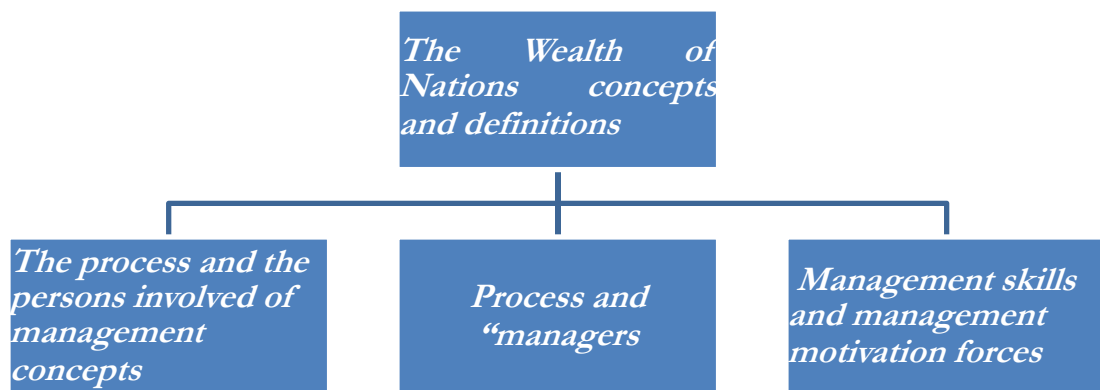
The founder of the science of economics, the Scot Adam Smith, in his 1776 book The Wealth of Nations, used "manage", "management" (even "bad management") and "manager" when dealing with the process and the persons involved in operating joint stock companies (Smith, V.) British economist John Stuart Mill (1806–1873) followed Smith in this use and clearly expressed his distrust of such hired people who were not driven by ownership. Since the 1880s the word "management" appeared occasionally in writings by American engineers, until it was canonized as a modern science by Frederick W. Taylor in Shop management in 1903 and in "The Principles of Scientific Management" in 1911.


Figure 2: Frederick W. Taylor in Shop management in 1903 (The Principles of Scientific Management in 1911)

While Smith and Mill used "management" to describe a process and "managers" for the persons involved, "management" in the American sense which has since been taken back by the British-refers not only to the process but also to the managers as a class of people. This class (1) does not own a business but sells its skills to act on behalf of the owners and (2) does not produce personally but is indispensable for making others produce, through motivation. Members of this class carry a high status and many American boys and girls aspire to the role. In the U.S the manager is a cultural hero.

2.2.1 Management in contexts in modern economies

Sustainability and political economy:

While theory points to efficiency gains from permanent redistribution, the implications of short-term redistributions are less clear. The insurance gains from targeted transfers also depend on the sustainability of programs across different states of nature, including coverage across groups facing different risks. In these respects the record is mixed. Some programs like the EGS have been sustained over long periods, and appear to have provided effective insurance Let us now turn to other parts of the world. We will look at management in its context in other successful modern economies: Germany, Japan, France, Holland, and among the overseas Chinese.
Figure 3: Management in contexts in modern economies (Bass, B. M. and Stogodill, 1990)

3   METHODOLOGY AND RESEARCH GOAL

Four-fifths of the world population, live in countries that are not rich but poor. After World War II and decolonization, the stated purpose of the United Nations and the World Bank has been to promote the development of all the world's countries in a war on poverty. After 40 years it looks very much like we are losing this war. If one thing has become clear, it is that the export of Western-mostly American-management practices and theories to poor countries has contributed little to nothing to their development. There has been no lack of effort and money spent for this purpose: students from poor countries have been trained in this country and teachers and Peace Corps workers have been sent to the poor countries. If nothing else the general lack of success in economic development of other countries should be sufficient argument to doubt the validity of Western management theories in non-Western environments.

3.1   Management transfer to poor countries

If we examine different parts of the world the development picture is not equally bleak, and history is often a better predictor than economic factors for what happens today. There is a broad regional pecking order with East Asia leading. The little dragons have passed into the camp of the wealthy; then follow Southeast Asia (with its overseas Chinese minorities), Latin America (in spite of the debt crisis), South Asia and Africa always trails behind. Several African countries have only become poorer since decolonization.

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 4: Management transfer to poor countries (Jon Stuart Mill, 1989)

Regions of the world with a history of large-scale political integration and civilization generally have done better than regions in which no large-scale political and cultural infrastructure existed, even if the old civilizations had decayed or been suppressed by colonizers. It has become painfully clear that development cannot be pressure-cooked; it presumes a cultural infrastructure that takes time to grow. Local management is part of this infrastructure; it cannot be imported in package form. Assuming that with so-called modern management techniques and theories outsiders can develop a country has proven a deplorable arrogance. At best, one can hope for a dialogue between equals with the locals, in which the Western partner acts as the expert in Western technology and the local partner as the expert in local culture, habits and feelings.

3.2   A theory of culture in management
Our trip around the world is over and we are back in the United States. What have we learned? There is something in all countries called "management" but its meaning differs to a larger or smaller extent from one country to the other, and it takes considerable historical and cultural insight into local conditions to understand its processes, philosophies and problems. If already the word may mean so many different things, how can we expect one country's theories of management to apply abroad? One should be extremely careful in making this assumption and test it before considering it proven. Management is not a phenomenon that can be isolated from other processes taking place in a society. During our trip around the world we saw that it interacts with what happens in the family, at school, in politics and government. It is obviously also related to religion and to beliefs about science. Theories of management always had to be interdisciplinary, but if we cross national borders they should become more interdisciplinary than ever.

3.3   Literature and Development concept
The second dimension is labeled Individualism and it is the degree to which people in a country prefer to act as individuals rather than as members of groups. The opposite of individualism can be called Collectivism, so collectivism is low individualism. The way I use the word it has no political connotations. In collectivist societies a child learns to respect the group to which it belongs, usually the family, and to differentiate between in-group members and out-group members (that is, all other people). When children grow up they remain members of their group, and they expect the group to protect them when they are in trouble. In return, they have to remain loyal to their group throughout life. In individualist societies a child learns very early to think of itself as "I" instead of as part of "we". It expects one day to have to stand on its own feet and not to get protection from its group any more; and therefore it also does not feel a need for strong loyalty.

Challenges of the Modern World - Contemporary Economy and Globalization

4 CONCLUSION

In fact the management theorist who ventures outside his or her own country into other parts of the world is like Alice in Wonderland. He or she will meet strange beings, customs, ways of organizing or disorganizing and theories that are clearly stupid, old fashioned, or even immoral-yet they may work, or at least they may not fail more frequently than corresponding theories do at home. Then, after the first culture shock, the traveler to Wonderland will feel enlightened and may be able to take his or her experiences home and use them advantageously. All great ideas in science, politics, and management have travelled from one country to another, and been enriched by foreign influences. The roots of American management theories are mainly in Europe: with Adam Smith, John Stuart Mill, Lev Tolstoy, Max Weber, Henri Fayol, Sigmund Freud, Kurt Lewin, and many others. These theories were replanted here and they developed and bore fruit. The same may happen again. The last thing we need is a Monroe doctrine for management ideas.

5 DISCUSSION

While leadership researchers have emphasized that managers need to vary the performance of their leadership functions depending on characteristics of their followers, the task, the organizational culture, their position power, and other factors, they have commonly equated followers with subordinates. The research presented in this paper has taken a distinctly different approach and examined the leadership behaviors of two groups of managers in their interactions with the members of their superiors and peers, in addition to their subordinates. The argument was made that in order for managers to be effective leaders in their interactions with their subordinates, peers, and superiors, they need to have a broad repertoire of leadership functions at their disposal as well the ability to vary the performance of these leadership functions depending on the organizations role of the person with whom they interact.

The results of this study show that behavioral repertoire has strong positive effects on subordinate, peer, and superior perceptions of effectiveness. These results indicate that to be effective it is important for managers to not only perform their leadership functions frequently in interactions with their subordinates, but also in their interactions with their peers and superiors. Having a broad portfolio of leadership functions at one's disposal will increase the likelihood that one can effectively meet the demands of the member of one's organizational role-set.

ABSTRACT
This article aims to present the main indicators for Science, Technology and Innovation (ST&I) generated by the Fundação de Amparo à Pesquisa do Estado de Minas Gerais (FAPEMIG), in four years (2008-2011). The methodology used was a case study, with documentary research, held in the annual reports of activities of the Foundation. The results showed that all indicators analyzed in aggregate form, evolved gradually. It is concluded that the FAPEMIG comes complying with their mission to induce and encourage research and scientific and technological innovation for the development of the State of Minas Gerais in the Southeast region, maintaining the recognition as one of the main agents of development inductors scientific, technological and innovation in Brazil.

*Keywords**: Development, Innovation, University*

1 INTRODUCTION

The constant promotion of science, technology and innovation (ST&I) allows a nation to achieve sustainable socio-economic development. Federal Law nº 10.973/04 of Brazil "establishes incentives for innovation and scientific and technological research in the productive environment, with a view to training and within the reach of technological autonomy and industrial development of the country", encouraging the construction of specialized environments and cooperative innovation (Brazil, 2004).

---

[1] We would like to take this opportunity to thank to the FAPERN/MCT/CNPq/CT-INFRA Nº005/2011 First Projects Program - PPP Infrastructure Program for Young Researchers.

In Brazil, through agencies, foundations and funds, to finance actions linked to ST&I happen so as to contribute to the development of the country. As the foundations of support to research in the country, the most representative are linked to a federal State, where some of them have assured operation are supported by State laws that ensure financial transfer in 1% of all State tax collected.

According to MEC (2012, p. 1), "the foundations are institutions created with the purpose of supporting the projects of research, teaching, and extension of institutional, scientific and technological development, the interests of federal institutions of higher education (IFES) and research institutions also", thus being able to contribute faithfully to the achievement of national innovation systems in a nation.

In numbers, the CONFAP (2012) Brazilian national territory confirms that there are 24 state foundations, these three have higher representativeness for funding, in large financial flows, ST&I. The *Fundação de Amparo à Pesquisa do Estado de São Paulo* (FAPESP), *Fundação de Amparo à Pesquisa do Estado do Rio de Janeiro* (FAPERJ) and *Fundação de Amparo à Pesquisa do Estado de Minas Gerais* (FAPEMIG) make up this trio.

In this context, choosing the FAPEMIG as case to be studied, the research aims to present the main indicators for Science, Technology and Innovation (ST&I) generated by the Foundation. For both the Organization of the present study begins with this introduction, followed by Section 2, literary review, which highlights concepts relevant to research. In continuity, in section 3, method, the methodological procedure used in the research is cited. Later, in section 4 is described in the object of study, recounting a brief history of the Foundation. The results can be observed Section 5, results, and shortly thereafter in section 6 are the conclusions. Finally, references are presented the bibliographies used.

2 LITERARY REVIEW

2.1 Innovation and Competitiveness

Zaltman et al. (1973) defines innovation as an idea, practice or a material that is perceived as new and relevant application. Thus, Dosi (1998) confirm that search involves innovation, experimentation, discovery, development, and adoption of new products, new production processes and new organizational settings.

The ability to generate technological innovation is proportional to the economic development of a nation. The economist Joseph Schumpeter He was one of the first proponents of this binding between a country's development and its ability to innovate. The original idea of Schumpeter and which to this day guides the thought of a broad group of economists, called neo-schumpeterian, is that technological innovation is the engine of economic development.

In the current environment, marked by competitiveness, innovation is seen as a way to overcome competition and achieve competitive advantage. From innovation strategies, opportunities can be converted into new ideas and put into widespread practical use (Tidd et al., 2001).

According to Rogers (2003, p. 140) the "most innovations are created by scientific research, although they often result from the interaction between scientific methods and practical problems ". Therefore the "innovation is no longer perceived necessarily as linear process, but

as a result of the complex interaction of various actors and institutions that constitute a system of agents strongly interdependent" (OECD, 1999, p. 11).

Tidd et al. (2001) evidenced during the Decade of 1990, through his researches in industrial organizations and English services, organizations can use innovation to differentiate their products and services, are typically twice as profitable as the others.

Understanding innovation as economic power, at the end of 2004, the Brazilian Federal Government sanctioned the innovation law (Law no. 10.973). Barbosa (2006) explains that this law encourages the promotion of science, technology and innovation in the industry, seeking the improvement of technological skills and Brazilian industrial development. This law covers important aspects as cooperation between science and technology institutions and enterprises, the Division of laboratories, incubation of small enterprises in public research institutes, services of P&D for businesses, the establishment of technology transfer offices (TTOs), as well as the participation of researchers in economic gains generated by the inventions and innovative sponsorship (Maculan, 2005; Mello, 2005).

2.2 National Innovation System

Freeman (1995) sets the National Innovation System as a set of institutions, actors and mechanisms in a country contribute to the creation, advancement and dissemination of technological innovations. Simonini (2010) includes the universities, companies, research institutions and other associations as actors, which in turn relating to the market and the current financial system, converges to the formation of the Innovation System (IS).

The OECD (1999) presents a pattern of co-operation in national innovation systems, in which we highlight the following: cooperation between University and industry; geographical proximity; innovation depends on cooperation; knowledge-intensive services; informal cooperation and trust; and finally is rising that the innovation system has different patterns of cooperation.

There is a diversity of systems because of their stage of development in which countries. According to Albuquerque (1999) this diversity could be perceived by the characteristics of the configuration of each system, such as the specifics of innovative companies, the interaction between firms and universities or research institutions, and even the various forms of financing of research and innovation.

2.3 Cooperation between: university, company and government

The cooperation between University, Government and company appears at the beginning of the 21st century as an instrument to promote technological development, dissemination and uptake of innovations. According to Queiroz (2007, p. 3) " The ability to innovate depends on the conduct of scientific research and requires human resources capable of generating and transmitting new knowledge ".

In this context, the role of universities has been acquiring greater relevance, since they still present themselves as the main locus in the trainer of new knowledge (Rapini, 2007).

In this scenario, it is crucial to the existence of an academic institution that plays a role in the innovation system and in the social, technological and economic development of the country. The University aims to be enterprising demand creation of complex structures within it to

House companies of technological base, promoting cooperation between researchers and local businessmen.

The effects caused by these changes drive the debate about what is the appropriate role that universities should play in matters related to technology and knowledge transfer.

Etzkowitz and Leydesdorff (2000) believe that, in response to this new environment, universities should take ownership of a "third mission". In addition to contributing to the development of the country with the formation of high-level human resources and research, third mission would seek to incorporate the mission to contribute more directly to economic development through cooperative and collaborative initiatives with the productive sector in order to achieve greater applicability for the knowledge produced.

Within this context, the entrepreneurial University differentiates itself from others with regard to three basic characteristics: support for entrepreneurial activities; existence of mechanisms for interface, such as the offices of technology transfer; and a significant number of employees capable of creating companies (Dzisah and Etzkowitz, 2009).

3 METHOD

As to the nature, this research is classified as applied. In relation to the objectives, this research is descriptive and exploratory. As for the approach, classified as qualitative using the case Study method.

The survey took place in two stages. The first corresponded to bibliographical research, in which it was necessary to review the existing literature and define the scope for the search, creating products such as the theoretical and research basis identification. The second was the documentary analysis phase, in which it was necessary to verify the common indicators for Science, Technology and Innovation (ST&I), in the reports consulted, making possible the formation of the results.

The documentary analysis phase, covered the annual activity reports in the period from 2008 to 2011, accessed via the Foundation's institutional website.

4 STUDYING OBJECT

The *Fundação de Amparo à Pesquisa do Estado de Minas Gerais* (FAPEMIG) is a foundation of the State Government, linked to the Secretary of State for science, technology and higher education, was created by Law Delegated nº 10, from August of 1985. Has the mission: "induce and encourage research and scientific and technological innovation for the development of the State of Minas Gerais", seeking "be recognized as the principal agent inductor scientific, technological development and innovation in the State of Minas Gerais" (Fapemig, 2011, p. 18).

Their performance is linked to the financing of scientific and technological research projects, in encouraging the training of human resources for Science and technology, the establishment of scientific and technological research groups, in promoting the productive sector and integrative research institutions and development, supporting the Organization of scientific and technological events, to carry out exchanges between Brazilian and foreign researchers in the Routing and guidance of patenting and commercialization of innovative products and processes.

The beneficiaries of the actions performed by FAPEMIG consist of Minas Gerais-based institutions or researchers that they maintain bond that falls in one of the following categories: i. Scientific, technological Entities and Innovation – STEIs; II. Direct and indirect administration corporations of the Government of the State of Minas Gerais, aimed at the development of S,T&I or other related scientific and technological activities; III. Associative entities, not-for-profit whose objectives are geared towards the promotion of scientific and technological development; IV. Private companies, enterprise companies, incubators, technology parks and the like, serving notices and specific programs; V. individual Researchers to keep some ties to STEIs. the activities developed by FAPEMIG are ensured by the State Constitution, which determines the allocation of 1% of the current budget revenues of the State for the promotion of science, technology and innovation.

5 RESULTS

In the quadrennium, the State Treasury provided USD 499 million, which added to external funds obtained, totaled USD 589 million invested in actions to promote the ST&I as shown in table 1.

Table 1: Kept financial resources (Authors, 2012)

YEAR	STATE TREASURE	OWN AND EXTERNAL RESOURCES	TOTAL	% GROWING
2008	US $ 110 millions	US $ 13 millions	US $ 123 millions	-
2009	US $ 102 millions	US $ 14 millions	US $ 116 millions	-5,6%
2010	US $ 132 millions	US $ 29 millions	US $ 161 millions	38,7%
2011	US $ 155 millions	US $ 34 millions	US $ 189 millions	17,3%
TOTAL:	**US $ 499 millions**	**US $ 90 millions**	**US $ 589 millions**	

As the targeting of funds raised in the quadrennium, the research projects, adding their natures (universal, induced, special, Endogovernamental and structuring) achieved major transfers, followed by investment in human resource training and scholarships, administrative costs, promotion of scientific and technical studies events and dissemination actions. Table 2 details the allocation of those resources.

Table 2: Percentual execution of the financial resources (Authors, 2012)

	ITEM	2008	2009	2010	2011
01	Research Projects - Universal	24,9%	25,3%	17,0%	19,5%
02	Research Projects - Inducted	17,0%	21,9%	29,3%	27,3%
03	Scholarship and HR formation	24,9%	25,3%	17,0%	17,8%
04	Scientific Events	2,4%	2,0%	2,2%	2,0%
05	Special Projects, Endogovernamental and Structural	30,4%	26,3%	29,0%	28,6%
06	Other Activities (Technical Studies and Disclosure)	1,2%	1,0%	1,0%	1,0%
07	Administrative expenses	3,3%	4,0%	4,0%	3,8%
	TOTAL:	**100%**	**100%**	**100%**	**100%**

As for the number of research projects included in the universal demand (independent-inducing themes), gradual growth in submission of these during the quadrennium, and even noting a reduction in the hiring of the projects in the year 2009, the remaining year's recovery was reaching maximum hiring 750 projects in 2011. These numbers detailed in table 3.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Universal research projects submitted and hired (Authors, 2012)

UNIVERSAL EDITAL	SUBMITTED QUANTITY	% SUBMITTED GROWING	HIRED QUANTITY	% HIRED QUANTITY
2008	1.436	-	737	-
2009	1.546	7,6%	703	-4,6%
2010	1.799	16,3%	720	2,4%
2011	1.866	3,7%	750	4,1%
	TOTAL: 6.647		TOTAL: 2.910	

As the number of research projects included in the induced demand (with induction of subjects by State organs), the growth of the submissions of the other years from the year of 2009 was significant, as shown in table 4. The data from 2008 and the quantities contracted for other years were not disclosed in the reports consulted.

Table 4: Submitting of Inducted Research Projects (Authors, 2012)

INDUCTED EDITAL	SUBMITTED QUANTITY	% GROWING
2009	1.610	-
2010	4.143	157,3%
2011	3.173	-23,4%
	TOTAL: 8.926	

As the training of researchers in the quadrennium to FAPEMIG offered 4,608 shares the scientific initiation within the school through the BIC Jr, 12.013 dimensions to scientific initiation within the undergraduate program PIBIC, 2.704 units in mastering, 1.862 in doctorate, 921 in post-doctorate, 102 at 430 and a visiting scholar program on technological development, totaling 22.640 quotas directed the training of researchers. The distribution of these shares and the percentage growth rates compared to the previous year are detailed in table 5 below.

Table 5: Shares of financial assistance for training of researchers (Authors, 2012)

	2008	2009	% GROWING	2010	% GROWING	2011	% GROWING	TOTAL
BIC JR	819	1.133	38,3%	1.273	12,3%	1.383	8,6%	**4.608**
PIBIC	2.510	2.944	17,2%	3.064	4,0%	3.495	14,0%	**12.013**
MASTERING	608	645	6,0%	675	4,6%	776	14,9%	**2.704**
DOUTORATE	429	436	1,6%	453	3,9%	544	20,0%	**1.862**
POST-DOCTORATE	347	288	-17%	222	22,9%	64	-71,1%	**921**
RESEARCHER VISITOR	30	18	-40%	26	44,4%	28	7,69%	**102**
TECHNOLOGICAL DEVELOPEMENT	93	125	34,41%	112	10,4%	100	-10,7%	**430**
TOTAL:	6.844	7.598		7.835		8.401		**22.640**

As the number of higher education institutions benefited from mining shares made available the scientific initiation programs, PIBIC program directed graduation contemplated more institutions that the BIC program Jr which is targeted to high school. Already the quotas

directed the graduate (*stricto-senso*), the master of most institutions that encompassed the doctorate as details the table 6 below.

Table 6: Institutions benefited by financial aid quotas (Authors, 2012)

BENEFITED INSTITUTIONS	2008	2009	% GROWING	2010	% GROWING	2011	% GROWING
BIC JR	30	35	16,6%	42	20,0%	43	2,3%
PIBIC	60	65	8,3%	71	9,2%	76	7,0%
MASTERING	32	34	6,2%	35	2,9%	35	0,0%
DOCTORATE	13	16	23,0%	17	6,2%	18	5,8%

As for the support of scientific events in the quadrennium, the Foundation has promoted 1016 events, and provided participation in 3420 events, 1210 collectively, 1145 individually in international events and 1065 individually in Brazilian events. The following table 7 details these numbers.

Table 7: Support the organization of and participation in scientific events (Authors, 2012)

ORGANIZATION AND PARTICIPATION IN EVENTS	2008	2009	% GROWING	2010	% GROWING	2011	% GROWING	TOTAL
Organization	234	236	0,8%	238	0,8%	308	29,4%	**1016**
Group Participation	246	287	16,6%	337	17,4%	340	0,8%	**1210**
Exterior Individual Part.	291	230	-20,9%	303	31,7%	321	5,9%	**1145**
Individual Brazil Part.	269	231	-14,1%	260	12,5%	305	17,3%	**1065**

As for the evaluation of projects undertaken in the quadrennium, 5504 57.41% evaluated projects were recommended, 36.35% conditioners and 6.23% rejected. Points out that in the year 2008 the project evaluation Committee was not yet established, what justifies the absence of data in that year. The numbers of reviews are detailed in table 8 below.

Table 8: Evaluation of projects (Authors, 2012)

YEAR	RECOMENDED	CONDICIONED	REJECTED	TOTAL
2009	341 (23,2%)	1015 (69,1%)	113 (7,7%)	1469 (100%)
2010	1540 (75,3%)	434 (21,2%)	71 (3,5%)	2045 (100%)
2011	1279 (64,3%)	552 (27,7%)	159 (8,0%)	1990 (100%)
TOTAL	**3160**	**2001**	**343**	**5504**

In the quadrennium, 40,224 scientific products were developed, 18.30% of these are articles published in magazine, 40.58% Congress presentations, 2.36% 0.49%, book chapters published books, electronic publications, 1.09% 1.19% newspaper publications of dissemination, 18.01% 8.27% summaries published works published in annals of events, 2.95% and 6.75% doctoral theses dissertations. These numbers are detailed in table 9 below.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 9: Scientific Products generated in finished projects (Authors, 2012)

PRODUCTS	2008	2009	% GROWING	2010	% GROWING	2011	% GROWING	TOTAL
Articles published in magazines	875	2.453	180,3%	2.144	-12,6%	1.890	-11,8%	**7.362**
Congress presentations	1.747	5.436	211,1%	4.620	-15,0%	4.520	-2,1%	**16.323**
Books' chapters	87	314	260,9%	270	-14,0%	280	3,7%	**951**
Published books	12	60	400,0%	61	1,6%	63	3,2%	**196**
Electronic publications	61	172	181,9%	88	-48,8%	156	77,2%	**477**

As intellectual property protections, FAPEMIG provides approval of computer software, patents and trademarks (national and international) divided into two fronts: institutional and independent. In the quadrennium, 50 brands, patents and 176 41 computer software's have been developed through the support of the Foundation. These numbers are detailed in table 10 below:

Table 10: Intellectual property protections (Authors, 2012)

YEAR	TRADE MARKS	NATIONAL PATENTS		PATENTES INTERNACIONAIS		COMPUTER PROGRAMS
		INSTITUTIONAL	INDEPENDENT	INSTITUTIONAL	INDEPENDENT	
2008	7	17	4	6	0	3
2009	20	36	2	5	0	9
2010	13	38	1	19	0	8
2011	10	32	9	6	1	21
TOTAL:	**50**	**123**	**16**	**36**	**1**	**41**

6 CONCLUSION

According to the indicator developed by the Economist Intelligence Unit that analyzes 25 indicators in eight categories to form the ranking of the best places to invest, the State ranked 3 in General, being recognized as the third largest economy in Brazil, with positive indices of political stability, market growth, incentives for investment, provision of skilled labor and the promotion of research and development (EIU, 2011).

The prominent position reported, is worth much to the growing performance of FAPEMIG in actions development ST&I. The developing mining economy providing increase in worker income, increasing their purchasing power, causes an increase in consumption levels. The benefits of this growth by collecting more taxes, as well as the Foundation, because owning

the rights of retention 1% of the amount collected. This sequence of facts, allowed the Foundation to increase the resources invested, in 2011, to record fundraising.

The allocation of these resources during the quadrennium are mostly directed to research projects, provision of scholarships to aid research and training human resources, shares these priorities of the Foundation. Both priorities observed positive growth, based on the first year of the quadrennium compared to others.

On the research projects, it was noted the latent concern Foundation in follow projects funded, in order to verify that the desired results were achieved, justifying the expenditures made and providing subsidies for public managers Guide and refine the policies of science and technology.
It was noticed that the Foundation held concern to cover his actions between higher education institutions in the State, looking for spraying among them the quotas available to researchers, avoiding concentrate resources, seeking joint development of these institutions.

Aiming to disseminate and share the knowledge generated by the projects and researchers, the Foundation also listed in its priorities the promotion of scientific events, noting during the quadrennium increasing in number of events promoted. In this same framework, the Foundation through its researchers, concentrated efforts on the elaboration of scientific products, where in all of their natures, there was a plausible growth, highlighting the increase in publications of articles in scientific journals.

Not only looking for share, but also protect the knowledge produced, the Foundation created the intellectual property management, aiming at the advancement of intellectual property policy, recognizing the strategic importance for technological innovation in the State.

In summary, the results make it possible to infer that the management of FAPEMIG happens in a structured way, realizing that the funds obtained for the actions of ST&I follow normal levels in every year, showing that the Foundation has clear strategies regarding the determination of priorities, these in turn critical points for the scientific and technological development of Minas Gerais.

ABSTRACT
*The authors present a new country market selection model using a three filter/two phase approach to scanning: 1) a **macro filter** using mega aggregate country statistics (external environments) in the **rough cut phase** with **"broad fit"** company compatibilities (values, vision, goals, capabilities, management feel) and critical success factors (make or break issues); 2) an**EM filter** to consider and evaluate emerging country markets of potential, also in the **rough cut phase,** matching the EM factors **"broad fit"** with the critical success factors of the organization and 3) a **micro filter** using key success factors for the company and product, market structural factors, and industry/competition factors which produce a **"narrow fit"** in the **diamond cut phase** with the organization's objectives, strategies and resources. The emerging markets will be given full consideration in this model and factors selected will be chosen with the "fit" of the specific company, product, strategies, internal and external environments pertinent to the unique blend of variables in the industry/organization.*

Keywords:Country location model, Country product market, Emergingmarkets, External environment, Internal environment, International business expansion, Scanning, Selection of country markets, Strategic fit

1 INTRODUCTION

Locating a business outside of the country is commonplace today and makes sense if the company desires increased sales, larger profits, market share, competitive positioning and scales of economy (Gaston-Breton and Martin, 2011; Hajidimitriouand Georgiou, 2000; Sowinski, 2000). With the interdependence of the world and the ability to research global options more readily through the internet, company managers are expected to conduct environmental scanning of countries and markets and the best possible strategies to enter these markets as a typical part of their jobs. Even small and medium sized firms will be compelled to find cost savings and/or increased revenues and profits across national borders (Knight andCavusgil, 2004; Stray, Bridgewater and Murray, 2001). As Thomas Friedman (2005) says in his book, <u>The World is Flat,</u> that at the beginning of the 21st century, the world entered a new phase of globalization based on disruptive social, political and technological events ("flatteners"). In this flatter world,

Challenges of the Modern World - Contemporary Economy and Globalization

companies and individuals will be able to collaborate and compete more successfully, whatever their size and wherever they are. Those that fail to adapt will suffer.

2 LITERATURE REVIEW

2.1 Location of Country MarketsAnd Scanning Process

Locating the right country and market within that country is similar to finding the right mate in a dating scene. It can seem very difficult (almost like locating a needle in a haystack) unless you have a refining process for going through all the candidates. Many experts suggest a phased approach going from preliminary screening and in depth screening of identified candidates to selection (Cateora, 1995; Cavusgil, 1985; Johanson, 1997; Koch, 2001; Kumar, StamandJoachimsthaler, 1994; Root, 1994). In fact, BrouthersandNakos (2005) found the use of such models was tied to better performance; the small businesses which used a systematic model for screening were more successful in their international expansion than those who used ad hoc methods. The authors agree that following a systematic phased model is helpful but contend that the "preliminary screening" phase needs to be refined further. That is the purpose of this paper – to give insights and new direction to the scanning process of country market selection.

For a country market, managers need to conduct an analysis of the company's core values and competencies as well as the goals (desires) it has for global expansion and find country markets that match these. In the negotiation world, these are called "deal breakers" and companies know them as the "key success factors" or broad "fit. Internet "Scanning" helps to "weed" out the potential country market opportunities from the over 200 possible country market potentials in the world. The factors for "weeding" should be customized to the company. In addition to using multiple factors, it is important to decide which factors are of highest priority, and when does one apply the various filters. Successful companies learn there is a pattern to globalization and the processes of scanning, from rough cuts to diamond cuts, are formulated. Because of differences in industries, products and companies, the variables can and should be uniquely chosen. This paper recommends factor categories and steps in this "filtering" process, which will enhance the effectiveness of the scanning process.

2.2 Past Model Descriptions of Scanning ProcessAnd Limitations

Previous models show grouping of countries approaches based on similarities or market potential. The models which use similarities help the managers select countries by their similarities on variables in the external environment, primarily on social, economic and political indicators (Cavusgil, Kiyak and Yeniyurt, 2004; Huszagh, Fox and Day, 1985; Samli, 1977). Models ranking market potential use aggregate market potential and overall attractiveness variables such as size, growth, competition, import demand of products or changes in import shares, economic development and ease of access (Armstrong, 1970; Conners, 1960; Dickensheets, 1963; Green andAllaway, 1985; Lindberg, 1982; Samli, 1977).

Although the grouping models have been criticized for their over-reliance on broad based factors and not enough emphasis on product specific factors, they can help to narrow the field of country choices (Douglas, 1971; Papadopoulos, 1983; Sakarya, Eckman and Hyllegard, 2007). The "rough cuts" are broad indicators and therefore are not sufficient alone for effective screening. The authors have added another phase of "diamond cuts" related directly to the product and

industry to overcome this criticism in their model. In addition, most grouping models do not include factors which truly estimate what emerging markets bring to the table (Anderson andStrandskov, 1998; BjoErkmanandEklund, 1991; Ellis, 2003; Sakarya et al., 2007; Sowinski, 2000). This limitation is addressed by the "rough cut" Filter II for emerging country selection.

3   THE 3/2 MODEL TO COUNTRY MARKET SELECTION

The authors recommend a three filter, two phase approach in their model to country market selection (scanning process) in order to get the maximum benefit of the current research and thinking. To start with, the analysts should conduct simultaneous selections of countries using the traditional aggregate variables analysis as Filter I, alongside the emerging countries analysis (Filter II). These broad based filters are the hammers of the "rough cut" phase. The final filter applied is micro-fit analysis (Filter III) and is the precision tool used in the "diamond cutting" phase. Please see Table 1 for the 3/2 Model.

The reason for the 2 broad parallel filters to be applied is to overcome some of the biases in the traditional mega analysis model used in the past and to allow a more full consideration of emerging country markets. These first two filters are part of the "rough cut" phase, meaning the company is looking at the "big picture" factors that will "make or break" the decision. These "must have" variables start the "rough cut" of companies in the playing field. Typically, companies start with 15-20 country markets. During the "rough cut" phase they narrow those down to 6-8 country markets. With simultaneous filtering of worldwide options versus emerging country options, the researcher will have countries that make the mega cut and the emerging market cut in their 6-8 country market refinement. Please see Table 1 for overview of phases.

3.1   Traditional mega Analysis Filter (I)

Traditional models include many mega statistics groupings in the arenas of economic, socio-cultural, technological and political factors. These factors are the basic tools of the "traditional mega analysis filter." Economic factors typically include GNP, GNP growth rate, size of market, economic development, inflation rate, stability of exchange rate and GDP. Socio-cultural variables could be demographics such as population, age, and income distribution, cultural practices, lifestyle, literacy rates and religious practices. Political factors looked at could be political stability, level of government control of business and sophistication of political environment including human rights and intellectual property rights.

Technological/infrastructural factors may be included as well, which look at the level of technology adoption, technology skills, communication systems and infrastructure such as access to markets which includes roads, shipping and air transportation, and availability of water and electricity. Also included in this filter are the synergies ("broad fit") with the core elements of the organization – do the vision, values and goals of the firm mesh with the market? Will the market be big enough to fulfill the goals of the organization? Are managers committed to enter the market and feel they are ready for new market entry? From this "traditional mega analysis filter" the researchers are able to glean the "best potential mega candidates". There should be about 6-10 traditional countries to begin the scanning process and the filter should narrow the choices to 3 or 4. Table 2 shows the "traditional mega analysis filter" elaboration of factors.

3.2 Emerging Market Analysis Filter (II)

When evaluating markets, it is important not to overlook a candidate based on the general traditional aggregate categories usually applied to country analysis such as "indicators of wealth", "size", "growth", "competition" and "ease of access" or indirect factors of market potential using "economic development", "internal stability", and "cohesion" factors, all of which tend to favor larger developed countries since they are bigger, more stable and less risky. Although mega statistics used in traditional models are valuable in assessing and comparing countries overall, these factors measure a country at a point of time. They often do not take into consideration how the population is expected to grow in the future but rather measure static or past info such as "GNP per capita", "GNP levels" and "balance of payments trends" as market potential (Arnold andQuelch, 1998; Cavusgil et al., 2004; Sowinski, 2000; Stobaugh, 1969).

Making the selection of criteria geared to the goal of "growth and expansion" may lead to criteria which better assess the opportunities of the "emerging market" countries. Intuitively and statistically, experts see that many developed countries are slowing in their growth and economies, becoming saturated and have highly competitive market structures. In contrast, emerging markets are highly attractive due to their increasing disposable incomes, large populations of young consumers and economic liberalization (Alexander and de Lira e Silva, 2002; Reda, 1998; Sowinski, 2000).

The variables which are more conducive to emerging markets proposed include "long-term market potential", "culture", "competitive strength of the industry", and "customer receptiveness to the products of the foreign industry and its country of origin" (EvanschitzkyandWaggenheim, 2006, p. 79; Sakarya et al., 2007, p. 215; Samli, 1977, p. 49). In their research, Yeniyurt and Townsend (2003) showed that the variable of "culture" was significant in new product acceptance while Kogutand Singh (1988) found "culture" to influence entry mode selection. The variable "psychic distance" was utilized by Brewer (2007) in his model. Sherrif, Brewer andLusch (2010) show that "cultural distance" has a direct impact on the level of exports.

Also Cavusgil (1997) developed a "market potential index" for emerging markets using 13 different economic, social and political variables whereas Arnold and Quelch (1998) suggest firms find their own ways to predict long term market potential in emerging markets. Table 3 shows these types of factor comparisons for the Emerging Markets Analysis Filter (Filter II).The potential risk may be greater for emerging markets but the potential gain is also higher, like picking the "long shots" in horse racing. Using the "emerging market analysis" filter, the 3-4 "Best Potential EM Candidates" emerge from the original playing field of 6-10 emerging country markets. Then from these two rough cut filters of "mega analysis" and "emerging markets", the company chooses the top candidates, which are combined as the "Best Potential Candidates.

3.3 Micro Fit Analysis Filter (III)

After the simultaneous rough cut filters are applied, a more "micro approach" filter (Filter III), which is very specific to the company's strengths and strategies as well as product/industry, should be conducted to evaluate the weeded down potentials. Normally this filter chisels the candidates down to 3-4 options. These would be more detailed demand variables such as Burger King's "growth in the shopping malls" and competitive forces analysis such as "franchisees with experience and capital." These are now going from "rough" to the "diamond" cut. What areas of

"fit", "core competencies" and "key success factors" are needed to be effective in the country market for their particular mix of products?

In addition, this filter needs to consider the most effective potential entry mode. In the case of Burger King, they have narrowed down the choice to franchising. In addition, researchers have shown the importance of integrating decisions with research factors. Fit does matter. Strategies in marketing and manufacturing have a significant impact on selecting the right location overseas (Caneland Das, 2002); goals of the firm influence international site selection decisions (Hajidimitriouand Georgiou, 2000); market orientation is tied to international market selection (He and Wei, 2011). Table 4 illustrates the categories of factors and fit variables to be integrated during the "micro fit analysis" filtering.

4   SCANNING PHASES

The 3/2 Country Market Evaluation Model has 2 scanning phases: 1) rough cuts phase and 2) diamond cuts phase. These "macro" and "micro" phase approaches to scanning are supported in the literature (Gaston-Breton and Martin, 2011;Westhead, Wright andUcbasaran, 2002).

4.1   Rough Cuts Phase

Companies want to assess the country markets they are selecting, making sure their minimum requirements are met. These "rough cut" criteria are the basis of the scanning process. For example, Burger King uses the criteria of "large populations (especially of young people), high consumption of beef, availability of capital to franchisees for growth, a safe pro-business environment, growth in shopping centers, and availability of a potential franchisee with experience and resources" to narrow down its country markets choices (Daniels et al.,2013, p. 472).

As you can see, these factors can be categorized into two phases, including broad external environmental factors encompassing socio-cultural (i.e. demographics: population size, age; lifestyle: eating habits), economic (i.e. availability of capital), and political (i.e. safe and pro-business environment) variables and more micro factors, such as "growth in shopping centers" and "potential franchisee with experience and resources". The broad variables are what constitute "rough cuts" and should be the "must haves" for any company. The "fit" here is about the "core values" with the broad based analysis. The "rough cuts" phase typically narrows down the field to 3-4 mega candidates and 3-4 emerging market candidates, thus totally 6-8 in number. Please refer to Table 1 for the pictorial model of the "rough cuts" phase.

4.2   Diamond Cuts Phase

The authors recommend that the company think about the best market entry mode for their company during the diamond cutting phase, as this choice will often impact on which micro-variables are significant. As in the case of Burger King, they have chosen "franchising" as their preferred mode of entry and they are interested in researching the micro-variables of "resources and experience of the franchisees" during this "diamond cutting" phase in their scanning process. Andersen andBuvik (2002) show in their research a significant relationship between mode of entry and the selection of market partners. This is also where the company's orientation to international business,their past experiences globally, the stage of internationalization, the company's core success factors (KinkelandErceg, 2004; Knight andCavusgil, 2004; Westhead,

Challenges of the Modern World - Contemporary Economy and Globalization

Wright, Ucbasevanand Martin, 2001) and even the basis of their assessment (are they looking at risk vs. benefit evaluation or methods comparing cost vs. marketing control) are internal factors which impact the decision of a country market and the entry mode chosen (Chen andMesner, 2011; ErramilliandRao, 1993) External factors to assess include country market potential for a particular product, the strategic significance of the market (i.e. competitors/partners there, important resources there) and anticipated overseas market risks, industry and company specific information, supporting industries' level of development as well as market barriers such as tariff barriers and government regulations related to product, distribution access, industry feasibility, and market growth rate (Cavusgil, 1985; Koch, 2001; Rahman, 2003; Stray, Bridgewater and Murray, 2001; Swoboda, Schwartz andHalsig, 2007; Whitelock, 2004). As these variables are applied, a strategic "fit" is found between the product mix, country market environment and the company, thus allowing the best country markets to emerge.

4.3 In Depth Screening and Final Selection
Thus the scanning phase is completed (the object of this model) and the more detailed work on analyzing these "best overall candidate" markets through personal networking, in country visits and more expensive (primary data) collection of company/competition/partners and/or customers/market research information begins. This is typically what the experts call "in depth screening." During this stage, companies narrow down the search from 3-4 country markets to 1 particular country market, which they then select as their targeted country, called "final selection". This completes the overall selection of country markets.

5 CONCLUSIONS
This model is unique to the literature since it looks at "rough cut" compatibilities of the company with the aggregate data on country markets, focuses on evaluating opportunities of more risky emerging markets (outside the context of mega statistics) which most models do not fully include, and then pinpoints analysis of synergies between the company (its objectives, policies, strategies, orientation, experiences, resources) and its market on external environmental factors such as the market potential (i.e. consumer demand financially measured in sales, revenues, profit), product/industry factors (i.e. partnerships/alliances, suppliers, competitive environment) and structural barriers to particular product/market entry (i.e. governmental, tariff, legal, political, distribution, infrastructure, business practices).

The array of variables to study can be overwhelming for any company, but it pays to be both systematic and integrative in the scanning process for country market selection as it is a significant decision. Each company has a unique set of capabilities, values and goals. Their products are diverse as well as their strategies and resources. Each country has a unique set of variables in its own environment in general and specific to a particular industry/product. The industry itself has its own characteristics and key success variables. These factors need to be brought together in a model which can be molded to the situation.

The 3/2 model presented in this paper builds on the past models of country market selection while adding unique "fit" components and gives firms the latitude to pick the variables that best match them. It is unique because it offers the firm an opportunity to take a rough cut look at traditional countries and emerging countries as separate sets.

LEGAL REGULATION OF THE SPECIAL ECONOMIC ZONESIN RUSSIA

Alina Gasumyanova
Ministry of Justice of the Russian Federation, Russia
Russian Law Academy of the Ministry of Justice,,Russia
alina_law@list.ru

ABSTRACT
The author in this work examines the current issues of development the special economic zones in Russia. The Federal law on Special Economic Zones in the Russian Federation, adopted on 22 of July, 2005, has become a firm basis for the establishment of public-private partnership in the country, promoted the investments in the economy, helped improving scientific and technological potential of the Russian regions. While being not perfect, the Law has been changed a lot since the year 2005, given the characteristics of the evolving market economy and the requirements of business entities, by improving the tax, administrative and customs systems.

Keywords: *Administrative regime, Industrial zones, Innovative economy, Investments, Legal regulation, Public-private partnership, Special economic zones, Taxes, Tourism*

1   INTRODUCTION

The current stage of development of the market economy in Russia is characterized by a modernization, among the factors of which there are the transition to innovative, improving scientific and technological potential and investment attractiveness. The latter, in particular, is possible in case of public policies aimed at creating an enabling environment for investments, protection of the domestic market and the competitiveness of domestic products. The stimulation of development of the national economy is impossible without the use of conventional and proven tools: concessional lending, taxation, government guarantees for external financing of production, providing a certain "package" of benefits and privileges to investors, government assistance in promoting Russian products to foreign markets. The mentioned above is the main tool of the special economic zones' system.

The mechanism of creation and functioning of the first special economic zones in Russia got its legal regulation in the 2005 federal law "On special economic zones in the Russian Federation» № 116-FZ. Although that law "gave life" to special economic zones in Russia, but the whole concept was not suggested. In this regard, numerous changes and additions to this law were subsequently made. The last amendments to this law made in the year 2012 took into account the positive experience of the existence of economic zones abroad, adapted to the realities of the Russian economy and the legal system.

2   TYPES OF SPECIAL ECONOMIC ZONES IN RUSSIA

There are four types of special economic zones in Russia:

- industrial production special economic zones;
- technology innovative special economic zones;
- tourism and recreational special economic zones;
- port special economic zones.

Challenges of the Modern World - Contemporary Economy and Globalization

The activities that residents can be engaged in the zone - that is the basis for the delineation of special zones by types. The kind of specific activities that the special economic zones residents are able to carry out in their territory depend on the socio-economic situation in the Russian Federation and the municipality, within which a special economic zone is supposed to be created, the strategy of socio-economic development, characterization and activity of the potential residents of the zone. In addition, Article 2 of the mentioned law allows the special economic zones of one or different types to join in clusters. As supposed, it will promote the development of manufacturing industries, high-tech industries, tourism, health resort industry, port and transport infrastructure, technology development and commercialization of their results and the production of new products.

In the context of the above, we note that in **the industrial production special economic zones** only industrial-production activity is permitted to perform, that is, the production and processing of goods (products) and their implementation, as well as the activities of logistics. The specific form of industrial and production activities, which will be made by residents of the zone should be determined by the subject of the Agreement on industrial and manufacturing activities, which is concluded between a resident of the zone and the Ministry of Economic Development of the Russian Federation. Currently, there are 4 areas of industrial type ("Alabuga", "Lipetsk", "Togliatti", "Pskov") located in the major industrial regions of the country. More than 60 residents, both Russian and foreign organizations, are registered on these territories. In accordance with Article 9 of the Federal Law only a commercial organization that makes capital investments in the amount of not less than 120 million rubles that is approximately 3 million euro (excluding intangible assets) can be the resident of industrial-production zones. A the same time the resident of industrial-production special economic zone is obligated to make capital investments in the amount of not less than 40 million rubles (about 1 million euro) (excluding intangible assets) during three years from the date of conclusion of the agreement on the implementation of activities. At the same time, before the year 2009 the minimum investment threshold for potential residents of the zones was higher - more than 10 million euro. Taking part in the work of the special Committee to draft amendments to the Law we repeatedly pointed out the need of lowering the threshold for investment. We believe that the reduction of the amount of investment required for the residents of industrial production special economic zones increases the investment appeal of areas, thus creating the possibility of joining in the special economic zone of a much larger number of investors. Fortunately the Legislator took into account the recommendations and appropriate amendments have been made recently.

Technology innovative special economic zones are created to develop a fundamentally new technologies, materials and products, the pilot production of small quantities of goods. This zone type is mainly based around the major research and education centers with a rich scientific tradition and recognized research schools, which opens up great opportunities for innovative business development, manufacturing high technology products and display it on the Russian and international markets. In four special economic zones of this type ("St. Petersburg", "Tomsk", "Zelenograd", "Dubna") more than 200 residents are registered. For example, the special economic zone "Tomsk", which is one of the first created special economic zone in Russia in 2005, successfully attracts investment into the region through the development of the following areas: IT and electronics, medicine, biotechnology, new materials and nanotechnology. In the special economic zone in St. Petersburg there are 33 investors implementing projects to develop software products and telecommunications equipment, digital measuring systems and information security, development and production

of solutions for the energy industry facilities, organization of laboratories and pharmaceutical facilities for the development, production and sale of drugs. In 2011, investments made by residents of the special economic zone "St. Petersburg" was 387.9 million rubles (about 10 million euro), which is almost 2 times higher than the previous year. Unlike the industrial production zones in the technology innovative zones as residents may be both commercial organizations and sole traders, who are registered within the zone and have signed an agreement with the authorities of the special economic zone.

Tourist and recreational special economic zones established for the implementation of tourist-recreational activities. Currently, there are seven tourist and recreation areas in Russia, including "Russian Island" in the Primorsky Territory and the North Caucasian tourist cluster created in the development of these regions, as well as the APEC summit in 2012and the Olympic games in 2014.

The fourth type of zones -**the port-logistics special economic zones**-established for the implementation of port activity and (or) the construction, rehabilitation and maintenance of infrastructure seaport, river port and airport. Russia has created two zones of this type ("Ulyanovsk" and "Soviet harbor"). Being in close to the main transportation routes, port and logistics SEZs could become a platform for the organization of shipbuilding and repair activities, the provision of logistics services, as well as a base for new routes. The Federal Law stipulates the following conditions for the area residents. If an agreement on the implementation of activities in the port special economic zone envisages the construction and reconstruction of infrastructure seaport, river port or airport, the port zone resident must make capital investments in the amount at least:
- four hundred million rubles -10 million euro- (excluding intangible assets) in the construction of infrastructure facilities seaport, river port and the airport, including the infrastructure of new sea port, river port and the airport, while a resident of the port special economic zone must make capital investments in the amount of not less than forty million rubles- 1 million euro- (excluding intangible assets) for three years from the date of conclusion of the agreement on the implementation of activities;
- hundred and twenty million rubles-3 million euro- (excluding intangible assets) for the reconstruction of infrastructure seaport, river port and the airport, while a resident of the port special economic zone must make capital investments in the amount of not less than forty million rubles-1 million euro-(excluding intangible assets) for three years from the date of conclusion of the agreement on the implementation of activities.

Due to the fact that on port special economic zones residents spreads the free customs zone, residents when concluding the agreement on the implementation of activities have to present to the customs authorities ensuring payment of customs duties and taxes, the amount of which may not be less than:
- thirty million rubles (750 thousand euro) for the storage of goods, wholesale trade, open trade in goods (including excise goods or minerals);
- ten million rubles(250 thousand euro) for the storage of goods, non-excisable goods, storage of goods, wholesale trade, stock trade;
- two and a half million rubles(62 and a half thousand euro) in the implementation of other port activities.

3 THE SYSTEM OF SPECIAL ECONOMIC ZONES' MANAGEMENT (THE ADMINISTRATIVE BODIES)

The successful functioning of special economic zones and the active involvement of investment into created on their territories projects depends primarily on effective transparent and harmonious system of administration of special economic zones and the interaction between the federal center, regions and business –structures. The global experience of the special zones suggests that without continued state support and coordination, such zones can not develop. Many countries have established special government agencies working on development zones. For example, in China, the highest administrative body of the free economic zones is the Office of the State Council of the PRC for free economic zones, which develops basic political attitudes and monitors their implementation, conducts and oversees other agencies in terms of their activity in the special economic zones.

Since the first appearance of special zones in Russia and up to2009 there was a multi level management (control) system of the special economic zones:
- Ministry of Economic Development of Russia performed the functions of normative legal regulation and public policy in the development of special economic zones;
- The Federal Agency for Management of Special Economic Zones and its territorial divisions carried out the direct control of the zones . Note that the Agency was created in 2005 to provide services and the implementation of law enforcement functions in the special economic zones, as well as monitoring the implementation of the agreement on certain types of business;
- joint stock company "Special Economic Zones" was engaged in construction of infrastructure facilities. It was created in 2006 as a state customer of special economic zones infrastructure construction;
- executive authorities of the regions of Russia.

However, experience of the created special zones in Russia proved the need for change of the complicated functional system, which was highly centralized and insufficiently flexible and didn't response to the needs of the residents of zones. In 2009, the Federal Agency for Management of Special Economic Zones was abolished and its functions were fully transferred to the Ministry of Economic Development.

Currently a two-level system of special economic zones control has been created. It is represented by the Ministry of economic development of Russia and the executive bodies of the regions of the Russian Federation (federal and regional levels) with the possibility of redistribution of powers between them. Moreover from the January 1, 2012 some functions of the zones control can be transferred to private management companies. The management company can be: an open joint stock company, one hundred percent of the shares belong to the Russian Federation and which is created in order to implement the agreements on the establishment of special economic zones; business entity, created with the participation of the open joint stock company for those purposes; any other business entity that has concluded an agreement with the Ministry of economic development of Russia to manage a special economic zone.

The involvement of management companies to the control process is due to a general trend of reducing a government involvement in certain areas of the economy, where the mechanisms of functioning has been already established, and where the processes of self-regulation of business is possible. Furthermore, the introduction of this measure gives meaning to the idea

of public-private partnership in Russia and foreign investment in special economic zones and in the Russian economy as a whole. Despite the fact that the term "public-private partnership" has no legal definition at the federal level, it is widely used both in the regional legislation, and in the concept of individual sectors of the economy. In addition, the strategies and concepts of social and economic development of Russia until 2020, public-private partnership is indicated as one of the most promising tools to stimulate the development of the economy. In theory, there are three known models of public-private partnerships:

1. Operating model - the investor takes on the responsibility for operation of the facility owned by the State, and for this service, and the state-owner of the facility - is responsible for the implementation of the social function of the consumers (residents of special economic zones), which pay for the service. This form is focused on the preservation of the state ownership of production facilities, and opportunities to influence the policy decisions taken within the zone. This model is characterized by the use of contract forms, lease agreements.

2. Concession model - the investor carries out works or supply certain services to end customers directly and get the right to finance the expenses of the board for the use of the object, with the responsibility for public functions is an entrepreneur (concessionaire), and for the government (grantor) hold control functions. Such a scheme is most common in the Russian and international practice, as it allows implement major social projects without significant budget financing.

3. Cooperation model - public functions are assigned to the joint venture that created the public partner with one or more private sector companies. Such a model is the most appropriate in term of the development of special zones in Russia, innovative and high-tech projects.

In this context, the legislator proposes the creation of asset management companies, which are empowered to engage residents in the special economic zones for infrastructure, including the funds to attract investors, and operation of infrastructure, project development planning area and other duties as may be required agreement on the management of the zones. The list of functions of the management company is public. The Management Company shall be responsible for the effective management of the property complex ,improved service of zones residents and participate in the future development of engineering infrastructure.

4   TAXATION IN SPECIAL ECONOMIC ZONES IN RUSSIA

The legal regime of business activity in the special economic zones is expressed in providing benefits and appropriate safeguards to the residents of economic zones, such as special land tenure, the customs, administrative and tax regimes. Special attention would be paid to the taxation in the special economic zones. Special tax mode of residents of the zones is to provide a more favorable tax treatment in the form of tax exemptions, tax breaks and other benefits that will be discussed later, without any obligation on the part of tax payers on the proper use of released working capital. According to the Tax Code of the Russian Federation, the tax system in Russia is composed of federal, state and local taxes. Accordingly, a resident of a zone pays the tax to the budget, depending on the type of its activities and which kind of taxes a specific payment is referred to.

For example, corporate income tax is a **federal tax**, that is, its size is the same for all the regions of Russia. Although the tax is part of the mandatory payments of federal level, it is enlisted to all types of budgets of the Russian Federation. As a result - the legislative (representative) bodies of the regions of Russia have the right to reduce the income tax rate to

the amounts payable to the regional budgets. In accordance with paragraph 1 of Article 284 of the Tax Code of Russia the current rate for all taxpayers of this tax is 20%; 18% of them go to the regional budget and 2% - to the federal budget. For residents of the special economic zones lower taxes may be set by the regional Law, in part which has to be included to the budget of the region of Russia. For example, in industrial production zone "Alabuga" income tax is 15.5% (instead of 20 %). The residents of technology innovative zones are exempt from this tax from the year 2012 to 2018.

Property tax is a **regional tax,** which is established by the laws of the regions of the Russian Federation. Currently, the residents of special economic zones are exempt from paying this tax for 10 years. Vehicle tax is also recognized as a regional tax, the payment of which the residents are also exempt.

Local taxes include, for example, land tax, the payment of which the special economic zones residents are also exempt. In the port zones tax rate of value added tax (VAT) instead of 18% for residents is 0% for 49 years.

5   CONCLUSION

In conclusion, we would say that in Russia all the conditions for the implementation of investment projects are set: the tax breaks, free customs zone regime, simplified access to infrastructure, preferential rates of land rent, the unique atmosphere of cooperation and partnership between the residents of the special economic zones.

TESTING STABILITY OF REMITTANCE INFLOWS IN SERBIA

Mirjana Gligoric

ABSTRACT

Remittances are an important and stable source of foreign funds for many developing countries. In the period before the global crisis, these countries faced a large inflow of foreign investments and banking capital, but the crisis has interrupted these flows, and even led to their withdrawal. On the other hand, data suggest that remittances are persistent at high levels, and had even recorded growth. Therefore, this trend led to our interest to examine the best features and possibility for efficient use of remittance inflows. Based on econometric analysis of the monthly data (using ARCH model) we test the volatility behavior of remittances (using as a proxy current transfer inflows data in Serbia). Findings show that current transfers (and therefore remittances) are a quite stable source of external financing on which economic authorities can mostly count on. Consequent appropriate policy support, which would stimulate savings and investments in capital and financial instruments, could result in positive effects on financial stability and economic growth not only in the short but in the medium and long term.

Keywords: Current Transfers, Remittances, Volatility

1   INTRODUCTION

In the period before the global crisis developing countries have faced significant inflows of foreign direct and portfolio investments and banking capital, but the crisis has stopped and reversed these trends. According to Bank for International Settlement banks from Western Europe have withdrawn from these countries more than seventy billions of US dollars during the ongoing and previous year. The second wave of the crisis, high indebtedness and permanent economic problems in many countries make investors and banks cautious in their new investments. Those circumstances pose serious obstacles to governments that are trying to recover the economies, attract foreign capital and finance previously accumulated debts in an environment of foreign funds scarcity and significant withdrawal of capital. Therefore, the inflows of remittances in developing countries, which remained at the high level even in the period of crisis, resulted in our interest to better investigate properties, possible usages and effects of these funds.

Remittances are the primary source of external finance for many developing countries (Chami et al., 2008; Ratha, 2009). According to economic literature and current events in developing countries, it is observed that remittances (and consequently current transfers) are, unlike other foreign inflows, characterized by significant stability (Chami, Hakura and Montiel, 2009; Ratha and Mohapatra, 2007). The benefits that a country can have from stable cash inflows are multiple as far as they focus on activities that contribute to economic growth and

development. Theoretically, channeling remittances into savings and investments can lead to long term GDP growth. Also, the fact that remittances reduce the volatility of GDP[1] and contribute to financial system development positively contributes to country's growth and development. Finally, these resources significantly contribute to the fight against poverty and inequality (Adams and Page, 2005; Gupta, Pattillo and Wagh, 2009).

In this paper, beyond theoretical and empirical data review, we present results of econometric analysis on stability of remittance flows by using current transfer inflows data to Serbia. With this analysis, we aim to remind how important remittance inflows are for developing countries and Serbia, how significant is their precise monitoring and recording as well as their channeling not only in consumption, but also in various investment alternatives that could provide long-term benefits to the local economy.

2   DEFINITION AND REMITTANCE FLOWS

Remittances from abroad present a significant component of the total foreign currency inflow in developing countries. Migrant remittances according to the World Bank include three categories: workers' remittances, compensations of employees and migrants' transfers.[2] Because of the difficulty of recording of these flows and often incomplete data (given that a large part of remittances are transferred through informal channels), a great number of countries partly estimate the value of remittance inflows.

According to the recent estimates of the World Bank for year 2011 steady inflow of remittances almost uninterruptedly continues despite the financial and economic turmoil of global proportions in the recent past. Remittance flows on global level are estimated at USD 501 billion. The amount of remittances received in developing countries reached the level of USD 372 billion, which significantly surpasses the level of official aid and is nearly equal to inflows   of   FDI   into   these   countries (http://web.worldbank.org/WBSITE/EXTERNAL/NEWS/0,,contentMDK:20648762~menuP K:34480~ pagePK:64257043~piPK:437376~theSitePK:4607,00.html). Officially recorded remittances in 2011 were approximately three times larger than official aid to developing countries. In the pre-crisis period of 1998–2007, on average, remittances were fifteen times higher than official transfers to recipient countries, eighteen times higher than official capital flows, more than twice the total private capital flows, thereby reaching 30% of the value of exports of the recipients (Barajas et al., 2010). The largest recipients of remittances in 2011 were India, China, Mexico and the Philippines. In many developing countries, the annual

---

[1] Rao and Hassan (2012) prove that remittances influence economic growth through four main channels: the volatility of GDP, the rate of investments, financial sector development and the exchange rate. Doubts about the existence and impact of remittances on long-term growth and often conflicting findings result from the fact that long-term impact of remittances on growth is not direct but takes place through channels, which can operate in different directions and thus diminish or even nullify the individual effects. The first channel implies that remittances as a stable source of funding reduce fluctuations in GDP. Given the confirmed inverse relation between volatility of GDP and GDP growth, remittances favorably affect growth.

[2] Workers' remittances in the IMF's Balance of Payments Manual, 6th edition (IMF, 2010) are defined as current private transfers of migrant workers who are residents of the country in which they work. Recipients of these funds are in their country of origin. Residential status includes an abroad stay of one year or longer. For stays shorter than one year earned income in that period is classified under the item compensation of employees. Migrants' transfers represent net value of migrants' assets being transferred from one country to another at the time of migration for a period of at least one year.

inflow of remittances reached and even exceeded one-fifth of the GDP (Nepal 20%, Tonga 20%, Moldova 23%, Lesotho 29%, Tajikistan 31%) (http://web.worldbank.org/WBSITE/EXTERNAL/NEWS/0,,contentMDK:20648762~menuP K:34480~pagePK:64257043~piPK:437376~theSitePK:4607,00.html; http://www.dbresearch .com/PROD/DBR_INTERNET_EN-PROD/PROD0000000000291419/Moldova.PDF).

According to the World Bank, the Europe and Central Asia region received approximately USD 41 billion in 2011 in the form of remittances. In fact, Serbia is among the biggest recipients in the region right next to the large economies such as Russia, Ukraine and Romania (The World Bank, 2011). Total inflow of migrant remittances (workers' remittances, compensations of employees and migrants' transfers) in 2010 in Serbia was estimated by the World Bank at the level of around 13% of the GDP, while the subcategory of pure workers' remittances was estimated at 8.7% of the GDP by the National Bank of Serbia.[3]

It is important to note that the real size of remittance flows that are not registered through official channels or are transferred through informal channels in some countries is often considered to be significantly higher than estimates made by the side of relevant institutions. This fact only increases their importance as potential source of external financing of both consumption and investments in developing countries.

3 THE STABILITY OF REMITTANCE FLOWS
Remittances have proven to be one of the most stable sources of external financing for developing countries during the past few decades and the last global crisis. They are much less responsive to economic cycles and economic shocks than foreign direct investments and other private and official capital flows (Chami, Hakura and Montiel, 2009; Ratha and Mohapatra, 2007). In developing countries, these flows have decreased by only 5.5% in 2010 compared to 2009, in contrast to the decline in foreign direct investment by 40%, and private capital inflows and portfolio investments by as much as 46% over the same period (The World Bank, 2011). The low volatility of remittances potentially helps developing economies to avoid sudden reversals in the behavior of their key macroeconomic fundamentals and possible consequences of these shocks on the room for maneuver of monetary and fiscal policy and the overall welfare.

---

[3] Foundation for the Advancement of Economics, based on the National Bank of Serbia's data.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 1: The stability of remittance flows compared to other sources of external financing in developing countries (The World Bank, 2011)

The degree of remittance flows' volatility depends on a variety of macroeconomic factors. Among them, the most important are fluctuations of production in the remitting and recipient country, changes in exchange rates, inflation, unemployment and socio-political environment. Stability of remittances consequently has impact on consumption patterns in the recipient country and the households' propensity to save. These parameters influence economic activity, primarily in the short and possibly medium term.

4   INFLOWS OF FOREIGN CAPITAL IN SERBIA

Serbia is one of the countries with emerging markets, which is a significant recipient of remittances in both absolute and relative terms - in comparison to the size of the GDP and other external inflows in form of foreign direct investment and development assistance.
Chart 2: Inflows of remittances, FDI and development assistance to Serbia from 2000 to 2011 (Authors' prezentation based on the World Bank's data - World Development Indicators)

In Serbia, workers' remittances account for a large part of the total inflow of funds from abroad. According to the National Bank of Serbia's data from 2007 to 2011 the remittances' inflows have reached between 2.5 and 4 billions of U.S. dollars annually. Also, they represent a significant portion of the GDP (7.6% on average for 2007-2011 period) and cover nearly 40% of the trade deficit (average for 2007–2011 period).

Since remittances represent the largest financial inflows in Serbia, especially in the period during the global crisis, they are of great importance to the national economy. However, large variations in these flows could be a problem for policymakers. It is therefore of great significance to empirically test the level of stability of these flows in order to see whether they can be used as a stable source of external funding which is particularly crucial now when other inflows of foreign capital are scarce.

5 THE ANALYSIS OF REMITTANCE VOLATILITY BY USING RECEIPTS OF CURRENT TRANSFERS IN SERBIA – DATA DESCRIPTION, METHODOLOGY AND RESULTS

Remittances from abroad react to economic and social changes in both the remitting and recipient countries. Remittances usually increase in cases of some unforeseen circumstances (such as natural disasters, economic shocks, political instability, wars etc.), for the purpose of helping the population (and the economy) in danger. However, if the undesired events happen in the remitting country, the value of remittances can significantly decrease.

Such movement of remittances indicates the potential change of their volatility over time and its grouping into zones of low and high volatility. The periods of high volatility are followed by more peaceful periods and vice versa. For this reason, it is valid to test this hypothesis by using the Autoregressive Conditional Heteroskedasticity Model-ARCH, as suggested by Engle (1982). ARCH and GARCH (Generalized Autoregressive Conditional Heteroskedasticity-GARCH, Bollerslev (1986)) models are particularly suitable for the volatility analysis of economic variables.

ARCH model of order q can be presented in the following way:

$$y_t = \beta_1 + \beta_2 x_{2t} + \beta_3 x_{3t} + ... + u_t$$
$$u_t \sim N(0, \sigma_t^2)$$
$$\sigma_t^2 = \alpha_0 + \alpha_1 u_{t-1}^2 + \alpha_2 u_{t-2}^2 + ... + \alpha_q u_{t-q}^2$$

(1)

The initial series of data subjected to analysis depends on the series of explanatory variables x_t, which can even be the previous values of a dependent variable y_t. We use u_t to denote the residual series, that is – the standard errors of the model, and σ_t^2 to denote the time dependent residual variance. Here, α_0 is used to denote the minimum constant volatility, and α_1 to α_q, to denote the variance which depends on the squares of previous process $\{u_t\}$ values.

The presence of the ARCH effect points to the existence of heteroskedasticity, that is - the change in residuals' variance over time, which is then possible to model with the adequate form of ARCH (or GARCH) specification.

Challenges of the Modern World - Contemporary Economy and Globalization

Considering the fact that we have a consistent time series of remittance inflows since 2007[4], we have decided to analyse remittance volatility using the data on current transfer inflows, which are available for a much longer time period (based on internal data of the National Bank of Serbia, for the period from January 2001 till August 2012). Considering the fact that remittances make the biggest part of current transfers and that a higly correlated behaviour between these two series is evident (Chart 3, correlation coefficient of 0.9576), we believe that current transfers are a good proxy for the analysis of remittance movements in Serbia. So, the observed time series consists of 140 monthly observations[5].
*Chart 3: Serbia: Receipts of Current Transfers and Remittances, Jan 2007 – Aug 2012
(National Bank of Serbia)*

The first step in the analysis is testing of the stationarity and linearity, which enables us to proceed with the further analysis of this time series.[6] Thus we primarily apply unit root tests.

Bearing in mind the exceptionally seasonal movement of remittances (increased inflows at the end of the year), and thus of current transfers too, the deseasonalization of data series was performed (by using Tramo/Seats method, Chart 4), followed by testing of the characteristics of seasonally–adjusted time series.

---

[4] NBS changed the methodology of the Balance of payments in January 2008, when it harmonized the methodology with IMF's BOP Manual 5. The data are also revised for year 2007. Because of that, the remittance series before and after January 2007 are methodologically inconsistent.

[5] In the previous analysis we analyzed the volatility of remittance flows for the period February 2007 - August 2012 and got results that lead to the same conclusions (Jankovic and Gligoric, 2012)

[6] We performed the data analysis and modelling using Eviews 6 programme.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 4: Seasonally-adjusted log series of current transfer inflows to Serbia, Jan 2001-Aug 2012 (Authors' calculations)

Seasonally-adjusted series of current transfer inflows to Serbia shows stationarity, which is supported by correlogram analysis and the unit root test (Augmented Dickey-Fuller Test).

After we confirmed that the series of current transfer inflows is stationary, we focused on specification of an adequate ARMA (p, q) model. ARMA (p, q) models show the linear dependence of the current values of some data series *y* on its previous values, as well as current and previous values of error *u,* which possesses the characteristics of the white noise process. ARMA (p, q) specification can be presented in the following way:

$$y_t = \phi_0 + \phi_1 y_{t-1} + \phi_2 y_{t-2} + ... + \phi_p + \theta_1 u_{t-1} + \theta_2 u_{t-2} + ... + \theta_q u_{t-q} + u_t$$

$$E(u_t) = 0; \quad E(u_t^2) = \sigma^2; \quad E(u_t u_s) = 0 \quad ,t \neq s$$

(2)

Non-standard observations can result in the biased estimation of the correlation structure of a series. Since the series of current transfer inflows is characterized by several non-standard observations we introduce three artificial variables: V1, V2 and V3 (V1 for January 2007 - The change of balance-of-payments methodology by NBS, which resulted in the data showing uncharacteristically low value of inflows in January; V2 for November 2008 - The beginning of the global economic crisis; V3 for February and March 2002 - The introduction of the euro and exchange of deutsche marks for new currency caused the increase of the value of transactions in exchange offices, which was methodologically recorded as the remittance inflow), and observe the correlation structure of the series devoid of the influence of structural breaks.

Table 1: Correlogram (Autocorrelation coefficients are statistically significant at the 5% significance level if they are outside the interval (±0.17), Authors' calculations)

lag	1	2	3	4	5	6	7	8	9	10	11	12
AC	0.49	0.47	0.38	0.35	0.30	0.28	0.22	0.26	0.19	0.12	0.17	0.06
PAC	0.49	0.31	0.11	0.08	0.03	0.04	-0.02	0.09	-0.01	-0.10	0.07	-0.09
lag	13	14	15	16	17	18	19	20	21	22	23	24
AC	0.11	0.20	0.18	0.14	0.19	0.17	0.24	0.16	0.10	0.09	0.03	-0.05
PAC	0.04	0.20	0.06	-0.06	0.07	0.04	0.08	-0.05	-0.10	-0.09	-0.09	-0.12

Challenges of the Modern World - Contemporary Economy and Globalization

More precisely, we observe the regression residuals of seasonally-adjusted current transfer series on the constant and the artificial variables: V1, V2 and V3. This is the way we model the series devoiding the influence of non-standard values.

After the influence of structural breaks is eliminated, the correlation on the first and a second lag becomes statistically significant (Table 1). It is modelled by including AR(1) and AR(2) components. So we choose ARMA(2,0) specification presented in Table 2 and in equation (3), whereas actual and estimated values are shown in Chart 5.

Table 2: Estimation of the equation of seasonally-adjusted current transfer values (V1=1 for January 2007 and 0 for other months, V2=1 for November 2008 and 0 for other months and V3= -1 for February and 1 for March 2002 and 0 for other months, Authors' calculations)

Variable	Coefficient	t-statistic
Constant	5.4894	62.60
Trend	0.0044	4.18
V1	-0.9015	-5.90
V2	-0.6285	-4.10
V3	-0.5494	-5.55
AR(1)	0.3369	4.05
AR(2)	0.3196	3.84
S=0.1676	Q(12)=10.97(0.36) JB=2.01(0.37)	SC=-0.5371

The following equation represents ARMA (2,0) model for seasonally-adjusted series of current transfer inflows in Serbia:

$$y_t = 5.4894 + 0.0044t + 0.3369y_{t-1} + 0.3196y_{t-2} - 0.9015V1 - 0.6285V2 - 0.5494V3 + u_t \qquad (3)$$
Chart 5: Current and estimated values of seasonally-adjusted current transfer series

Correlogram and Breusch-Godfrey Serial Correlation LM Test do not indicate the presence of a significant remaining autocorrelation. This is confirmed by the value of the product of the number of observations and the coefficient R^2, Obs*R-squared (13.81), which is smaller than

Challenges of the Modern World - Contemporary Economy and Globalization

the critical value of χ^2 square distribution with m=12 ($\cong \sqrt{T}$) at the significance level of 5% (21.03).

Normality analysis indicates that residuals do not deviate significantly from a normal distribution (Chart 6). The indicator of distribution kurtosis has a value of 3.58, whereas the skewness is closer to 0 and equals -0.05, which indicates a symmetric structure. The same conclusion on a normal residual distribution is reached by observing the value of Jarque-Bera statistics, which equals 2.01 (p=0.37).
Chart 6: Histogram

Histogram and correlogram of residuals squared do not suggest the presence of ARCH effect, i.e. heteroskedasticity. Still, in order to check for the absence of heteroskedasticity, we also conduct the ARCH test, where we include one lag. The results of ARCH (1) test are shown in Table 3.

Table 3: The results of the ARCH test (Authors' calculations)

F-statistic	6.30E-05	Prob. F(1,136)	0.9937
Obs*R-squared	6.39E-05	Prob. χ^2	0.9936

The value of the product of the number of observations and the coefficient R^2, Obs*R-squared (6.39E-05) is smaller than the critical value of χ^2 distribution with m=12 ($\cong \sqrt{T}$) at the significance level of 5% (21.03). We conclude that there is no ARCH effect in the model's residual series.

We obtained the following equation (t-statistics in parenthesis):
$$\sigma_t^2 = \underset{(6.6123)}{0.026664} - \underset{(-0.0079)}{0.000548}\, u_{t-1}^2 \tag{4}$$

The absence of the ARCH effect is also confirmed by the obtained equation (4), which shows that there is no statistically significant influence of residuals from the previous period on the variance. The indicator of that is the extremely low value of t-statistics = -0.007937 (p-value = 0.9937) of coefficient α_1.

6 CONCLUSION

The absence of volatility, or rather the stability of remittance flows is considered to be their much valued characteristic, particularly in the period after the global crisis, when the external cash inflows to developing countries are scarce, and even start to decrease. Therefore, it has been our aim to empirically confirm the absence of significant volatility of remittances to Serbia, in order to be certain that it is reasonable to count on their stable inflow in the process of creating medium-term macroeconomic policies.

Findings based on the econometric data analysis of current transfers and remittances and their volatility show that they are a quite stable source of external financing that economic authorities can mostly count on and which can be used both, in the gradual stabilization of spending, that is already the case, and for the stimulation of new investment activities. As a result, that would have a positive effect on the overall growth of our economy.

Challenges of the Modern World - Contemporary Economy and Globalization

EDUCATION FOR SUCCESSFUL INTERCULTURAL COMMUNICATION AND CULTURAL INTELLIGENCE

Anita Goltnik Urnaut

Faculty for Commercial and Business Science Celje, Lava 7, 3000 Celje, Slovenia,
anita.urnaut@fkpv.si

ABSTRACT
Intercultural intelligence is the capability to function effectively in culturally diverse settings and consists of different dimensions (metacognitive, cognitive, motivational and behavioural) which are correlated to effectiveness in global environment (cultural judgment and decision making, cultural adaptation and task performance in culturally diverse settings). The purpose of the article was to check the relationship between knowledge and experiences of intercultural communication and the score of cultural intelligence. The sample consists of 107 students from Faculty for commercial and business science Celje; they answered the questionnaire of education on Intercultural communication and the Cultural intelligence scale (Ang, Dyne and Koh, 2006). The results show that the number of intercultural knowledge sources, number of foreign languages knowledge, frequency of communication with persons from other cultures in private and business time and frequency of international travels correlate significanly with the score of Cultural intelligence scale and its dimensions.

Keywords: *Cultural adaptation, Cultural intelligence, Experience in intercultural communication, Increasing cultural intelligence, Intercultural Education*

1 INTRODUCTION

The competence for successful intercultural communication in global world is becoming increasingly important. Globalization has made the world seem smaller, our awareness of cultural diversity is rising and the need for effective intercultural communication is present in most companies, project teams and with the management.

Each expatriate needs different abilities and competencies for successful work than employees who work in their own countries. In the selection process some specific criteria should be used for prediction of future success in global environment.

Globalisation touches the employees who work in their homecountry too, because the interaction and transaction with foreign companies today is almost inevitable.

Researchers tried to find personality factors which predispose people for successful live and work globally. Downes, Varner and Hemmasi (2010) focused on Big Five personality traits and found that extraversion (the amount of interaction with the external world, being with people, to be action-oriented), emotional stability (ability to cope with stress, not get upset easily, cope with unexpected situations…) and openness (creative, imaginative, curious, adventurous, awareness of their feelings) have a significant, positive impact on expatriate adjustment. Agreeableness (the ability to form social alliances) is significant and positively associated with expatriate job performance.

The most important factors which distinguish successful employees from less successful ones are knowledge, abilities and motivation.

The concept of Intelligence first referred to intellectual functioning; intelligence is defined as general cognitive problem - solving skills. It is a mental ability involved in reasoning, perceiving relationships and analogies, calculating and learning quickly.

First it was believed that there was one underlying general factor at the intelligence base (the g-factor). Gardner (1983, 1999) developed the Multiple Intelligence Theory which consisted of 8 primary intelligences: linguistic and logical-mathematical intelligence (valued in schools), musical, bodily-kinaesthetic and spatial intelligence (valued in the arts or sport), interpersonal and intrapersonal intelligence ('personal intelligences') and naturalist intelligence.

Legg and Hutter (2006) studied different definitions and summarized with: "Intelligence measures an agent's ability to achieve goals in a wide range of environments".

Mayer and Salovey (1990) introduced a concept of "emotional intelligence" (the ability to monitor one's own and other's feelings and emotions, to discriminate among them and to use this information to guide one's own thinking and actions), which became popular with Goleman's book Emotional intelligence; why it can matter more than IQ (1995). It was presented as an important factor of life and work success.

»Emotional intelligence is your ability to recognize and understand emotions in yourself and others, and your ability to use this awareness to manage your behaviour and relationship.« (Bradberry and Greves, 2009).

Researchers found Emotional intelligence an important factor of success and satisfaction at work, attitude toward work, the ability for effective team work, stress management, quality of work and life, mental health and also a factor of selection of human resources for different jobs.

Emotional intelligence is a part of social intelligence, which was first introduced by Thorndike (1920) as "the ability to understand and manage men and women, boys and girls – to act wisely in human relations". Goleman (2006) defines social intelligence as a social awareness and social facility (response and adaptation to others and the social situations).

Earley and Ang (2003) developed the construct of cultural intelligence, defined as »an individual's capability to function and manage effectively in culturally diverse settings; a multidimensional construct targeted at situations involving cross-cultural interactions arising from differences in race, ethnicity and nationality«.

Cultural intelligence comprises metacognitive, cognitive, motivational and behavioural dimensions. Metacognitive cultural intelligence includes mental processes which individuals use to acquire and understand cultural knowledge, cognitive cultural intelligence reflects knowledge of the norms, practices and conventions in different cultures acquired from education and personal experiences; motivational cultural intelligence reflects the capability to direct attention and energy toward learning about and functioning in situations characterized by cultural differences. Behavioural cultural intelligence reflects the capability to exhibit appropriate verbal and nonverbal actions when interacting with people from different cultures (Ang et al., 2007).

Challenges of the Modern World - Contemporary Economy and Globalization

Cultural intelligence is related but distinct from other forms of non-academic intelligence (Ang, Dyne and Tan, 2003).

Some researches focused on factors that could improve intercultural encounters.

With studies of correlation between cultural intelligence and work outcomes Ang with co-authors (2007) found the relationships between the dimensions of cultural intelligence (metacognitive, cognitive, motivational and behavioural) and intercultural effectiveness (cultural judgment and decision making, cultural adaptation and task performance in culturally diverse settings). »Metacognitive and cognitive cultural intelligence predicted cultural judgment and decision making; motivational and behavioural cultural intelligence predicted cultural adaptation; and metacognitive and behavioural cultural intelligence predicted task performance. «

Rehg, Gundlach and Grigorian (2012) examined the influence of cross-cultural training on cultural intelligence and specific self-efficacy and found that cultural intelligence can be improved through training: training using a lecture format significantly improved average levels of cultural intelligence on the cognitive and behavioural dimensions, while it less significantly improved motivational dimension.

Successful intercultural communication is vital for organisations, their business success and global competitiveness. Organizations should consider candidate's personality as an important criterion for selection to work with business partners from other cultures and to work abroad. Cultural intelligence may be an essential element in the recruitment and retention process, due to correlation between cultural intelligence and job satisfaction and intent to renew contract (Sims, 2011) for international organisations as it has been shown to predict the cultural adaptability of people who find themselves in cross-cultural situations (Earley and Ang, 2003).

2 AIMS OF THE PAPER AND HYPOTHESIS
This paper aims to assess the relationship between cultural intelligence and cultural education, language knowledge and work experience and some organisational factors.

Hypothesis:
H 1: There are no differences in cultural intelligence scores according to gender, age and years of working experiences.
H 2: There is no correlation in scores on cultural intelligence scale and knowledge of foreign languages.
H 3: There are no differences in score on cultural intelligence scale according to the working place.
H4: There are no differences in score on cultural intelligence scale according to the some organisational factors (number of employees, number of foreign markets).
H5: Regression model shows no influence from educational independent variables (attendance in intercultural communication education, number of different ways to gather knowledge) on dependent variable (to cultural intelligence).
H6: There are no discriminant functions which distinguish more culturally intelligent student from less culturally intelligent ones.

3   METHOD

3.1   Participants

Data was collected from 107 part-time students of second Bologna level at Faculty for Commercial and Business Science Celje (study programs: commercial science, business informatics, tourism); 74 women and 33 men with average age 34,4 years who participated in the study.

3.2   Materials and data collection

Empirical method was used; data was collected with Culture intelligence scale (Ang, Dyne and Koh, 2006) and Survey about intercultural education and experiences.

All questionnaire items, originally published in English, were translated into Slovene; the students joining the subject Intercultural negotiation got written instructions and sent the completed questionnaires by e-mail.

4   RESULTS

Table 1: Descriptive Statistics for Cultural intelligence dimensions

Cultural intelligence dimensions	N	Minimum	Maximum	Mean	Std. Deviation
Metacognitive	107	1,75	7,00	4,8902	1,30771
Behavioural	107	1,60	7,00	4,7570	1,19212
Cognitive	107	1,67	6,17	3,8240	0,97259
Motivational	107	1,40	7,00	5,2449	1,19221
Total score CQ	107	2,20	6,70	4,6350	0,95476

Students get the highest average score on motivational dimension (M=5,24, SD=1,19) and the lowest in cognitive dimension (M=3,82; SD=0,97). The average score of the whole scale is above the middle of the scale (M=4,63; SD=0,95).

Results in table 1 show that student have good metacognitive, behavioural and motivational cultural intelligence and average cognitive cultural intelligence. Compared to the results of Arg et al. (2007), the score does not differ much from the average of the USA students' sample; who score a little higher on metacognitive dimension (M=5,00, SD=0,93) and motivational dimension (M=5,35, SD=0,93) and are lower than our sample in behavioural dimension (M=4,18. SD=1,18) and cognitive dimension (M=3,67; SD=0,97).

The influence of the gender on cultural intelligence was tested with t-test, there were no statistically significant differences between men and women. The differences between the age groups and also between groups concerning years of working experience were tested with ANOVA, and no significant differences were found. Work experience is not correlated with cultural intelligence scores.

Results support the hypothesis 1: There are no differences in cultural intelligence score according to gender, age of respondents and years of working experiences.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: F-test of differences according to working place in Cultural intelligence dimensions

Cultural intelligence dimensions	Working place	N	Mean	Std. Deviation	F	Sig
Metacognitive	intercultural communication	6	5,7500	1,03682	1,544	0,218
	management	24	4,9688	1,37784		
	others	77	4,7987	1,29272		
	Total	107	4,8902	1,30771		
Behavioural	intercultural communication	6	5,7000	0,68993	2,185	0,118
	management	24	4,8167	1,41902		
	others	77	4,6649	1,12317		
	Total	107	4,7570	1,19212		
Cognitive	intercultural communication	6	4,6944	1,00784	3,406	0,037
	management	24	3,9792	0,96348		
	others	77	3,7078	0,94364		
	Total	107	3,8240	0,97259		
Motivational	intercultural communication	6	6,2333	0,52789	3,240	0,043
	management	24	5,4750	1,28782		
	others	77	5,0961	1,16013		
	Total	107	5,2449	1,19221		
Total score	intercultural communication	6	5,5583	0,69528	3,564	0,032
	management	24	4,7375	0,98469		
	others	77	4,5312	0,92984		
	Total	107	4,6350	0,95476		

We divided the respondents in three groups, according to their working place; part-time students who have a job with intensive intercultural communication, managers and others. Scores of the cognitive, motivational and total score are significantly different, depending on working place. Results in table 2 do not support the hypothesis H2: There are no differences in scores on cultural intelligence scale according to the working place.

Table 3: ANOVA of differences according to number of foreign languages spoken in Cultural intelligence dimensions

Cultural intelligence dimensions	Number of languages spoken	N	Mean	Std. Deviation	F	Sig
Metacognitive	1,00	40	4,5438	1,21012	4,090	0,020
	2,00	37	4,8378	1,43761		
	3,00 or more	30	5,4167	1,12252		
	Total	107	4,8902	1,30771		
Behavioural	1,00	40	4,3350	1,30827	5,242	0,007
	2,00	37	4,8378	1,23903		
	3,00 or more	30	5,2200	0,71506		
	Total	107	4,7570	1,19212		
Cognitive	1,00	40	3,6083	0,70261	6,454	0,002
	2,00	37	3,6396	1,08832		
	3,00 or more	30	4,3389	0,97033		
	Total	107	3,8240	0,97259		
Motivational	1,00	40	4,7900	1,20932	7,254	0,001
	2,00	37	5,2649	1,25968		
	3,00 or more	30	5,8267	0,78912		
	Total	107	5,2449	1,19221		
Total score	1,00	40	4,2725	0,82166	9,002	0,000
	2,00	37	4,5851	1,03949		
	3,00 or more	30	5,1800	0,76874		
	Total	107	4,6350	0,95476		

Scores of the metacognitive, behavioural, cognitive, motivational dimension and total score are significantly different depending on knowledge of foreign languages. Students with the knowledge of 3 and more foreign languages score higher on all culture intelligence dimensions. Results in table 3 do not support the hypothesis H 3: There are no differences in scores on cultural intelligence scale according to the knowledge of foreign languages.

The correlation between organisational factors and cultural intelligence were not significant; results do not support the hypothesis H4: There are no differences in score on cultural intelligence scale according to some organisational factors (number of employees, number of foreign markets).

Table 4: Regression analysis - Coefficients of factors influencing cultural intelligence (total score of CQ)

Model	Unstandardized Coefficients		Standardized Coefficients		
	B	Std. Error	Beta	t	Sig.
(Constant)	4,067	1,001		4,063	,000
Gender	,041	,178	,020	,232	,817
Age	-,018	,031	-,156	-,581	,562
Work experience in years	-,002	,026	-,024	-,089	,929
Frequency of international communication in private time	-,261	,091	-,312	-2,878	,005
Frequency of international communication in working time	-,118	,070	-,188	-1,680	,096
Frequency of international travels	,266	,122	,254	2,182	,032
Organisation – number of employees	-1,219E-6	,000	-,003	-,033	,974
Organisation – number of foreign markets	,000	,002	-,018	-,193	,847
Number of learning sources	,153	,048	,363	3,204	,002
Working place	,011	,086	,013	,130	,897
Number of foreign languages knowledge	,240	,112	,203	2,144	,035

a. Dependent Variable: CQ aggregated (total) score

Regression analysis of factors influencing cultural intelligence showed that the multiple correlations between 11 independent variables and cultural intelligence are 0,619. With the variables included in the model we can explain around 40% cultural intelligence variance (square R is 0,383; F=5,301, Sig. 0,000). In table 4 we can see high value of Beta coefficient for variable Number of learning sources (0,363; persons who use more sources of knowledge have higher cultural intelligence), frequency of international communication in private time (-0,312; higher frequency of private conversation with the people from different nations is connected with higher cultural intelligence (frequency scale: very often=1, not at all 5), frequency of international business travels (0,254; lower frequency of international travel connected with work is connected with higher cultural intelligence (frequency scale: very often=1, not at all 5) and the number of foreign languages knowledge (0,203).

The Regression analysis of factors influencing specific dimensions of cultural intelligence showed some significant correlations:
- Metacognitive dimension is explained with number of learning sources (Beta=0,278, t=2,181, Sig.=0,032);
- Behavioural dimension with number of learning sources (Beta=0,289; t=2,333, Sig.=0,022), frequency of international communication in private time (Beta=-0,236; t=-1,989, Sig.=0,050) and frequency of international business travels (Beta=0,263, t=2,062, Sig.=0,042);

Challenges of the Modern World - Contemporary Economy and Globalization

- Cognitive dimension of cultural intelligence with Number of learning sources (Beta=0,301, t=2,528, Sig.= 0,013) and frequency of international communication in private time (Beta=-0,277, t=-2,432, Sig.=0,017);
- Motivational dimension of cultural intelligence with Number of learning sources (Beta= 0,291, t=2,458, Sig.=0,016), frequency of international communication in private time ((Beta= 0,313, t=2,755, Sig.= 0,007) and frequency of international travels (Beta= 0,268, t=2,202, Sig.= 0,030), number of foreign languages knowledge (Beta=0,196, t=1,979, Sig.= 0,051).

Results of regression analysis do not support the hypothesis H5: Regression model shows no influence from educational independent variables (attendance in intercultural communication education, number of different ways to gather knowledge) on dependent variable (cultural intelligence). There are some factors influencing total score: number of learning sources, frequency of international communication in private time, frequency of international travels and number of foreign languages knowledge.

Table 5: Differences between more and less culturally intelligent students

Independent variables	1 N=15		2 N=73		3 N=19	
	Mean	Std.deviation	Mean	Std.deviation	Mean	Std.deviation
Work experience in years	13,87	11,01	9,80	9,08	15,42	9,73
Frequency of international communication in private time	3,47	1,06	2,78	1,07	1,84	0,90
Frequency of international communication in working time	3,40	1,64	2,58	1,44	1,58	1,22
Frequency of international travels	4,47	0,92	4,16	0,83	3,47	1,17
Number of learning sources	2,33	1,18	3,27	1,76	6,33	2,77
Organisation – number of employees	250,07	423,27	928,08	2438,33	818,84	1849,35
Organisation – number of foreign markets	0,73	2,09	19,51	52,68	11,74	16,28
Age	36,40	8,02	33,15	7,81	37,84	9,08
Number of foreign languages knowledge	1,47	0,52	1,88	0,82	2,42	0,69

Students were divided into 3 groups according to their score on cultural intelligence scale; (AS=4,64, SD=0,955; group 1: less than 3,68; group 2: 3,68-5,59; group 3: more than 5,60)

Table 6: Summary of Canonical Discriminant Functions

Function	Eigenvalue	% of Variance	Cumulative %	Canonical Correlation	Wilks' Lambda	Chi-square	df	Sig.
1	,618[a]	86,0	86,0	,618	,562	57,116	18	,000
2	,100[a]	14,0	100,0	,302	,909	9,479	8	,304

Discriminant analysis eliminated 1 discriminant function which divides individuals who have high, moderate and low cultural intelligence (table 6).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 7: Structure matrix

Independent variables	Correlation Function 1
Number of learning sources	,841[*]
Fequency of international communication in private time	-,567[*]
Number of foreign languages knowledge	,465[*]
Frequency of international communication in working time	-,441[*]
Frequency of international business travels	-,365[*]
Work experience in years	,159
Age	,155
Organisation – number of foreign markets	,033
Organisation – number of employees	,063
Chart 1: Unstandardized canonical discriminant functions evaluated at group means

Results do not support the hypothesis H6: There are no discriminant functions which distinguish more culturally intelligent students form less culturally intelligent students. The discriminant function shows the difference variables: number of learning sources, frequency of international communication in private time, number of foreign languages knowledge, frequency of international communication in working time, frequency of international business travels.

5   DISCUSSION OF RESULTS

Researchers have begun to study new concepts of practical intelligence to find the answer to the question why some individuals perform better than others in situations which involve interaction with people from different cultural background. Cultural intelligence was conceived in the new century, when we have experienced a great expansion of globalization. Effectiveness in global environment is vital for a great number of organisations, which need leaders and employees who are capable of understanding, functioning, and managing in the global environment. They can bring the organisations a competitive advantage (Ang and Inkpen, 2008).

In the study, whose main aim was to assess the relationship between cultural intelligence and cultural education, language knowledge, work experience and some organisational factors, we measured the cultural intelligence of the students, who listened to the subjects Intercultural negotiation and Intercultural communication at second Bologna level. Their average score on the cultural intelligence scale was above the middle level of scale (M=4,63, SD=0,95). Looking into the dimensions of cultural intelligence, we can see that the highest average score

was in motivational dimension and the lowest in cognitive dimension. Only some students have work-experience in multicultural environment, and therefore their knowledge about rules in other cultures is limited. Metacognitive and behavioural cultural intelligence are also above the middle of the 7 level scale.

Students have above average capability to direct attention and energy toward learning about and operating in culturally diverse situations. Results of our students are similar to results of other students and higher than in employees involved in different studies conducted by Ang et al. (2007).

There is no influence of the gender, age, years of work-experiences, size of the company and number of international markets on cultural intelligence.

The working place is an important factor of cultural intelligence. Cognitive and motivational dimension and total score of cultural intelligence are significantly different depending on working place. Part-time students who have a job with intensive intercultural communication score higher than managers. The lowest score was found for students, who have others workplaces or are unemployed.

Those results support the findings about possibility to increase cultural intelligence through learning (Ng, Dyne and Ang, 2009).

Knowledge of foreign languages is a significant factor of cultural intelligence. Students with the knowledge of 3 and more foreign languages score higher on all culture intelligence dimensions. Learning new languages can increase the abilities for successful working in global environment.

Variables number of learning sources, frequency of international communication in private time and number of foreign languages knowledge positively correlate with cultural intelligence and explain more than one third of cultural intelligence variance.

Practical implications following from these findings are: organisations should provide more different knowledge source, the more sources will an individual use the bigger increase in cultural intelligence can be anticipated.

The correlation with business international travel is nominally positive, but because the scale of frequency was negative (from more frequent to less frequent), the number of international business travels does not increase cultural intelligence. Closer look into the results shows that only 4 students have frequent work obligation abroad and more than 75% have rare or no such situations.

Practical implications following from these findings could be that organisations should stimulate employees for bigger involvement in language courses, gathering knowledge in different ways and gathering experience with private involvement in intercultural situations.

Discriminant analysis showed factors which distinguish more and less culturally intelligent individuals: the number of learning sources, frequency of international communication in private time, number of foreign languages knowledge, frequency of international communication in working time, frequency of international business travels.

The results of the study support the findings from researchers who found that international experiences can increase cultural intelligence (Ang, Dyne, Tan, 2003) and supplement the range of organizational interventions for enhancing global leadership effectiveness which range from didactic programs to intensive cultural experiences (Caligiuri, 2006) with the promising positive influences of different experiences of communication with people from different cultures and the ability to converse in a different language. Crowne (2008) showed that number of countries visited correlates with cultural intelligence, presented study shows that also frequency of communication with other cultures correlates with cultural intelligence.

6   CONCLUSION

Cultural intelligence is a new construct that has no extensive attendance in Slovenia yet; the study advances the research on cultural intelligence with some new variables concerning educational factors and experiences.

The findings of this research identified a number of different ways of gathering knowledge as important possibility to enhance cultural intelligence and consequently success in global environment.

Important factors of cultural intelligence are, beside the number of intercultural knowledge sources, also the number of foreign languages knowledge, frequency of communication with persons from other cultures in private and business time and frequency of international travels which correlate significantly with the score of Cultural intelligence scale and its dimensions.

CHALLENGES OF THE WELFARE STATE: THE SPANISH CASE

Miryam de la Concepcion Gonzalez-Rabanal
Universidad Nacional de Educacion a Distancia (UNED), Facultad de Derecho,
Departamento de Economia Aplicada y Gestion Publica, Spain
mcgonzalez@cee.uned.es

ABSTRACT
Recent events - especially the economic crisis- have revealed the need to maintain the welfare state, especially in developed countries (the most attacked by the crisis) which are also hit the hardest by the recession and job losses. On the one hand, the increase in demand for social services joins the decreased capacity to collect taxes as a result of the fall in economic activity and declining social contributions because of the rising unemployment. On the other, economic difficulties to prop up the welfare of citizens have caused the most unrest and political debate about whether social spending is precisely that what must suffer cuts to balance the public accounts. The answer of each country to this question will depend on its ability to meet new challenges without compromising the future of younger generations. The objective of this paper is to discuss the Spanish model of welfare, taking into special consideration the demographic effects of an aging population and the reversal of migration flows in order to discern which direction and what concrete measures can answer the previous question. This has been a response that in the Spanish case, has highlighted the need to review the excessive benevolence in granting a benefits system and the existing pockets of fraud in the tax system.

Keywords: Economic Crisis, Social benefits, Welfare State

1 INTRODUCTION

It is obvious that the recent events undergone by most developed countries have revived the controversy over the level of Welfare State (WS) viability.

Regardless of the doctrinal discussion aroused by the increasing presence of the public sector in the economy, new arguments have been swayed in regard to the size of such in the so called market economies, among which the Spanish economy is found, and about what should be the priority actions and the amount of benefits offered by WS, both in way of services and pecuniary value, to its beneficiaries.

2 THE SPANISH WELFARE SYSTEM

It is a well-known fact that the functioning designed by the constituent legislator in the text that was passed in 1978, when speaking about the Social State[1] and "economy market", has been the legal frame of the highest rank under which the progressive enlargement of its benefits has been implemented, both in subjective terms (the population that benefits from such) and objective terms (the number of situations that are covered).

---

[1] The Magna Norm, in its 1st article states the following: "Spain is constituted as a Social State and democratic by Law, upholding as core values of its legal system freedom, justice, equality and political plurality" and in the 38th article (within the section that refers to the rights and obligations of citizens) it says: "Free enterprise is recognized within the frame of market economy. Public authorities shall both guarantee and protect such exercise and defend productivity, in accordance to the requirements of the general economy and, in its case, the planning thereof."

Traditionally, the intervention of the public sector in the economy aimed towards achieving the citizenship´s wellbeing has been defined in three main fronts:

- Designing of fiscal and monetary measures (for instance, by means of applying very progressive taxation or granting loans at a low interest rate).
- Investing in the development of public services which are necessary in order to assure an adequate level of life for citizens.
- Adopting normative dispositions to monitor the social and employment conditions of citizens, not only those that have to do with job performance, but also those whose end is protecting the weaker (underage, dependent, outcast, unemployed).

To that end, the WS has basically focused on achieving three objectives:
- Financial security.
- Reducing inequality.
- Fighting poverty.

With those purposes in mind, the manifestations of its protective actions have been increasing in an ever-growing catalogue of benefits.

Thus, seeking to guarantee worthy levels of income –not only for workers[2]– since keeping a worthy level of life is considered to be a right, not charity, the system foresees benefits of economic nature in the cases of retirement, disability, unemployment, etc., but also the free supply of certain goods and services. It is known that in Spain access to education is universal and free (besides mandatory) between six and sixteen years of age and that health assistance is also universal and free through the National Service of Health[3].

In this way, the justification in Spain rests in on the fact that, as a consequence of certain events, whether they be expected (old age) or unexpected (unemployment, disability), there is an uncertainty generated over the income flow of individuals receiving public aid and the granting of this kind of benefits try to reduce.

In order to have this inequality reduced[4], measures can be applied that affect the generation of revenue, for instance, by means of implementing progressive taxes, but also through an ample catalogue of services and benefits that would allow for the equality of opportunities, since the income that the market itself yields (functional sharing of income) directly relates with factor productivity and this is in turn –as it is known– closely dependent on human capital. For that reason, besides the income perspective, the expenditure side (which represents an important part of the WS models) has a meaningful effect on the achievement of equality. Such is the case of education or health.

---

[2] Let us remember that the origins of the Spanish welfare system trace back to Bismarck´s professional model.

[3] Access to medicines is articulated by means of a copayment formula (40% in general), although some medicines are foreseen to be provided free of charge to certain collectives (pensioner or chronically ill). Nevertheless, as will be stated later on, these formulas have been revised, not without controversy, in order to demand a higher co-responsibility in the use of medicine on the part of the patient, and some Autonomous Communities, since health competencies were totally passed on to them, have established the payment of 1€ per prescription (such is the case of Madrid and Catalonia) which has presently been appealed against before the Constitutional Court in some cases (Catalonia) or is expected to be shortly (Madrid).

[4] Needless to insist that equality favors social cohesion and this is also one of the modern objectives of WS.

Finally, with aims to achieving the objective of fighting poverty and in order to favor the integration of the outcast, the WS foresees policies and grants benefits in the case of unemployment, for instance, but it also supplies a wide catalogue of social nature services to those who have less free of charge.

3   THE SPANISH RECENT CONTEXT

Certainly, all the development and expansion experienced in Spain has not been indifferent to the concourse of several factors which are economic, political, social and demographic in nature, and which determine the new horizon that it will have to face in a short frame of time and which will affect its financial viability in the long term, that is, its sustainability.

A brief overview over the financial model of the Spanish welfare system, sticking to the Social Security, education and health, reveals the close dependence existing between its level of resources and the development of the economy.

It is true that, in the recessive stages of the economic cycle, to the inherent challenges of obtaining public resources (to fund health or education) we have to add, in the Spanish case, the difficulties in collecting contributions (of employees and employers) and the imbalance that results from facing a wider catalogue of situations of need[5] affecting a growing number of potential beneficiaries (real ones), and in turn increasing the cost of opportunity of continuing the collection of resources for WS purposes.

But in the Spanish model there have also concurred other factors of political nature, like the booming demand for social benefits that took place after the establishment of democracy in our country, and especially considering the gap that existed when compared to those countries of our closer economic surroundings.

This comparative backwardness, therefore, led to an unparalleled growing social expenditure that now needs to be, not only maintained but, increased since the coverage threshold in social matters keeps an upward trend and any holdup or regression is interpreted as social involution process, which is difficult to defend from a political stand point.

But in the Spanish case, the to-a-certain extent "logical" evolution of the welfare systems linked to the democratization processes of society (in which there has been a transfer between political rights to social rights) has been joined by a firm process of administrative decentralization , the so-called "Autonomies State", which has not been exempt from malfunctions and criticism from the WS development point of view, and which has occasionally led to wasting public resources and lack of control over the expense on wellbeing, getting even to create situations of discrimination among citizens, depending on their location in the Spanish territory (Autonomous Community in which they live).

Other factors of social nature, like high levels of fraud[6] in the perception of benefits (pensions, unemployment, dependency, health or pharmaceutical expense) or the failure to disclose income in contributing to the system (irregular recruitment), while at the same time

---

[5] Almost complete lack of resources or a significant reduction of them.

[6] For example, a report by the Court of Auditors published on January, 2012, has shown the dependency income of 30,000 deseased persons has been paid, amount that represents over 140 million euros ever since the Dependency Law was passed (December 14, 2006).

the political agenda pulls out benefits that were not formerly part of the WS configuration (as is the case of the dependency), have contributed to the questioning of the financial viability of the system.

Finally, and as if all the aforementioned issues were not enough, a series of variables of demographic nature has irrupted affecting the WS sustainability and, as it happens in Spain, have become even more obvious as a result of the basic data linked to the economic development: on the one hand, the birth rates decrease and, on the other, the life expectancy increases.

It is true that, during the later years of economic boom, the increase of dependency rates (ratio between pensioners and contributors) which is consequence of the "ageing of ageing"[7]has been compensated by immigration (Del Brío Carretero and González Rabanal, 2004, pp. 105–124), but it is also true that direction of migrations has changed[8] as a consequence of the economic crisis (once again, Spain has become a country of exiting net population). This change has come together with a growing concern for brain-drain and has forced our welfare system, during all this time, to assume from the beginning the increase of certain components of social expenditure linked to the immigration phenomenon (Gimeno Ullastres and González Rabanal, 2003, pp. 155–165) and, more recently, to the loss of qualified human capital. It has also been necessary to face other challenges which come as a result of the progressive ageing of the population (higher amount of retirement pensions because of increasing number of pensioners that result from early retirement and reconversion processes, as well as the higher life expectancy).

4   THE CHALLENGES

In order to have a better knowledge of the challenges that the future of the WS in Spain faces, it is necessary to go over the reasons that have explained its main components.

The expenses in health have grown considerably in Spain as a result of considering health a universal benefit in nature (General Law of Health, 1986), which has entailed a significant increase in the number of beneficiaries and, in some cases, has led to abusing the benefits granted by the National Health Services (sanitary tourism, fraud in medical prescriptions…). That has come together with other phenomena that have important effects over the increasing health expenditure. I am referring to the impact that an ageing population has over such (Spain is at the head in life expectancy statistics[9]); the innovation and technological advance processes which affect, not only the provision of services, but also diagnosis or treatments; medication in processes that are not strictly medical; the decreasing disease tolerance; the loss of co-responsibility on the part of the patient[10] for his or her use of services; the increase in the number of hospital beds; the abuses of diagnostic tests and the growing expenses in staff.

---

[7] A recent study of the Population Fund of the United Nations (PFUN) shows that the population in Spain that is 60 years old or more represents 22.7% of the total amount and in year 2050 this amount will increase to 38.3% thus placing us in the eighth place in the world.

[8] Until recently, Spain has been a net receiver of immigrants in which the foreign population has represented 12% of the sum total of citizens.

[9] In 2012, life expectancy was 81.9 years. This number has increased since 2008 in almost half a year and increases every passing day in 4.8 hours.

[10] The concept of universality gets confused with gratuity which leads to an abusive use of the services offered.

In the case of the development of expenses in pensions, the explaining variables can be classified into three categories: once again the demographic factor, the normative or political factor (acknowledgement of non-contributive benefits, which used to be of assistance), and the financial crisis context.

In the case of social expense in education, such has been universalized (1982–85[11]), there has also been –just as it happened with the health system- a total decentralization of competencies and the period of mandatory schooling has been increased from age 14 to age 16 (1990), although approximately 1/3 of all students are studying in subsidized schools.

With this panorama, what are the main challenges that the WS in Spain is facing? In general, guaranteeing the sustainability of the system in the long term, becoming necessary to intensify actions against fraud, improving the financing system so that, in the case of Social Security, the contribution rates and its basis would match real wages, encouraging the use of generic medicines, establishing taxes on certain consumptions or the practice of some unhealthy habits or extreme sports, rationalizing expenses –whether centralizing supplies or, at least, the information about the product cost offered by different suppliers and, even, the same supplier in different territories or for different centers-, carefully analyzing the effects that result from the migratory phenomenon and, under any circumstance, prevent fraudulent recruitment, expand the working life of employees (linked to exiting the crisis and improving employment), extending the calculation period for the retirement pension to all the contribution history, postponing the retirement age according to the higher life expectancy of the population, rationalizing the financing system of benefits and monitoring the fraud in their perceptions, foreseeing the creation of funds or remnants in order to reduce the level of dependency of resources to the economic circumstances of the moment, improving the schooling performance rate, increasing the average expense on students and reducing the student/teacher ratio, working on adjusting the educational system to the formation needs of the labor market, improving the pedagogic capacities of teachers, stressing individualized treatments and the adoption of programs adapted to the level of intellectual capacity of the student, favoring talent, regardless of the economic stratum of origin …

5   CONCLUSION

The especial circumstances under which the expansion of the WS took place in Spain have been conducive to a set of characteristics that have affected its future development as well as the possible challenges faced in the actual context of economic crisis.

Its fast and belated expansion, the obsession to rise to the level of other current models in the countries of our closer economic surroundings, the especial incidence of political variables (democratization, administrative decentralization), as well as social (considerable increase of the coverage provided, fraud), economic (the context of the crisis, maybe worse and longer lasting than what other countries have considered) and demographic (strong birth rate decline and firm increase of life expectancy), have made our expenditure in wellbeing to be, in terms of GDP, one of the fastest growing accounting entries that our country has experienced since democracy was established.

---

[11] On July 3, 1985, an Organic Law is passed that regulated the Right to Education.

Nevertheless, the present economic crisis context in which the future of the most highly developed economies lies increases the cost of opportunity of obtaining resources towards that end.

Because of all those reasons, it is expedient to face the challenge of ageing of the ageing, of the excessive cost of certain entries that are a consequence of fraud, or of the low level of responsibility of those involved…, without entailing a regression in the level of coverage that was achieved. It is expedient to favor rationality in the use of resources, which are evermore necessary while scarcer, seeking out efficiency and a return in those services provided and expenditures realized, trying to make them more suitable, not only to the needs of individuals, but to the needs of society as a whole. That is the only way the financial sustainability of the system will be ensured as well as the wellbeing of present generations, without compromising the future ones so that, what has been achieved so far may be consolidated and even improved in the future, regardless of what may happen in the economy and its adverse cycles.

INTERNATIONALISATION AND MOBILITY IN HIGHER EDUCATION

Stefka Gorenak
Faculty of Commercial and Business Sciences, Slovenia
gorenak.stefka@siol.net

ABSTRACT

Sustainable development has become an important issue on international, regional and national agendas concerning education, internationalisation and mobility policy over the past few years. The new vision of education emphasises a holistic and interdisciplinary approach to developing knowledge and skills needed for a sustainable future, as well as the necessary change in values, behaviour and lifestyles. More and more students are choosing to study abroad with the Erasmus programme, which supports cooperation and mobility in higher education. Erasmus, Erasmus Mundus and Tempus programmes support mobility, partnerships and international educational cooperation. Higher education institutions have identified at least three criteria for a "beneficial" curriculum: internationalisation is an explicit goal of the degree programmes, there is room in the curriculum for internationalisation and the curriculum allows flexibility when it comes to details such as recognition of credits or recommended study schedule. The programme also supports cooperation among higher education institutions and mobility for academic, technical and administrative staff. The current social development is changing the European higher education scene through increased international student and faculty mobility, internationalization of study programs and schools, and the opening of local higher-education markets to international competition. The world of work, growing more and more international and multicultural, needs people who are able to find their way across national, cultural and ethnic boundaries Paper discovers mobility, internationalization and sustainability implementation into higher education programs in the Slovenian higher educational private institution and ways of fostering sustainability in higher education. Based on findings of the evaluation, this paper outlines a mixture of recommendations and ideas on several levels: national, institutional and operational.

Keywords: Curriculum, Education, Internationalisation, Mobility, Slovenia, Sustainable higher education

1 INTRODUCTION

Sustainable development has become an important issue on international, regional and national agendas concerning education, internationalisation and mobility policy over the past few years. Education, research and innovation play a central part in the promotion of sustainable development. EU is and important regional actor for Slovenia. The ideal would seem to be that education for sustainable development should support the value-based inter-generational interpretation of sustainable development, which already in itself encompasses the idea of nurturing all the elements of sustainable development in a based way and in dialogue with one another. Sustainable development should be seen as a dynamic process; accordingly, development goals should be reviewed when visions, circumstances and the level of knowledge change. UNESCO (2005, p. 2) emphasises the importance of improving the quality of learning in education for sustainable development. In addition, the current priority is that education for sustainable development should be included in all education. Socially and culturally sustainable development requires that we intentionally build

institutions that are more humane and supportive of all of their members. Education for sustainable development in business schools starts with the challenges related to the general societal and environmental situation and development opportunities for corporations. When information on environmental or societal questions is presented in relation to a student's world view, values and background, a student will be more motivated to assimilate the information. Information on sustainable development increases a student's sense of responsibility and sensitivity to related issues, which are fundamental elements of responsible behaviour. Transformative learning is a collective process of teachers and students (Wals, 2006, p. 49). Corporate social responsibility as well as internationalisation can be improved when the top and middle management is educated to integrate not only financial issues but also environmental and social issues in strategic overall management.

The new vision of education (especially higher education) emphasises a holistic-and interdisciplinary approach to developing knowledge and skills needed for a sustainable future, as well as the necessary change in values, behaviour and lifestyles. It should be remembered that sustainable development is a moral precept as well as a scientific concept which includes also the internationalisation and mobility in higher education process. European countries will make a common strategy for the first time with the concrete aim of crating better conditions for mobility in Europe. More and more students are choosing to study abroad with the Erasmus programme, which supports cooperation and mobility in higher education. Erasmus, Erasmus Mundus and Tempus programmes support mobility, partnerships and international educational cooperation. The programme also supports cooperation among higher education institutions and mobility for academic, technical and administrative staff.

Our aim is to discover mobility and internationalization, sustainability implementation into higher education programs or subjects in the biggest private Slovenian educational institution. It has been it has been established in 2005 and over 2000 students are enrolled every year and it offers three programmes - commerce, tourism and business informatics. The second aim is to learn about ways of fostering sustainability in higher education as well as its implementation.

2   SUSTAINABLE HIGHER EDUCATION AND STAKEHOLDERS

The present global crisis emphasizes stronger than ever the idea of corporate responsibility, a new commitment to responsibility being demanded of companies as well as educational institutions (state and private) in order to create economic and social value. Organizations and society at large recognize that ethically and socially responsible behaviour plays a crucial role in good business practices. The current social development is changing the European higher education scene through increased international student and faculty mobility, internationalization of study programs and schools, and the opening of local higher-education markets to international competition. An important part of innovation of this changing is also how to transmit appropriate knowledge, skills and values from society to people (Potočan and Mulej, 2010). Giacalone (2008) suggests that business schools need to ensure that students are equipped with ethical integrity to meet challenges in the real business world (Lau, 2009).

The current economic and financial crisis is not the only world-wide crisis. As Porter and Kramer (2002) highlight, companies (as well as e.g. universities/faculties) have to change their focus towards the social setting in which they act and interact. In January 2003, the National Council for Science and the Environment (NCSE) released its recommendations for Education for a Sustainable and Secure Future (2003), a document written to "shape the

upcoming United Nations Decade of Education for Sustainable Development (2005–2015)." Development, higher education institutions are responding to the call for leadership by starting and/or expanding environmental education programs, integrating sustainability issues throughout the curriculum, adopting sustainable operations, and building green facilities, stakeholders involvements, as well as mobility and internationalisation of educational institutions. The growing use of corporate social responsibility all over the world, firms and educational institutions are increasingly incorporating social strategies and CSR initiatives, giving a positive response to a real stakeholders demands. They strive to develop reflective and critical business leaders who believe in the competitive advantage of business organisations as well as in the harsh reality of global competition. These are not contradictions – it is about driving sustainable change in business and society. Good case presents 'The 2010 CBS Report on Progress': UN Principles for Responsible Management Education (PRME) summarises what the Copenhagen Business School (2010) has accomplished and plans to accomplish since committing to furthering the implementation of PRME's objectives as a signatory in August 2008. The main part of the report is divided into six sections, based on themes from the six different PRME principles: business in society (purpose), curriculum change for sustainability (values), interdisciplinary approaches (methods), a sustainability platform for social impact (research), understanding complexity through interaction (partnership) and stakeholder engagement for sustainability. Their broad range of disciplines helps them prepare graduates and faculty better to address the grand societal challenges of the global economy.

Factors of successful change efforts in higher education identified in the literature as being related to successful transformative change processes in higher education are (McNamara, 2010): (1) internal conditions, (2) external environments, (3) leadership characteristics), (4) change process; (5) engagement of constituents; (6) facilitated learning and (7) change characteristics. The list of recommended strategies and suggests methods for implementing the sustainable strategies are (McNamara, 2010): (1) obtain backing of the college/university president's office as a champion of the initiative; (2) institutionalize the sustainability initiative; develop, formally adopt, and implement a sustainability plan; (3) allocate resources necessary to achieve the plan; (4) foster greater and more active participation of the faculty in promoting sustainable efforts; (5) build a strong student commitment; (6) engage more people; (7) try to get everyone to be part of a continuing effort and stay the course and pick up the pace!

3 HIGHER EDUCATION AND WAYS OF INTERNATIONALISATION

The internationalisation of higher education has many functions. One important function is to prepare students for an international living and working environment. The world of work, growing more and more international and multicultural, needs people who are able to find their way across national, cultural and ethnic boundaries. The main problem in supporting internationalisation is not the absence of ideas and opportunities but rather that there is no systematic planning of internationality. Activities which support internationalisation are often arranged in a haphazard manner, without proper planning. This is why internationalisation is hard to integrate to the curricula and why the various models supporting it remain isolated experiments. To replace such random practice, the means of internationalisation should have well-defined learning outcomes to help the students work on their international competencies through-out the curriculum.

Higher education has many ways of supporting internationalisation these are (Garam, 2012, pp. 2–27):

a) International student mobility, which translates into a minimum of three months of study or training abroad, is till the main mode of introducing internationality into a degree programme.

b) Intensive courses, summer schools and other short-term international modules wrap a range of international activities into a single package.

c) Teacher's mobility and incoming lecturers foster an international perspective.

d) The integration of international and Slovenian students through joint courses taught in a foreign language is another mayor way for Slovene students to become more international.

e) At their best, language and communication studies combine the study of language with cultural and communicative knowledge.

f) The availability of studies in cross-cultural communication varies a great deal.

g) Information and communication technology may replace or complete physical mobility through, for example, streamed lectures of distance assignment which are part of mobility period.

h) An international perspective in the teaching can be created through international literature or case studies, by taking and international focus in one's research and by introducing and comparing international practices.

Internationality can become more systematic and planned, when there is a logical continuum from national-level steering to institutional policies and individual students. Several institutions accumulate individual elements supporting internationalisation into a module which the students can include in their degree. The international module should have proper learning objectives and a clearly defined extent. The criteria for crediting courses and other models of study should also be defined. Internationality should be an explicit goal of the degree programmes and there should be room for it in the curriculum. Flexibility on details is also called for.

Higher education institutions have identified at least three criteria for a "beneficial" curriculum: (a) internationalisation is an explicit goal of the degree programmes; (b) there is room in the curriculum for internationalisation; (c) the curriculum allows flexibility when it comes to details such as recognition of credits or recommended study schedule. Van der Wende prognoses structural ways of internationalising the curriculum. Listing the criteria of internationalised curricula, her typology is one way of conceptualising different structural choices which can integrate an international dimension into the content of higher education curricula (1996, p. 46). Higher education is all for making internationality an integral part of the studies, yet separate international modules are being built.

The personal study plans, which all students make, can also be made to serve internationalisation, as they are on opportunity to provide more individual guidance and to pay closer attention to the students' individual circumstances. Research literature defines the international curriculum through goals/outcomes, contents and target group. An international curriculum prepares the students for an international environment and explicitly seeks to provide them with knowledge, skills and a frame of mind for cross-cultural communication (Green and Mertova, 2009; Wende, 1996). Education can become international only with the combined efforts of the management and the grass roots of an institution: the institutions define the goals and policies of internationalisation, while the degree programmes set the

learning objectives and work on the curriculum, teaching practices and assessment in accordance with the goals (Olson et al., 2008; Clifford, Josephs, 2005). To look at the structures only does not describe the concrete ways which internationalise teaching practice and processes; it may provide the big picture, but not the fine detail (Green and Mertova, 2009, pp. 40–41). The concrete ways of internationalisation can be placed under three headings: student mobility, staff mobility and internationalisation at home (Green and Mertova, 2009, p. 31–34). Students have traditionally made us of international mobility. The problem is, however, that international mobility often lacks clear learning objectives, and if these goals exist, there are few ways of follow-up (Green and Mertova, 2009, p. 36). Much talk about internationalisation focuses on mobility, even if most students do not take part in it. Internationalisation at home should be available to all – through, for example, international literature, international case studies and examples in the classroom, teachers from abroad, foreign students in one's own institution, a multicultural campus and virtual international contacts (Beelen, 2011; Green and Mertova, 2009, p. 32).

While teaching through a foreign language does not in itself make teaching international, it is hard to imagine an international department without courses given in a foreign language. A positive approach to internationalisation is called for on many fronts, from the management of the institutions to the teachers and students. The management is on the whole considered to feel positively about internationalisation. Their support can be seen in many ways: (a) internationalisation is given a prominent place in institutional strategies and development programmes; (b) policy guidelines support internationalisation; (c) internationality features in the goals, monitoring and resource allocation of institutions, degree programmes and the work of individual teachers; (d) internationalisation is encouraged, and the management shows leadership by example. The teachers meet many pressures and demands. Working on internationality is just one of them. Also, not everyone is ready to teach a multicultural group in a foreign language.

Working life needs are a central argument in justifying a strong or weak international perspective. The degree programmes differ in the extent of their active working live contacts. One of the means are alumni as coaches and sources of information of the kinds and competences needed in working live. According to the representative of the degree programmes, international competences are what the students are expected to have, but there are variations by educational field. Three criteria stand out: an international perspective on one's own field, intercultural competence and an awareness of global linkages. The students are expected to have the following competences in particular: language skills are considered central among the competences gained through internationality, and fluency in English is regarded as especially important. The curriculum needs to prepare the students to keeping an eye on what goes on in the outside of Slovenia, as well as ability to communicate across cultural and national boundaries. The higher education representatives felt that their institutions provide students with reasonable competences to use and improve their language skills and to monitor the international developments of their own field. The world of work, growing more and more international and multicultural, needs people who are able to find their way across national, cultural and ethnic boundaries. The strategy for the internationalisation of higher education institutions in Slovenia (prepared by Ministry), sets the goal that Slovene higher education provide the students with competences to work in an international environment and that all higher education degrees incorporate a module supporting internationalisation process. This module is expanded on in the student's personal study plans and can be completed through a mobility period or international courses.

4 CURRICULUM AND INTERNATIONAL MOBILITY - CASE

Problem definition – Many educational institutions abroad have successfully implemented sustainability and mobility into higher education curriculum as well as in the strategy. Researchers, mentioned before, indicate that business sustainable education and internationalisation implementation into business education have many positive effects on students and their behaviour as manager and leaders in business practice and international competitiveness. Responsible governance helps educational institutions to build good relations with stakeholders and support the strategies, which have to be holistic and systemic. Students are very important stakeholders, mobility helps by internationalization process of educational institution as well as its competitiveness in the educational market in Slovenia and abroad.

Hypothesis: The biggest higher educational institution of commerce and economics in Slovenia has implemented sustainability curriculums (partly – some topics are included) as well as systemic and holistic internationalisation and mobility into its strategy.

Methodology: Web page of faculty and mobility reports as well as in-depth interviews with persons included into mobility process have been realized with the aim to indicate how sustainability is included into curriculums of various higher education programs/modules. Simultaneously, in-depth interviews with professors (lecturers, staff and students – totally 16) were used to highlight the whole mobility process of each group of outgoing mobility. Incoming mobility has not been realized in the period of 2008–2011.

Research questions: Are subjects which include sustainability implemented into higher education curriculums? Has educational institutions implemented sustainability and mobility into its strategy? Mobility - In which type of mobility have you been involved in which countries and how long (days/months)? We ask you to evaluate the whole mobility process – preparation, organization and realization, financial support, the usefulness of the knowledge and experience in the work? Has mobility contributed to the development of your skills and how did you present your experiences to other (potential and previous) mobility participants? How do you evaluate the mobility coordinator work and support? Based on this experience, how likely are you to recommend mobility. What would you like to recommendations the faculty management about internationalisation and mobility in the future?

Research findings in general – Sustainable curriculum and subjects (mostly as the elective subjects) at all levels of Bologna education process have been successfully implemented in the biggest private faculty of economics and business in Slovenia. On the other hand it is significant that the faculty do not pay enough attention to sustainability and it should be more proactive and flexible (by reaccreditation of the curriculum it has to be respected). Very often we discuss about corporate responsibility but very seldom about responsibility of universities/faculties (business schools) and which part of their responsibility is oriented to the curricula and quality of their programmes as well as their participation to sustainable development and welfare society. Educational institutions (state and private) still have not implemented the holistic and systemic sustainable educational management into their strategies and they do not report about their activities in their reports (sustainable educational report). The top management should be the motivator and beginner but all stakeholders must be involved in this process, internationalization and mobility is just part of it. The particular challenges that mobility poses have to do with student motivation and quality assurance. Students (in Turkey and in Spain) were very good supervised. If they are good informed they

would know better which courses they can take abroad and what they need to complete before departure. Good preparation can avoid potential problems, proactive orientation is very important. Intensive course, summer schools and other short-term international modules wrap a range of international activities into a single package. These include the mobility and co-operation of students and teachers, studying in a multicultural group and new international perspectives. Intensive courses often also lead to closer international co-operation, and a module of one or two weeks is easy to fit into the teacher's work plans. Teachers mobility and incoming lecturers foster an international perspective. They contribute to staff training, help to export know-how and to prepare joint projects. The programmes and faculty support mobility by incorporating it into the planning of their overall work and make it more systematic by setting and monitoring mobility goals. Integration of international students is promoted outside the classroom by, for example rewarding students who take up tutoring international students. The availability of studies in cross-cultural communication varies a great deal. It also makes sense to use the expertise of institutional language services or language centres. Information and communication technology may replace or complete physical mobility through, for example, streamed lectures or distance assignments which are part of a mobility period (especially when financial support is limited). On the other hand, technology can also provide easy-to use solutions: students can meet through virtual platforms, video-conferencing makes it possible to attend lectures streamed from abroad, and email enables easy communication. An international perspective in the teaching may be challenging in practice, because internationality is then the responsibility of every single teacher and of no one in particular. All above mentioned activities have been implemented and we can see the positive results. Faculty has also implemented criteria of international sustainable curricula which integrate an international dimension (Garam, 2012): (1) the curriculum has an international subject or content, (2) the curriculum has broadens the original subject area by an internationally comparative approach, (3) the curriculum prepares students for international professions, (4) the curriculum with a focus on language and cultural studies explicitly addresses cross-cultural communication issues and provides literature of training in intercultural skills, (5) interdisciplinary programmes such as regional and area studies (base for projects), (6) the curriculum leads to internationally recognised professional qualifications, (7) the curriculum leads to international joint or double degrees, (8) the compulsory components of the curriculum are offered at institution(s) abroad and are taught by local teachers, (9) the curriculum (just few subjects) is explicitly designed for foreign students.

The internationalization and mobility are integrated in the strategy and faculty reports (evaluation report and annual report) about its activities where stakeholder management plays very important role. Mobility from 2008–2011 has been realized in EU countries and EFTA countries. All persons involved in mobility (4 students, 3 - staff and 9 teachers) were very satisfied with preparation for mobility, organization and mobility realization. But on the other hand they think that the financial support (donation) does not cover the costs, even it is additionally supported by faculty and from this reason they had to cover the part of costs from their own account. The faculty did not offer any foreign language courses because it is expected that everybody is able to communicate without problem in English at least. The mobility was very good organised (14 persons were very satisfied). The mobility helps them by networking (institutions, teachers, students) as well as by intercultural experiences (skills in intercultural management, intercultural human resources management, intercultural negotiations etc.). With the aim to encourage the others for mobility they presented their mobility experiences. All of them were very satisfied with mobility coordinator at the faculty.

5   CONSLUSION

Internationalisation and mobility should have well-defined learning outcomes to help the professors, staff and students, work on their international competencies through-out the curriculum. In 2020, 20 per cent of European graduates must have either studied or taken work experience abroad. The goals, which will be outlined in a communique, are expected to focus on three overall themes: quality education for more young people, increased employability and strengthened student mobility. The aim of strengthening student mobility will be reached through a number of initiatives that promote students' opportunities to study abroad. Countries will work to remove barriers to mobility in relation for example to visa regulations, crating better opportunities for work and residence permits, language education, funding of study abroad periods and the assessment of international qualifications. Our research indicated that the biggest private commercial and economics faculty in Slovenia has implemented all requested activities which refer internationalisation, mobility, sustainable education which are integrated into its strategy. Faculty continuously evaluate and reports about its internationalisation and mobility process. Based on findings of the evaluation, this paper outlines a mixture of recommendations and ideas on several levels: national, institutional and operational. The basic characteristics of the integrated programme are: a more substantial programme, a simpler programme and a more decentralised programme. The European Policy Statement (EPS), a specific instrument which the Commission has implemented to encourage institutions: to adopt a coherent policy for their European co-operation activities and to achieve a more durable impact and to ensure more effective use of available found. The requirement to submit an EPS encourages institution to clarify, negotiate and communicate their vision and strategy regarding internationalisation. There is sample evidence that the EPS indeed supports this process.

ABSTRACT
Croatian tourism is characterised by an exceptional international orientation, resulting in the fact that major disorders in the emissive European countries' economies are inevitably reflected also on tourism in the Croatian destinations. By enriching tourist contents, competitiveness is stimulated and the economic and financial effects of the subjects involved in the provision of tourist choices of a specific tourist destination are stimulated. As creation of tourist offers consists of many partial participants who offer their own tourist products, it is rational to coordinate the efforts of all partial participants in order to create an integral tourist product. An efficient destination management can have considerable influence on achievement of the sustainable development and on improvement of economic and social conditions for the community, from which emanates a further question: how to successfully activate destination management in Croatian destinations? Article defines and analyses importance of (integrated) quality for development and competitiveness of a destination, starting from global proportions to local dimension of Croatian destinations. The research is conducted to confirm the basic hypothesis which results in defining needed development guideline by most recognized tourist experts. The authors pose basic hypothesis with implication there is no quality management system or planned development in Croatian destinations which prevents possibilities of sustainable (competitiveness) development. Furthermore, the following issues are considered: destination management; systems organisation; relationships, destination's aims and objectives; destination lifespan cycle; adjustments to the European Union, etc. Quoted issues must serve the purpose of adjustment of Croatian destinations to the tourist trends of Europe.

Keywords: *Destination, Destination management organisation, Destination system elements, Integrated management, Quality, Stakeholders*

1 INTRODUCTION

Integration of different quality elements has been widely diskussed topic and there have been different approaches taken as the quality perception and dimensions vary. However it is clear that the quality of any business system, including the destination seen through the economical aspect, depends on the quality of each of its individual element. In the late 90-ies European Union introduced a concept called integrated quality management (IQM) as an initiative founded to encourage development and implementation of sustainable and quality oriented approach to tourism destinations. Although on a theoretical and scientific level the approach was diskussed and analized, it is yet to determine if integration of destination's elements has been fully accepted among croatian destinations in practice. The objective of the paper is to identify the level of integration of croatian destinations with the purpose of achieving a steadily growing

competitiveness on the market as well as to sound the opinion of croatian tourism professionals on the current and needed position of the destinations considering competitiveness of their tourism product, organisational framework and leadership among existing destination models. Article establishes organisational and functional destination managment model correspondent to modern management practice as well as specificity of local environment of Croatian destinations.

2 THEORETICAL BACKGROUND

Each tourist destination represents an integral tourist product, such product being so named due to the fact that it was created as a product of integral planning of tourism in the region of a specific tourist destination.

Destination management necessarily deals with the question of management of resources of a specific tourist destination. Consequently, it is in order to emphasise that under the term tourist destination a particular geographical region, territorial and administrative unit or a specific tourist attraction, offering to tourists experiences ranging from acceptable to unforgettable, can be defined (Bornhorst et al., 2010). From a conceptual point of view, that is if we take into consideration the manageability of a destination, it is far more efficient to regard a destination as a geographical region that has its necessary critical mass or as a cluster attraction, so that the destination can offer its visitors tourist experiences that attracted them into that area. A destination can be regarded as a combination (or even as a brand) of all products, services and ultimately experiences provided locally. It also enables us to assess the impact of tourism regionally, as well as manage demand and supply in order to maximise benefits for all stakeholders (Buhalis, 2000).

Concept Integrated quality management (IQM) was developed by European Comission focusing on the total quality of tourist destination and its integral elements as well as producing benefits to all the stakeolders of a destination. IQM is strategy with the main focus on the cosumers' expectations, while ensuring benefits to four differenet stakeholders' groups: tourism professionals, tourists, local community and enviroment (European Comission, 2000). IQM therefore is a principle that integrates all the destination's elements with the purpose of achieving maximum quality (Avelini Holjevac, 2005).

Content development as an added value to a destination offer is a generator of economic growth (Sucic, 2012). One of the biggest problems here is ensuring the rational use of free public natural resources (for example sea, landscapes, mountains) for the benefit of all stakeholders, with simultaneous preservation of the same resources for future generations.

3 RESEACH METHODS

The research is conducted to confirm the basic hypothesis which results in defining needed development guideline by most recognized tourist experts. Upon examination of up to date researches and papers, the following hypotheses are set.

H1: There is a significant lack of management and organisation throughout croatian destinations and the focus shall be put on creating synergy and partnership among stakeholders

H2: DMO should represent a destination leader in croatian destination as a flexible body enabling s clear development policy through structural management with focus on processes which is not a current reality.

H3: Successful destinations carry out destination branding and monitor the stakeholders' role, i.e. their significance for the destination management.

H4: Legal, political and organisation framework is crucial to developing solid platform of destination' system elements and is a wide improvement area.

H5: Researchers' interest in the topics of policies and strategies in destination management contributes to the destination development.

In order to sound the opinion and attitude of Croatian destination stakeholders, a survey has been carried out among tourism professionals (representatives of public and private sector – hotels, travel agencies, destination entrepreneurs, local authorities etc) examining the attitudes and opinions they hold of DMO, needed organisational and legal adjustments as well as destination elements to build destination networking on. Survey was carried out in the period from 2009 until 2011 and the research was executed as a part of doctoral studies of one of the authors and consequently adjusted and developed for the purpose of this paper.

Two major phases of the research were conducted: survey analisys as well as the processing the carried interviews. Based on results given by both phases a basic chart was created and conversion to SPSS was conducted along with the description of certain variables as well as its modalities. Both descriptive and inference statistical analisys were carried. Inference analisys was mainly based on h-quadrant tests, all variables of the survey being nominal. Besides, there were t-test as well as f-test used to define arithmetic mean and for the smaller independent patterns the differences tests were conducted. To given results there were interview conclusions added and commonly they represent indicative information through several interactive sessions, questionnaire and interview phases and are concised and presented in this article.

4 RESEARCH RESULTS - MEASURES

Groundwork of the research process is represented by empirical research executed on a representative sample of 12 coastal destinations in Croatia. Sample consists of the following destinations: Poreč, Umag, Rovinj, Rijeka, Crikvenica, Zadar, Šibenik, Vodice, Split, Makarska, Hvar and Dubrovnik. Criteria of the sample selection was share of the arrival and overnight proportion to the overall arrival and overnight results in Republic of Croatia. Complex research was based on an experts' analysis through different scientific methods such as survey and interview. The aim was to determine standpoints of different critical populations: mayors office and local authorities, local tourist board director, regional tourist board director, directors and managers of few destinations' biggest travel agencies, several tourism operation representatives (e.g. employee of the hotel, restaurant or a local entrepreneur), director or manager of few destinations' hotels. The goal was to define positions and judgements of main destination's tourism creators whose critical expertise could define the needed development directives.

Questionnaire used during the research was divided into 3 main sections: 1st that would define behavioural characteristics of participants, 2nd that would determine the existing level

Challenges of the Modern World - Contemporary Economy and Globalization

of destinations' organisation setup as well as presence and potential of creating synergy and partnership models and 3rd that would define level of implication of destinations' quality models to sustainable competitiveness development. Analysed research results are presented in the following text.

Questionnaire was carried out mainly by representatives of private sectors and there was a significantly low response rate from the local sector population. Main part of the examinees belong to the micro and medium teams, 83% of them. Among private sector 28 % of the examinees belong to foreign companies which indicates ownership structure (mostly in hotels companies, to be presumed) across the coast. Chart 1 shows business function and role in tourism activity of examined destinations' representatives.
Chart 1: Examinees' distribution among business sectors

Once the structure of each population was analysed, one of the main objects was to determine whether in Croatian destinations partnership and longterm quality plan is incorporated. The results are rather indicative as the great majority of examines agreed that there is no any form or framework of partnership models existing in their destination. Mentioned results are shown in Chart 2.
Chart 2: Presence of quality and partnership models in croatian destinations

Chart 2 is indicating extremely negative standpoints among tourism professionals to the existing models and organisation patterns of the destinations. Emphasized minority of examinees believed that there is a sufficient level of partnership in the destination, but if these questionnaires are further analysed it is interesting to find that there is predominant population of 57% belonging to a public sector.

Further examination of the existing cooperation models between destination stakeholders indicate that there is no suitable form of cooperation nore leader to reach common goals, but there is a certain indication that the existing and potential leader should be entity of tourist board.

Almost 34% of the participants believe that the leader of their destination is hotel structure which can be related to destinations with high presence of major tourist chains. For the further analysis, it is crucial to stress out the noticed will and motivation throughout the populations for the creation of partnership forms that would result in building a quality strategy and development plan. Eventhough 79% of the examinees showed their knowledge of the modern European management practices, there is still considerable portion of them (21%) who do not posses practice nore awareness of the modern tools and theories which is a frightful fact if we take into consideration that experts' analysis was the base of the research. If these numbers are to be analized, 78% of the examinees that do not have the knowledge of IQM, are older then 45 years of age and only 16% of them are under 25 years of age. This forms significant statistical difference ($t = 5,12$ $p < 0,001$) and with 99,9% certainty is to be concluded that the proportion of those experts who do not recognize modern management practices and belong to older population is higher. If the distribution to different sectors is analized, there is 1% of those who do not know IQM and believe there is no quality model in their destination that work in the public sector as well as over 50% of those who believe there is an existing quality model in their destination that work in the public sector. The dirrefence again is statistically significant ($t = 5,47$ $p < 0,001$) and is to be concluded that there is a higher propotion of examinees coming from publich sector who believe that there is a quality management in their existing destionation model.

Destination stekaholders mostly agree (66% of them) that longterm strategical planning is crucial for the destination development and that the focus should be on the common goal and benefits for all steakholder. There is a significant indication that the current destinations' (organisational, legal and political) set up does not correspond to modern European practices. Results brought through the research show that large majority of examinees, over 85% of them, expressed their negative opinion on the existing organisational framework and destination concept as well as the existing partnership level while they hold very positive opinion of the existing resources in their destination and potential to develop a more structural destination body. Over 80% showed their extremely positive attitude toward destination integration led by an institutional leader such as DMO, moreover they feel that the leader should be a public body that could represent common interests and carry out not only the setup development, but a monitoring of the process creation and execution. If this part of the survey is carefully analized, there is a need to confront results of the existing and needed leader of the destination. Comparison of such frequencies was tested by a hi-quadrant and the test data was following (Table 1):

Table 1: Leader of the destination – research results

Destination development leader	Existing	Needed
Tourist board	20	37
Local authorities	5	23
Rest	61	26
Total	86	86

Differences between noted and theoreticall freqeuencies are statistically significant (N = 86 df =2 χ^2 = 69,013 p < 0,001) which indicates an important gap between the existing forms of leadership and the needed ones.

Although an indicative lack of knowledge and information about modern management postulates as well as insight to modern practices was discovered at the certain level, more then 90% of the stakeholders, regardless of the sector they belong to, showed very positive attitude and motivation toward joining to a certain networking model under DMO leadership and they are ready to invest their resources into in project development in order to obtain a clear and strategic development policy of a destination.

By analysing the overall results it is possible to define several general trends that examinees find crucial for achieving increasing competitiveness. Key words to focus on are generally: quality improvement, involvement of all stakeholders and partnership of destination participants, longterm development and sustainability strategy. Mentioned trends confirm the groundbase of integrated quality management as a modern postulate in destinations' organisation. More then 80% of survey participants find the need of the investment to destination's content oppose to structures/accomodation development, stressing out the importance of outlining and creating market strategies creating an added value for the consumer.

Analysis of frequences about the grounbdbase of destinations' competitiveness was also conducted by hi-quadrant test and results introduced significant statistical differences (N = 86 df = 4 χ^2 = 125,24 p < 0,001). The highest frequency difference was noticed at following modalities: «nature resources and attractions» and «content offer». If modality «nature resources and attractions» is analized, expected frequency was 6 and the noticed frequeny was 30 and by modality «content offer» expected frequency as 36 and the noticed frequency was 7. If these results are further compared by different variables, following contingent tables can be formed:

Table 2: Examinees distribution variables vs different research variables (made by authors)

RBB	Variables in contingent tables	Form of conting. table	N	χ^2	df	p	Stat. signif.
1.	Sector distribution Needed base of destinations' competitiveness	2 x 3	86	3,780	2	0,151	
2.	Age distriubtion Needed base of destinations' competitiveness	3 x 3	86	0,704	4	0,951	
3.	Management level Needed base of destinations' competitiveness	3 x 3	86	0,309	4	0,989	
4.	Investement direction Needed base of destinations' competitiveness	2 x 3	86	5,989	2	**0,050**	*

*Remark: * statistically significant up to 5%; ** statistically significant up to 1%; *** statistically significant up to 0,1%*

Results shown in the table indicate there are no statistically significant links between the research results and different paraments of the examinees (age, sector distribution or management level).

On the other hand, there is statistically significant link between modalities about groundbase of destinations' competitiviness and direction of needed investments (p = 0,050). Contingent table test for the mentioned hi – quadrant test follows:

Table 3: Destinations competitiveness vs investment areas – frequencies

Investement areas	Needed base of destinations' competitiveness			Total
	Nature resouces/Accomodation/Gastronomy	Content/Marketing	Rest	
Accomodation capacities	2	9	6	17
Redesign of contents	17	44	8	69
Total	19	53	14	86

Following frequencies can be turned into percentages as follows:

Challenges of the Modern World - Contemporary Economy and Globalization

Table 4: Destinations competitivemness vs investment areas (%)

Investement areas	Needed base of destinations' competitiveness			Total
	Nature resoures/Accomodation/Gastronomy	Content/Marketing	Rest	
Accomodation capacities	**12**	**53**	**35**	100
Redesign of contents	25	63	12	100
Total	22	62	16	100

A further independent analysis was conducted in order to verify hypothesis and the algoritam was formed using six main variables and forming a new one. Following existing variables were used:

o Knowledge and awareness of IQM,
o Knowledge, awareness and existance of quality and competitiveness plans,
o Private-public partnership existance,
o Private-private partnership existance,
o Public-public partnership existance,
o Knowledge level of tourism stakeholders.

Newly formed variable was named «Destination development level (DDL)» by summary of the mentioned six variables, highest possible level being 12 and lowest possible level being 6. Summary of the existing variables follows:

6   0 examinees
7   0 examinees
8   5 examinees
9   14 examinees
10   35 examinees
11   25 examinees
12   7 examinees

First 2 points (8 i 9) create one DDL group (higher level group), next point (10) forms another DDL group (medium level group) and another 2 points (11 and 12) create the highest DDL group forming three different modalities of the newly created variable:

- Low DDL (11 and 12 points) – 32 examinees;
- Medium DDL (10 points) – 35 examinees;
- High DDL (8 and 9 points) – 19 examinees.

Additionally, newly formed variable was put into corellation with further dependent variables which showed there was no statistically significant difference, but the given test showed indicative destination development results. Results of the basic research project implicate to an alarming state of destinations' organisation and point out potential development paths. Interpretation of the results confirm the autohors' hypothesis that suggest there is a significant lack of management and organisation throughout croatian destinations as 78% of the destination belong to medium or low DDL and the focus shall be put on creating synergy and partnership among stakeholders.

Challenges of the Modern World - Contemporary Economy and Globalization

Participants do not only find it cruicial, but they show significant level of motivation to form a common body under whose leadership the changes would be undertaken. Existing entities of tourist board present a possible destination leader which would need to go through organisation and structural changes meanwhile political and legal environmental changes should also occur.

Results show the existing resources thoughout Croatian destinations with a great potential for an increasing destination competitiveness trend once the solid and integrated destination model is achieved. The Tomas (Čorak et.al., 2009) research by the Institute for Tourism shows that competitiveness is not built only on the price, but on the attempt at removal of competitive weaknesses, namely:

- Experience at the destination (versatility of special events, culture, entertainment, sport, possibility for shopping),
- Destination atmosphere (equipment and appearance of beaches, tidiness/landscaping of public areas),
- Destination functioning (information at the destination, transport and marketing).

So called quality destination chain, within the existing potentials, is crucial and possible in order to achieve longterm competitiveness, however focus on the ground and more basic organisational model is needed as a platform for integration of destination elements.

5 DISCUSSION

The research shows that the existing destination models need to face a significant organisational swift into more flexible form that is able to adjust to ever-growing and ever-changing market needs as well as to carry out a basic and longterm development strategy. The existing legal and operational borders should expand in order to reduce administration cost and speed up decision and operation chains. There is a suggestion for a *new zone destination model (NZDM)* that could carry out destination development of a wider area regardless of current administration framework. NZDM would be supported by current county tourist boards transformed into so called *destination management units (DMU)* as well as local tourist boards transformed into *destination management operation centres (DMOC)*. Suggested model has three main vertical management levels (macro, mezo, micro) and it would represent a turning point into a modern concept of tourism management organisation.

Even though designing an optimal destination model is implicating a detailed analysis article could represent a guideline and contribution to destination management development. The objective of destination quality management and the purpose of integration is no other than enlarging destination values into the total destination product with appropriate standards which will be long-term sustainable and competitive.

On the way to the destination integration, the key of the aforementioned efforts is lifelong learning, persistency and faith into a shared vision. Investments to education, knowledge sharing is crucial. Recommendations given in the paper hold positive effects for both private and public sector: stronger appearance on the market, costs reduction, sharing information and knowledge, sharing of tools, ideas and technologies. A leading body such as DMO should represent the source of changing trend.

Challenges of the Modern World - Contemporary Economy and Globalization

WOMEN ENTREPRENEURIAL NETWORKS AND SMALL BUSINESS DEVELOPMENT: A STUDY BASED ON TOURISM INDUSTRY IN SRI LANKA: ONGOING RESEARCH PROJECT

Surangi H. A. K. N. S.

Business School, Faculty of Business and Law, University of Lincoln, United Kingdom
shapugoda@lincoln.ac.uk

ABSTRACT

This study aims to explore the role and impact of women entrepreneurs' networks on small business performance and examine the importance of factors that are perceived by women entrepreneurs to influence the process of networking. The focus of the study is in the field of networking of entrepreneurs and it is concerned with the main theoretical and practical perspectives of entrepreneurial networking .While women's entrepreneurship is a central aspect of economic development and public policy concern in most countries, scholarly research about their entrepreneurial activities is comparatively scarce. This study specifically focuses on women entrepreneurs who engage in tourism industry within the small business sector in Sri Lanka. This study adds to the extant literature through its two-dimensional focus on entrepreneurial networking. The structural dimension which investigates who are parts of the entrepreneurial networks; the relational side which explores the contributions each tie brings to the entrepreneurial venture. Having established that a qualitative methodology is most suitable for this study, the in-depth interview and observation are deemed a particularly suitable research tools. Narrative approaches are suggested in order to "tap" the voice – and thus the stories – of the acting entrepreneurs.

Keywords: Narratives, Networking, Small business, Tourism industry, Women entrepreneurs

1 INTRODUCTION

Networking is an influential tool by which entrepreneurs use a wide variety of contacts to help them achieve their business and professional objectives and it gives them greater access to information, resources, new clients and people with similar business interests so on (Ascigil and Magner, 2009; Barnir and Smith, 2002). Networking is mostly important for women, who generally have more limited access to information and business contacts, whether through various membership such as trade organisations, business networks and business clubs. Traditional role patterns continue and the combination of running a business and managing the home leaves little time for other activities (Loscocco et al., 2009; Mand, 2006; Maclean, 2010). Unlike most male counterparts, many women entrepreneurs combine setting up and running a business with managing the household (Maclean, 2010).

The rise of female entrepreneurs has involved academic interest and female entrepreneurship has developed as a separate research field (Tulus, 2009). Academic interest in female entrepreneurship is inspired by both the economic and equality implications of the occurrence. Given the fact that entrepreneurship is considered as the main source of economic growth, employment, poverty alleviation, regional development and innovation, women are a readily available resource that countries at different stages of economic development may use to accomplish economic progress (UNDP, 2011). Indeed, Tulus (2009) revealed positive relationship between the female share in entrepreneurship and economic performance at both country and regional levels.

Challenges of the Modern World - Contemporary Economy and Globalization

Entrepreneurial networks, as an important strategy for the development of small business sector, are increasingly the focus of attention for entrepreneurs, public authorities, policy makers and academics (Sherre and Keith, 1997; Audrey and David, 2006; Premarathna, 2001). For example, a number of researches (Premarathna, 2008; Daniel 2010; Yee 2011) have studied the importance of networking in entrepreneurial success. Networking linkages can be seen to be important for small firms. The need for external assistance to strengthen an often weak base of resources is even more crucial in the case of the small business sector in many countries. Therefore; it is difficult for many small organizations to survive without any support from the network actors.

Over the past few years much has been written about the rapid spread of various types of firm networking, the area of women entrepreneurs' networks and small business entrepreneurship is still a challenging research field. This study is devoted to explore the role and impact of women entrepreneurs on small business development and effect factors that are perceived by women entrepreneurs for their networking relationship.

Networks can be defined as personal relationships between an entrepreneur and his 'external actors' (Robinson, 2007; Birley, Cromie and Myers, 1991). The external actors (outsiders) can be individuals or organizations. Entrepreneurs build up such network relationships (contacts) in order to obtain necessary resources and to perform activities

2   BACKGROUND TO THE STUDY

Small business enterprises play a vital role in the economies of both developed and developing countries, representing well over 60% of all manufacturing enterprises in the world (Michael and Markarues, 2009; Kodithuwakku, 2008). This sector constitutes 95%, 97.3% and 85.5% of all businesses in United Kingdom, New Zealand and Australia respectively (Kodicara, 2008). The small and micro enterprises play a major role in the Kenyan economy and according to the Kenya National Bureau of Statistics 2007, the sector contributed over 50 percent of new jobs created in the year 2005 (Michael, Makarius and Samuel, 2009). About 98% of enterprises in most Asian countries are classified as small enterprises and they make contribution heavily to total employment in any nation frequently representing more than 50% of total employed (Geoffrey, 2009). Small and medium enterprises in Pakistan in 2005 contributed over 30% to GDP (Muhammad, 2007).

The role of the Small business sector has become very significant and they have been identified as an important strategic sector for promoting growth & social development of Sri Lanka. Over the years, this sector has gained wide recognition as a major source of employment, income generation, poverty alleviation and regional development (White Paper: Task Force, 2009). Small business Enterprises play an important role in job creation; this is evident from table 1 which captures the employment generated by micro (<10 persons) and small and medium enterprises (10-99 persons) as published by the Department of Census and Statistics (DCS).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Number of persons engaged in micro, small and medium enterprises, 1992-2005
(DCS Annual Survey of Industries 2003, DCS data 2007)

Size	Persons engaged									
No of Persons	1992		1993		1996		1997		2005	
	No:	%	No:	%	No:	%	No:	%	No:	%
<10	2,911	1	3,002	1	46,995	9	48,225	10	53,352	11
10-99	44,406	15	48,389	14	119,146	22	113,408	23	190,638	17
Total	292,736		345,036		536,913		495,355		1810475	

From the inception of industrialization of the Sri Lankan economy, small business sector was recognized as an important sector to be developed. But the progress of this sector was not up to expectation and it had high failure rate and they are continuously facing various problems such as lack of finance and other resources, networking, marketing etc. (Premarathna, 2002; Rathnayake, 2006). Considering table 2 it can clearly be identified that number of small business establishments is very high but value added is very low when compared to the three other sectors. Therefore, the contribution of small business sector to the national economy in Sri Lanka is still low when compared with the other developed and developing countries. Nevertheless, according to recent available statistics from various sources, the small industries are much more labor intensive than larger industries. For instance, their capital-labor ratio is less than one-third of that of manufacturing as a whole. The productivity of the sector is considerably lower (Premaratna, 2001).

Table 2: Servicers classified by persons engaged, 2008 (DCS , 2009)

Size-No of persons	No of establishment	No of persons	Out put	Value added
<10	39.2	2.9	0.7	0.6
10-39	36.8	7.6	4.1	4.2
40-99	12.1	8.4	5.7	5.5
100 above	11.9	81.1	89.5	89.7
All	100	100	100	100

In this setting, many researchers have considered these problems and they have found out various constraints such as finance, lack of planning and networking (Premarathna, 2002, 2005; Rathnayake, 2006; Selvamalar, 2005). Nevertheless, the ideal solution is not yet up to expectation. Moreover, some researches into small-business development revealed that the rate of failure of small scale businesses in developing countries is higher than in the developed world (Marlow, 2009).

Tourism is an industry that depends on synergy, partnership and working together. Therefore, the network approach is highly relevant to the study of tourism industry. There should be strong linkages existing between tourism with the other external bodies to survive in the field. Outsourcing, subcontracting or other linkage arrangements between businesses in hospitality industry and other external actors are crucial means of developing small enterprises. For

tourism to be beneficial in terms of income generation, economic growth, employment generation, poverty alleviation, and rural development, it has to be linked to local economies such as agriculture and micro and small scale enterprises (Patience and George, 2009).

The economy of the Sri Lanka mainly depends on plantation crops, apparel industry, tourism and foreign employment. Tourism has been a dynamic income generation source for the Sri Lankan economy by now. Tourism continued its position as fourth largest foreign exchange earner even in the year 2009 and the portion of tourism's contribution to foreign exchange earnings in 2009 amounted to 2.6% (*SLTDA*, Annual Statistical Reports 2009). The political and economic stability has arrived after period of 30 years waging war and it can be clearly seen strong green light for the industry to grow at a very fast rate as never in the history before. Blessed with around seven world heritages named by UNESCO, Sri Lanka is considered to be one of the most important cultural and biodiversity hotspot areas of the world though it is a small country. This symbolizes that the island is having immense possibilities and potentials in converting the destination towards a center in attracting more and more tourists and it will result in attracting foreign exchange as well as nurturing new ventures related to the industry.

The Sri Lanka Tourism industry depends heavily on its Small Enterprises and many Establishments are sole proprietor or partnerships (SLTDA 2011).

Table 3: Composition of tourism business in 2011 (SLTDA 2011)

Business type	Total establishment	Small		Medium and Large	
Hotels and boutiques (39)	287	202	70%	85	30%
Guest houses	497	386	78%	111	22%
Restaurants	357	279	78%	78	22%
Travel agents	559	458	81%	101	19%
Homestay units	71	41	100%	0	-
Bungalows	36	26	100%	0	-
Shops	140	107	76%	33	24%

The figure (table 3) says that more than 75% of tourism businesses belong to the small category. According to the SLTDA, in 2011 there were close to 1907 tourism-related businesses throughout the country, with 57 786 people employed in jobs directly related to tourism while indirect employment was 80 899.

2.1   Sri Lankan women entrepreneurs and their network relationship

Considering the average rate of business start-up from 1998 to 2002 , it can be noted that the number of women entrepreneurs' rate (0.8%) is low compare to their male counterpart (2.5%) in Sri Lanka (UN, 2003). Moreover, typical woman entrepreneurs' business enterprises are very small, with low turnovers, a low number of employees and no professional assistance (UN, 2003). In the process of entrepreneurship, women have to face a greater ranging of problems associated with entrepreneurship, than men, and these problems can be doubled because of her dual role as a wage earner, and a homemaker (Selvamalar, 2005).Women in entrepreneurship have been largely neglected both in society in general and in the social sciences. Not only have women lower participation rate in entrepreneurship than men but they

also generally choose to start and manage firms in different industries than men tend to do (Brush, 1992). Women entrepreneurs play a non-trivial role in the economy, they face challenges and obstacles different from those faced by men and they act differently (UN, 2003).

Sri Lankan women entrepreneurs have fewer business contacts and lack knowledge of how to deal with the supporting organizations. Moreover, most women entrepreneurs operate on a small scale, and are generally not members of professional organizations or part of other networks in Sri Lanka (UNESCAP, 2005; Tules, 2009). Most existing networks are male dominated and sometimes not particularly welcoming to women but prefer to be exclusive (Premaratna, 2002; Thirkawela, 2011). Even when a woman does venture into these networks, her task is often difficult because most network activities take place after regular working hours. Lack of networks also returns women's awareness and exposure to good role models. Few women are invited to join trade of missions or delegations, due to the combined invisibility of women-dominated sectors or subsectors and of women as individuals within any given sector. As an example of this, at a small and medium enterprises trade fair among south Asian countries held in Sri Lanka in 2004 where it has been estimated than women operate around half of all SMEs, less than 20 women were registered among the approximately 250 participants (UNESCAP, 2005). Information is a most important resource for women entrepreneurs. Because, information can relate to markets, suppliers, costs and technology, and networks have emerged as key strategy for giving support to women entrepreneurs. Networking is very important to the success of a business, and it is identified as one of the key ways to strengthen women's enterprises as it can provide access to information, new customers and suppliers (UNESCAP, 2005; Mya, 2011).

In most of the Asian countries like Sri Lanka women are viewed as weak, passive, obedient or submissive. Furthermore, dominant religious beliefs and traditions do not favour women being involved in outside activities. In some cases society has some stereotype such as weakness in a man if his wife is working in business. When women are involved in business activities, they have to deal with many people, and sometimes travel away from their homes and participate in business parties like cocktail. Such things are not well accepted by Asian societies (Ranasingha, 2009; UNESCAP, 2005; Ram and Seela, 2010; Surangi, 2010; Surangi, 2008).

Business enterprises have contacts with a number of groups. These parties can be social networking, commercial networking and profesional networking.According to the research findings women entrpreneurs prefer especially to keep social networking with friends and relatives compared to their male counterparts in Sri Lanka .In contrast, majority of male entrpreneurs prefer to have close connections with commercial networking (Surangi, 2010; Wasanthi, 2011).

Sri Lankan society is still patriarchal and Sri Lankan women are traditionally considered homemakers and not businesspersons. In a previous stating, the majority of woman mentioned that they received excellent or good family support for their business and they said that it is difficult for them to manage the entire business without the help from male counterparts (Surangi, 2010; Rathnayaka, 2006). Women's family obligations also bar them from becoming successful entrepreneurs in both developed and developing nations (Botha, 2006). Having primary responsibility for children, home and older dependent family members, few

Challenges of the Modern World - Contemporary Economy and Globalization

women can devote all their time and energies to their business. Moreover, business success depends on the support extended by family members (Surangi, 2010).

3   OBJECTIVES OF THE STUDY

Researchers have interpreted gender differences in network composition as posing a disadvantage for women in the business world and weak ties are the source of male entrepreneurs success (Foss, 2010; Kristina, 2010; Wendy and Doyle, 2001). Women who include greater proportions of kin and female in their discussion networks may secure greater social support than men, but at the cost of sacrificing the necessary instrumental support needed for economic achievement (Klyver, 2007, 2011). Social support provides the emotional strength owners and managers need to cope with daily exigencies, but such ties may also limit the diversity and reach of women's networks. Women's networks tend to be more limited and to focus on family and friends whereas male entrepreneurs have wider networks (Chirs et al., 2011). Taken that as given, this study attempts to achieve the following objectives.

1. To explore the role and influence of women entrepreneurs' networks on small business performance
2. To examine the importance of factors those are perceived by women entrepreneurs to influence the process of their networking.

4   RESEARCH QUESTIONS

To achieve the research objectives, the study seeks the following research questions.

1. Why and how women entrepreneurs form their networks?
2. What is the contribution of each network actors to the development of small businesses?
3. What are the influencing factors for women entrepreneurs' process of networking?

5   RESEARCH METHODOLOGY

Given the limited understanding of the role of the women entrepreneurs' networks in the small business development, a qualitative research method will be considered the most appropriate, as it is useful in areas that are not well advanced theoretically. Therefore, this study is exploratory in nature and data are qualitative. Consequently, the research process of this study is inductive rather than deductive. Thus, this study adopts a phenomenological approach to obtain a deep understanding of entrepreneurs' experience of their networks, revealing the impact of these network relationships on the small business performance.

Having established that a qualitative methodology is most suitable for this study, the in-depth interview and observation are deemed a particularly suitable research tools. The in-depth interview enables the researcher to understand other persons' "constructions of reality", by allowing interviewees to respond in their own language .The interview type, which will be chosen for this research, can be referred to as semi- structured. Completely unstructured interviews are considered inappropriate due to the risk that the interviewer would fail to collect the desired information .On the other hand, the imposition of too rigid a structure on the interview might have inhibited the flow of information and might have prevented the emergence of useful and revealing insights.

The sampling frame of businesses in the hospitality sector in Sri Lanka will be obtained from list of divisional secretarial offices and tourist board. The lists included some basic information such as date of registration, type of business (hotel, guest house, restaurant, travel agencies, shops etc.) as well as their contact details. Purposive sampling method will be used to select entrepreneurs.

Challenges of the Modern World - Contemporary Economy and Globalization

Narrative approaches are suggested in order to "tap" the voice – and thus the stories – of the acting entrepreneurs. To analyze data the interviews will be taped and the transcripts will be analyses with the help of NVivo software to identify emergent themes.

6   CONTRIBUTION TO KNOWLEDGE

The purpose of this research is to study the role of entrepreneurs' networks and its impacts on small- scale business performance that run by the women entrepreneurs in Sri Lanka and influencing factors for women entrepreneurs networking process. Entrepreneurial networking and small business development have been a well-researched area by scholars for many years especially in developed countries. But, there were few studies carried out to examine the relationship between entrepreneurial networking and business success in Sri Lanka. In the networking literature, women entrepreneurs are under researched area in both developed and developing countries and there is limited academic research with empirical material on this topic specifically focusing on women entrepreneurs in Sri Lanka. As an attempt to fill the gap this study will examine how entrepreneurial networking among women entrepreneurs impact on small business growth in Sri Lanka.

Much of the research on entrepreneurial networks is concerned with structural characteristics. The connectionist perspective studies are mainly concerned with the content flowing across network relationship (Sullivan, 2006). In the present work, researcher considers both structural and connectionist perspectives to be important. Apart from structural and connectionist perspectives, the research on entrepreneurship has emphasized influencing factors of the networking process for women entrepreneurs (Johannisson, 2000; Zhao, Frese and Giardini, 2005). Most social network studies focus only on the outcomes of networks (e.g., business growth) rather than on their influencing factors. In this study, the researcher will concentrate on the influencing factors for women entrepreneurs' networking process, in particular, on how women entrepreneurs actively enlarge social networks in order to achieve higher business growth. Fewer studies have explored the factors influencing the network process (Zhao, Frese and Giardini, 2005).

The objective of this research is to gain an understanding of the networking process in which women small firm owner-managers engage. It has been noted that, while much research has been undertaken to discover the structure of small firm networks, less is known about the influencing factors for women entrepreneurs networking (Moghli and Muala, 2012). Such a situation has been explained by the fact that structural dimensions of a network are eager to quantitative methods, and accordingly, these have tended to dominate small firm research to date .However, it has been stated that the understanding of networks proffered by such quantitative methods is limited and in some cases, confusing and this research will adopt a qualitative methodology.

Moreover, this study is worth to academic research and policy development because of the significant contribution these businesses could make to economic development, employment generation of the country.

The finding of this research work is significant for several reasons. Most importantly, this research work will throw more light on the issue of networking of women entrepreneurs in the Sri Lankan economy. The result of this study will help consultants, researchers and policy makers on women entrepreneurship to understand the role of entrepreneurial networking and

its impact on the small business development better so as to help women to make supported business decisions. The result of this study can help women entrepreneurs who are seeking information and resources on how to handle their business. It will create an opportunity for further research on motivation and women entrepreneurship, small business sector and tourism industry.

7   CONCLUSION

In summary, despite the research attention on entrepreneurial networking in recent years, prior work has tended to focus on how actors connect (structural dimension), however, there is a lack of research about the resources actors can potentially gain access to by examining with whom they connect and what resource they have (relational dimension). Therefore, while the study of the structural dimension of networks has been found to disclose variations between male and female business owners, there is still a lack of research into the relational dimension of networks which may uncover differences in resource mobilization. Moreover, few studies have acknowledged the impact of gender on networking experiences (Garcia and Carter, 2009) .To date, researchers focus to study gender differences in entrepreneurial networking (Klyver, 2007; Batjargal et al., 2009; Miller, Besser and Riibe, 2007; D'Exelle and Holvoet, 2011; Foss, 2010; Garcia and Carter, 2009), but very little research has been conducted specifically focus on women (Sappleton, 2009; Roomi, 2009; Tsuchiya, 2010). In addition to, it can be clearly seen that quantitative research are dominant in networking literature. In all respect, this research is a preliminary step towards filling this academic gap. In addition to, the controversial evidence of women entrepreneurial networking identified by the academic literature and the shortcomings of the existing research in women entrepreneurs' networks provide compelling reasons for further research on women entrepreneurs' networks in entrepreneurship in a transition context.

ABSTRACT
Development of industry and technological civilization in the nineteenth and twentieth century and extensive use of natural forces in the activities of many enterprises contribute to the (excessive) abuse of the environment. Using of forces of nature in extensive way not only presents a risk for human health or life, but it is also dangerous for the environment. In order to increase liability for environmental damage the Directive 2004/35/CE of the European Parliament and of the Council of 24 April 2004 on environmental liability with regard to the prevention and remedying of environmental damage was implemented. This document established a framework for environmental liability based on the „Polluter Pays Principle" with a view to preventing and remedying environmental damage. As a consequence of new liability regime, the legal environment of business has changed. In fact it turned out that risk management tools like standard General Liability insurance used so far are not sufficient anymore. This issue should be treated as a challenge by insurance sector that will aim at developing specialist insurance products like for example Environmental Impairment Liability (EIL) Insurance providing the protection for entrepreneurs who use the environment. The aim of the study is to present this type of insurance. Analysis of the literature led the authors to the hypothesis that EIL insurance could be a response to the legal requirements as well as (it could be) a part of Corporate Social Responsibility used by rising number of companies. CSR is defined as the way in which companies take into account social, environmental, and economic concerns in all of their activities. Building corporate social responsibility on this idea can increase demand for EIL insurance on the one hand and meet CSR's objectives on the other.

Keywords: *Corporate social responsibility, Environmental damage, Environmental impairment liability (EIL) Insurance, Environmental liability directive, Polluter pays principle*

1 INTRODUCTION

Introduction of the Directive 2004/35/CE of the European Parliament and of the Council of 21st April 2004 on environmental liability with regard to the prevention remedying of environmental damage[1] caused changes to the legal conditions of companies embedded in the natural environment. Implementing the Environmental Directive into the legal system of the EU countries has increased environmental liability with regard to prevention and remedying of environmental damage. According to the research conducted by FERMA[2] most companies are not aware of the impact of the new law on their operations. Mere 56% of the 68

---

[1] Further called the Environmental Directive.

[2] Federation European of Risk Management Associations.

researched firms[3] know exactly how the aforementioned Environmental Directive has been implemented into their legal system (Sonigo, 2012).

According to the Directive, damage is a measureable adverse change in the natural resources or a measureable, direct or indirect, impairment of usability of these resources. The following article aims to present one of the methods of environmental risk management, namely Environmental Impairment Liability (EIL) insurance. A comparison of a standard civil liability insurance of company operations and property and an independent civil liability insurance against environmental damage shows that the latter provides a significantly broader coverage and fulfils the obligations imposed on the companies by the legislator to a much larger extent.

Moreover, as the authors believe, this kind of insurance may be a proper reflection of the more and more frequently stated corporate mission objectives related to CSR (Corporate Social Responsibility) policies.

2   CORPORATE SOCIAL RESPONSIBILITY

Corporate social responsibility can be described as a company's voluntary consideration of environmental and social problems in commercial operations and relations with the interested parties which exceeds the minimal legal requirements. The definition included in the ISO 26000 document published in November 2010 by International Organisation for Standardisation states that social responsibility is a company's obligation to include social and environmental aspects in decision-making and to take responsibility for the impact of these decisions on society and environment (Społeczna odpowiedzialność przedsiębiorstw, CSR, 2011). Although the latter area is not mentioned by company representatives as particularly relevant to company development, its importance for the society in general cannot be underestimated.

Another definition can be found in the so called Green Paper[4], where CSR is defined as a concept according to which "companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis" (Green Paper, 2001, p. 6).

What caused CSR to develop was in particular the increase in ecological awareness and growth of ecological movements. In the 1980s chemical industry was severely criticized, especially in the aftermath of the Bhopal catastrophe in central India. As a result of methyl isocyanate leakage from Union Carbige pesticide plant in a densely populated area approx. 15,000 people were killed and 0.5m were injured. As a consequence of this and similar incidents governments were reluctant to give permissions to build new plants, local communities protested against them, while many highly qualified workers sought jobs in other lines of business. In response to these problems as well as in order to protect their position, chemical companies initiated a program called "Responsible Care". At present it embraces companies which generate about 85% of overall global chemical production. The program encourages environmental management activities, promotes industrial health and

---

[3] 95% of the researched companies generate more than €50m in turnover.

[4] Green Paper is a series of reports published by the Commission regarding various areas of politics. They are mainly addressed to the interested parties, organizations and private individuals who have been invited to participate in conferences and debates. (http://ec.europa.eu/information_society/tl/help/faq/index_pl.htm).

Challenges of the Modern World - Contemporary Economy and Globalization

safety, improvement in transparency and dialogue with stakeholders. Similar activity can also be seen in Poland, where it is coordinated by Polish Chamber of Chemical Industry and gathers the largest companies in chemical business (Gasiński and Piskalski, 2012, p. 14).

The above example is just one of the numerous types of activities taken up by companies, which are aimed at reaching CSR objectives. Companies are becoming increasingly interested in CSR strategies. "KPMG International Survey of Corporate Responsibility Reporting 2011" shows that social reports are issued by a growing number of organisations: 95% out of 250 largest global companies publish reports on their socially responsible activities, which is an increase from 80% in 2008 (KPMG International Survey of Corporate Responsibility Reporting, 2011, p. 6).

One of the CSR related solutions may be civil liability insurance against damage to the environment. It is particularly important for companies which use natural forces in their activities or for those whose operations may cause damage to the environment.

3 ENVIRONMENTAL IMPAIRMENT LIABILITY INSURANCE BASED ON THE EXAMPLE OF THE POLISH INSURANCE MARKET

A growing number of companies are becoming aware of the impact of failure repair cost and possible penalties for polluting the environment on the company financial condition, in extreme cases even leading to its bankruptcy. The main sources of costs are related to cleansing the damaged area, paying the compensation to third parties and individuals, reconstructing and rehabilitation of the contaminated ecosystem and restoring biological balance. Additional costs may be connected with court trials and legal defence. In an attempt to meet the rising demand for financial methods of environmental risk management, insurers offer a few possible options of protection against environmental damage. Polish market offers the following products: environmental clause which broadens the scope of civil liability insurance of company operations and property, protection against environmental damage within the automobile civil liability insurance, environmental guarantee and an increasingly common, though available for a relatively short period of time, specialist environmental impairment liability insurance (Wedziuk, 2012). The first and the last deserve more attention from the point of view of any company. The act on environmental damage prevention of 2007 implemented into the Polish law the Directive 2004/35/CE which introduces liability for environmental damage in a much broader scope than what is covered by the protection of the clause within standard civil liability insurance of company operations. The main difference consists in that the clause only covers sudden and accidental events, while the environmental damage civil liability insurance provides protection from gradual and continuous events, also called gradual release, resulting from business activity. A sudden event refers to a short period of time, mostly 48 or 72 hours, during which emissions of harmful substance and the resulting damage must become apparent. Opposed to that, independent environmental insurance may even cover historical damage due to the introduction of retroactive period (Wedziuk, 2012). Therefore, it can be seen clearly that the environmental clause may cover merely a small fraction of the damage, and as it is only limited to the short period of time of the damage occurrence, the compensation may not suffice to pay all the damage-related expenses. It is also vital that the clause in question protects third parties exclusively, covering personal and property damage, as well as the costs of damage residue repair. It does not include the property and business affairs of the author of the damage. On the other hand, the EU Directive on environmental liability of 2007 and the respective Polish Act on environmental damage prevention and remedying puts responsibility on the entities operating within the environment

for both damage caused to the third parties and to the natural environment, including the cost of restoring and reconstruction of protected species and habitats, groundwater or surface water, and soils (EnviroPro, 2011). It is again worth noticing that EIL insurance damage has a far broader scope than the standard civil liability insurance including the environmental clause. It is also important to remember that liability within the EIL insurance does not require the aggrieved party to be identified and the compensation claim to be submitted to the insurer. The insurance company covers the particular costs imposed on the insured by way of an administrative decision (Wedziuk, 2012). Table 1 shows the main differences between the two products.

Table 1: Main differences between civil liability insurance and environmental insurance
(Cameron, 2010)

Category of comparison	General Liability	Environmental
General Coverage Available	NO GL policies only respond to Sudden and Accidental Events	YES
Gradual Release	NO GL policies only respond to 3rd party claims for damages. Does not cover 1st party, therefore any land which is owned by the Insured is not covered	YES
1st party clean-up	NO	YES
1st party business interruption	NO Seeing a growing number of specific exclusions for fauna and flora	YES
Biodiversity	NO GL policies are linked to property damage which by virtue means someone had to have suffered loss to property they owned	YES
The Unowned Environment	NO	YES

The choice of one or the other form of insurance is largely dependent on the type and scope of risk that a given company is exposed to as a result of the business activity it conducts and the technology it uses. In the case of a company which permanently uses dangerous substances it is more beneficial to obtain specialist EIL insurance, including gradual damage (due to lack of time limitation concerning the leakage becoming apparent, releasing the dangerous substance and occurrence of damage). When comparing the two types of risk transfer onto the insurer one should pay particular attention to Insurer's liability exclusions. To present a meaningful example, let us look at the general terms of civil liability insurance of business activities and property of TUiR Allianz S.A. The damage defined by the regulations of Directive 2004/35/CE is directly excluded from the coverage. Similarly, PZU S.A. is not held liable for

any damage regulated by the above directive. STU Ergo Hestia S.A. does not account for the damage directly or indirectly resulting from emission, leakage or any other way of a dangerous substance permeating into the air, water or soil. There are also other exclusions found in both types of insurance:

- damage which occurred prior to the insurance period, also the damage that became apparent before the insurance took effect but the insurance company was not notified about it,
- deliberate fault resulting from managerial action,
- planned or anticipated action resulting from emissions or negligence,
- war or terrorism,
- penalties and fines (contractual, non-compensative, due tax payments, non-financial claims)
- radioactive contamination,
- damage resulting from pollution of the environment where an underground tank is the source of pollution,
- damage resulting from deliberate negligence or conscious and deliberate disregard of summons enclosed in an official, regulatory or administrative letter, violation of orders included in an admonition directed by a Regulatory Body or in a writ, injunction or administrative order directed to the Insured or Officer in charge,
- lead or asbestos contamination.

Unfortunately, it is mainly among large chemical, oil or power companies that environmental insurance is arousing interest. Other companies are hardly aware of the threats and financial liability of the perpetrator for the damage caused to the environment that the environmental act imposes on them. Moreover, they are often certain that, if any damage should occur, it will be covered by the general liability insurance. According to Global Casualty Insurance Programmes Benchmarking Report 2011 45% of the respondents believe that their potential exposure to environmental risk is covered by the current civil liability policy (Global Casualty Insurance Programmes Benchmarking Report, 2011, p. 17).

Environmental Impairment Liability insurance issues are more complex. The main problem refers to the insurers' lack of experience in estimating this particular type of risk and consequent tentative approach to the described product. Insurance companies are therefore more willing to offer civil liability insurance including the environmental clause (usually called the 48 hour or 72 hour clause). Insurers approach risk assessment and calculation of the premium amount in a variety of ways. To name some of them, ACE Group underwriters calculate the premium individually, taking into account the scope and period of insurance, type of business activity, amount of company's own stake as well as damage history. On the other hand, Ergo Hestia pays attention to the amount of revenue the company generates, the level of the insurance liability and the area of industry in which the client operates (Bartman, 2012, p. 22). Besides, insurers assess the population density in a given area, its surroundings, vicinity of water bodies, soil quality. One of the crucial elements influencing risk assessment is materials (like raw materials or chemical substances) processing and storage procedures that the client has in place as well as use of ground-level and underground tanks. Insurers are also likely to ask about emissions, waste management, asbestos-containing materials and preventive measures in case of a leakage. This is why risk engineers often conduct a detailed inspection of the insured plant and ask a large number of specialist questions before they present the final insurance offer.

Challenges of the Modern World - Contemporary Economy and Globalization

The premium amount varies from several to more than ten thousand PLN for a year's long insurance period (amounting to approx. 15 per mille) while broadening the general civil liability insurance may cost up to 30% of the premium that a given company pays for the basic scope of insurance (Wedziuk, 2012).

Another problem connected with supply is that insurance companies are lacking in highly qualified professionals or financial reserves required to manage this kind of insurance product. Co-operation of re-insurers and insurance companies could provide a solution, especially if backed by involvement of National Fund for Environmental Protection and Water Management (whose statutory aim is to facilitate preventive action in environmental protection) in establishment of re-insurance companies. Such co-operation could lead to lowering the premium levels and the resulting growth in popularity of this product among entrepreneurs (Fiedor, 2007, p. 150–153).

Whether it would be possible and legitimate to introduce an obligatory environmental insurance is still another problematic issue, which might lead to an increase in the use of this kind of insurance. Many European countries have already introduced such obligatory insurance, e.g. Germany, Belgium or Sweden (Fiedor, 2007, p. 145). Unfortunately, its scope is rather narrow due to insufficient legal regulations and reluctance of the insurers who have already incurred losses which result from offering this type of insurance.

4   ENVIRONMENTAL DAMAGE ASSESSMENT METHOD

An essential issue related to environmental damage liability insurance is the complex process of damage assessment and adjustment. Occurrence of damage involves many different types of loss and various factors, which must be subject to thorough analysis requiring vast knowledge and experience. Among the required activities one might mention: identifying the source of contamination, minimising the loss and limitation of the damage. They may also involve contamination analysis, and sometimes even modelling animal migration or estimating the progress of the damaged biotope restoration. That is why usually insurance companies outsource the task of assessing particular damage to independent experts. Obviously, this results in increasing the costs incurred by the insurer, which in turn causes the insurers to raise the premium amount.

According to the rule of "the polluter pays", which is the main principle of the Directive 2004/35/CE as well as the Polish act on damage prevention and remedying, the entrepreneur must be held liable for environmental damage or causing threat of such damage resulting from their activities. The 18 point of the preamble mentions three possible ways of charging the costs:
-   costs of indispensable preventive and remedying resources
-   costs reimbursed by the entrepreneur if the competent authority acts on behalf of a company on its own or through a third party
-   costs of evaluating the environmental damage and in some cases the costs of evaluating the direct threat of such damage.

Unfortunately, the Directive does not describe explicitly any methods of environmental damage evaluation, which is an additional difficulty for insurers. Generally, two methods can be used:
-   preventive (costs of prevention) for preventive measures,

- remedial (costs of replacement) for remedial measures.[5]

The preventive method amounts to operators providing all the required information about the imminent threat of environmental damage, or if there is a likelihood of such an occurrence, taking proper measures to prevent it. Moreover, in case of such an occurrence, competent authorities may instruct operators to apply particular preventive measures or take such measures themselves (Graczyk, 2005, p. 93).

Appendix II to Directive 2004/35/CE describes common framework of activities which should be conducted in order to select the most appropriate remedial method in relation to environmental damage caused to water or protected species or habitats.
Figure 1: Remediation methods (Own study based on Appendix II to Directive 2004/35/CE)

Primary remedial measures are the ones that restore the damaged natural resources and/or impaired environmental functions to the baseline condition. If they prove insufficient, complementary remedial measures can be used. In order to compensate for interim loss which occurred after the damage and prior to restoring the natural resources/functions to the baseline condition, compensatory remedial measures are used. Interim loss can be defined as loss resulting from the fact that natural resources/functions cannot be applied to the society or other resources until primary or complementary measures have been used (Directive 2004/35/CE, 2004).

In order to eliminate problems regarding determination of environmental damage and which remedial measures should be used and in what manner, REMEDE programme (Resource Equivalency Methods for Assessing Environmental Damage in the EU) financed by European Commission was implemented by the EU. A team of lawyers, economists and ecologists participated in evaluation of 50 environmental damages and prepared Appendix II to the Directive 2004/35/CE. (Kmiecik, 2008, p. 17). The purpose of REMEDE is to draw up, test and promulgate the methods (called resource equivalency methods) of determining the type and scope of remedial measures application required to compensate for environmental damage.[6] An interesting case where these methods were used is *Vistula river crossing by the Yamal gas pipeline* (Kiejzik-Głowińska, Lipton and Tederko, 2008). The construction started in October 1998 and was completed in May 2000, which was 14 months longer than originally planned. The delay resulted in increasing the damage and raised its remedial costs.

Challenges of the Modern World - Contemporary Economy and Globalization

The project involved:
- using resource equivalency analysis (REA) with regard to natural habitats in order to calculate interim losses caused by damage to the environment (crossing the river valley by a pipeline),
- presenting the methodology of damage assessment in the terrestrial and aquatic environment both in the area of direct and indirect impact of the investment,
- calculating interim losses caused by environmental damage and assessing indispensable remedial action to compensate for these losses.

The damage led to destruction of terrestrial habitats (including riparian forest (willows and poplars), riparian willow shrub and herbal shrubs, sandbar and grassland) and aquatic habitats (including the deepwater in the main stream of the river and the shallow waters in the vicinity of shoreline, islands and backwaters). In order to calculate interim losses the resource equivalency method was used separately for terrestrial and aquatic environments while applying annual discounted service loss (DSHaYs) where the total refers to the overall number of lost habitats affected by damage in the course of construction and during the period of restoring the baseline condition. The outcome of the remedial action was calculated by means of habitat "scalars" (separate for each type) which were used for normalisation of damages.

From the insurance point of view, calculating the remedial costs is of prime importance. The invoiced elements included:
- planning and design
- obtaining necessary permits
- obtaining land
- implementing the project
- nurturing activities (assumed period of 40 years)
- monitoring
- reserve (option I - 30% for replanting trees, option II - 10% for forest preservation).

The table below shows that overall cost of remedial measures regarding terrestrial habitat in option I (replanting a new forest) and aquatic habitat (improvement of river channel condition) amounted to approx. €196,000. On the other hand, option II remedial measures (preservation of the existing forest) ranged from €173,000 – €180,000. It is apparent that the cost of replanting a new forest is higher than the cost of preserving the existing one.

Table 2: Total costs of remedial measures 2008 data (Kiejzik-Głowińska et al., 2008)

Type of habitat	Terrestrial damage (riparian forest)		Aquatic damage (main river channel)
Type of remedial measures	Forest replanting	Preservation of the existing forest	Improvement of river channel condition
Cost of remedial measures	€12,000/ha	€7,150 – 9,350/ha	€31,200/ha
Total cost	€43,056	€20,375 – 27,115	€152,880

Indemnity claims trials are another important issue relating to environmental damages. In the light of Polish judicial experience, most insurance cases regarding civil liability for environmental damage end in settlement. However, there are still too few real cases to make it possible to evaluate and determine how to adjudge losses caused by environmental damage.

5   CONCLUSION

Changes in the company's legal environment which defined the new framework of corporate activities relating to the natural environment have caused a growing interest in this method of risk management among both companies operating in a manner causing danger to the environment and insurers who could provide appropriate services. Directive 2004/35/CE and the locally equivalent Act on environmental damage prevention and remedying are very strict in defining operators' civil liability for polluting the natural environment. Legal changes which have taken effect since 2007 have caused operators to find the previously available traditional civil liability insurance of business activity and property including the environmental clause to be insufficient. More and more often insurers offer now independent environmental insurance against environmental pollution. The scope of insurance protection is much broader here. What is more, the insurer does not only pay compensation for damage caused to third parties, but also covers the environmental damage and incurs the costs of removing the damage residue and restoring the habitat to the baseline condition. The described solution is mainly dedicated to large companies whose operations affect the environment to a substantial degree. Remedial costs that the policy covers are really high, and their calculation and adjustment is complex, so insurers must often turn to experts for specialist assistance. The environmental insurance market in Poland is still limited, but it is developing vigorously. Beside insurers, also financial institutions are showing a growing interest in this product. It is due to the fact that they may protect themselves against environmental damage or increased liabilities because of adverse effect of their operations on the environment. Besides, transferring the risk relating to liability for environmental damage onto the insurer is both an effective management method and a way to run a socially responsible company.

LINKS BETWEEN GOVERNANCE AND DEVELOPMENT

Veli Himanen
Relate Partnership, Finland
veli.himanen@relate.fi

ABSTRACT
This paper aims to link public governance with economic and social development. The aim brings forth two research questions: how to assess the quality of governance and how to determine links between governance and development. Our approach combines categories of social orders with indicators available in public databases. Then we screen data on 143 countries in 2007 in order to check the usability of this approach and to find out links between governance and development. Our analyses prove that corruption perception index scores (CPI scores) explain best differences between countries in the quality of governance as well in economic and social development. Additional explanations can be searched from ease of doing business and from economic inequality. Still, there is room for differences originating from regional characteristics. Even though the paper is addressing an extensively studied area, the new approach could still promote a distinctive contribution for the current scientific debate.

Keywords: Economic development, International comparison, Public governance, Social development

1 INTRODUCTION

The paper aims to highlight possible links between the quality of governance and economic and social development. Therefore, the paper analyses: first, the quality of public governance in 143 countries in 2007[1]; second, possible links between the quality of governance and economic development; third, possible links between the quality of governance, economic development, and social development, and fourth, observed development paths. We start our search by generating a new approach for assessing the quality of governance and then use it in the following analyses.

2 QUALITY OF PUPLIC GOVERNANCE

It is not at all clear how to define the quality of public governance. It seems that many authors consider that democracy is synonym for good governance. According to the following analyses, corruption perception index score (CPI score) provides the best indicator for the quality of governance[2]. Our analyses below prove that governance has also special regional features.

2.1 Theoretical Approaches

As a concrete attempt to categorise governing regimes, the Polity IV Project has calculated authority indexes for all countries based on a scale ranging from -10, meaning a hereditary monarchy, up to +10, meaning a consolidated democracy[3]. According to the Project, the number of consolidated democracies was around 25. There are, of course, many other

---

[1] All countries with at least a million inhabitants and necessary data in 2007 are included.

[2] For details of corruption perception index score see: http://www.transparency.org.

[3] Polity IV Project is led by Monty G. Marshall, for details see: www. sytemicpeace.org/polity/polity4.htm.

Challenges of the Modern World - Contemporary Economy and Globalization

approaches for assessing the quality of governance. Marshall and Cole (2008, pp. 16–17) have provided so called fragility index that describes the efficiency and legitimacy of governments. A total of 19 countries got the best value and 13 the next best. Lijphart (1999, p. 48) claimed that there were 36 countries (with population over 250,000) that had been continuously democratic since 1977. North et al. (2009) claimed that today we have, in principle, only two types of social orders: limited access orders and open access orders. The difference between these two types stays in the limits to form organisations. The first ones restrict the rights to form organisations for the national elites and the last ones leave them open to all citizens. They stated that only 25 countries had open access orders and the rest had limited access orders or had reached threshold conditions between these two. Thus, there have been differences between authors how to measure the quality of governance, and the number of the countries with the best governance system has varied between 19 and 36. Roskin (2004) turned the question upside down by claiming that in order to assess different regimes, it is best to study their results. Next we shall develop own approach for assessing the quality of governance that combines above mentioned categories of social orders with some indicators. But we shall remember also Roskin's advice.

We can divide social orders into economic and political spheres that are, of course, tightly knighted in countries with limited access orders. There are some indicators available in public databases which provide possibilities to measure the scale of access into these spheres. On the economic sphere, it seems at first sight obvious that ease of doing business describe this[4]. In order to find indicators that describe access into the political sphere, we have to consider basic characteristics of the limited access societies that are driven by the elites. When economic and political issues are there interlinked, it is obvious that traditional gift exchange is common. Thus, we can use CPI scores as proxies for the access into the political sphere. The share of national income for the richest decile could also be used for the same purpose, because it is probable that the elites take a bigger share in the limited access than in the open access societies.

However, when considering these three indicators in detail, we can notice limitations in their use. First, because good ranking in ease of doing business needs obviously a highly developed administration, it is clear that the indicator is also showing access to the political sphere – not only to the economic one. In addition to that, a more serious problem is related to the ordinal ranking provided by the database that does not reveal the amount of differences between countries achievements[5]. Second, the use of data on the share of the richest decile is limited because of inaccuracies and differences between national studies. According to Human Developed Report 2007/2008, some countries have studied income and some expenditure and the studies are from different years; from 1993 to 2005. On the other hand, CPI scores seem to be well suited for our purposes. It is interesting to notice that CPI scores correlate well with average GNI (PPP) per capita. They explain 78 per cent of variation between countries and when removing big oil exporters, 84 per cent. Therefore, we start next analysis with CPI scores and, when necessary, complete them with other indicators.

---

[4] World Bank Group and International Finance Corporation provide a yearly ranking list of countries according to ease of doing business.

[5] Himanen (2013) has transformed the ordinal ranking list to a cardinal one (ease of doing business scores) but that cannot overcome the original lack of data on the amount of differences between countries.

Challenges of the Modern World - Contemporary Economy and Globalization

2.2   Quality of Governance in 143 Countries in 2007

The distribution of CPI scores (Figure 1) show a diminishing difference between countries from the biggest scores to the smallest ones. In addition, we may notice a clear drop around the score 6. In order to be able to analyse the included countries further on, we have divided them into six baskets according to their CPI scores (Table 1).
Figure 1: CPI scores in 2007 in 143 countries (Transparency International, 2007)

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: The quality of governing in 143 countries in 2007 according to CPI scores (order according to CPI scores and the countries with the same score are in the alphabetic order)

Basket					
One	**Two**	**Three**	**Four**	**Five**	**Six**
Denmark	Botswana	Colombia	Algeria	Burundi	Azerbaijan
Finland	Hungary	Ghana	Armenia	Honduras	Belarus
New Zealand	Italy	Romania	Dominican R	Iran	Congo Republic
Singapore	Czech Rep.	Senegal	Lebanon.	Libya	Côte d'Ivoire
Sweden	Korea Rep.	Brazil	Mongolia	Nepal	Ecuador
Netherlands	Malaysia	China	Albania	Phlippines	Kazakhstan
Switzerland	South Africa	India	Argentina	Yemen	Kenya
Canada	Costa Rica	Mexico	Bolivia	Cameroon	Kyrgyzstan
Norway	Slovakia	Morocco	Burkina Faso	Ethiopia	Liberia
Australia	Latvia	Peru	Egypt	Pakistan	Sierra Leone
United Kingdom	Lithuania	Georgia	Eritrea	Paraguay	Tajikistan
Hong Kong	Jordan	Saudi Arabia	Guatemala	Syria	Bangladesh
Austria	Mauritius	Serbia	Moldova	Gambia	Cambodia
Germany	Oman	Trinidad and T.	Mozambique	Indonesia	Central African R.
Ireland	Greece	Bosnia and Her.	Rwanda	Russia	Papua New Guinea
Japan	Namibia	Gabon	Uganda	Togo	Turkmenistan
France	Kuwait	Jamaica	Benin	Angola	Venezuela
United States	Poland	Lesotho	Malawi	Guinea-Bissau	Congo Dem. Rep
Belgium	Tunisia	Macedonia FYR	Mali	Nigeria	Guinea
Chile	Bulgaria	Swaziland	Ukraine		Laos.
Spain	Croatia	Thailand	Nicaragua		Chad
Uruguay	Turkey	Madagascar	Niger		Sudan
Slovenia	El Salvador	Panama	Mauritania		Uzbekistan
Estonia		Sri Lanka	Timor-LestE		Haiti
Portugal		Tanzania	Vietnam		
Israel			Zambia		

Transparency International has provided confidence intervals for CPI scores that give the range inside which a score is according to 90 per cent probability. Therefore, we can see that there existed quite clear difference between the first two baskets. However, differences between the other baskets were not that clear, e.g. Basket Three had 11 countries with the lower ends of their confidence intervals dropping down to Basket Four and correspondingly

Challenges of the Modern World - Contemporary Economy and Globalization

Basket Four had 8 countries with the upper ends of their confidence intervals reaching to Basket Three. In principle, we can state that for individual countries near the lower or upper end of their baskets (excluding the border between the first two baskets) it is not sure to which basket they actually belonged. But this uncertainty does not disturb general conclusions to be drawn below. However, it means that small differences between countries' scores are uncertain for comparison. Thus, we cannot be certain, e.g. if there were less corruption in the United Kingdom than in Hong Kong, but quite certain that there were less corruption in the United Kingdom than in France and the United States but more than in Sweden and Singapore.

There exists regularity among the baskets, so that also average ease of doing business scores and average GNI (PPP) per capita diminish from basket to basket (Table 2). Average GNI (PPP) per capita in Basket Five forms the only anomaly. This is probably due to many big oil exporters in that basket. As proved by Himanen (2013, p. 104), big oil exporters can have high affluence compared to their CPI scores.

Table 2: Average CPI and ease of doing business scores and average GNI per capita in 143 countries divided into six baskets according to their CPI scores (Himanen, 2013, p. 143)

Basket	Number of countries	Average CPI score in 2007	Average ease of doing business score in 2007 (1	Average GNI (PPP) per capita in 2007 ($)
One	26	7.9	8.9	33490
Two	23	4.7	7.2	16560
Three	25	3.4	5.6	7110
Four	26	2.8	3.7	3520
Five	19	2.4	3.3	3870
Six	24	2.0	3.3	3230
Total/average	143	4.0	5,4	11700

When comparing the above baskets with the other approaches referred above, we may notice that the number of countries in Basket One is about the same as in many other estimates of the best governed countries. When aligning our baskets with the approach of North et al. (2009), we can form three categories of states: i) Basket One includes countries with the open access social orders; ii) countries in Baskets Two and Three have reached threshold conditions for moving into open access orders; and iii) countries in the last three baskets have stayed in limited access orders. We will consider the stability of these three categories below in the connection of development paths.

3   GOVERNANCE AND ECONOMIC DEVELOPMENT

Above we noticed very strong correlation between average GNI (PPP) per capita and CPI scores in 2007. This is most interesting result when the relationship between governance and economic development is a thoroughly studied subject, but the current literature leaves a reader – to say the least – in a bewildered state. We screen next recent literature on the subject and then discuss own results for different countries and regions.

3.1 Bewildering Theories

Acemoglu and Robinson (2012, pp. 44–69) argued that the current big differences in countries' affluence cannot be explained by the earlier proposed theories. They named the following failed theories: i) the geography hypothesis, advocated in his time by philosophy Montesquieu and later on by Diamond (1997) and Sachs (2006); ii) the cultural hypothesis, starting from Max Weber's idea about the importance of the Protestant ethic, and recently advocated again by Landes (1999, p. 510); and iii) the ignorance hypothesis that citizens and governments do not know how to improve situation. Acemoglu and Robinson concentrated in explainingon why poor nations got it wrong, and their answer includes solving basic political problems and thereby establishing good institutions and governance. However, Banerjee & Duflo (2011, pp. 233–243) proved that the major figures in development economics, like Acemoglu, Robinson, Easterly, and Sachs had got it wrong. The correct answer can be found in marginal stepwise improvements (policies instead of politics) under the current (imperfect) institutions because wholesale changes in institutions are very rear and can also be counterproductive. De Soto (2001, p. 6) stated that development was restricted because possessions already existing in poor countries are not adequately documented and therefore cannot be turned into capital, but Sachs (2006, p. 321) claimed that de Soto had got it wrong. On the top of this, we can notice that Keen (2011) proved that the current mainstream concept of economics, neoclassical one, is fundamentally flawed and therefore have led macroeconomics into a totally wrong direction. In addition to the above mentioned broad approaches, we may notice exercises aimed to find statistical relationships between governance and economic development. However, according to North et al. (2009, pp. 2–3), it has remained open if there is a causal link. Actually, we noticed above very strong correlation between GNI (PPP) per capita and CPI scores, and in order to check the meaning of this correlation we screen next the exceptions.

3.2 Exceptions Confirm the Rule

When considering a country to have exceptional character if its GNI (PPP) per capita is more than 10 per cent out of the general patterns of a basket, we found 47 countries (of a total of 143) of which 21 were richer and 26 poorer than the common limits for the relevant baskets.

The reason for greater richness in 14 countries was income from oil and gas exports. Regarding the remaining seven countries without big oil or gas exports, we can notice that: i) Greece had the lowest CPI score and ease of doing business score in Western Europe and therefore it is possible that a regional impact has increased Greece's affluence into a higher level than Greece's scores suggested; ii) Italy has been relatively losing affluence that can be due to the poor quality of governance (the second lowest ease of doing business and CPI scores) when compared to other Western European countries; iii) South Korea's GNI (PPP) per capita was not very much over the upper limit of Basket Two and therefore the necessary explanation can be found in the high rank in ease of doing business; iv) Argentina has been relatively losing affluence for a long time possibly due to the poor quality of governance like Italy above; v) Lebanon's special features originate probably from the long civil war; vi) both Ukraine and Belarus had higher affluence than there CPI scores could explain and we may suspect some regional impact.

Twenty sub-Saharan countries were included in the group of 26 poorer countries. The reasons for the over-representation of sub-Saharan countries can be the colonisation period and the civil wars that made these countries so poor that it takes a long time before improved governance can increase affluence. In addition, we have to remember the impacts of malaria

and HIV/AIDS. Regarding the four countries from South America, we may claim that in these countries there still existed some restrictive features like low ease of doing business and/or high economic inequality. Behind the relative poverty of Tunisia and Jordan we can expect some regional cause added by somewhat low ease of doing business score in Jordan.

As a conclusion for the above analysis, I want to state that, in principle, good governance (assessed according to CPI scores) explains well differences between countries' GNI (PPP) per capita. The exceptions of this rule are mainly due to oil and gas exports and to some kind of regional effect. Thus we can agree with Acemoglu's and Robinson's statement above that good governance is most important but still insist that, in addition, there exists some regional impacts originating from geography, history, religion, culture or whatever. After this discussion on governance and economy, we will consider how these are related to social development.

4 SOCIAL DEVELOPMENT

The definition of social development is, of course, a complicated issue. Without going into theoretical discussions, we consider next how well countries have succeeded to empower and protect citizens. The aim is to highlight countries' achievements in 2007 explained either by national income per capita or by the quality of governance.

4.1 Empowering Citizens

Empowerment includes here three domains: education, economic equality, and average life expectation at birth. Achievements in education are next considered according to primary enrolment rates, PISA scores, and top university rates. Differences in education are quite difficult to define because no indicator is suitable for all categories of countries: primary enrolment rates are suitable for poor and middle-income countries, PISA scores for middle-income and rich countries, and top university rates for rich countries.

Primary enrolment rates followed countries' GNI (PPP) per capita ($R^2=0.44$) better than CPI scores ($R^2=0.26$). The lower correlation of the latter was mainly due to the fact that many post-Soviet countries had quite high enrolment rates despite their low CPI scores and the same was also true for some Asian countries. In principle, sub-Saharan countries had lower than average enrolment rates. That was not totally due to their low affluence, but was also a regional feature. However, we may notice that some poor African countries in baskets 3 and 4 had reached enrolment rates around 90 per cent, i.e. relatively good governing had improved education options despite of poverty. We can notice also that among the rich countries (GNI (PPP) over $15,000 in 2007) there were five countries (including both oil exporters and post-Communist countries) with somewhat low enrolment rates. These all were actually from Basket Two, and thus worse governing (compared to other rich countries in Basket One) could be a reason. An enrolment rate describes the share of children receiving the basic education. The efficiency of education has been assessed by the PISA studies. PISA scores correlated quite well with GNI (PPP) per capita ($R^2=0.74$) and almost as well with CPI scores ($R^2=0.62$). There were quite interesting regional differences, even when considering the limited number of countries included in the PISA studies. First, the Pacific was clearly the best region. Second, Eastern Europe (including also the Baltic States and Russia) had quite similar results as Western Europe. Third, some countries from South America had quite low scores. The top universities were very much concentrated into the rich countries[6]. Most of

---

[6] Academic Ranking of World Universities in 2007 retrieved 20.10.2007 from www.arwu.org.

them had at least two top universities per ten million inhabitants. The exceptions that did not have any were either big oil exporters or quite small countries. The rate of top universities per ten million inhabitants correlated as well with GNI (PPP) per capita (R^2=0.82) as with CPI scores (R^2=0.81).

We will discuss economic equality with the aid of inequality ratio that is the share of national income for the richest decile divided by that for the poorest decile. Economic inequality correlates neither with GNI (PPP) per capita nor with CPI scores. However, there is a regularity that all rich countries had ratios below 20 (there was no data of the big oil exporters: Kuwait, Saudi Arabia, and Oman), and correspondingly there was only one country, Chile, with inequality ratio over 20 in Basket One. Economic inequality seems to be very much a regional phenomenon; low inequality ratios were common in Eurasia when high ratios were common in Latin America and Southern Africa.

Average life expectancy at birth correlated well with GNI (PPP) per capita (R^2=0.67) and CPI scores (R^2=0.66). The high explanation powers were due to the fact that rich countries had also high CPI scores and long life expectancy at birth when poor sub-Saharan countries had very low life expectancy at birth as well as low CPI scores. Two regional characteristics were obvious: first, very short life expectancy in sub-Saharan Africa almost disregarding of wealth or CPI scores; and second, the post-Soviet countries had clearly low life expectation at birth, even if considering differences in income.

4.2 Protecting Citizens

Here we will discuss homicides, road traffic deaths and prisoners. The rate of homicides correlated almost as well with GNI (PPP) per capita (R^2=0.35) as with CPI scores (R^2=0.29). Thus, homicide rates were usually higher in the countries with low affluence and/or low CPI score, but there were a lot of exceptions. The modest explanation power was probably due to rather strong regional impacts; especially in Latin America there were many countries with very high rates. Also, most post-Soviet countries had, compared to other Eurasian states, high rates.

Road traffic death rates correlated as well with GNI (PPP) per capita (R^2=0.50) as with CPI scores (R^2=0.49). Relatively high explanation power is due to the money needed for construction, maintenance, and control of road networks as well as to the capable administration needed for law enforcement. However, only a half of differences between countries could be explained by the above indicators, and we may suppose that the other half can be attached to some historical or regional reasons, like high road traffic death rates in Africa. In a way, CPI score analysis complement GNI (PPP) per capita analysis. For example, Greece and Kuwait had quite high road traffic death rates when compared to their affluence, but quite normal if compared to their CPI scores.

 Prisoner rates did not correlate with GNI (PPP) per capita or with CPI scores. Regional influence was a major explaining factor, so that most Western European countries had low rates, most post-Soviet countries had high rates, and the United States had the highest rate. In addition, we have to remember that low income countries (average GNI (PPP) per capita below $3000 in 2007) had low rates, probably due to their inefficient legal systems.

We may conclude that both GNI (PPP) per capita and CPI scores influence empowerment and protection of citizens. This is, of course, an expected result when these indicators are strongly

Challenges of the Modern World - Contemporary Economy and Globalization

correlated, but as we noticed above they may have also somewhat separate influences. In addition, some regional features seem to have big independent impacts.

5   DEVELOPMENT PATHS

Historical evidence proves that most countries – but not all – have got richer during the last decades, even though there has been big differences in economic growth rates. During 1970-2007, only 20 countries (of the included 143 countries) had average annual real growth rate per capita of at least three per cent that means that their citizens' average GNI (PPP) per capita increased three times during these years.[7] About a half of these countries were from Asia and the rest were spread around the world. During more recent years 1996-2007, there were 20 countries with economic growth rates of at least 4.5 per cent that means some 70 per cent increase in their citizens' affluence during these years. A half of these were post-Communist countries and almost a half of the rest were again Asian countries. Thus behind these high growth rates, we can see both regional causes – whatever they are – and wholesale regime changes. As a recent great example of wholesale regime changes, we discuss next post-Communist countries and after them try to assess the direction of changes in the quality of governance.

5.1   Post-Communist Countries

As a starting point, we have to remember that the Communist regimes were extremely restrictive regarding access to political and economic spheres. Both were reserved mainly for the members of the ruling Communist party that formed therefore the national elites. Because these elites were better educated and had better networks and financing opportunities than other citizens, they could exploit the opportunities that the change of the regime provided. This meant for them options to capture political and economic power also after the regime change. Therefore, based on the original changes around 1990 and later development, quite different regimes have emerged. As a rough structure for the situation in 2007, we can divide the post-Communist states[8] into three major blocks according to the liberalisation of access to political and economic spheres (Table 1): i) liberal access countries included Slovenia and Estonia; ii) threshold countries included most Eastern European countries and Lithuania, Latvia, Georgia, and China; iii) limited access countries: included Albania, most post-Soviet countries added by Mongolia, Vietnam, Laos and Cambodia. Although the national Communist parties have kept power in China, Vietnam, and Laos, these countries have liberated access to the economic sphere. In principle, it is clear that European post-Communist countries had better public governance than Asian ones. However, we have to notice that China was included in the threshold countries.

5.2   Progress or Regress?

We concluded above that CPI scores formed the best indicators for assessing the quality of governance. With the aid of these scores, we divided the included countries into three categories according to their development stages. We try next to assess possible general tendencies in development by analysing countries movements between these three categories from 2007 to 2011. We will consider that a change has happened if the CPI scores differ from

---

[7]   The   ERS   International   Macroeconomic   Data   Set   retrieved   20.12.2007   from www.ers.usda.gov/Data/Macroeconomics.

[8] I have divided Europe into three parts: Western Europe includes countries that stayed out of communism; Eastern European countries got communism after WW II; and the post-Soviet countries were annexed into the Soviet Union.

each other at least by 0.4 that correspondence with the common confidence range in 2007.[9] The average CPI score for all 143 countries was 3.9 both in 2007 and 2011. However, there were 44 countries that had a significant (at least 0.4) change in their CPI scores from 2007 to 2011, of which 27 scores were reduced and 17 improved.

In Basket One, CPI scores were increased in two and decreased in four countries. However, all countries could still be included in Basket One. Among the threshold countries, CPI scores were improved in five and decreased in fifteen countries. Botswana had the highest CPI score in 2007 in Basket Two and had still improved position so that Botswana could be upgraded into Basket One in 2011as a first country from Africa. On the other hand, Senegal and Mexico from Basket Three had so low CPI scores in 2011 that they could be moved to Basket Four, i.e. out of the threshold category. Instead of them, Rwanda, Zambia, and the Gambia, could be moved from the limited access order countries to the threshold category in 2011.

As noticed above, the average CPI score for all countries had not changed from 2007 to 2011, even though, there were more countries with decreased than increased scores. In principle, the above defined three categories were quite stable. The countries with changes in CPI scores were spread all over the world. A minor tendency that the development was most positive in sub-Saharan countries and most negative in European countries is, of course, quite uncertain due to the small number of changes per region. When interpreting these results, we may remember that the financial crisis that started in 2008 was still on going in 2011. The crisis was worst in Europe that could explain reductions in CPI scores in many European countries when a positive economic growth in many sub-Saharan countries could explain a more positive development there. These speculations would provide some support for the connection between economic growth and the quality of governance.

6   CONCLUSION

Our new approach for assessing the quality of governance by CPI scores divides the world into three distinct categories: 26 countries with open access social orders; 48 countries with threshold conditions; and 69 countries with limited access social orders. In principle, there is no certainty that states are improving their governance; we could notice both progress and regress. CPI scores explain well differences in countries' affluence, and exceptions are mainly caused by oil and gas exports added by some regional effects.

Many phenomena related to empowering and protecting citizens could be explained either by affluence or by the quality of governing. However, on top of that, we could notice the impact of regional features. Thus short average life expectancy at birth was a sub-Saharan feature and in a milder form also found in post-Soviet countries. Economic equality was best in Eurasia and worst in Latin America. High rates of homicides were common in Latin America and relatively high also in post-Soviet countries. Road traffic death rates were high in Africa. The highest rate of prisoners was in the United States and also quite high rates were common in most post-Soviet countries.

The use of CPI scores for assessing the quality of governance can be complemented by two other indicators that aid to explain many differing characteristics: ease of doing business and economic inequality. It is possible that CPI scores highlight, in addition to corruption and access to the political sphere, also the general business climate in the country and by that way

---

[9] CPI scores for 2011are from Transparency International's Annual Report 2011 retrieved 10.12.2012 from www.transparency.org.

reflect access also to the economic sphere. In principle, this paper has opened a simple approach, by using CPI scores as proxies for the quality of governance, to analyse many interlinking phenomena of our complex world.

ABSTRACT
Searching for job, a new and better workplace, nowadays is challenging and tiresome. Labour market opportunities don't offer much choice and due to the financial crisis hundreds of people stay unemployed. Recruitment of employees has become the critical part in modern society development and human resource management. This has been recognized by the theory and extensive literature reviews regarding employment have already been published. The purpose of this paper is to provide a selective literature review that presents the current status of research on various recruitment topics and to stimulate future research on several recruitment issues. Through this paper the recruitment issues and labour market in Croatia will be analyzed and the purpose is to present the employment rates and developments of labour market in selected Croatian counties. The analysis will be made using secondary data available online regarding the number of current and past job seekers and job openings.

Keywords: Croatia, Employee recruitment, Employment process, Labour market, IT

1 INTRODUCTION

In this rapidly growing knowledge economy, companies are in need of competitive advantage of more efficient exploitation of human resources and intellectual capital. Human resources (HR) are the key components in every organization representing total knowledge, talent, attitude, creative ability, aptitude and belief of an individual involved in the affairs of an organization (Dhamija, 2012). To achieve its strategic objectives, a fundamental concern for an organization is that its HR strategy is directed towards having the right people with the right skills, knowledge and attributes in the right positions. The amount to which the demand for labour, in numbers and in the availability of various skills, expertise and knowledge, can be met by the available supply is a key driver on the range of choices that an organization has when determining an appropriate HR strategy (Wilton, 2010). Labour market context shapes the approach which company takes towards human resources management and is one of the key factors in determining an organization's '*degrees of freedom*' in human resources strategic formation (Boxall and Purcell, 2003).

Job search is process that aims to match job seekers to suitable job opportunities (Hasluck and Green, 2007). From a company's perspective, recruitment of efficient staff is one of the important activities as it generates the human capital (Dhamija, 2012). Recruitment includes ″*practices and activities carried out by the company with the aim of identifying and attracting*

potential employees" (Breaugh, 2000). Having various options when defining their recruitment process, companies can choose between traditional and e-recruitment methods. Today, companies mostly go for the online recruitment method, as traditional job advertising method has a higher cost expectation. The use of online recruitment has grown over the past years and the Internet is now widely adopted medium for recruiters and job seekers (Parry and Tyson, 2008).

Changing environment of the labour market, especially in developing countries, implies a change in the supply and demand for the workers. Turbulent environment creates gaps between the knowledge and skills of unemployed and the knowledge and skills that employers (companies) are looking for, thus becoming one of the biggest problems and challenges for each policy maker. This is a reason why link between labour market and recruitment process is becoming more and more interesting for researchers. There are a lot of reasons for the gap between demand and supply side and it is important to stress that education and training have to become crucial part in prevention of unemployment. Trend indicates that the better process of education and training of workers results with lower unemployment; workers becoming more flexible and more comfortable in the workplace (Kacun, 2002).

1.1   Research question and research methodology

The research problem is investigating the relationship between structural unemployment and the largest companies in selected Croatian counties. Structural unemployment is more typical for developing countries where economy is not efficient for hiring all available workforce. Also, the purpose of this paper was to address issues of employee recruitment and current labour market situation in selected Croatian counties. Through this paper authors present the evidence of recruitment and labour market in Croatia using secondary data available online.

This paper presents a qualitative and quantitative analysis of labour market and recruitment process based on data collected primarily from the *Annual statistical report by Croatian Employment Service* (HZZ, 2013) and from the report on the ranking of *500 largest Croatian companies* posted by Poslovna.hr and business publication Lider. Base for the empirical data analysis was also review of some recent literature made by researchers. This paper poses a research question: *Is there relationship between structural unemployment and dominant industry in selected counties?* Before the presentation of the results of the analysis, it must be noted that the main object of analysis in this research paper are large companies from different industrial sectors in Croatia. The research sample was made of 200 companies with the top composite scores based on their rankings for market value, sales, profits and assets. Companies show a very high range in the number of employees from 5 to more than 11,000.

In the article, the authors first present the results of a literature review about HRM, recruitment process and labour market. After that, the authors present the research results that were collected through secondary data analysis.

2   OVERVIEW OF PUBLISHED PAPERS – HRM, RECRUITMENT PROCESS AND LABOUR MARKET

Human resource management (HRM) thinking and practice have evolved in new directions during the first decade of the twenty-first century. The concept of human resource management has a built-in management and human resource development issue in the context of strategic management on the one hand and refluxes to the whole strategic concept and long

neglected human dimension on the other hand (Bahtijarević Šiber, 1999). Research on HRM began in the 1980. One of the first studies of HRM was *The Warwick study* in the late 1980s. This was the research program which included 15 organization and 350 in-depth interviews. All respondents were ranged from senior executives to shop-floor employees, but still the most attention was focused on key line managers. Ten years later *The Loughborough study* showed that HRM is resilient phenomenon. This study was made on Britain's major companies (Storey, 1995). Fombrun et al. (1984) summed up "generic" HRM functions which are performed via different HRM practices in organization. These generic functions include HRM policies (developing policies relating to personnel management of the firm); employment (defining recruitment and selection procedures for staffing needs); development (strategies for training and development of employees); performance (performance appraisal programs); compensation (designing reward systems for the employees).

Focus of this paper is the HR recruitment function. Due to decrease of possibility that the human resources can be imitated recruitment function distinguishes the company and differentiates the company's employees from those of its competitors (Wright and McMahan, 1992). Recruitment activities are executed by organizations for following purposes (Barber, 1998): (1) to define the target population for satisfying organization's personnel needs; (2) to select labour market segments and geographic regions for conducting recruitment campaigns; (3) to choose the medium for reaching the target population; (4) to deliver messages for disseminating information through the selected medium; (5) to prepare final offers for acquiring qualified applicants; and (6) to create general policies and actions for managing the overall recruitment function.

Interest in the topic of employee recruitment has increased over the last years. In the first edition of the Handbook of Industrial and Organizational Psychology in 1976, less than one page of coverage was filled with the topic of employee recruitment (Breaugh, 2000). Nowadays articles are filled with theory and practices of the of employee recruitment issues. The internet has proved to be immensely powerful tool for different kind of services like HR planning, HR evaluation, HR rewards and HR recruitment. The role in the employee search through use of the information technology will be discussed later.

Vital values for organisation are the experiences, skills, innovativeness and insights of its people. Human resources are the key components in every organization and they represent the total knowledge, talent, and attitude of an organization. Wright and McMahan (1992), drawing on previous research from Barney's (1991) and his resource-based theory of the firm, argue that human resources may be used as a source of sustained competitive advantage when main requirements are met. Firstly the HR must add value to the company's production processes; secondly the skills that company inquires have to be extraordinary and also cannot be easily imitated. Wright and McMahan (1992) stated that companies' human resources are the key resources, and cannot be replaced with technological advances and other substitutes if they provide the core source of sustainable competitive advantage. Recruitment includes practices and activities carried out by the organization with the aim of identifying and attracting potential employees (Breaugh and Starke, 2000). Labour market is the mechanism through which human labour is bought and sold as a commodity. It constitutes the systematic relationship that exists between workers and their working organizations, it presents the means by which labour demand (the number and type of available jobs) is matched with labour supply (the number and type of available workers) (Wilton, 2010). As mentioned earlier the development of HRM in companies has increased in the last years. Global labour

markets are constantly in the process of changing. Data and analysis of unemployed people who are actively trying to find any type of job are directly connected with the processes in the labour market and HRM and recruitment strategy of companies.

There are a several types of unemployment (Samuelson and Nordhaus, 2011): (1) Structural unemployment, (2) Frictional Unemployment, (3) Cyclical Unemployment. For the purpose of this research, we will look into structural unemployment which is a result of mismatch between available jobs and demand for workforce. To prevent gap between demand and supply, labour market as well as the organisations have to be more flexible and constantly work on restructuring their processes, strategies and structures. Flexibility also means that employers who are on demand side have to *"increase their efforts to find suitable staff"* using different recruitment methods which leads to different recruitment strategies (Henkens, Remery and Schippers, 2005). In his working paper The Labor Market Effects of Employer Recruitment Choice, DeVaro (2007, p. 4) concludes that *"employers and job seekers are brought together for potential matches through their recruitment and job search activities"*.
Analysing labour market in Germany, Wieczorek (2005) found out that many jobs have been lost owing to structural change and globalisation. Growing industries like information and communication technologies, media, medical engineering, etc., generate a demand for workers with specific qualifications that are currently not on the supply side. In the book 'Labour Market and Skills in the Western Balkans' Arandarenko and Bartlett (2012, p. 5) remark that *"the economic transition in the Western Balkans has involved large-scale structural change which has come about through the processes of privatisation and enterprise restructuring"*.

The same situation is also present in Croatia, which is a transition economy, where turbulence in the labour markets has been even greater because of the structural changes in all segments of the economy and in all industries. Those changes have become even more dominant during the current global economic crisis. Unfortunately, in his working paper Scarpetta (1998) concludes that one of the key features of the European labour market is the rise in long-term unemployment and discouragement among the job-seekers. During the years this situation has not been becoming better.

3   USAGE OF IT IN RECRUITMENT PROCESS

Organizations are facing a day-to-day challenge of strong competition for skilled employees while on the other side they have to cope with decrease in physical, manpower and financial resources for recruitment process. (Dileep and Srota, 2012). One of the answers to this problem is becoming recognized in omnipresence and increased availability of ICT, which enabled new worldwide trends for HR functions - online recruitment also known as e-recruitment (Bussler and Davis, 2001). E-recruitment has evolved into a sophisticated interactive engine that automates and virtualizes all the aspects of the hiring process (Dysart, 2006) and has grown rapidly over the past ten years. As Cober and Brown (2006) noted, it is now widely used by both recruiters and job seekers across the world. Usage of IT and the internet can facilitate selection of employees (Galanaki, 2002). The Society for Human Resource Management (2008) has published report on workplace trends during the period 2007–2008 which indicates following:

- A higher demand for skilled workers, e-recruiting tools and the mobility of the workforce in today's economy.
- Organizations have found themselves in high competition for a shrinking supply of workers.

- Due to greater prevalence of HR outsourcing and increased use of HR technology the HR professionals are demanding increased customization of products and services from outsourcing partners.
- An increase in Business Process Outsourcing (BPO) including recruiting and great increase of technology used in the practice of recruitment.

Sing in 2006 indicated that recruitment is one area where all the big and contemporary companies who follow last achievements leverage IT (Dileep and Srota, 2012). One of the mostly widespread models of e-recruitment is through company's own websites which is more popular among larger companies and the other is hosting own requirements on other websites. That is also why there are ever more specialized websites where job seekers can post their resumes, and companies post their vacancies. To distinguish employees with low-quality bio-data's from the ones that the company needs the pre-employment testing was introduced. These tools test online the employment assessments and filter the applicants.Various IT applications have been developed in order to help the company and the job seeker in fulfilling their goals. Applicant Tracking Systems (ATS) i.e. web-based ATS which makes it easier for organisation to keep track of their job applications and helps them hire the right people. The system is easy-to-use, cost effective and tracks applicants' status as they move through workflow, and allows users to retrieve all applicants at a certain stage, thus giving them control over all applicants at all times (Gara, 2001). Integrating Human Resource service delivery models and operating HR systems through technology the HR are adding value to the company through saving time and money for more strategic HR activities (Dileep and Srota, 2012).

Person's decision to apply for a specific job opening could be affected by self-examining if their characteristics fit the observed organizational characteristics (Cable and Judge, 1994). So, as we are aware that companies obtain information about their prospective employees, job seekers as well use all the available information from recruitment messages as the foundation for developing fit perception with hiring organizations. Previous research of online available recruitment information has shown that among 200 the best Croatian companies only 63.5% have a webpage regarding employment. Also only 26% of them offer an online application. Important thing for companies in order to ensure positive communication with potential employees is the availability of their webpage in other languages though only 70% of Croatian top companies offer a page in English (Klačmer Čalopa and Horvat, 2012).

4 EVIDENCE FROM CROATIA
A job vacancy is a *paid post that is newly created, unoccupied, or about to become vacant*: a) for which the employer is taking active steps and is prepared to take further steps to find a suitable candidate from outside the enterprise concerned, and b) which the employer intends to fill either immediately or within a specific period of time (EVC, 2012). For the individuals the employability depends on the knowledge, skills and attitudes they possess, the way they use those assets and present them to employers and the context (e.g. personal circumstances and labour market environment) within which they seek for work. Market is consistent of job seeker and job vacancies. Though, can the supply of job seekers be enough for the demand of job vacancies?

For this paper unemployment and job vacancies in top 200 companies in Croatian counties were analysed. Secondary data available in annual statistical report, journals and online was used. As the source of information, the data available on Croatian Employment services

Challenges of the Modern World - Contemporary Economy and Globalization

website regarding the unemployment and job vacancies was used. Using '*The Best 500 Companies'* listing the first 200 companies, based on the new added value was included in the analysis. This listing is formed in association of Financial Agency of Croatia, Institute for Business Intelligence and journal 'Lider' (2012). Companies are ranked according to the new added value, which is a sum of profit before tax and expenditures for salaries. The authors of this article analyzed the first 200 companies with regard to their location in Croatian counties. The results are presented below.

By comparing the ratio over different years the figures indicate how labour market tightness is developing over time (see figure 1). The indicator should be interpreted with care because the ratio of unemployed to the stock of job vacancies tends to be overestimated. The job vacancies in agriculture and the public sector are excluded to get cross-country comparable data and generally not all available job opportunities are measured by job vacancy statistics because not all job opportunities are announced as job vacancies (European Vacancy Monitor, 2012). The Chart 1 shows the ratio between number of unemployed people and the stock of job vacancies for the year 2012 in every county.
Chart 1: The rate between unemployment and job vacancies for Croatian counties for the year 2012 (authors work; Croatian Employment services, HZZ)

The Chart 2 (below) shows the ratio between number of unemployed people and the stock of job vacancies for the period of 9 years (2004-2012) for Croatia. The analysis was made using data from 'Croatian Employment services' regarding unemployment for a period of time.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 2: The ratio between unemployment and job vacancies for Croatia for the period 2004 – 2012 (authors work, data source: Croatian Employment services, HZZ)

It is obvious that number of unemployed has been almost three times higher than the number of free work places. This implies high unemployment rate in Croatia. But how does the number of job vacancies from the perspective of the companies look like? To analyse the demand for workers, authors used the Top 200 companies in Croatia regarding the new value added. The authors have analysed the territorial dispersion of the top 200 companies. The data on 200 top Croatian companies show their dispersion across Croatia, which is as follows:

Table 1: Territorial dispersion of 200 Croatian biggest companies 2012 (Lider, 2012; authors work)

County	%	County	%	County	%
Zagreb	6,5	Virovitica-Podravina	2	Vukovar-Syrmia	1
Karlovac	1	Požega-Slavonia	1,5	Split-Dalmatia	8
Varaždin	3	Brod-Posavina	1	Istria	2
Koprivnica-Križevci	5	Zadar	0,5	Dubrovnik-Neretva	0,5
Bjelovar-Bilogora	0,5	Osijek-Baranja	2,5	Međimurje	1,5
Primorje-Gorski Kotar	9	Šibenik-Knin	1	City of Zagreb	53,5

The most of the 200 biggest Croatian companies (53.4%) are located in capital of Croatia – City of Zagreb, followed by Primorje-Gorski kotar county (9%), Split-Dalmatia county (8%) and Zagreb county (7%). For further analysis of structural unemployment these 3 counties and City of Zagreb was analyzed in detail.

County	%
Zagreb	7
Primorje-Gorski Kotar	9
Split-Dalmatia	8
City of Zagreb	53.4

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 3: The analysis of 3 counties and city of Zagreb and the share of companies by industry for the year 2011

Chart 3 shows the overview of the companies form top 200 by industry presented through the 3 county and the City of Zagreb. For the comparison the number of job seekers in these selected counties and City of Zagreb by the industry of their previous work is presented in the chart 4.
Chart 4: The analysis of 3 counties and city of Zagreb and the share of job seekers by industry of their previous work for the year 2011

The analysis of both figures shows discrepancies in the demand of employees and the supply i.e. the profile of job seekers. This confirms what was mentioned in many analyses before, that there is a high structural unemployment due to the imbalance between demand and supply side. In her research paper Obadić (2008) remarks that Croatian labour market shows structural problems like inflexibility, mismatch between supply and demand based on

profession and education. The literature recognises various causes of structural unemployment, i.e. by technological advances, trade agreements, industries that are declining and other (Amadeo, 2012). Our analysis shows that for example in City of Zagreb there are a large number of job seekers in the ICT sector, as well a large number of companies in this sector. Though, a high demand for employees in administration and management, due to the number of companies in this sector, is not met by the number of unemployed in this sector. Analysing the Primorje-Gorski Kotar County it can be noticed that there is a significant number of unemployed in the accommodation and food industry and transportation. From the top 200 countries which are situated in Primorje-Gorski Kotar County the most are in hotels industry and tobacco, which show an discrepancies between job seekers and job vacancy. The same situation is in other two counties.

5   CONCLUSION AND IMPLICATIONS FOR FUTURE WORK

The research was conducted to understand the connection between labour market (structural unemployment) on one side, and the position and recruitment process of the largest companies in selected counties on the other side. We wanted to present the fact that in the counties with large companies, structural unemployment is even more evident. Usually, big companies have a lot of power because of the industries they're involved in. And certain type of industries is looking for certain type of people with specific skills and knowledge. That indicates the discrepancy between supply and demand for workers in their professions, qualifications or regional distribution.

Also, in the article we made short presentation about effect of technology, market and development of HR on the recruitment process. The literature review showed that implementing IT into human resources management improves and has positive effects on the recruitment process. As the evidence from Croatia show, companies aren't aware of the advantages that either e-business or e-recruitment has to offer.

KNOWLEDGE MANAGEMENT

Oxana Ivanova
Ulyanovsk State University, Russian Federation
oxana_ivanova91_@mail.ru

ABSTRACT
Knowledge management is considered to be one of the most important innovative methods to increase the profitability of the company as actually it is a question of aspiration to use knowledge of her employees for the more successful performance. Knowledge management efforts typically focus on organizational objectives such as improved performance, competitive advantage, innovation, the sharing of lessons learned, integration and continuous improvement of the organization. This document introduces the principal features of the phenomena, proves the value of information holders and also relates directly to the effectiveness with which the managed knowledge enables the members of the organization to deal with today's situations and envision and create their future.

Keywords: *Data Mining, Explicit, Implicit And Tacit Knowledge, Self-Training Organization, Worker Of Knowledge*

"Cogito ergo sum"
René Descartes

1 INTRODUCTION

Knowledge management (KM) comprises a range of strategies and practices used in an organization to identify, create, represent, distribute, and enable adoption of insights and experiences. Such insights and experiences comprise knowledge, either embodied in individuals or embedded in organizations as processes or practices.

Origin preconditions of this term and thus the whole managerial concept had place even in the middle of the XX century. At this particular time the main ideas of the post-industrial society and new type of workers — "workers of knowledge" were created. The theory of the new society had the development in E.Toffler's works where he specified 1956 as symbolical start date of a new civilization. Knowledge and information were announced as the main values. In the 1970th, the information bases of knowledge management were developing in works V.M. Glushkov, R.F.Gilyarevsky, L. S. Kozachkov. At the end of the 1980th Sweden, USA, Japan developed three different approaches to the concept the "knowledge managements" which have received further corresponding names: Scandinavian, or European, American and Japanese.

In 1990 in the book "The fifth discipline: Art and the practician of the self-training organization" Peter Senge represents the learning organization concept — the company capable to continuous self-training.

An established discipline since 1991, KM includes courses taught in the fields of business administration, information systems, management, and library and information sciences. More recently, other fields have started contributing to KM research; these include information and media, computer science, public health, and public policy.

Many large companies and non-profit organizations have resources dedicated to internal KM efforts, often as a part of their business strategy, information technology, or human resource management departments. Several consulting companies also exist that provide strategy and advice regarding KM to these organizations.

2   KM BASIS

Knowledge management efforts typically focus on organizational objectives such as improved performance, competitive advantage, innovation, the sharing of lessons learned, integration and continuous improvement of the organization. KM efforts overlap with organizational learning, and may be distinguished from that by a greater focus on the management of knowledge as a strategic asset and a focus on encouraging the sharing of knowledge. It is seen as an enabler of organizational learning and a more concrete mechanism than the previous abstract research.

2.1   Approaches to a knowledge term

A broad range of thoughts on the KM discipline exist; approaches vary by author and school. As the discipline matures, academic debates have increased regarding both the theory and practice of KM, to include the following perspectives:

- Techno-centric with a focus on technology, ideally those that enhance knowledge sharing and creation.
- Organizational with a focus on how an organization can be designed to facilitate knowledge processes best.
- Ecological with a focus on the interaction of people, identity, knowledge, and environmental factors as a complex adaptive system akin to a natural ecosystem.

In the KM literature, knowledge is most commonly categorized as either explicit or tacit (that which is in people's heads). This characterization is however rather too simple, but a more important point, and a criticism, is that it is misleading. A much more nuanced and useful characterization is to describe knowledge as explicit, implicit, and tacit.

1. Explicit: information or knowledge that is set out in tangible form.
2. Implicit: information or knowledge that is not set out in tangible form but could be made explicit.
3. Tacit: information or knowledge that one would have extreme difficulty operationally setting out in tangible form.

The classic example in the KM literature of true "tacit" knowledge is Nonaka and Takeuchi's example of the kinesthetic knowledge that was necessary to design and engineer a home bread maker, knowledge that could only be gained or transferred by having engineers work alongside bread makers and learn the motions and the "feel" necessary to knead bread dough.

The operational origin of KM, as the term is understood today, arose within the consulting community and from there the principles of KM were rather rapidly spread by the consulting organizations to other disciplines. The consulting firms quickly realized the potential of the Intranet flavor of the Internet for linking together their own geographically dispersed and knowledge-based organizations. Once having gained expertise in how to take advantage of intranets to connect across their organizations and to share and manage information and knowledge, they then understood that the expertise they had gained was a product that could be sold to other organizations. A new product of course needed a name, and the name chosen, or at least arrived at, was Knowledge Management. The timing was propitious, as the

enthusiasm for intellectual capital in the 1980s, had primed the pump for the recognition of information and knowledge as essential assets for any organization.

Perhaps the most central thrust in KM is to capture and make available, so it can be used by others in the organization, the information and knowledge that is in people's heads as it were, and that has never been explicitly set down.

What is still probably the best graphic to try to set forth what KM is constituted of, is the graphic developed by IBM for the use of their KM consultants, based on the distinction between collecting stuff (content) and connecting people, presented here with minor modifications:

Table 1: IBM graphic of KM

	COLLECTING (STUFF) & CODIFICATION	CONNECTING (PEOPLE) & PERSONALIZATION
DIRECTED INFORMATION & KNOWLEDGE SEARCH EXPLOIT	Databases, external & internal Content Architecture Information Service Support (training required) data mining best practices / lessons learned/after action analysis (HARVEST)	community & learning directories, "yellow pages" (expertise locators) findings & facilitating tools, groupware response teams (HARNESS)
SERENDIPITY & BROWSING EXPLORE	Cultural support current awareness profiles and databases selection of items for alerting purposes / push data mining best practices (HUNTING)	Cultural support spaces - libraries & lounges (literal & virtual), cultural support, groupware travel & meeting attendance (HYPOTHESIZE)

2.2   The mission of knowledge management

The reason of appearance of the concept of Knowledge Management is the information processing problem in large corporations. It became clear that the main weakness is keeping isolated the knowledge accumulated by specialists of the company. The knowledge which isn't used and doesn't increase, and, finally, becomes old and useless, exactly like the money which are stored without turning into a working capital, finally, depreciate. The significant contribution to development of this area of management was made by the well-known economist Peter Druker. He introduced the term "worker of knowledge" into circulation (the person who has the higher education, capabilities to purchase and apply theoretical and analytical knowledge, has absolutely other, new approach to work and other mentality; this is the person who always keeps the labor instruments just in case. Peter Druker determined knowledge as the main resource distinguishing business and giving to it decisive competitive advantages.

Knowledge management has two main missions. The first is increase of efficiency, use of knowledge for a growth of productivity by increase in speed or cost reduction. The second is promotion of innovations, creation of new products and services, new entities and business

processes. The first task received the name "make as it is necessary" or "knowledge for application", and the second — "think up itself" or "knowledge for research".

Different frameworks for distinguishing between different 'types of' knowledge exist. One proposed framework for categorizing the dimensions of knowledge distinguishes between tacit knowledge and explicit knowledge. Tacit knowledge represents internalized knowledge that an individual may not be consciously aware of, such as how he or she accomplishes particular tasks. At the opposite end of the spectrum, explicit knowledge represents knowledge that the individual holds consciously in mental focus, in a form that can easily be communicated to others.

Early research suggested that a successful KM effort needs to convert internalized tacit knowledge into explicit knowledge in order to share it, but the same effort must also permit individuals to internalize and make personally meaningful any codified knowledge retrieved from the KM effort. Subsequent research into KM suggested that a distinction between tacit knowledge and explicit knowledge represented an oversimplification and that the notion of explicit knowledge is self-contradictory. Specifically, for knowledge to be made explicit, it must be translated into information. Later on, Ikujiro Nonaka proposed a model (Socialization, Externalization, Combination, Internalization) which considers a spiraling knowledge process interaction between explicit knowledge and tacit knowledge.
Figure 1: The SECI model (Nonaka and Takeuchi, 1995)

In this model, knowledge follows a cycle in which implicit knowledge is 'extracted' to become explicit knowledge, and explicit knowledge is 're-internalized' into implicit knowledge.

3   CHAPTER. STAGES OF KM
Looking at KM historically through the stages of its development tells us not only about the history of KM, but it also reveals a great deal about what constitutes KM.

3.1   Information technology
The initial stage (the firststage) of KM was driven primarily by IT, information technology. That first stage has been described using an equestrian metaphor as "by the internet out of intellectual capital". The concept of intellectual capital provided the justification and the framework, the seed, and the availability of the internet provided the tool. As described above, the consulting community jumped at the new capabilities provided by the Internet, using it first for themselves, realizing that if they shared knowledge across their organization

more effectively, then they could avoid reinventing the wheel, underbid their competitors, and make more profit. The first use of the term Knowledge Management in the new context appears to have been at McKinsey. They realized quickly that they had a compelling new product. Ernst and Young organized the first conference on KM in 1992 in Boston. The salient point is that the first stage of KM was about how to deploy that new technology to accomplish more effective use of information and knowledge.

The first stage might be described as the "If only Texas Instruments knew what Texas Instruments knew" stage, to revisit a much quoted aphorism. The hallmark phrase of Stage 1 was first "best practices," to be replaced by the more politic "lessons learned."

3.2   HR and corporate culture

The second stage of KM emerged when it became apparent that simply deploying new technology was not sufficient to effectively enable information and knowledge sharing. Human and cultural dimensions needed to be addressed. The second stage might be described as the " 'If you build it they will come' is a fallacy" stage—the recognition that "If you build it they will come" is a recipe that can easily lead to quick and embarrassing failure if human factors are not sufficiently taken into account.

It became clear that KM implementation would involve changes in the corporate culture, in many cases rather significant changes. Consider the case above of the new pediatric medicine and the discovery of the efficacy of adding orange juice to the recipe. Pharmaceutical sales reps are compensated primarily not by salary, but by bonuses based on sales results. What is in it for that sales rep to share her new discovery when the most likely result is that next year her bonus would be substantially reduced? The changes in corporate culture needed to facilitate and encourage information and knowledge sharing can be major and profound. KM therefore extends far beyond just structuring information and knowledge and making it more accessible.

As this recognition unfolded, two major themes from the business literature were brought into the KM fold. The first was Senge's work on the learning organization. The second was Nonaka's work on "tacit" knowledge and how to discover and cultivate it. Both were not only about the human factors of KM implementation and use; they were also about knowledge creation as well as knowledge sharing and communication. The hallmark phrase of Stage 2 was "communities of practice." A good marker of the shift from the first to the second stage of KM is that for the 1998 Conference Board conference on KM, there was for the first time a noticeable contingent of attendees from HR, human resources, departments, and by the next year, 1999, HR was the largest single group, displacing IT attendees from first place.

3.3   Taxonomy and content management

The third stage developed from the awareness of the importance of content, and in particular the awareness of the importance of the retrievability of content, and therefore of the importance of the arrangement, description, and structure of that content. Since a good alternative description for the second stage of KM is the "it's no good if they don't use it" stage, then in that vein, perhaps the best description for the new third stage is the "it's no good if they try to use it but can't find it" stage. Another bellwether is that TFPL's report of their October 2001 CKO (Chief Knowledge Officer) Summit reported that for the first time taxonomies emerged as a topic, and it emerged full blown as a major topic (TFPL, 2001 Knowledge Strategies – Corporate Strategies.) The hallmark phrases emerging for the third

stage are content management (or enterprise content management) and taxonomies. At KMWorld 2000 a track on Content Management appeared for the first time, and by the 2001 KMWorld Conference, Content Management had become the dominant track. In 2006, KMWorld added a two-day workshop entitled Taxonomy Boot Camp, which still exists today. The hallmark terms for the third stage of KM are taxonomy and content.

4 CHAPTER. KM ACTUALLY

Besides of the enhancement of process of hiring, integration and personnel training, knowledge management assumes also such specific functions of management as forming of reserve managerial structure. Thus mass investments to the sphere of knowledge are explained by a number of factors, among which: rough progress of information and communication technologies and increasing complexity of the financial relations that raises requirements to qualification of employees, their flexibility and readiness for training; the globalization forcing many organizations to adjust customer relations within a global information network; competition aggravation and fall of the prices of separate services that forces banks to increase performance.

It's important to notice that knowledge management is effective when, at least, the financial effect from the knowledge created and delivered to the consumer by means of this system, exceeds direct and indirect finance costs on creation and knowledge management system maintenance. As a maximum, investments into creation and maintenance of such system should be more effective (according to the financial criteria), than alternative investment competitors (with whom the projects are forced to compete always – and in favorable conditions, and, especially, in the conditions of crisis).

It is obvious that the highly effective knowledge management system is really necessary. As a result of its implementation each employee should receive the personal order on the workplace, and a convenient access to all the necessary knowledge for accomplishment of the service duties in a responsibility zone. Such workplace is called "corporate cockpit", by analogy to a warplane cabin.

The foundation of "corporate cockpit" is necessary to show, how products and/or company services help the company client to create and/or use most effectively above described "system of corporate cabins".

In spite of the fact that the exact cash equivalent of cost of knowledge in the organization can't be calculated, there are some criteria of measurement of their economic value. The difference between market value of the company and cost of its tangible assets is one of cost indexes of intangible assets the majority from which represents organizational knowledge. Only from 6 to 30% of cost of the company contain the assets mentioned in traditional balance statements; the rest is intangible assets. Thus, 50% of investments of production companies are the non-material spheres, such, as scientific researches and developments, training, etc. Many large companies spend more sums, than for other expenditure items for a salary, and pay to certain employees much more, than the rest. What does the company get by that high expenses? Working experience and knowledge which develop empirical rules, create judgments and direct the search of models and semantic decisions.

It shall be helped by openness of management and trust. The capability of the organization to perceive the knowledge, to extend them and to operate in coordination on a basis of this

Challenges of the Modern World - Contemporary Economy and Globalization

knowledge determines its capability to be trained. In the last decades a wide circulation in the world gained the concept and practice of life-long education as a package of measures which is giving the chance to the person to study during all his life by the theory of "educational value in any place, at any time and any content". It is acknowledged that distribution of educational resources of the person during all his life, instead of their concentration during strictly certain period is reasonable. It assumes forming of system of life-long education taking into account self-training with consulting and methodical support (the organization of a network of open universities, distance training, etc.).

Thus, there is the direct interaction between knowledge management and the top-management representing its five main functions – planning, organization, motivation, control and communication.

Business-forum on Knowledge Management was held in Moscow on 25-26 of October 2010 as a part of Top Class International series. It was the first professionally managed event on knowledge management in Russian history. 175 participants from 8 countries took part in the forum. Top-managers and professionals in the field of knowledge management form Fortune Global Top 500 companies Lukoil, TNK-BP, Sberbank, Rosneft and other Russian largest companies like ROSATOM, Rosgosstrakh, Uralsib, Domodedovo and Sheremetyevo airports attended the event. 6 international and more than 20 Russian speakers, including Larry Prusak (consulting NASA and World Bank Group, USA), Nick Milton (director and co-founder of Knoco Ltd, Great Britain), David Snowden (the founder and Chief Scientific Officer of. Cognitive Edge, Great Britain- Singapore) shared their ideas with the audience. This forum shows that Russia really keeps go a long way of knowledge itself, of knowledge based on the industries and of knowledge institutions of processes that would certainly bring more complex and more product in economics for Russia. Innovation and collaboration are two main drivers of the knowledge activity in the world, and the Russian specialists are ready to concentrate their forces upon them both.
Chart 1: KM growth 2001 through 2011

Challenges of the Modern World - Contemporary Economy and Globalization

In November 2012 representatives from different fields of knowledge management - government officials, scientists, entrepreneurs, marketers, bloggers have met again at the 3-d annual Business Congress TOP-CLASS INTERNATIONAL "Knowledge Management Russia - 2012" to discuss the problems of implementation of knowledge management in Russian companies, its particular qualities in various fields, its impact on the development of Russian business. They looked at examples of the implementation of knowledge management practices of Russian (Russian Railways, Sberbank of Russia, etc.) and foreign companies. Special attention was given to the subject development of Russian knowledge-community, cooperation (including the creation of social projects) between government, business, academia and representatives of social media - bloggers as centers of formation of public opinion.

The program of the congress included reports and discussions on the following subjects:
1. new trends in world practice of knowledge management,
2. methodology of idea management,
3. approaches of open innovations,
4. technologies of crowdsourcing,
5. methods of identification and use of tacit knowledge,
6. mechanisms of formation of strong teams,
7. knowledge sharing,
8. the tools, allowing to enrich and strengthen knowledge of each other.

The 4I system is developed by specialists of the TEKORA company on the basis of technology of activization and use of intellectual potential of employees. The 4I system is implemented in the largest companies of Russiam such as JSC RZhD, JSC OGK-3, etc.

4I system ("Information Incubator of Innovative Ideas") – a communication platform for management of ideas:
- activise the intellectual potential of the company staff and creates conditions for identification and formalization of the hidden knowledge;
- allows to direct intellectual efforts of employees to the search of the solution of the actual problem facing the company;
- automates the process of handling of offers, involving in process staff of the company and reducing load of experts and the persons making the decision;
- allows to reveal the most actual offers with the minimum costs of time and resources;
- helps to adapt and make use of experience and knowledge of the employees, to extend the best practicians in the company;
- promotes to create the teams and build the horizontal communications of staff of the territorial distributed companies;
- reveals the employees possessing unique knowledge.

5 CONCLUSION

In an organizational context, data represents facts or values of results, and relations between data and other relations have the capacity to represent information. Patterns of relations of data and information and other patterns have the capacity to represent knowledge. For the representation to be of any utility it must be understood, and when understood the representation is information or knowledge to the one that understands. Yet, what is the real value of information and knowledge, and what does it mean to manage it?

Without associations we have little chance of understanding anything. So here is our example. When a boss asks what will be the quantitative and quality result by the end of the month, a responsible manager will answer "I can't predict, because there are many factors which may influence on the final product". He will be confused because he used to operate the data, the information, but not the knowledge itself. Data doesn't predict trends of data. What predicts trends of data is the activity that is responsible for the data. To be able to estimate the sales for next quarter, the manager would need information about the competition, market size, extent of market saturation, current backlog, customer satisfaction levels associated with current product delivery, current production capacity, the extent of capacity utilization, and a whole host of other things. When he will be able to form a complete pattern he will have knowledge, and will then be somewhat comfortable estimating the sales even for next quarter.

The value of Knowledge Management relates directly to the effectiveness with which the managed knowledge enables the members of the organization to deal with today's situations and effectively envision and create their future. Without on-demand access to managed knowledge, every situation is addressed based on what the individual or group brings to the situation with them. With on-demand access to managed knowledge, every situation is addressed with the sum total of everything anyone in the organization has ever learned about a situation of a similar nature.

ABSTRACT

We examine the motives of capital structure choices of a broad sample of 11 thousands nonfinancial companies at different stages of their life cycle (LCO) in the emerging capital market of Russia. To identify the life-cycle stages we use the rating method based on a combination of financial measures. We identified the determinants of the capital structure and applied the tests for pecking order (PO) and trade-off (TO) models of capital structure choices to the general sample and at each life cycle stage. We have found that LCO stage is a significant determinant of a company's capital structure in Russia. We show that the research models based on PO and TO concepts have different explanatory power varying through life-cycle stages: trade-off theory is more applicable for the companies at the growth stage, while pecking order better explains the company's behaviour at the stagnant stage. Sectorial analysis provided further interesting insights: TO prevailed over PO on all LCO stages for the companies in mining, transport, service, construction and manufacturing industries; PO theory shows strong significance on stagnant stage for the companies in wholesale and agricultural sectors.

Keywords: Capital structure, Emerging capital market, Financing policy, Life cycle of organization

1 INTRODUCTION

The concept of the organizational life cycle (LCO) is associated with the management theory and explains the organic changes within organization. LCO describes significant differences between the stages which are due to the competition's challenges, internal conflicts of interests and management dilemmas. As long as the financing policy of the firm depends on strategic goals in operating and investment activities, it should change in line with transition of the firm thru LCO. Economic literature provides no uniform view on financing policy at different stages of LCO, therefore the empirical analysis from this perspective is important for in-depth understanding of capital structure choices.

We contribute to the literature by identifying the impact of LCO stages on capital structure decision-making. We provide new empirical results on financing policies in specific environment of emerging capital markets. We found clear differences in the motives of

financing policies of the Russian companies at different LCO stages. Finally, the paper also shows that industries matter for the capital structure choices at different LCO.

The paper also refines the technique of identification LCO stages for specific environment in emerging capital market using the data of the Russian companies. The results showed sustainable differences between companies at LCO stages. Therefore the technique based on financial metrics can be applied to a broad spectrum of research problems in corporate finance in order to carefully adjust the research to the specific nature of each LCO stage in emerging capital markets and promote further specification of available researches.

The paper is organized as follows. Section 2 provides overview of existing literature in LCO stages identification and theoretical background for the research. In section 3 we explain the sample selection procedure, the methods used for LCO stage identification and the results. Section 4 provides the arguments for the research model for financing choices at different LCO stages. Empirical results and alternative explanations are discussed in section 5.

2   IDENTIFICATION OF LCO STAGES

Despite diversity of LCO models concerning the number of stages, their key characteristics the existing papers are generally based on three of them: L. Greiner, I. Adizes, D. Miller and P. Friesen models.

The L. Greiner model (1972) is the earliest LCO model which emphasizes five main phases: creativity, direction, delegation, coordination and collaboration. This model considers the development of the firm only in the positive direction that imposes restrictions on a range of the companies to which it can be applied. Besides, this model doesn't define the ending points of LCO. The model proposed by I. Adizes (1988) is a complex theoretical model which consists of 10 stages starting with the courtship when only the idea of the future organization appears to the death, a concluding stage of LCO. In contrast to L. Greiner, I. Adizes shows not only a managerial problems and dilemmas of each stage, but also corporate culture and organizational climate. The second difference is that the author considers not only an ascending curve of organization activity, but also descending part, responsible for movement to "death".

D. Miller and P. Friesen (1984) summarized and integrated earlier researches and proposed condensed 5-staged classification of LCO. At a birth stage the firm makes attempts to become viable entity in some specific area. The growth phase is characterized by achieving initial success in the industry with a firm reaching distinctive characteristics. At the maturity stage sales level stabilizes, the degree of innovative implementations falls and bureaucracy develops in the organization. Usually the revival stage represents processes of diversification and increase in production level. The final stage – decline – is characterized by stagnation when the firm "is dried up" together with the market as a whole.

However it is necessary to mention that condensed version of LCO stages is usually used from a perspective of financial analysis than in the analysis of organizational activities. It is due to the need to receive the quantitative estimates of firm's parameters related to each stage of LCO, and to construct the expected financial models requiring certain assumptions and simplifications to reflect the reality. Therefore 5-staged D. Miller and P. Friesen model is the most frequently used model or its reduced option with three or four life cycle stages.

Challenges of the Modern World - Contemporary Economy and Globalization

Initially the theory of LCO was developed within management and marketing fields of activity of the companies, however the decisions made by managers are bound to influence operating, investment and financial activities. J. Anthony and K. Ramesh (1992) revealed that the influence of unexpected changes in growth of revenue, capital expenditure and in profit on stock returns differs between growing and mature firms. E. Black (1998) confirmed the assumption of growing influence of net profit on the share price in process of its transition to the subsequent stage of LCO. D. Jenkins et al. (2004) shows that at a recession stage the profitability has higher impact over market capitalization as compared to the revenue growth due to the development of new products necessary for saving market power. V. Dickinson (2006) in her paper showed the role of previous profitability changes, growth of net operating assets, dynamics of operating margin and assets turnover for predicting future profitability depending on the current LCO stage of the frim. H. DeAngelo, L. DeAngelo, and R. Stulz (2006) show that dividends, in most cases, are paid by the companies which have reached maturity stage. Besides dividend policy, the LCO stage to a large extent defines as well capital structure policy: G. Teixeira and M. Santos (2005) in their empirical study proved that financial leverage reaches its maximum at the growth stage and then decreases in process of firm's transition to later stages. Therefore it is possible to draw a conclusion of the importance of understanding the current LCO stage for carrying out correct research of investing, financing and dividend policies. However currently there is no single conventional algorithm capable to define at what stage of LCO a company was in a specific time frame.

Existing literature provides different approaches for identification of LCO stages based on financial measures which can be classified into two groups. According to the first approach LCO stage of the company is determined irrespective of characteristics of other organizations (Grabowski and Mueller, 1975; Dickinson, 2006; Miller and Friesen, 1984). The second approach is based on the research ratings by a specific index or group of indices (Anthony and Ramesh, 1992; Pashley and Philippatos, 1990). The second group of methods will be much more preferable to develop research model for large samples, however it requires more accurate financial statements, cash flows data, etc. The rating methods are applicable for the analysis of a broad sample of companies which ideally represent full range of industries in the economy.

3 THE RESEARCH MODELS FOR LCO STAGES AND THE SAMPLE

The sample includes 11688 Russian joint-stock companies for the period of 2000 to 2009 collected from the Ruslana Bureau Van Dijk database with overall 71130 firm-year observations. The companies of financial sector, social services, and also the government institutions and organizations are not included. As research requires existence of wide range of the companies, including the firms at the early stages of LCO we applied the criteria of minimum 1 million US dollars for the sales revenues or the total assets. Industry structure of the sample is rather balanced with little shift to manufacturing companies. Holding companies were excluded to limit the effect of non-consolidated financial statements under Russian financial accounting standards.

The technique of J. Anthony and K. Ramesh (1992) was used as a basic approach for understanding LCO curve. Due to the scarce data on several financial measures we adjusted the technique to the availability of the data. We changed two out of four classification variables used for ranking. Therefore, four variables are used:
1. the age (AGE) calculated as a difference between the current year and year of incorporation of the company;

Challenges of the Modern World - Contemporary Economy and Globalization

2. the growth rate of sales revenue (SG) calculated as follows:
   $$SG_t = (Sales_t - Sales_{t-1})/Sales_{t-1};$$
3. retained earnings to total assets (RE/TA);
4. the change in net fixed assets to total assets (NFA/TA): NFA/TA_t = ((net tangible assets$_t$ + net intangible assets$_t$) - (net tangible assets$_{t-1}$ + net intangible assets$_{t-1}$)) / assets.

These financial variables are calculated for each firm-year. Then for each variable (SG, RE/TA, NFA/TA) we found a median. It requires at least three observations in a row for each company. Median values are indicated as MSG, MRETA, MNFA/TA.

Table 1: Assignment of scores

Interval	Score			
	AGE	MSG	MRETA	MNFA/TA
0-33 %	1	3	1	3
33-66 %	2	2	2	2
66-100 %	3	1	3	1

According to expected behaviour of variables at each LCO stage all observations are classified by each variable into three groups or respectively three stages of LCO: growth, maturity and stagnation. The higher the total score of the firm the later the stage at its LCO. The ratio of retained earnings to total assets (MRETA) is assumed to increase with transition to later stages. On the contrary, the pattern for the variables describing sales revenue growth (MSG) and capital expenditure (MNFA/TA) is reverse: the higher values for them are expected at early stages.

According to the method developed by Anthony and Ramesh (method 1) for each observation the firm-year total score is calculated. Then all observations are splitted into three quantiles corresponding to three life cycle stages. The lower values of total score correspond to an early stage of LCO. Such classification was made for each year, that's why each observation is assigned to particular LCO stage. However this approach is based on the assumption of even distribution of the companies between the stages.

Following approach proposed by Jenkins distribution of observations on a total score is made by five stages: growth, growth/maturity, maturity, maturity/stagnation and stagnation. After that the observations which were in the intermediate stages (growth/maturity, maturity/stagnation) are eliminated. The observations in the final groups or three main stages are more homogenous than according to the previous method.

The data on the companies assigned to each LCO stage according to the method 1 is provided in the table 2.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: Distribution of the companies by stages according method 1

	2003	2004	2005	2006	2007	2008	2009	Total
growth	3153	3383	3606	3562	3815	6220	3895	27634
maturity	3544	3837	4058	4207	4571	2701	4504	27422
stagnation	1960	1888	1997	2457	2646	2471	2655	16074
Total	8657	9108	9661	10226	11032	11392	11054	71130

In total about 36 % firm-year observations were assigned to the growth stage, 41 % to a maturity and 23 % to a stagnation stage (we do not use 2008 year in calculation because of high influence of crisis). The smallest number of the companies is assigned to a stagnation stage that is rather adequate reflection of the reality as the majority of the Russian companies have short history. The results of the application of the method 2 are given in table 3.

Table 3: Distribution of the companies by stages according to method 2

	2003	2004	2005	2006	2007	2008	2009	Total
growth	1750	3383	3606	3562	3815	3437	3895	23448
maturity	1742	1830	1956	2035	2221	2701	2125	14610
stagnation	679	600	674	935	1001	709	995	5593
Total	4171	5813	6236	6532	7037	6847	7015	43651

The growth stage includes about 54 % firm-year observations; 33% firm-year observations correspond to a maturity, and 13 % to the stagnation stage. Remaining 27479 observations within the intermediate stages were eliminated. The number of the observations assigned to the growth stage according to the second method remained practically at the same level as in the first one. At the same time the number of observations at a maturity was reduced practically twice, and number of observations at stagnation stages – three times. Therefore the characteristics of the firms at growth stage appeared more clear and sound, than that of the companies at other LCO stages.

4   FINANCING POLICY THROUGH LIFE CYCLE STAGES

The studies of financing policy at early life cycle stages mostly show that internal financing is primary source for funds. Comparison of financing policy of the small and large companies shows that larger companies have higher debt level and follow pecking-order theory while for the small fast-growing companies it is not confirmed (Murray and Goyal, 2003). Z. Fluck, D. Holtz-Eakin and H. Rosen (1998) in their research showed that the proportion of financing received from insiders increases at early life cycle stages while the proportion of external financing falls. However at some point this relation becomes reverse. Authors explain this result by development of reputation of the company in the debt markets that allows it to receive cheaper sources of external financing. C. Ou and G. Haynes (2003) assume that very insignificant number of the small companies uses external equity financing and the majority of firms use internal sources of financing or external loans. A. Robb (2002) shows that the young companies use rather more debt, than more mature ones though the younger ones experience more difficulties with collateral for banking loans.

D. Diamond (1991) in his research tries to explain the differences in financing policy for each LCO stage showing that the companies can rely either on banking, or on public loan financing in developing their reputation to fit debt market requirements. I. Ivanov (2010) shows

reduction of debt level when company advances to maturity stage and then its increase at decline stages with the sample of the Russian companies.

According to S. Myers (1984) capital structure is subject to influence growth opportunities due to the problem of lack of investments. Therefore the companies at earlier stages can use short-term loans to solve this problem. D. Diamond (1991) also assumes that the companies having information on favourable growth opportunities can use short-term loans. D. Diamond highlights a liquidity problem for debt maturity structure, so the companies with a high credit rating can be inclined to a choice of a short-term debt while the companies with a low rating will prefer long-term loans.

In the following section we will formulate main hypotheses which will be tested within this research.

The hypotheses:
H1: If the firms are following pecking order of financing then the changes in debt level are determined by the financing deficit, the intercept (equation 1) will be zero and the β is equal or very close to 1:

$$\Delta D_{it} = \alpha + \beta Def_{it} + \varepsilon_{it} \tag{1}$$

The independent variable *Def* characterizes a financing deficit and is defined as the amount of an investing cash flow and dividends minus an operating cash flow.

The trade-off theory assumes, that the company aims to target capital structure.
H2: If the firms are following trade-off logic of financing then the change in debt is determined by the target financial leverage and therefore the intercept is zero (equation 2), and the beta is positive but lower than 1:

$$\Delta D_t = \alpha + \beta(Dtarget_t - D_{t-1}) + \varepsilon_{it} \tag{2}$$

The *Dtarget* represents the target debt level which can be defined on the basis of expected values of the regression equation derived from the previous analysis of the determinants of capital structure.

The last stage of analysis is the combined model which consists of independent variables. According to resulting coefficients we could identify the best fit model from equation 3 and therefore the most reasonable explanation of the capital structure choice at different life-cycle stages.

$$\Delta D_t = \alpha + \beta_1(Dtarget_t - D_{t-1}) + \beta_2 Def + \varepsilon_{it} \tag{3}$$

At first step of econometric analysis, we have applied 0.01 and 0.99 quantiles to exclude outliers and executed variation analysis to address multicollinearity problem. Then, specifications of regression equations were examined with Hausman tests: fixed-effect model appeared to fit better than random-effect model and pooled model respectively. Also modified Wald test for homoscedasticity was made: the null hypothesis was rejected, that is why we need to use robust estimations that were received from testing model with heteroscedasticity.

Challenges of the Modern World - Contemporary Economy and Globalization

5   EMPIRICAL RESULTS AND ALTERNATIVE EXPLANATIONS

Having identified life cycle stages of the companies according to Anthony-Ramesh and Jenkins et al. modified methodologies we have tested the stability of resulting life cycle segmentation by comparing selected financial ratios. According to the results ROE and ROCE is falling in line with transition to the further life cycle stages, ROA and ROS are lowest for the growth stage. Financial leverage falls with transition to mature stages, but as it varies significantly within the stages further analysis of capital structure choice which we proposed in our study would better explain the nature of this variation. We also found out that the Jenkins et al. modified method of identification gives more precise results while Anthony-Ramesh modified method remains its legibility for a wider sample.

The analysis of financial policies within LCO includes several empirical tests in which we define the motives for capital structure choice for the firms at different stages. First we proved the importance of LCO for capital structure choice by including LCO-stage dummies in pecking order of financing (PO) and trade-off (TO) models which turned out to be significant. Than we analyzed PO, TO and combined models for every LCO stage and both methods of life cycle stage identification. The results for Anthony-Ramesh identification method are presented in the table 4. It is worth mentioning that Anthony-Ramesh method and Jenkins et al. method showed practically the same results.

Table 4: Capital structure theories testing for different life-cycle stages (Anthony-Ramesh identification method)

Trade-off model

Variable	TDR growth	TDR mature	TDR stagnant	TDRA growth	TDRA mature	TDRA stagnant

r2_a	0.1845	0.1271	0.078	0.21	0.1441	0.0983

legend: * $p<0.1$; ** $p<0.05$; *** $p<0.01$; TDR – relation of long-term and short-term percentage debts to the total debt and accounting cost of its share capital; TDRA – relation of total value of obligations to the accounting cost of its assets

According to the table 4 we could conclude that PO motives for capital structure choices are weaker for the firms at the growth stage, but they become more valuable for stagnant stage. As for the growth stage of LCO the motives of trading off between marginal benefits of debt versus marginal costs (TO) have the higher power to describe capital structure choices.

It is important that coefficients for the variables varied for different life cycle stages but their signs remained the same. Testing of the trade-off theory showed the significance of independent variable at all stages, thus the greatest value of coefficient corresponds to a growth stage. Within the pecking order theory the coefficient at Def variable was significant at all stages, but its greater value corresponds to a stagnation stage. Pecking order theory can not explain fully the capital structure choices at any LCO stage, but the significance of the coefficients at deficit (Def) predetermines the need for testing combined model. On the basis of results of separate models, as well as with the results of combined tests it is possible to draw a conclusion on lower applicability of PO theory for capital structure choices at the

growth stage and on its higher significance for the companies at a stagnation stage. The TO theory provides strongest explanation for the growth stage and is also applicable at other stages. Finally, the analysis of combined model showed the dominance of the TO theory for the growth stage, while the PO theory better explains financing policy for the companies at a stagnation stage.

The sectorial analysis for agricultural sector revealed a high coefficient at the variable Def (~0.86) on stagnant stage in case of PO theory, but an equal role of both explanations is still observed in case of combined model. The TO theory prevailed over PO theory in case of mining sector, especially on the stagnant stage: the Def variable was insignificant in the combined model. Similar dominance of TO theory is evident for transport and service sectors, moreover for the companies in service sector the beta coefficient at independent variable is close to 1 (~0,99). Similar results were obtained for construction and manufacturing industries. The PO theory is not confirmed on stagnation stage for the retailers. The TO theory is prevalent for growth and maturity stages for the wholesale trade, but PO theory becomes significant on the stagnation stage.

ABSTRACT
The aim of the paper „European Union regional policy as a tool for effective intensification of interregional cooperation" is to provide an overview of European Union regional policy. Regional disparities among Polish regions are significant that is why the article presents the attempt of the identification its size. Moreover the paper focuses on interregional cooperation which is the priority during integration process nowadays and it will be one of the most important branches in the next programming period.

Keywords: *European integration, Interregional cooperation, Regional policy, Regions*

1 INTRODUCTION

The disparities in regional development have been present in the policies pursued by individual economies for centuries. Inability to deal with this matter resulted primarily from the lack of basis for the functioning of regional policy. Economic reality in the member counties of the European Union, however, forced the evolutionary approach to the sphere of economic life, which is the regional policy. In the era of the formation of functioning of the European Union's regional policy increasingly important is becoming the knowledge about the effects of European integration, which is largely initiated by enhancing cross-border and the euro-regional cooperation.

The aim of this paper is therefore to present the evolution of the concept of regional policy of the European Union in the context of European integration. The author pays special attention to the aspect of cross-border cooperation, which is going to play an important role in integrating Europe over the next few years.

This work consists of three main parts. The first part will indicate the key assumptions of the new strategy *Europe* 2020 *for smart, sustainable and inclusive growth*, that is the long-term plan for socio-economic growth of the European Union. In the second part the content of regional policy will be briefly presented. Particular emphasis will be placed on the presentation of the main objectives of the cohesion policy for 2014-2020.

2 REGIONAL POLICY OF THE EUROPEAN UNION - ITS ORIGINS AND DEVELOPMENT

The lexicon of regional policy indicates that in the context of the European Union the regional policy means an intended influence, in a form of intervention, of the authorities and European institutions on economic growth and social development in order to achieve sustainable development (Kundera and Szmyt, 2008, p. 78). This definition means that the entire regional

Challenges of the Modern World - Contemporary Economy and Globalization

policy realized within the European Community or by the authorities of individual countries refers to the creation of equal opportunities of development for the regions and especially to helping underdeveloped areas with severe underdevelopment. The efforts made by the European Union in the area of regional policy focus on strategic activities carried out in cooperation with governments of voivodships and other local government entities whose purpose is to improve the competitiveness of the economies of individual regions, to create equal development opportunities and to achieve social, territorial and spatial cohesion (Grosse, p. 14).

The regional policy of the European Union together with the actions taken by the government of the member country can bring benefits to the entire European Community. The reasons for combining these policies are:

- Financing. Poor member countries are not able to solve their own regional problems, so the European Union grants financial aid to mitigate the negative effects of regional issues.
- Achieving externalities. Solving regional problems in one region or member country is beneficial for the entire Union, even by gaining new experiences that can form the basis for further evolution of regional policy.
- Achieving the effects of integration. It primarily means the activation of redistribution mechanism which helps reduce disparities within the Community.
- Coordination of other policies (Apap, Kaniewska, Sitek, Walewski and Szczygielski, 2003, p. 30).
- Reduction of Poverty, (Dearen, 2004, p. 17) thatis why the developing, low-income countries often have the priority in the allocation of resources within the European Union's regional policy.

Contemporary regional policy on different levels, e.g. regional, national and European, is characterized by a high degree of intervention. The regional level is represented mainly by local authorities which carry out regional objectives by helping local entrepreneurs. On the national level, regional policy aims at reducing the inter-regional disparities within the country, while the European level refers to the regional policy on a global scale, which primary goal is to achieve a similar level of economic development of all European Union countries. On all those three levels, there are tasks, which main objective is eliminating disparities in regional development. The current form of regional policy within the European Community resulted from many factors, which over time enabled the process of evolution from the regional policy with a very limited scope to the policy being an essential element of economic policy.

The issue of regional development based on common principles has been ignored for many years. For a long time it did not become the subject of solutions applied within the Community and was taking the form of a declaration rather than concrete actions and solutions. It was the adequate annotations of the 1957 Treaties of Rome, establishing the European Economic Community and the European Atomic Energy Community, which included concern for the development of regions in the EU member countries. One of the major activities of the Community at the time was expanding resources through the valorization of regions lagging behind and the use of unemployed workforce (Pietrzyk, 2004, p. 62). It was the de facto the first material evidence of the existence of contemporary regional policy. The purpose of the newly established European Economic Community was to strengthen the unity of the economies by ensuring their harmonious development

(Tkaczyński, Marmot and Villa, 2008, pp. 43–46). It was expected that the effect of the EEC will be a reduction of development disparities between regions. With the establishment of the European Economic Community the European Social Fund and the European Investment Bank started functioning and have been operating until now. The first one to a large extent carries out the tasks from the field of human resources, while the European Investment Bank is an instrument which aims at increasing the competitiveness of weaker regions through investment in modernization and creation of new businesses (Wojtaszczyk, 2005, pp. 33–34).

3   REGIONAL DISPARITIES OF POLISH REGIONS

The economic and social disparities in the European Union can be easily seen. Their perception does not require precise indicators showing the level of regional and socio-economic development. Currently the richest region of the Community is the Inner London, where the GDP per capita is 290% of the EU-27 average. By contrast, the north-eastern part of Romania is the poorest region and generates only 23% of the average GDP of the EU (Laissy, 2008, p 4). The reason for this huge development gap between countries belonging to the European Union is that regional policy is the responsibility of individual governments. Regional policy based on the principles of the Community covers primarily the identification of areas and the extent of support for individual governments within independent regional policies of the member countries.

Regional policy - as it has been repeatedly mentioned, has become in recent years the most important mechanism of reducing regional disparities. The attention in the literature of the subject is drawn to the fact that government intervention should be directed to the poorest regions and its key objective should be restructuring of the economy. In the era of functioning of the European Union it has become one of the key dimensions of its activity. The help provided by the European Communities is crucial also for Poland. The actions taken in order to reduce regional disparities are rational when the dimensions of the problem to be tackled are known and the next stage of this work will therefore be to answer the question: How large are disparities between the regions in Poland? Answering this question will make the objectives and principles of the regional policy of the European Union towards Poland much more clear.

Table 1: The main measures indicating the diversity of Polish regions, as of the year 2008 (CSO, Katowice 2010, pp. 58, 73, 75; http://www.stat.gov.pl/gus/5840_1487_PLK_HTML.htm?action=show_archive; GUS, Warszawa, 2009, pp. 112–113, 166; Regiony Polski, 2010, pp. 4, 20, 24.)

Voivodship	Population density per km².	GDP per capita in zl and %	Total output in zl and %	Avelage salary in zl	Nominal income of households per capita in zl	Unemployment rate	Investment outlays in %	Expenditures on R&D and innovation activity .
Poland	122	33462 (100%)	2670006 (100%)	-	21869	9.1	100%	100%
Dolnośląskie	144	35989 (107,6%)	225663 (8.5%)	2978,50	22612	9.5	8.5	5.9
Kujawsko-Pomorskie	115	28926 (86,4%)	124680 (4.7%)	2589,30	19718	12.6	4.6	1.7
Lubelskie	86	23219 (69,4%)	94170 (3.5%)	2577,68	16253	10.8	3.5	3.1
Lubuskie	72	28709 (85,8%)	60424 (2.3%)	2563,04	19114	11.5	2.0	0.4
Łódzkie	140	31140 (93,1%)	155760 (5.8%)	2621,35	21277	9.1	6.8	5.5
Małopolskie	217	28878 (86,3%)	190170 (7.1%)	2834,67	19115	7.1	7.4	11.6
Mazowieckie	140	52770 (157,7%)	587129 (22.0%)	3997,81	31647	7.4	21.8	43.1
Opolskie	110	28379 (84,8%)	61497 (2.3%)	2770,12	18203	9.1	1.8	0.5
Podkarpackie	118	23101 (69,0%)	97104 (3.6%)	2461,16	15732	12.4	3.6	2.3
Podlaskie	59	24434 (73,0%)	59625 (2.2%)	2642,69	17480	8.9	2.2	1.0
Pomorskie	121	31754 (94,9%)	155108 (5.8%)	3093,90	21495	8.2	6.4	5.2
Śląskie	377	36126 (108,0%)	366436 (13.7%)	3146,66	23741	6.9	12.6	7.9
Świętokrzyskie	109	26763 (80,0%)	68112 (2.6%)	2605,72	17799	13.4	2.6	1.2
Warmińsko-Mazurskie	59	24814 (74,2%)	72953 (2.7%)	2514,85	17399	15.5	2.7	1.0
Wielkopolskie	114	34934 (104,4%)	251346 (9.4%)	2791,97	22845	5.9	9.3	7.9
Zachodniopomorskie.	75	30357 (90,7%)	99828 (3.7%)	2774,61	21430	12.6	4.2	1.6

The purpose of presenting this table is an attempt to explore regional differences in the Polish voivodships. It has to be noted, however, that the presented indicators are fragmentary in nature, which means that the in-depth analysis of regional disparities requires the use of appropriate research methods and the application of adequate measures. Though, the analysis of the table components lets identify fundamental differences between Polish voivodships.

The last step showing differences between Polish regions is identifying, based on the above table, the regions with the best values of indicators and those with the worst and then determining the scale of imbalance between them.

Table 2: The most and the least developed regions in Poland

The most developed regions:	Population density	GDP per capita	Total output	Average salary	Nominal income of households per capita	Unemployment rate	Investment outlays In %	Expenditures on R&D and innovation activity
Mazowieckie	140	157,7%	22.0%	3997,81	31647	7.4	21.8	43.1
Śląskie	377	108,0%	13.7%	3146,66	23741	6.9	12.6	7.9
Wielkopolskie	114	104,4%	9.4%	2791,97	22845	5.9	9.3	7.9
The least developed regions:								
Warmińsko-Mazurskie	59	74,2%	2.7%	2514,85	17399	15.5	2.7	1.0
Podlaskie	59	73,0%	2.2%	2642,69	17480	8.9	2.2	1.0
Lubuskie	72	85,8%	2.3%	2563,04	19114	11.5	2.0	0.4
Differences between the highest and lowest value.	**318**	**84.7%**	**19.8 %**	**1482,96**	**14167**	**9.6**	**19.8**	**42.7**

The data presented in the above table shows the scale of disparities between the richest and the poorest Polish voivodships. Table 2 allowed to make the selection, which showed three most developed regions, i.e. Mazowieckie, Śląskie, Wielkopolskie, and the least developed: Warmińsko-Mazurskie, Podlaskie oraz Lubuskie. Among the indicators used for evaluation of voivodships especially GDP per capita, unemployment rate, investment outlays and expenditures on R&D should be mentioned. In case of the first indicator, a substantial difference is observed between the best performing Mazowieckie and Podlaskie which GDP is about half lower. Not without significance for the GDP per capita is the unemployment rate, and that is why the unemployment is the lowest in areas with high Gross Domestic

Challenges of the Modern World - Contemporary Economy and Globalization

Product, and vice versa. As can be seen from the table, unemployment in Mazowieckie is two times lower than in the economically weaker Warmia.

Regional disparities among Polish regions are also visible in terms of investments. The highest recorded GDP accompanies a high level of investments, both in fixed assets and in research and innovation. Forerunner in this regard is again Mazowieckie where as much as 20% of all investments in fixed assets and up to 40% on R & D and innovation is incurred around the capital, which leads to the conclusion that Mazowieckie plays the role of the Polish innovation and competitiveness center.

4 CROSS-BORDER COOPERATION AS A REGIONAL POLICY TOOL FOR INTEGRATION

Interregional cooperation may be internal, that is between the regions inside the country and external, which is defined in the literature as across-border cooperation, also referred to as a form of international cooperation, as it relates to the actions taken jointly by the communities from two or more countries in order to strengthen neighborly relations. Regional policy, regional development, inter-regional cooperation and European integration are undoubtedly related to the concept of the region, which in economic terms is a separate part of the economic environment, permanently inhabited, cultivated and controlled by the community, disposing of a set of resources and conducting bidirectional exchange of goods (Bojar, 2006, p. 5).

Interregional cooperation as well as regional policy has been neglected in the EU structures for a long time. In the current programming period the European Union member countries, thanks to the evolution of regional policy, can now benefit from many forms of interregional cooperation and not only within their own borders. The starting point for this work should be a cross-border region as a basis for further consideration of the issues of cooperation and integration as well as regional and interregional cooperation. The literature treats a cross-border region as the area inextricably linked with geography, history, ecology, ethnic groups, economic opportunities, but separated by having sovereignty of governments on each side of the border. Cross-border region is defined by the following concepts (Greta, 2003, pp. 33–35):

- cross-border region as a border zone.
  Such definition of the cross-border region is mainly derived from the Community Law, which defines the border zone, a region where people are able to benefit from tax exemptions and duties on imports, which refers to any area with a radius of 15 km and which center is a customs post. In this way the cross-border region as a border zone narrows the definition of cross-border region to the territory defined by the selected cultural and socio-economic criteria.
- cross-border region as a pole of attraction.
  Each cross-border region has its characteristic features in the field of industrial activity and therefore these regions are considered in terms of completeness, that is if the cross-border region forms a complete entity, centrality - which is the identification of centers and poles that make up city structures and from the point of view of centres of power, namely, how interests and strategies of the respective groups and social forces are developing.
- cross-border region as an administrative or political unit.

Challenges of the Modern World - Contemporary Economy and Globalization

> Cross-border region is a public territorial unit located below the national level and having a common land border with one or more units of the same type situated in the neighboring country.

A cross-border region is inseparably associated with the concept of cross-border cooperation, which within the current programming period is one of the more important areas of regional policy of the European Union, which is intensifying the integration of the regions of the European Community. Cross-border cooperation is one of the concepts that is well defined in the literature.

A special form of cross-border cooperation is the euroregional cooperation, which is associated with the term euroregion, that is a separate European region located on the border of two or more neighboring countries, and which goal is to accelerate the economic growth and civilizational development and to equalize the level of development with the most developed regions in Europe (Galicki, 1993, p 2). Euroregion is a form of cross-border cooperation between the inhabitants of the border regions. Euroregions do not conform to any law or government institutions and have no direct political power and their role is limited to the power of local authorities, which constitute them. The aim of euroregions is to promote their interests across the border and to cooperate for the good of border communities (Otocan, 2010, p 4). This raises the question of what is the difference between the cross-border region and the euroregion. The definition quoted above shows that the euroregion is a more formalized unit, because it is based on agreements between state, self-government or local organizations. It can also be noted that it is narrower than the concept of a cross-border region. Euroregional cooperation shows similar relations with the concept of cross-border cooperation. Cross-border cooperation is broader and does not require the creation of permanent institutional structures, whereas euroregional cooperation is a form of cross-border cooperation, which introduces the institutional forms of activity - euroregions. Another difference between the two types of cooperation is the time horizon. Euroregion is created with a long-term perspective (Perkowski, 2010, pp. 16–17).

2007–2013 and 2014–2020 are special periods in the functioning of the regional policy of the Community, which is the most important position in the Union budget. The primary and overarching objective which would justify its operation is the need to promote economic growth and sustainable development by mitigating the economic and social inequalities.

The cooperation between the regions of the European Union takes place in many areas, but the most popular are the cross-border cooperation and the following it euroregional cooperation. The European Union considers trans-border activities, as one of the top priorities of regional policy. In the programming period 2007–2013, the European Commission incorporated the third goal: European Territorial Cooperation, which is directly related to cross-border problems in Europe. The budget for this priority continues to be marginal, but the evolution of approach to regional problems and in particular to the problems of cross-border cooperation leads to a growing awareness of the essence of creating effective cooperative relations in the border areas of the member countries.

When reflecting on regional disparities in Poland, which is a member of the European Union, the indicators presented in this paper should be compared with the EU indicators. So the data for 2004 indicates that the Mazowieckie voivodship is comparable with the level development of the poorest region of Greece. The only chance for the gradual mitigation of internal

development disparities is an effective policy of the government, which on the basis of properly and carefully performed studies will be able to take reasonable and beneficial to the whole economy measures to minimize the negative effects of the economic disharmony. Absolutely necessary in these activities is also the support of the European Union, which on a basis of experience in the field of regional policy gained from other members, is able to support Poland in the implementation of plans which will harmonize Polish economic, social and economic reality.

5 THE ROLE OF COHESION POLICY 2014-2020 IN THE EU's ENDAVORS FOR SMART, SUSTAINABLE AND INCLUSIVE GROWTH

In order to get Europe out of the economic and financial crisis, the European Commission proposed a new long-term EU development program for the period 2010–2020, which is represented by *Europe 2020 - A strategy for smart, sustainable and inclusive growth*. The document is based on the experience gained from the Lisbon Strategy which was implemented from 2000 till 2010. The European Union, realizing the overarching objectives of the Europe 2020 strategy for employment, research and development, climate change and energy, education and poverty and social exclusion, makes efforts to achieve smart and sustainable development. In order to achieve these objectives it will be assisted by the cohesion policy, which is an integral part of development policy. The financial resources assigned for the area of policy directed to the regions in the new programming period 2014-2020 will amount to one third of the EU budget. This volume shows how vital will be the role of cohesion policy in achieving goals of the EU 2020 strategy. First of all, the cohesion policy means investing in knowledge and development. It creates favorable conditions for innovation, research, education, job creation, social inclusion, information technology, etc.

6 ASSUMPTIONS OF THE DOCUMENT EUROPE 2020 - A STRATEGY FOR SMART, SUSTAIABLE AND INCLUSIVE GROWTH

The Europe 2020 strategy for smart, sustainable and inclusive growth is a document outlining long-term vision of the social market economy. It proposes a new, more powerful model of economic governance. It also assumes a stronger supervision by the European Union, measures protecting the stability of the euro area and the sanative activities in the financial sector (http://ec.europa.eu/europe2020/priorities). Europe's long-term development plan also emphasizes the need to strengthen the management structure by obeying the principle of regular and transparent monitoring and authorities at the highest political level, that is, one might think, the leadership of the European Council.

The Europe 2020 document consists of the following elements:
- 3 priority areas
- 5 main objectives,
- 11 integrated guidelines,
- 7 flagship initiatives.

Standard and continuing priority of the European Union is to accelerate its economic growth and increase employment rate. Europe 2020 document proposes three interrelated and mutually reinforcing priority areas (http://www.mg.gov.pl/files/upload/8418/EUROPA_PL.pdf).

1. Smart growth, which is based on developing an economy based on knowledge and innovation.
2. Sustainable growth, means transformations towards low-carbon economy, which is more environmentally friendly, resource efficient and more competitive.

3. Inclusive growth, is characterized by support for the economy that has a high level of employment and ensures economic, social and territorial cohesion.

The realization of these areas is bound with five main objectives of the whole EU which it will try to achieve within 10 years. However, in order to take into account the specific situation of the individual member countries, all countries in collaboration with the European Commission also appointed their own goals, which are consistent with these five objectives. Countries which economies are more developed and technologically advanced, by virtue of their better starting position, will pursue more ambitious goals.

The main objectives set for the whole European Union are as follows:
Objective 1: Achieving the employment rate of 75% among women and men in the age group of 20-64 years.
Objective 2: Improving the conditions for research and development. In particular the total volume of public and private investment in this sector should reach 3% of GDP.
Objective 3: Reducing greenhouse gas emissions by 20%. It was assumed that the share of renewable energy in overall energy consumption in relation to the level of 1990 will increase by 20%, the energy efficiency will increase by 20%, and attempts to reduce greenhouse gas emissions by at least 20% of will be made by 2020.
Objective 4: Improving the level of education, primarily with regard to the share of young early school leavers, which should not exceed 10%, and the percentage of people aged 30-34 years, who hold a university or equivalent degree, which should be at least 40 % of the total labor force.
Objective 5: Promoting social inclusion, in particular through the reduction of the number of people at risk of poverty and social exclusion by at least 20 million people (www.mg.gov.pl).

All the above-mentioned objectives are to serve smart, sustainable and inclusive development of the EU. All of them are interrelated and interdependent with each other. Employment growth for example will reduce the size of poverty and social exclusion, increase of the level of education will lead to increased employment and it will reduce unemployment and poverty, investments in R&D sector will generate new jobs, resulting in an increase of EU competitiveness, an adequate increase in spending on research and wider use of information and communication technologies will allow to achieve the objectives of low-carbon, environment friendly economy, etc. In 2020, as a result of the achievement of these main objectives it will be possible to assess the overall condition of the EU, measured by the most important parameters, both separately in each country, and at the same time across the EU.
Implementation of five main objectives of the Europe 2020 strategy is to be supported by seven flagship initiatives proposed by the European Commission. Their purpose is accelerating and focusing of implementation methods of the three main strategic priorities. The flagship initiatives are as follows (http://www.mg.gov.pl/files/upload/8418/EUROPA_PL.pdf, p. 5):
1. The Innovation Union is one of the flagship projects of the Strategy.
The research clearly shows that increased investment in R&D to 3% of EU GDP by 2025 would allow to create 3.7 million jobs and to increase the GDP by as much as 795 billion euro per year. Thus the demand for scientific staff in Europe would increase (*Communication from the Commission to the European Parliament*).
The initiative is focused on innovation and the creation of a common market for innovation. Particular attention is paid to the development of the individual stages of the innovation process, from initial research to their implementation and facilitating the transformation of

innovative ideas into new products, technologies, services, etc., which in turn will have impact on economic growth and job creation. Innovation Union strengthens the knowledge base in Europe, eliminates the social and geographical disparities by spreading the benefits of innovation across the European Union. The initiative also supports efforts to pool resources for breakthrough projects through the establishment of European innovation partnerships, associating operators at the EU and the national level.[1]

2. Youth on the move. This initiative emphasizes the need to improve the performance of education systems by providing a high quality academic education, enhance the competitiveness of EU higher education institutions, support for young people entering the labor market by simplifying procedures for foreign study trips and internships outside their home country.

3. Resource efficient Europe directs its efforts to make the EU economic growth independent from resource and energy consumption, and to shift towards a low carbon economy and to increase the use of renewable energy sources.

4. Digital Agenda for Europe. Its mission is to create a single digital market based on a very fast internet and interoperable applications.

5. An industrial policy for the globalization era - aims at improving the business environment, especially for SMEs, strengthening cooperation between industry and science and promoting the development of strong, sustainable and competitive industrial base.

6. An agenda for new skills and jobs, focuses on the modernization of labor markets and strengthens the position of people by developing their skills, teaching new skills and supporting adaptation to the changing social conditions in the labor market in order to facilitate their retraining.

7. The European Platform against Poverty tries to provide economic, social and territorial cohesion and decent conditions for the poor and to enable them to actively participate in society.

All the initiatives proposed by the European Commission are implemented simultaneously both at Community and national level.

The new strategy also includes a set of integrated guidelines, which are general recommendations for countries belonging to the European Union. They relate to different areas of economic policy. These guidelines are to improve the achievement of the five mail objectives of the Europe 2020 document. The number of integrated guidelines, compared with the Lisbon Strategy, has been reduced from 24 to 10.

Below the 10 guidelines proposed by the *Europe 2020 strategy* are presented (www.mg.gov.pl):

Guideline 1 - Assuring the quality and sustainability of public finance.

Guideline 2 - Addressing macroeconomic imbalance.

Guideline 3 - Reducing imbalance in the euro area.

Guideline 4 - Optimizing support for R&D and innovation, strengthening the knowledge triangle and unleashing the potential of the digital economy.

Guideline 5 - More efficient use of resources and reduction of greenhouse gas emissions.

Guideline 6 - Improving the business and consumer environment and modernizing the industrial base in order to ensure correct functioning of the internal market.

Guideline 7 - Increasing the participation of women and men in the labor market, reducing structural unemployment and promoting employment quality.

---

[1] Innovation Union – New program within a strategy Europe 2020, European Commission portal (http://ec.europa.eu/commission_2010-2014/tajani/hot-topics/innovation-union/index_en.htm).

Guideline 8 - Developing a skilled workforce corresponding with the labor market needs and promoting lifelong learning.
Guideline 9 - Improving the quality and performance of education and training systems at all levels and increasing participation in tertiary or equivalent education.
Guideline 10 - Promoting social inclusion and combating poverty.

In accordance with the Lisbon Treaty, the guidelines 1 to 6, which are related to economic policies, were approved by the EU Economic and Financial Affairs Council (ECOFIN). Other, related to employment policy, that is 7 to 10, were accepted by The Employment, Social Policy, Health and Consumer Affairs Council (EPSCO) after consulting the European Parliament. The guidelines are the basis for developing by all EU governments the National Reform Programmes (NRP), which are a fundamental instrument for the implementation of the strategy at the level of member countries.

The document *Europe 2020 Strategy for smart, sustainable and inclusive growth* is a concrete plan for the development of the European Union, the effects of the implementation of which should be visible in 2020.

Cohesion policy, through realization of its goals, contributes to the development of the European Union by strengthening such key areas as: innovation, human capital, education and research. In this way it primarily promotes investments in the knowledge-based intelligent information society. Focusing its activities the policy will help in the future the members of the European Union and its regions to cope with the enormous challenge of creating smart and sustainable economy with greater capacity for innovation and more effective cooperation between industry and science.

According to the opinion of the Committee of the Regions "*The contribution of cohesion policy to the Europe 2020 Strategy*", adopted at the 86th plenary session in Brussels on 5 and 6 October 2010, the objectives of the Europe 2020 Strategy will play a key role in EU's cohesion policy. The opinion emphasizes the interdependence of politics and a new development plan for the Union.

7   CONCLUSION
The debate on the new approach to regional policy functioning within the Multiannual Financial Framework 2014-2020 has been going on for quite a long time. Nevertheless, it still requires a number of arrangements and negotiations. Unfortunately the chances for the start-up of national operational programs of the new cohesion policy at the beginning of 2014 decrease with each passing day. Due to the fact that the negotiations on the general regulations on the EU level of have not been definitely closed, these programs will be implemented with a significant delay.

ABSTRACT
Socio-economic changes of Montenegro, as a young democracy, have introduced need for reform of educational system, specially higher education, to support and faster process of transition of its economic, political and social system. Highly educated young individuals are the most important factor for building one modern, democratic society, with strong EU integration aspiration, able to implement and develop European values as democracy, rule of low, respect to minorities. Bologna process was one of the basic frameworks for transformation and reform of higher education at the European continent. Accession of a new member country to the EU involves a complex process of its adjustment to the "rules of the game" for new member states. In that regard the Bologna process has offered perfect instrument for the essential reforms in higher educational system for all accession countries. For the Montenegro as a new country, skills and experiences acquired under the communist system became less marketable in the new market environment, compared to human capital acquired during the transition. For the higher educational system in Montenegro, Bologna reform of higher education towards more competitive and knowledge based economies, was the major reform path. All these have created urgent need for the high educational reform to enhance growth and increase the competitiveness. That's why Montenegro has introduced intensive high education reform package, signing of the Bologna Declaration in 2003. This paper will try to give answers to: Will Montenegro be able to compete in the knowledge economy and develop skills required for the twenty-first century? What are the major obstacles that higher education faces in Montenegro?

Keywords: Bologna process, Higher education, Quality, Reforms

1 INTRODUCTION

The harmonization of the European educational system was on of the results of integration, where effective European-level distribution of knowledge, mobility of labor, increasing the competitiveness of the European Union and the prosperity of European citizens were reasons for the development of the reform package today known as the Bologna process. The Bologna process has aimed the establishment of a competitive European higher education area and attracting students and instructors from outside. The intensive educational reform towards more educate and competitive European citizens, should proved strong support for the realization the Lisbon Strategy at 2000. The Lisbon strategy adopted 2000, aimed transition towards a knowledge economy, and by reaching the Lisbon objectives, the EU will become the most competitive and dynamic knowledge based economy of the world.

Accession of a new member country to the EU involves a complex process of its adjustment to the "rules of the game" for new member states. The EU integration process has influenced

and continues to influence the knowledge economy catching up process of new member states (Reinhile and Mrak, 2009). In that regard the Bologna process has offered perfect instrument for the essential reforms in higher educational system for all accession countries.

In the last decade, Montenegrin higher education system has been under intensive transformation. The Bologna process has been the major high education reform initiative (Lucin and Samardzija, 2012). For the Montenegro as a new country with strong EU aspirations, skills and experiences acquired under the communist system became less marketable in the new market environment, compared to human capital acquired during the transition. The expenditures on education were falling, what have had a significant effects on the quality of education, during the transition period (Campos and Dean, 2004). A recent comprehensive review of education systems in the region by (Luca et al., 2007) concludes that ex education systems focused on "memorized factual and procedural knowledge" have generated skills that are appropriate for planned economies but not necessarily for the demands of a new market economy.

All these have created urgent need for the high educational reform to enhance growth and increase the competitiveness. Things on which country can mostly have influence are increasing of competitiveness of people i.e. educated individuals, who have modern and applicable knowledge, creativity and innovation. That's why Montenegro has introduced intensive high education reform package, signing of the Bologna Declaration in 2003.

2   BOLOGNA DECLARATION AND BOLOGNA PROCESS

The basic higher education framework in EU is designed by the Bologna process. The process is a product of a series of meetings of Ministers in charge of higher education policy, with the goal to establish the European Higher Education Area by 2010. The basic precepts of the Bologna process date back to the Sorbonne Joint Declaration on Harmonization of the Architecture of the European Higher Education System, signed on 25 May 1998 by the education ministers of four countries: France, Germany, Italy and the United Kingdom (European Commission, 2010).

The Bologna Declaration on the European Higher Education Area, mostly based on the Sorbonne Declaration, was signed in June 1999 by ministers from 29 European countries. The Declaration became the basic document for the signatory countries in establishing the general framework for the modernization and reform of European higher education. This Bologna Declaration designed a set of actions to make European higher education more compatible and comparable, more competitive and more attractive for Europe's citizens and for students and scholars from other continents. The signatory countries were 5 EU Member States, three EFTA countries (Iceland, Norway and Switzerland) and 11 EU candidate countries (Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Romania, Slovakia and Slovenia). In 2001, Croatia, Cyprus and Turkey were accepted as new members. In 2003 at the Berlin Conference, seven new signatory countries joined the Bologna Process: Albania, Andorra, Bosnia and Herzegovina, the Former Yugoslav Republic of Macedonia, the Holy See, Montenegro, Russia and Serbia. May 2005, the Bologna process was extended to Armenia, Azerbaijan, Georgia, Moldova and Ukraine. In 2007, country membership got the Republic of Montenegro as an independent State in the European Higher Education Area.

In the Bologna Declaration, ministers affirmed their intention to (European Commission, 2009):

- Adopt a system of easily readable and comparable degrees;
- Implement a system based essentially on two main cycles;
- Establish a system of credits (such as ECTS);
- Support the mobility of students, teachers, researchers and administrative staff;
- Promote European cooperation in quality assurance;
- Promote the European dimensions in higher education (in terms of curricular development and inter-institutional cooperation).

The Bologna process created a new sociopolitical area of higher education that brings together the European states, supra and international organizations, civil society and employers (Croshe, 2009). By the time the Bologna process has grown from 29 countries in 1999 to 47 today. The growing 'market share' of the EHEA in worldwide student mobility proves that European higher education has become more attractive since the Bologna Declaration.

Regarding increase of quality and better coherence, the main Bologna reforms concentrate on: the three-cycle degree structure (bachelor, master, doctorate), quality assurance in higher education, recognition of qualifications and periods of study, involving flexible, modernised curricula at all levels which correspond to the needs of the labour market. (IP/10/246) All countries have adopted two or three degree system, and are using European Credit Transfer and Accumulation System (ECTS) or some compatible systems. In the first cycle most countries have had combination of 180 ECTS and 240 ECTS. For the second degree the most common system is 120 ECTS. The combination 180+120 ECTS or model "3+2" is mostly popular within the countries. Usual length of doctoral studies is 3-4 years.

Bologna process has resulted in establishing the common instruments: European Credit Transfer and Accumulation System (ECTS), the Diploma Supplement (DS) and National qualification Frameworks (NQF). Almost all signatory countries fully implement first two instruments in their higher education systems, but still there are lagging in national qualification achievements.

In the first 10 years all countries have implemented most elements from reform architecture: involving legislation and national regulation. The states see the Bologna process more as an instrument to help them resolve their national problems, to make their universities attractive for the students of other continents, than as a way to harmonize their higher education (Charlier, 2006). The focus in the second decade of the Bologna Process should be the achievement of more strategic goals, what need further substantial efforts from governments, institutions, students and staff, merging with the strong commitment at national, regional and institutional levels.

The Europe 2020 strategy, put knowledge at the heart of the Union's efforts for achieving smart, sustainable and inclusive growth. This is because higher education and its links to research and innovation, plays a crucial role in individual and societal advancement and in providing the highly skilled human capital and the articulate citizens that Europe needs to create jobs, economic growth and prosperity (European Commission, 2011). The main areas for reform identified in the new agenda are:

- To increase the number of higher education graduates;

- To improve the quality and relevance of teaching and researcher training, to equip graduates with the knowledge and core transferable competences they need to succeed in high-skill occupations;
- To provide more opportunities for students to gain additional skills through study or training abroad, and to encourage cross-border co-operation to boost higher education performance;
- To strengthen the "knowledge triangle", linking education, research and business;
- To create effective governance and funding mechanisms in support of excellence.

The suggested reforms will produce several outcomes, by 2020. First, significant increase of young people successfully completing higher education, meaning that 40% of 30-34 year old citizens in the EU should have completed tertiary or equivalent education. Student higher education participation has increased in last decade significantly, but still it is insufficient to meet future projected growth in knowledge-intensive jobs[1]. With regard to reach this goal, Member states have to work very intensively to attract foreign students, broader society groups (disadvantages and vulnerable groups) and reduce higher education drop-out. Since EU is facing the constant shrinking students group for recruiting, as an impact of demographic ageing.

The second goal, reducing school drop-out rates below 10%, to meet this goal it is necessary to improve earlier educational outcomes that will affect to cumulate reduce school drop-out.

Third, increase research activities at the universities, with increasing research investments up to 3% of EU's GDP[2]. Hhowever, universities have lost their research monopolies. The balance between teaching and research are changing, leading to different 'portfolios' at different types of universities, e.g. the dominance of undergraduate teaching in some cases, and research – coupled with post-graduate training – in others (Havas, 2009). European economies have to become more research-intensive, based on higher education research, according to reach high levels of competitiveness, to be able to support industries of tomorrow.

The crucial aim of higher education is improving its quality and relevance in the time of fast and constant changes. Constant changes require adjustments in curricula, practical experiences in courses, exchange staff and students, flexible and innovative learning approaches and delivery methods. Employers and labor market institutions should be present in designing and delivery programmes, as well as life long process progammes. It is important to stress out that increase of Higher education quality depends on competence and motivation of teachers and researches, good requirement procedures, constant professional development, better recognition and working conditions, stimulation rewarding process will be the essential drivers towards increasing quality. To achieve these, it is necessary to have adequate higher education funding. The public investment is basic for sustainable higher education, but future increase of the education funds, means larger participation of private sources and more flexibility in governance (Tandberg, 2010).

---

[1] By 2024, 35% of all jobs in the EU will require high-level qualifications, comparing with current situation where only 26% of the workforce has a higher education qualification.

[2] The EU lags behind in the share of researchers in the total labor force 6 per 100, comparing to competition countries: compared to 9 in the US and 11 in Japan.

3   THE NEED FOR HIGHER EDUCATION REFORM IN MONTENEGRO

Changes in European Higher Education Area and the Europe 2020, and Montenegro's commitment to European integration have created the need for reform of higher education. Montenegro is a small[3], middle income and relatively young country, got its independency in 2006. Candidate status was awarded to Montenegro at the end 2010, and negotiations for EU membership will begin in 2012. Moving closer to EU accession, Montenegro will need to increase significantly its competitiveness, and important mechanism for increasing competitiveness is improving the efficiency and quality of higher education and strengthening of the links between research, innovation, and business (World Bank, 2011). University education is recognized as a creator of both human capital and knowledge, and with Montenegro integration to EU it becomes imperative that its outputs are best quality, improving efficiency with high respect to the labor market and local/regional industry.

Changes in Montenegrin economic structure have occurred and new potential growth engines are tourism, service, energy sector and other knowledge-driven industries. The economic relevance of the heavy metal industries was important in early phases of Montenegro development mostly based on broader ex Yugoslav market. Nowadays, its importance has declined, owing to deteriorating competitiveness. Education system, particularly the tertiary level should be more sensitive to the economy's needs and supply with applied and competitive knowledge, having in mind needs of Small and Medium Enterprises as the important sources for future growth.

It becomes important to transform higher education and research into generators of economic growth in Montenegro, develop capacity to meet the EU Acquis requirements towards EU integration, and work towards the priorities expressed in the Europe 2020.

Montenegro is a small country in Europe, and education is the precondition of its further development, prestige and progress, particularly the higher education. In this context, universities may become the driving force of its development, or at least, to improve its competitiveness and prospects at both regional and global scene.

Higher education reform and reorganization of the University of Montenegro began by signing of the Bologna Declaration in 2003 but formal application started by adopting a new legal framework, which consisted of the Law on Higher Education (2003), and continued by adoption of the statute of universities and faculties (2004) and regulations for their implementation. This created a normative institutional framework of higher education in Montenegro[4],

---

[3] Population estimate 623,000 citizens.

[4] Including The Law on Higher Education (Official Gazette of the Republic of Montenegro No. 60/03, 45/10, 47/11), Law on Education Inspection (Official Gazette of the Republic of Montenegro No. 80/04), Law on Recognition and Evaluation of Education Certificates and Equalization of Qualifications (Official Gazette of Montenegro, No. 57/11), Law on National Professional Qualifications (Official Gazette of Montenegro, No. 80/08 and14/09), Law on National Qualifications (Official Gazette of Montenegro, No. 80/10), Law on Recognition of Foreign Qualifications to Perform the Regulated Professions (Official Gazette of the Republic of Montenegro No. 18/11), The application of these laws is more precisely defined in the accompanying by-laws: The Strategy of Development and Financing of Higher Education 2011-2020, Regulation on Norms and Standards for Funding of Public Institutions of Higher Education and Funding of Higher Education Students (Official Gazette of the Republic of Montenegro No.33/11), Regulations on Description of Levels and Sub-levels, by-laws in accordance with the law on National Qualification Framework ("Official Gazette of Montenegro", No. 51/11), Admission Policy of the University of Montenegro 2012.

Challenges of the Modern World - Contemporary Economy and Globalization

Application of this institutional framework in Montenegro has led to an increase of both, higher education institutions and number of students. In the early stage of implementation of the Bologna process, University of Montenegro was the only institution of higher education in Montenegro. Changes introduced by the Law in 2003 brought more open and flexible system of the Higher Education, so that the greatest obstacles to its implementation were at the University of Montenegro, which still has had the strength and capacity to overcome internal resistance and their own conservatism, and thus facilitate the reform and necessary innovation (Academy, 2009).

The Law promoted the equality of public and private institutions of higher education and established the basic principles for the new organization of universities and study regime established in accordance with Expert Recommendations. Today, there are 3 universities in Montenegro, i.e. the University of Montenegro (UCG) - State University, (which consists of 20 faculties, three research institutes, and one independent study program, which are located in eight different towns throughout Montenegro), two private universities, Mediterranean University and the University of Donja Gorica and 7 independent private faculties. Number of students has increased significantly and amounted to approximately 25,000 students, out of which approximately 20,000 students are educated at the University of Montenegro, and about 5,000 in private institutions of higher education[5]. In terms of structure of enrolled students, the typical high interest of students for the humanistic groups of science - about 70% of enrolled students, while only 3% are enrolled in the art studies.

The new Law on Higher Education has provided the reform of higher education, primarily aiming to increase efficiency of studies and system harmonization with European trends in higher education based on the principles of the Bologna Declaration and Lisbon Convention. Obligations derived by joining the Bologna Process and Lisbon Convention were, primarily, aimed to achieving goals that are of primary importance for the promotion of European higher education system, such as (Ministry of Education and Sports, 2011):

- Adoption of the system based on three cycles of study. These are undergraduate, postgraduate and doctoral study;
- The introduction of ECTS (European Credit Transfer System) - as a measure of the scope of the study;
- Adoption of the system of easily understandable and comparable academic titles;
- Implementation of "diploma supplement" as a supporting document that describes the adopted program;
- The introduction of "joint degree" issued by two or more institutions;
- Promotion of European cooperation in quality assurance;
- Promotion of mobility of students and academic staff;
- Defining the process of recognition of qualifications and diplomas attained in accordance with the Lisbon Convention;
- Establishment of accrediting agency; • Introduction of quality assurance;
- Involving students as partners in the education process;
- Establishment of Universities as a single legal entity (requirement of Magna Carta Observatory)
- Establishment of opportunities for the realization of "lifelong learning" (LLL).

---

[5] This is by 65% more students comparing to the school year 2005/6 with the share of self-financed students increasing from 53.3 percent to 79.7 percent.

Education activities at the institutions of higher education are realized through the academic and applied courses. Study programs are organized in three cycles as undergraduate, postgraduate and doctoral programs. Undergraduate academic studies last at least three and maximum four years (180 or 240 ECTS credits), and applied undergraduate studies last three years (180 ECTS credits). Postgraduate specialist studies last one year (60 ECTS credits). Postgraduate master studies (academic and applied) last one year (60 ECTS credits) following the specialist studies, and two years (120 ECTS credits) after the undergraduate studies. Doctoral studies last three years (180 ECTS credits) (Ministry of Education, 2011).

4   ASSESSMENT OF IMPLEMENTATION OF THE BOLOGNA PROCESS

Implementation of the Bologna process on Higher Education System (HES) of Montenegro has caused many changes and has had different effects on all actors involved in this process. Based on the current implementation, it can be said that the principles of the Bologna Process in Montenegro, in technical, normative and organizational sense have been adequately implemented. This is indicated by evaluations obtained at the Ministerial Conferences which measure the implementation of the Bologna Process among the signatory countries, where Montenegro has achieved the highest rating of 3.88 at the last Ministerial Conference held in Bucharest in 2012.

At the very beginning of this process, the application of these principles referred to state universities only, but private higher education institutions were established later and they have tried to meet the requirements of the market in the segments that could not be achieved by the University of Montenegro. What characterizes the higher education in Montenegro today is significantly more interest for further post-secondary higher education (52%), than is the case in the EU countries. Students who complete vocational schools, most frequently opt for further education, due to the inability of the labor market to absorb them. In this way, all higher education institutions are facing large demand for their services, especially in the field of humanities. Based on this, admission to most institutions of higher education is more massive than an individual or elitist.

Socio-economic changes and transition of Montenegro, as it was the case in most countries of the region, led to shut down of technological and metal complexes, and thus influenced the change in demand for higher education profiles. Modern, dominantly service-oriented economic development resulted in the dominant orientation of high school graduates to the humanities, (more than 80%) and very little demand for technical faculties, or science. Such changes in demand for HE services, mostly affected the University of Montenegro, which was established in 70's of the last century, when the need for technical faculties was expressed. This still represents a serious problem for the efficient functioning of the university. So far, the State University has shown very low flexibility to adapt the existing (especially technical) study programs to the newly incurred market needs, the needs of predominantly small and medium size enterprises. On the other hand, the faculties of humanities meet strong student interest, and because of this situation on the HE market, many private education institutions attempt to fill existing gaps. The presence of private institutions has given an offer for profiles that could not be offered most efficiently by the University of Montenegro, which introduced a desirable competition in the area of higher education in Montenegro, but the regulator has a lack of incentives to make the newly created environment that would foster quality higher education (Academy, 2009).

Challenges of the Modern World - Contemporary Economy and Globalization

One of the objections mentioned in academic work is that reform, unlike to other levels of education, was implemented without any previous strategy, action plan or other similar planning documents. Secondly, no special budgetary funds were allocated to this reform, but it is mostly financed by the University of Montenegro and foreign donations through appropriate projects (Academy, 2009).

In order to address the problems in higher education in the best way and increase the quality, the Ministry of Education and Sports in cooperation with the World Bank has developed the *Strategy for Development and Financing of Higher Education* (2011), the main component of which will be funded from a loan granted by this institution to the amount of 12 million EUR. Based on the analysis of higher education, and reports of re-accreditation of institutions and study programs, the following problems in higher education were systematized:

- Quality of education in Montenegro is very different;
- Rapid growth in number of institutions of higher education and number of students, without the existence of links between that growth and labor market needs;
- The system of financing of higher education does not track changes in the growth of higher education;
- Private investments (companies, funds and other legal and natural persons) are an integral part of higher education, with increasing participation in the financing of higher education;
- Cooperation among the institutions of higher education, which aims to raise the general level of education quality, is not satisfactory;
- The introduction and implementation of the Bologna process has not yet been analyzed;
- It is evident that there is a low number of citizens with higher education compared to developed countries;
- The concept of lifelong learning is still not sufficiently promoted and developed;
- There is no database of Montenegrin scientific diaspora and their involvement in the native country;
- The higher education system is neither competitive nor attractive at the international level;
- International cooperation and academic mobility is not satisfactory (no courses in English, insufficient infrastructural facilities: accommodation...);
- Scientific research is not sufficiently represented in the higher education process.

In order to implement the commitments of the Bologna Process, a number of institutions and stakeholders have been established in higher education of Montenegro. The most important actors in establishing of education policy in Montenegro are: the Council for Higher Education, Universities (state and private ones), Ministry of Education and Sports, Chamber of Commerce, Employers, Ministry of Science, Council for Science, students and NGOs. Reform in higher education has been accompanied by reform of governance, moving from state-governance model to the state supervision. Some elements of the new model have been introduced but not fully developed and clarified. Bologna process has introduced institutional reforms in Montenegro higher education system, in sense of establishment of all necessary stakeholders but still significant role and full influence eider of them haven't been develop yet, making the most important obstacle for successful implementation of Bologna Process.

5 INSTEAD OF CONCLUSION- OPTIONS FOR IMPROVING HIGHER EDUCATION IN MONTENEGRO

The issue of quality is certainly the central issue of the application of the Bologna process and will certainly occupy an important place in the coming years in Montenegro. Although we have no reliable criteria based on which we can currently measure the quality of higher education in Montenegro, the most important stakeholders in the high education process indicate that one of the biggest problems of this process is the question of quality. The evaluations of labor market and international partners (World Bank and European Commission), are becoming louder indicating that the increase in quality of higher education is the basis for the growth of competitiveness of Montenegro and its survival at large common EU market.

Again, it should point out that the current implementation of the Bologna process in Montenegro was mostly referred to building of institutional and administrative preconditions for its implementation. Up to date, the Bologna process has brought many positive changes, such as: duration of study is significantly reduced, the organization of education process is better designed than it was the case in "old" system - students must regularly carry out their duties, if they wish to complete their studies on time, and the possibility of acquiring an internationally recognized diploma was created as well. Also, the reform of the education system delivers multiple benefits to researchers, through the mobility of researchers and the possibility of involvement of our scientists in the European Research Area.

What will characterize the next period of implementation of the Bologna process is the orientation of all interested stakeholders on fundamental and essential changes in the higher education that will have an effect on increasing the quality. The largest number of complaints is related to the large number of institutions that were established in the short term, which number is perhaps too high for the size of Montenegro, offering a different quality of education. Reducing the number of programs, with clearly defining the criteria for closure, through their matching to the needs of labor market and strategic development orientation of Montenegro is one of the directions of the reforms to be implemented in order to increase quality.

Increasing the quality of higher education today necessarily requires *innovation of the curricula*, in order to define learning outcomes and acquisition of knowledge adapted to the needs of the labor market, in order to ensure greater employability of our students after graduating. Increasing quality means *improving existing academic staff*, predominantly through increased mobility of teaching and non - teaching staff, as encouragement to the young staff that works at the higher education institutions to continue their education i.e. to prepare their master and doctoral thesis at the European universities. Since the quality of human capital is crucial in increasing the quality of higher education, the project of the World Bank, within the Component 2[6] provides EUR 2.1 million for these purposes. Also, the improvement of teaching staff can be achieved by building closer links with the scientific diaspora, who would be interested in participating in teaching or research projects on part time or full time basis.

Increasing the mobility of academic staff is of great importance; however, mobility of academic staff is still very low. Improving this practice requires a greater stimulus towards the mobility of academic staff, where staying abroad would be further evaluated. In addition to

---

[6] World Bank, Higher Education And Research For Innovation And Competitiveness Project, 2011.

mobility, it is important to adjust the criteria for selection of academic and scientific titles to changed needs, structure and functioning of the University. Having involved in European projects, academic staff are also offered numerous training opportunities, study visits, research work with European colleagues.

In next decade of Bologna process implementation our higher educational institutions have to work with EU partners to further develop decentralization culture and practice, exchange experience with region and international community in other to strongly increase quality of higher education.

ABSTRACT
In this study, authors systematize the use of the term "disaster" in relation to the functioning of local government units (LGUs), based both on literature and studies conducted in the Polish local government. Local government entities do not take effective action in the risk management process relating to catastrophic risks, even in the narrow sense referring only to the effects of nature. Realization of catastrophic events results losses primarily economic, social and environmental. To further the proper functioning of local communities seem necessary systemic solutions to the financing of the effects of the implementation of a catastrophic event that would allow continued unimpaired functioning of the local community.Based on our preliminary survey and analysis of available data (Ministry of Finance, Ministry of Interior) identified sources of funding for the impacts of a natural catastrophe (mainly flooding). The results of these studies clearly indicate that a large inconsistency and arbitrariness in deciding whether the same local government and state authorities. The paper attempts to identify the various proposals for systemic solutions that would ensure that the local government losses due to natural disasters. Work in this area seem to be all the more necessary that the insurance market is increasingly refuses to cover this risk.

Keywords: Financing of natural disasters in local government, Impact of flooding to local governments, Natural disasters

1   INTRODUCTION

A local self-government is defined as a model of democratic local authority, which ensures universal participation of urban and rural inhabitants in the exercise of public authority in a country (Ginsbert-Gebert, 1992, p. 1). According to the European Charter of Local Self-Government, a local self-government denotes the right and the capacity of local authorities, within the limits of the law, to regulate and manage a substantial share of public affairs under their own responsibility and in the interest of the local population[1].

For many years Poland has been a country with a tradition of local self-government. Local government ensures the participation of social representatives in the execution of public administration. The beginnings of local self-governance date back to April 1791. Decentralization of the power in Poland differed substantially in different periods of the history, however, in 1950 local government, and in particular its subjectivity, was abolished completely. Changes in the Polish political system in 1990 also resulted in changes in relation

---

[1] European Charter of the Local Self-Government Art. 3 sect. 1

to territorial system. Although communits (gminas) had already existed since 1973, the Act of 8 March 1990 on Territorial Self-Governance gave it a completely new legal status and a new position in the structure. Gminas acquired legal personality and as a consequence the right to their own property and revenues as also to independent decisions on their allocation[2]. At the same time, the responsibility for the performance of tasks, including property management, were transferred to gminas. As of Jan 1st 1999 a new, three-level territorial division of the state was introduced in Poland. Within this model, a commune (gmina) is at the basic level, a district (poviat) is at the intermediate level and a province (voivodeship) is the highest one. In 1999 16 voivodeships, 308 land poviats, 65 city poviats, and 2489 gminas (Regulski, 2012, pp. 4–15) were established. Additionally, in 2002 seven new poviats were set up. All the above constitute a specific socio-economic system which consists of (Jastrzebska, 1997, p. 7):

- inhabited area,
- authority i.e. democratically elected bodies,
- organisational entities of a gmina, poviat and vivodeship.

The purpose of the reform creators was to really enable local communities to deal with tasks concerning them. It was thus assumed that the relations between the state and self-government would be based on the principle of subsidiarity. According to this principle, central public authority bodies should only carry out such tasks which cannot be properly performed by local and regional self-government communities or individual entities. Consequently, as long as it is possible, local self-governments should carry out particular tasks which have a public character (Piotrowska-Marczak, 1998, p. 37). Distribution of tasks between various levels of authority and administration depends on (Borodo, 1997, pp. 11–16):

- constraints on decentralisation indicated by principles of economy and thrift,
- possibility of establishing a local (regional) market within the range of meeting communal needs,
- founding the operations on local (regional) manufacturing resources.

According to legal regulations, it is possible to distinguish several spheres of autonomy of local self-government entities (LSGE) (Jastrzebska, 1999, pp. 17–18):

- its own property and property rights,
- establishing laws on the area of a LSGE,
- legal entity,
- judicial protection of independence,
- the right to undertake operations,
- allocating a source of income,
- formal and factual separation of local budgets from the state budget,
- the right to manage its own affairs,
- limited scope of surveillance of a *gmina, poviat* and *voivodeship* operations,
- establishing self-government administration with the purpose of achieving the entities' objectives.

One of the most significant threats to the functioning of a self-government are disastrous events, including natural disasters. Among many self-government activities, next to satisfying social needs, there is also protecting the property, which is often the key element influencing the standard of living of gminas' inhabitants. Catastrophic risks oblige self-government units to take preventive (reduction of the probability of particular event occurrence) and repressive

---

[2] These rights were subsequently guaranteed to gminas by the Constitution.

actions (saving the property affected by a disaster). Nevertheless, the costs borne in respect of repairing the damaged infrastructure elements are essential. This article aims at indicating system solutions that could replace the prevailing action-based and discretionary manner of financing the consequences of catastrophic events to the self-governments' property. In order to do so, we have defined the notion of catastrophic events, including flood which is the most severe natural disaster threatening Poland. The next stage includes the analysis of the scope of losses incurred due to floods and the methods of their financing on the example of two, by far, biggest floods in Poland (1997 and 2010). Moreover, proposals of system solutions based on mutual insurances, possible to be implemented by local self-government units have also been indicated.

2 CATASTROPHIC RISKS – DEFINITION, COMMON TYPES OF CATASTROPHIC THREATS IN POLAND

The word catastrophe is derived from the Greek word (καταστροφή), which means a decisive, ultimate event. According to "Encyclopædia Britannica" catastrophe is a sudden and unexpected event causing adverse effects such as human and material losses. Specific types of catastrophe are cataclysms or natural disasters, seen as extreme natural phenomena that result in significant losses on the territory where they occur (including those that pose a threat to human life), often changing the image of the earth surface as also causing high losses in the economy and capable to alternate the environment. In accordance with the safety provisions of the National Crisis Management Plan, there are 18 types of threats identified in Poland (KPZK, 2012, pp. 35–37). The predominant ones are: flood, landslide, frost, hurricane, fire, drought and others threats. Over the past twenty years floods have generated the greatest value losses. Fires come as second and the third are industrial accidents (Table 1). However, the number of floods is almost one hundred times bigger than the number of fires.

Table 1: Estimated value of losses caused by crisis situations in the period of 1990 – 2010 (Łyskawa 2012)

Event	Losses (PLN)
Flood	23 430 110 302
Fire	21 000 000
Industrial accident	7 000 000
Epidemics	19 000 000
Transport disaster	3 350 000
Drought	98 829 600
Gales and hurricanes	176 148 646
TOTAL	23 755 438 548

Floods are natural disasters characterised by the most adverse effects not only in Poland. On the basis of the data collected during the years 1995-2004, it is estimated that 20% of victims of all natural disasters from that period are flood victims. Moreover, floods cause 30% of economic losses borne as a result of all elemental disasters (Majewski, 2004, p. 10).

Flood is a random phenomenon, one of the extreme natural phenomena. The Directive on the assessment and management of flood risks defines flood as "the temporary covering by water of land not normally covered by water. This shall include floods from rivers, mountain torrents, Mediterranean ephemeral water courses, and floods from the sea in coastal areas, and may exclude floods from sewerage systems" (2007/60/EC). The concept of flood risk is also

associated with flood. The Directive on the assessment and management of flood risks defines flood risk as "the combination of the probability of a flood event and of the potential adverse consequences for human health, the environment, cultural heritage and economic activity associated with a flood event" (2007/60/EC).

Management of catastrophic risk, and in particular flood risk has been described in a number of European Union documents, beginning with the community action programme in the field of civil protection, and ending with the Council Directive on critical infrastructures or the Directive on the assessment and management of flood risks.

3   FINANCIAL CONSEQUENCES OF FLOODS IN POLAND

Flood means not only a threat but also damages and economic, social and environmental losses. Official statistics from the Polish Central Statistical Office (GUS) indicate an increasing average value of flood losses in Poland (Chart 1). The period between 1991-1998 including the 1997 Central European flood is an exception. After excluding the event from that period, the average annual value of losses drops to PLN 1.474 billion.
Chart 1: The average annual flood losses in Poland (PLN billion) (Own work based on the Polish Central Statistical Office data)

It should be noticed that this data is based on the records from the Ministry of Internal Affairs and Administration. The real estimates of losses are significantly higher. In 1997 the flood loss estimation reached PLN 12-12.2 billion, while in the 2010 flood it reached app. PLN 14 billion. Although the losses caused by the floods in 1997 and in 2010 are practically the same, according to the records of the Ministry of Internal Affairs and Administration the difference between them is almost double. It is the result of higher losses borne by individuals in 2010 (Chart 2).
Chart 2: Losses due to floods in 1997 and 2010 according to the entities bearing the loss (PLN billion) [3] (Wieteska-Rosiak, 2011, p. 160)

The losses in the LSGE infrastructure in 2010 include many elements indispensable to proper functioning of local communities, such as roads and bridges or schools and nursery schools (Table 2).

Table 2: Infrastructural renovation needs due to the 2010 flood; in numbers (own work based on the Ministry of Internal Affairs and Administration data)

Type of flood loss in 2010	Number
Number of victims (evacuated)	266 000 (30 000)
Length of damaged roads in gminas, poviats and voivoideships	80 000 km
Length of national roads requiring repair	1 160 km
Length of flood barriers requiring modernization or total reconstruction	1 300 km
Number of bridges requiring renovation	59
Number of landslides to be removed	111
Number of schools affected by the flood	800
Number of nursery schools affected by the flood	160

According to the Government Centre for Security, the pattern of flood threat occurrence is not regular – the voivoideships that are most threatened by the occurrence of flood are: małopolskie, podkarpackie, śląskie, dolnośląskie and opolskie. Floods constitute a threat for territories and infrastructure in 1039 gminas, including inter alia 86 500 residential buildings, 2600 public utility buildings, app. 2 thousand bridges and 280 sewage treatment plants. The official data from the Polish Central Statistical Office almost exclusively concerns the losses to the property of LSGE (Chart 3). Almost 100% of the losses registered in 2010 are the self-government losses[4].

---

[3] The total value of losses for the year 1997 is almost consistent with the Polish Central Statistical Office estimation and it amounts to 12.8 billion; in 2010 the total value of losses presented in the chart amounts to 10.9 billion – app. 3 billions of losses are not included in the Polish Central Statistical Office estimations.

[4] As mentioned before, the Polish Central Statistical Official (GUS) in its official statistics noted exclusively the data from the records of the Ministry of Internal Affairs and Administration. This statistics barely includes losses other than self-government losses.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 3: Losses in the self-government infrastructure (Own work based on Polish Central Statistical Office data)

According to the data collected by the Supreme Chamber of Control (NIK), in 1997 the estimated loss of the commune property amounted to PLN 3085.4 million [NIK, 2000]. In the records of the Ministry of Internal Affairs and Administration it is noted that in the 2010 flood the self-government property losses were 1 billion higher – 4411 million and it constituted over 30% of all estimated losses.

4   FINANCING FLOOD EFFECTS IN LOCAL SELF-GOVERNMENT UNITS
So far, no comprehensive solution that would enable financing the effects of a catastrophic event has been developed in Poland. In case of small-scale events the financing is based predominantly on own resources (private or public) as well as on compensations in respect of property insurances. Financing the effects of large-scale and big range catastrophic events looks slightly different. This situation concerns not only the losses borne by individuals but also by public entities, including territorial self-governments.

The analysis of financing of the 1997 flood has shown that the losses in the area of the dolnośląskie voivoideship constituted app. 70 % of all losses in the municipal property in Poland. The funds collected to cover the losses were enough to satisfy only app. 14% of the financial needs.

The main source of financing the flood losses in the municipal property was the national budget (50.9%), followed by national special purpose funds and government agencies loans and subsidies (14.2%) and the support of the EU (14%). 67.8% of the funds came from the national public sources.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 4: Breakdown of the sources used to cover the losses in 1997 (%) (Own work based on Supreme Chamber of Control data)

The significance of the compensations from property insurances was minimal (0.1%). In comparison, almost 10% of the total loss (private and public) borne as a result of the flood in 1997, was financed by insurance companies. Therefore, most insurance compensations concerned the private sector.

A part of the gminas' budget associated with eliminating the consequences of natural disasters showed a deficit of PLN – 402.5 million (Table 3).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Revenues and expenses of self-government units in respect of elimination of the consequences of natural disasters in 2010 (PLN million) (Own work based on Polish Central Statistical Office data)

Revenues in respect of eliminating the consequences of natural disasters, including	**2309.0**
direct loss settlement	185.4
social welfare	746.7
Expenses in respect of eliminating the consequences of natural disasters	**2711.5**

The gminas' revenues in over 86% came from public funds (Table 4). Government subsidies covered benefits for the flood victims and the ongoing flood-control action. The subsidies for property renovations constituted only app. 17% of the damaged property value. In the years 2010-2011 the State spent PLN 3.33 billion on eliminating the consequences of natural disasters, including app. PLN 1.66 billion for damaged property renovation which was app. 40% of all property losses caused by the flood. Since the size of the flood losses in 2010 was higher than 1% of GDP, it was possible to solicit support from the EU. The European Parliament and the Council of the European Union allowed the mobilisation of the resources from the EU Structural Fund in 2011 in order to reconstruct the self-government infrastructure.

Table 4: The EU and government support for self-government units affected by the flood in 2010 (PLN million) (own work based on Ministry of Internal Affairs and Administration data)

Financing purpose	2010	2010-2011
Direct loss settlement	201.00	201.00
Benefits for the flood victims	750.00	923.00
Subsidies for self-government property renovation	686.00	1 659.80
Flood-control programme (for self-government)	367.40	554.00
Other support		299.54
Total government support	**2 004.40**	**3 337.80**
Including resources from the EU and the 3*200 Programme		**3 770.35**

Regrettably, in case of the year 2010 there is no data on the compensations from insurance companies that were received by self-government units. However, it is worth mentioning that the level of financing of all losses caused by the 2010 flood, based on insurance compensations, was raised from 10% in 1997 to over 12% in 2010.

The main sources of funds used for eliminating the consequences of natural disasters are: government support, support from other public financial sector entities as also the EU support. The scale of financing allows to reconstruct only some elements of the self-government units' property – in the year of the flood it was merely a dozen or so per cent. Such situation, therefore, made it impossible for local communities to function properly.

5   THE NEW SOLUTION OF FINANCING THE CONSEQUENCES OF NATURAL DISASTERS IN LOCAL SELF-GOVERNMENT PROPERTY

When it comes to financing catastrophic events we can identify two main mechanism types – self financing and transfer of financial risk. The former is the ex ante financing, which means financing via a catastrophic fund consisting in the budget surplus transferred to the fund by

entities or conditional credit contracts which guarantee that the bank is ready to mobilise the resources in case of a catastrophic event. The latter is the ex post type that is associated with taxes imposed as a result of a catastrophe, mobilisation of budgetary reserves, credits etc. The transfer of financial consequences of risk occurrence can be conducted by the implementation of insurance or non insurance solutions. For non insurance solutions the transfer of the consequences of natural disasters (including floods) for self-government units could be aimed at financial markets and conducted via, for example, risk securitisation – catastrophe bonds (transregional and transnational).

Insurance methods (i.e. transfer to the insurer) could be based on an obligation to insure the self-government property, create insurance pool or to appoint a mutual insurance company. Such a mutual company could function as a big public or regional mutual insurance companies, that could aim at establishing an association. In the case of mutuality, however, the State should play an essential part as the reinsurer of 'last resort' – by intervening only when the losses are too high to be covered by way of normal insurance activity. This would not involve public resources in financing any commercial activity but would significantly guarantee solvency of such an insurance company.

5.1   Insurance mutuality in financing the consequences of catastrophic events
The process of insurance mutuality is generally realized by insurance companies called mutual insurance associations. Mutual insurer's members mutually protect themselves from adverse effects of random events. Such a solution has both, advantages and disadvantages (Table 5)

Table 5: Disadvantages and advantages of a catastrophic mutual insurance company

Advantages	Disadvantages
• awareness of an 'own' insurance company (advantage for regional solutions) • lower cost of insurance • autonomy in surplus management • insurance coverage for a risk that the market does not want or which has inadequate market price • insurance budget stabilisation (independence from price volatility and insurance coverage availability), • risk management centre • direct access to the reinsurance market (direct negotiations, lower reinsurance cost, higher flexibility of the reinsurance programme) • no need to organise tenders for insurance contracts concluded with a TUW by entities being a TUW member. • aiming at including other insurances • influence on increasing competitiveness on the insurance market (reduction prices on the market) • lower capital and solvency requirements	• in case of the regional solutions necessity to additional risk spread, • limited ability to control claims and influencing its reduction, • tendency to an ex gratia compensation • lack of knowledge about the concept of mutuality in self-government, • short-term insurance policy (risk management) in self-government units or its lack, • high cost and relatively complicated procedure of an entity's organisation, • necessity to accumulate initial capitals, • lack of the state/European Commission's insurance policy for the support of the TUW activity, • necessity to accept legal solutions (especially in the scope of a government acting as a reinsurer of "last resort") by government/politicians/EU, • a new system of solvency assessment of insurance companies (Solvency II) and in the future, forcing the concentration of small TUWs, making their activity similar to that of a joint stock company or even converting them into traditional joint stock companies.

The main strength of the solution based on insurance mutuality would be the awareness of an "own" insurance company. Here we should point at the advantage of regional solutions over

an entity in the form of a large, public insurance company, which could be perceived at the local level as an "outside" company.

The form of a mutual insurer essentially allows to lower the cost of insurance (which can be reduced by eliminating the total acquisition costs), also thanks to the freedom of disposal of any surplus. Unfortunately, in the case of a catastrophe risk (especially the natural disaster) there is a de facto lack of ability to control the claims and the impact on its reduction. Mutual insurer, however, allows for insurance coverage of the risk that is "not wanted" by the market or for which the price is inadequate, which can be more often observed in the market for the risk of flooding. Mutuality would allow self-government units to stabilize the insurance budget by getting isolated from price fluctuation and making the coverage available in the insurance market, and, what seems to be very important, such a company could become a risk management centre. In the case of self-government units, according to the research, the risk management process is not functioning effectively. An own insurance company would have direct access to the reinsurance market. Direct negotiations would result in lower reinsurance cost and greater flexibility of reinsurance program.

The mutual insurance solution, especially as far as regional companies are concerned, would require additional risk spreading – when catastrophe risk occurs in the region, the regional TUW, despite the reinsurance program, may not be able to pay the compensation or the liability of the State as the reinsurer of last resort could be very high. Additional spreading may be provided through mandatory exchange of risk between mutuals.

Major constraints for the development of this solution is the lack of knowledge of the idea of mutuality at self-government and central levels. Also, quite a high cost and relatively complicated procedure of the entity's organization as also lack of specialized self-government staff are the possible disadvantage.

Lack of an insurance policy of the State and the European Commission to support the activities of mutual insurance is a threat to this concept. A new system for solvency assessment of insurance companies (Solvency II) is the possible future forcing the concentration of small TUWs, making their activity similar to that of a joint stock company or even their commercialization.

In case of creating a mutual insurance company for local, self-government communities, it is also worth to indicate an extremely high social value of this form of insurance activity.

6   CONCLUSION

The scale of budgetary one-off engagement of funds and the discretionary power of this solution prevents normal reconstruction of gminas property potential, and thus prevents appropriate implementation of tasks by territorial self-governments. It is impossible to meet the social needs or raise the standard of living of the inhabitants when rapid and complex loss recovery in the infrastructure is not provided. Such a situation necessitates a search for a system solution that would guarantee compensations to self-government units in case of natural disasters on both supra-regional and local scale. Such a solution could be the result of activities of self-government units themselves, which could, on their own initiative, supported by the activities of the State, create a system based on insurance mutuality. Lack of awareness and lack of insurance policies at both local and state level constitute threats to the proposed system solution.

ABSTRACT

The paper demonstrates methodological aspects of the innovative development diagnostics of a region. These aspects are illustrated by the results of the factor and cluster analyses of the innovative development indicators that assist in the identification of the innovation profile of the Siberian Federal District and the Russian Federation regions. Differences in the sets of factors and indicators that statistically explain the innovative development in Russia and Siberia in different years are demonstrated. Regions of the Siberian Federal District with similar profiles are identified.

Keywords: *Cluster analysis, Factor analysis, Innovation status, Innovation strategy, R&D, Region, Region innovation profile*

1 INTRODUCTION

In the present time regional innovation policy is widely discussed by both researchers and policy makers. Innovations, regional innovation policy, and regional innovation systems were studied by many Russian economists such as I. Dezhina, L. Gokhberg, V. Ivanov, D. Lvov, S. Kazantsev B. Kleiner, N. Kravchenko, B. Lavrovskiy, V. Makarov, P. Minaker, E. Monastirniy, A. Novoselov, G. Untura, M. Yagolnitser, etc. Moreover, recently several official documents and legislative acts that set priorities of the regional policy for the near future have been approved. Examples include: "The Innovation Strategy of Tomsk Oblast" (2003), Law No. 15/2011-OZ "On the Innovation Policy of the Public Authorities of Moscow Oblast" (2009) and "The Innovation Strategy of Krasnoyarsk Krai Until 2020" (2011). To study the innovation dynamics and the scale of innovation activities different methodology is used, including qualimetrics (Kazantsev, 2012) and statistical methods (the factor (Bogachev, Briskin, 2010; Markov, 2010), regression (Suslov et al., 2012) and cluster analyses (Markov and Yagolnitser, 2006; Untura et al., 1998).

Numerous publications of the Institute of Economics and Industrial Engineering of the Siberian Branch of the Russian Academy of Sciences (IEIE SB RAS) demonstrate that the development of Siberia as a resource region does not exclude the active use of innovations in the resource sector as well as the creation of the high tech manufacture. However, innovation profiles of the Siberian regions are very different from each other. This fact should be taken into account when developing strategies for this macro region (Untura, 2012).

The goal of the paper is to analyze scientific and innovative activity indicators of the Siberian Federal District regions using methods of factor and cluster analyses; diagnose the innovative

development of Siberia and compare it to the analogous results for the Russian Federation. The diagnostics[1] of the innovation profile based on the cluster analysis will likely allow taking into account the specific features of regions in the public policy initiatives.

2 EXPERIENCE OF THE STATISTICAL METHODS APPLICATION TO THE EVALUATION OF THE INNOVATION DEVELOPMENT LEVEL

In European literature the experience of the use of factor analysis to study the innovation dynamics of firms, industries and territories is reflected in the works of Radosevic (2011), Kleinknecht, Monfort and Brouwer (2000), Matinez-Pellitero et al. (2008), Srholec and Verstpagen (2008), and also Žížalová (2009). We should note that Scholec and Verstpagen and Žížalová apply a two-stage factor analysis in their research. The direction of the research illustrates an interesting trend: the majority of research is conducted on the micro-level and only a few papers study the innovation policy of territories.

In Russian literature the factor analysis has been applied to the solution of the following tasks: the analysis of the innovation activity in the oil and gas sector (Markov, 2010), of the federal goal-oriented programs (Bogachev and Briskin, 2010), and of the high-tech clusters in Novosibirsk (Markov and Yagolnitser, 2006). These works partly fill the gap in the regional diagnostics of the innovation activity.

However, to our view, it is necessary to develop, adapt and test common statistical methods to fully analyze and *diagnose* the state of the innovative activity of regions in order to develop the targeted regional policy. To do so, it is necessary to unmask indicators that make the highest contribution into the innovative activity of territories by using statistical tools. One of the methods applied in our paper is the principal component analysis that includes factor and hierarchical cluster analysis. Therefore, the importance of the work lies in the possibility to identify the priorities of the innovative activity of the Siberian regions using the comparative statistical tools in Statistical Package for Social Science (SPSS).

3 EMPIRICAL BASE AND RESEARCH RESULTS

For each region we use twelve indicators available from Federal statistics reports of ROSSTAT (Rosstat, 2012). All indicators are grouped according to the LOGFRAME methodology of the World Bank. Logframe groups all indicators into four categories C1 – input, C2 –output, C3 –outcome, C4-impact, where input is the expenditure of resources that results in some output. The outcome of the policy is an application of the output and the macroeconomic impact is the application of the outcome to the one of the spheres of the people's welfare (Kaneva, 2011; Logical Framework Methodology, 2012). Table 1 presents the indicators, their values for Russia and Siberia and the breakdown into classes according to the LOGFRAME methodology.

---

[1] Here and further on we will define diagnostics as "a recognition of a particular object or of a system via a timely registration of their considerable parameters and the following attribution to a particular diagnostic category in order to forecast their behavior and to make a decision to influence the behavior in the desired direction" (Untura, 1998).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Indicators of the innovative activity for Siberian Federal District and Russia in 2007 and 2010

First, using the factor analysis the authors plan to reduce the number of variables and group variables into factors that best describe innovation processes currently taking place in Siberia. Second, the factors will be used to construct regressions to find statistically significant relationships between the variables that constitute factors. Third, the hierarchical cluster analysis will be applied to group regions into clusters with similar innovation profiles. The results are displayed in the dendrograms 1-4.

We applied this methodology to the data from 2007 and 2010 time periods. These years match the ends of the first and the second stages of the Government Development Strategy Until the Year 2020 (Project of the Government Strategy, 2011). The first stage covers years 2006 and 2007, and the second stage covers the period from 2008 to 2010. The results for both periods for Siberia are compared to the analogous results for the Russian Federation.

3.1 Factor analysis of the indicators of the innovation activity of the Siberian regions

3.1.1 Factor analysis of the indicators of the innovation activity of the Siberian regions in 2007 and 2010

The results of factor analysis of the innovation dynamics of the Siberian regions in 2007 are presented in Table 2. Table 2 lists the factor loadings and the rotated components matrix[2].

Table 2: Factor loadings and the rotated component matrix, Siberia, 2007, 10 variables

Variable	Components	
	Factor 1	Factor 2
X_1	**0,963**	**0,208**
X_2	**0,979**	**−0,045**
X_3	**0,928**	**0,203**
X_4	0,755	0,381
X_7	0,567	0,696
X_8	*0,119*	*0,984*
X_9	*0,124*	*0,983*
X_{10}	0,898	0,389
X_{11}	0,898	0,381
X_{12}	**0,980**	**0,118**

We will now analyze factors 1 and 2 from with respect to the variables that constitute the factors. Maximum factor loadings for the factor 1 correspond to the variables X_1, X_2, X_3 and X_{12} (marked in bold text in the table 2). This factor can be characterized as «investments in

---

[2] The procedure of variable space reduction does not have strict rules and is partly subjunctive. Researchers are advised to select variable that have correlations with the extracted factors that are over 0,8 that are also weakly correlated with other factors.

R&D and the human capital». Factor 2 is based on the two variables (marked in italics in the table 3) - X_8- volume of innovation products and services in mln RUR and X_9- volume of innovation products and services of firms that carry out technological innovations. These two variables have factor loadings of 0,984 and 0,983 respectively. This factor can be called «volume of innovation production».

The analysis carried out for 2010 showed that all communalities were greater than 0,8 and none of the variables were excluded from the analysis. Three factors explaining 92% of the total variance were extracted. Factor 1 is a complex factor and consists of the four variables X_1, X_2, X_4 and X_{12}. Some of the variables included are input variables (organizations, personal, expenses on R&D) and some are outcome variables. Generally speaking we can label this factor «effectiveness of the investments in R&D and the human capital» or «the innovation productivity». Factor 2 is based on the variable X_7- expenses on technological innovation, mln RUR. Factor 3 is also based on a single variable. This variable is X_6 - share of organizations that carry out research and development in the total number of organizations (%). We will call this factor «share of innovative organizations».

3.1.2 Comparative analysis of the innovation profile of the Siberian regions in 2007 and 2010

The year 2007 coincides with the end of the first stage of the innovative development of Russia according to the Government Development Strategy of the Russian Federation Until the Year 2020. Table 3 enables us to see how innovation profiles of the Siberian regions change from 2007 to 2010.

Table 3: Factors explaining the innovative development of Siberia in 2007 and 2010

2007		2010	
Factor	**Variables**	**Factor**	**Variables**
Factor 1. Investments in R&D and human capital	X_1 – number of organization carrying out R&D; X_2 – personnel in R&D; X_3 – number of PhD students; X_{12} – internal expenses on R&D	Factor 1. Investments in R&D and human capital	X_1 – number of organization carrying out R&D; X_2 – personnel in R&D; X_4 – number of critical technologies created; X_{12} – – internal expenses on R&D
Factor 2. Volume of innovative products	X_8 – volume of innovative products and services; X_9 – volume of innovative products and services of the organizations that realize technological innovations	Factor 2. Expenses on technological innovations	X_7 – expenses on technological innovations
		Factor 3. Share of innovative organizations	X_6 – share of organizations carrying our R&D

Challenges of the Modern World - Contemporary Economy and Globalization

At the next stage of our research we construct linear regressions based on the variables that constitute the factors. For instance, the regression based on the second factor will take the following form [3]: $X_8 = 186,7 + 1,02X_9$.

We can state that by constructing the regression we found a statistically significant relationship between the outcome variables C3 "volume of innovative products and services" and "volume of innovative products and services of the organizations that realize technological innovations" in 2007. The analogous regressions were built for 2010[4]: $X_8 = 172,3 + 1,18X_9$.

Regressions demonstrate that the volume of innovative products is positively dependent on the volume of innovative products of firms that innovate technologically. This, among other things, means that the state should stimulate activities of firms with the non-financial levers: promote technical parks, technopolises, and different types of associations of innovative firms.

---

[3] Regression coefficients are statistically significant at the 95% level. There are no effects of multicollinearity and heteroscedasticity. R^2=0,99.

[4] Regression coefficients are statistically significant at the 95% level. There are no effects of multicollinearity and heteroscedasticity. R^2=0,98. Darbin-Watson coefficient is greater than 2.

3.1.3 The comparative analysis of the innovation profile of the Siberian regions and Russia (table 4)

Table 4: Factors explaining the innovative development of Siberia and Russia in 2007 and 2010

Siberian Regions		Russian Federation	
2007		**2007–2010**

Factor 3. Share of innovative organizations	X_6 – share of organizations that realize technological innovations		

Another method that allows us to diagnose the innovation development and can influence the realization of the differentiated regional innovation policy for different groups of regions is the cluster analysis (Markov and Yagolnitser, 2006; Untura, 1998).

4   HIERARCHICAL CLUSTER ANALYSES

We then use hierarchical cluster analysis to group regions of the Siberian Federal District into groups with a similar innovation policy5. Cluster analysis results for 2007 for Siberia are demonstrated below (Figure 1).

Looking at Figure 1 we conclude that all regions group into three large clusters and Novosibirsk Oblast as a region with the highest number of research personnel and patents forms a separate cluster. Analogous results for 2010 are presented in Figure 2.

It is evident from the figure that cluster analysis results are almost the same for 2010 and 2007. Novosibirsk Oblast again represents the separate cluster but a new cluster containing small regionsand Zabaykalsky Krai forms. Changes affect other regions in 2010; now small regions belong not to one but to several clusters. Moreover, Altai Krai and Kemerovskaya oblast form one cluster together with small regions.

Distance between clusters
-------------------------5-----------------10-----------------15------------20--------------25
Figure 1: Cluster Analysis for Siberia regions in 2007

---

5 The Ward method is used for calculation of the hierarchical clusters. According to this method initially each object forms its own cluster. At the next step the distance between objects is measured and the pair of objects with the smallest distance between them forms the next cluster. The procedure is repeated until clusters of approximately same size are formed and the inter-cluster variance is minimized. We use Euclidean distance is a measure of the distance because it facilitates the discrimination of clusters. Choosing from a variety of methods we first decided to apply "the nearest neighbor" method. This method states that the distance between the two closest objects in the nearest cluster defines the distance between clusters. There is an alternative method called the farthest neighbor method according to which a distance is defined as the largest distance between two objects in the different clusters. This alternative method was then used because the results were easily interpreted.

Challenges of the Modern World - Contemporary Economy and Globalization

Distance between clusters

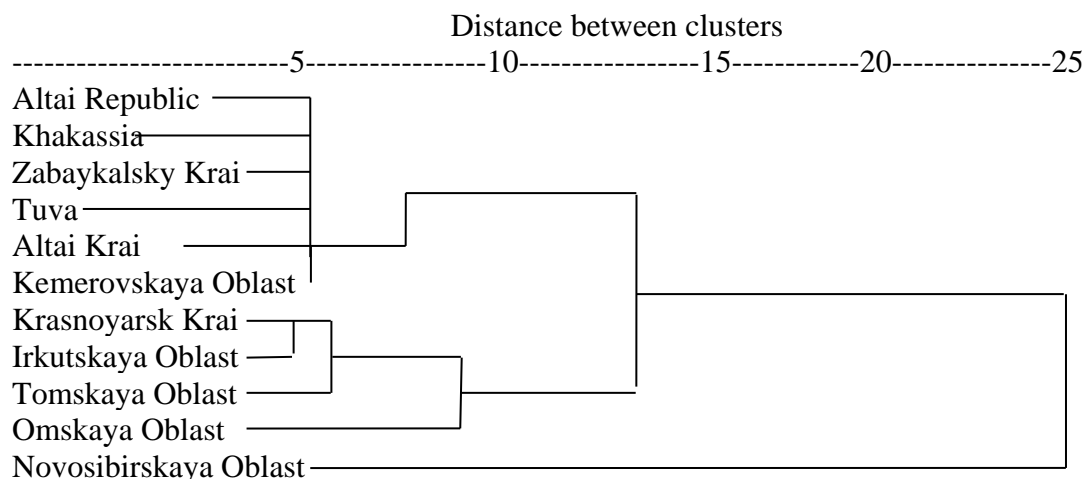
```
--------------------------5-----------------10-----------------15------------20--------------25
Altai Republic
Khakassia
Zabaykalsky Krai
Tuva
Altai Krai
Kemerovskaya Oblast
Krasnoyarsk Krai
Irkutskaya Oblast
Tomskaya Oblast
Omskaya Oblast
Novosibirskaya Oblast
```


Figure 2: Cluster analysis for Siberian regions in 2010

After having analyzed the results of the hierarchical cluster analysis presented in Figures 1 and 2 the authors excluded the factor of size of the regions. To do that all indicators were changed to the following:
- number of graduate students per 10 000 people;
- number of researchers per 10 000 people;
- expenses on technological innovations per 1000 rubles of GRP;
- volume of innovation products and services per 100 rubles of GRP, etc.

Two indicators were excluded from the analysis:
- number of organizations carrying out R&D;
- share of organizations that realize R&D in the total number of organizations.

After that the standard hierarchical cluster analysis procedure was performed for 2007 and 2010. The "farthest neighbor method" and Euclidian distance were again applied. The results are presented in Figures 3 and 4.

Figure 3 demonstrates that all Siberian regions group into the four large clusters. Kemerovskaya Oblast represents a separate cluster as a region with the greatest volume of innovative products per 1000 RUR of GRP and the greatest number of the leading technologies used per 1000 researchers. Tomsk and Novosibirsk Oblast as the regions with similar innovation profiles also represent the separate cluster. As before, small regions are grouped together into the third cluster. All other regions are grouped into the forth cluster.

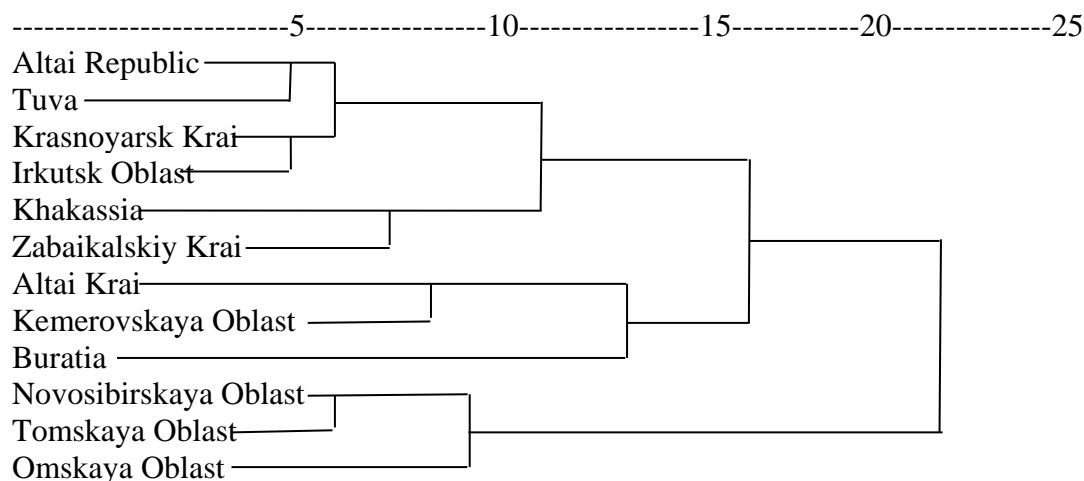
Distance between clusters
Figure 3: Results of the cluster analysis when taking into account the size of regions, 2007


Figure 4: Results of the cluster analysis when taking into account the size of regions, 2010

Results of the cluster analysis of the Siberian regions when taking into account size of the regions (Figure 4) for 2010 are hard to interpret. At the first iteration Novosibirsk, Tomsk and Omsk Oblasts form one cluster and Altai Krai and Kemerovo Oblast form a different cluster. The third cluster includes Tuva and Altai Republic. After taking into account the size of the regions small regions now belong to different clusters in accordance with different priorities of their innovation policies.

5   CONCLUSION

Regression analysis demonstrated statistically significant positive relationships between the variables X_8 and X_9 at the level of the Siberian Federal District. Also regressions can be used to forecast profiles for the near future. The hierarchical cluster analysis showed that in 2007 in Siberia three clusters existed. Novosibirsk as the innovation leader formed the separate cluster. Small regions also were grouped separately. Similar results were obtained for 2010. The exclusion of the size factor led to the change in the cluster structure. Novosibirsk and Tomsk Oblasts were included in one cluster as the regions with the similar innovation

profiles. Small regions again formed the separate cluster. Results for 2010 were non-demonstrative and difficult to interpret.

THE EFFECT OF PUBLIC INVESTMENT AND FIRM-BASED INVESTMENT INCENTIVES ON EMPLOYMENT: A PANEL DATA ANALYSIS FOR TURKEY

Hacer Simay Karaalp

Pamukkale University, Faculty of Economics and Administrative Science, Turkey
skaraalp@ pau.edu.tr

ABSTRACT

This paper investigates the effects of two public policies, public investments and the firm-based investment incentives within the context of Law No. 5084, which considers the support of employers' social security premium payments on the private sector employment at the NUTS 3 regional level (81 provinces) of Turkey for the period of 2002-2011. To the best of the author's knowledge, there appears to be no empirical study that deals with the effectiveness of both public investment and the investment incentive within the context of Law No. 5084 on employment at the regional level. The results indicate that both public investments and incentive investment have a positive impact on employment. Moreover, the estimation results show that provinces where firm-based incentive investment was applied within the context of Law No. 5084 indicate a significantly better effect on employment in the following year. However, during the interpretation of the analysis one should also take into account the faults of the implementation. On the other hand, public investment for infrastructure and education also affected employment positively.

Keywords: Employment, Firm-based investment, Public investment

1 INTRODUCTION

Although the effectiveness and the success of the public policies on private sector performance have been discussed since the earlier regional development policies, they still preserve their prominence in the development process of countries, especially to stimulate economic activities in the lagged regions and thus to attract investment, government support for firms' production and investment costs by applying public policies. Therefore, firms' competitiveness and the scale of new investments will increase and new employment opportunities will be revealed.

Turkey, which is an emerging economy, has been struggling with regional and local economic development problems like many other developed and developing countries. One of the main problems in Turkey is the unbalanced economic development between eastern and western regions of the country. Since the inception of the Turkish Republic and with the initiation of the planned period since the 1960s, different regional development policies have been implemented in order to induce investment, to create jobs and to increase growth in low income regions to equalise interregional per capita income. While, in the period of etatism, the main attempts were towards the redistribution of public services and industrial investment to different parts of the country in order to develop a national economy, since the planned period regional development policies have focused on the growth centres. After the 1980s, following the rise of endogenous development theories in regional economy, the incentives for enhancing local potentials in priority regions for development (PRD) was applied in the regional policy of Turkey (http://research.sabanciuniv.edu/8875/1/MILESTONES_OF_REGIONAL_POLICY_IN_TU RKEY.doc). In the 1990's, in parallel with the rise of the new regionalism approach, the

effect of active regional policies in general and the necessity of public intervention gained importance (Karaçay-Çakmak and Erden, 2004; Pirili, 2011). In this context, during the last decades of the 20th century, Turkey's attempts to adopt the regional policy criteria of the EU in order to harmonise its legislation and the effect of public policies in regional economic development also became important in Turkey. Within this framework, Law No. 5084 enacted in 2004 comprises of the incentive for regional investment and employment as the most comprehensive and the most recent regulation for 49 provinces.

Investigating the impact of public policies, in this context public investment and incentives, together or separately on output and employment has been an issue for limited empirical studies dealing with the national and regional levels of Turkey in recent years (see Kaynar, 2001; Karaçay-Çakmak and Erden, 2004; Ay, 2005; Erden and Karaçay-Çakmak, 2005; Akan and Arslan, 2008; Özkök, 2009; Eser, 2011; Yavan, 2011). The results of these studies generally point to the positive effects of investment incentives on output and employment. However, some studies found no clear evidence of the positive effect of investment incentives (see for instance Karaçay-Çakmak and Erden, 2004; Erden and Karaçay-Çakmak, 2005; Eser, 2011). Eser (2011) concluded that, although the effect of investment incentives with Law No. 5084 increased employment in the less developed regions, due to problems arising from the structure of investment incentives they were sometimes inefficient in directing the investments in terms of regions and sectors. On the other hand, most of the limited number of empirical studies analysed the impact of public investments on income with the national and regional levels (see Karadağ, Önder and Deliktaş, 2004; Yıldırım, 2005; Deliktaş, Önder and Karadağ, 2009; Önder, Deliktaş and Karadağ, 2010). According to the findings of these studies, public investment is an effective policy tool for increasing regional income and reducing regional disparities.

Therefore, the main aim of this paper is to analyse the effects of two public policies, public investments and the firm-based investment incentives within the context of Law No. 5084, which considers the support of employers' social security premium payments on the private sector employment at the NUTS 3 regional level (81 provinces) of Turkey for the period of 2002-2011. To the best of the author's knowledge, there appears to be no empirical study that deals with the effectiveness of both public investment and the investment incentive within the context of Law No. 5084 on employment at the regional level. In this respect, the present study is the first attempt to investigate the effects of both public investments and the incentive investment on employment by using panel data analysis.

The remainder of this paper is organised as follows. Section 2 provides basic information about the regional development theories. Section 3 gives brief information about public investments and the investment incentives in the regional development of Turkey. The methodology and the data set employed in the study are presented in Section 4. The panel data estimation results are given in Section 5. The paper concludes with a summary analysis of the findings in Section 6.

2   THE REGIONAL DEVELOPMENT POLICIES

The regional disparity which is the economic and social opportunity gap among regions has been one of the most important issues in terms of economic and regional development in all countries since the industrial revolution. During the development efforts of countries, while some regions stand out among others and attract capital, investment and population, some regions lag behind. Since regional disparities threatened the economic development of

countries, finding a solution became necessary for all countries. First of all, there was an attempt to explain regional disparities in terms of economic, historical, geographical, social and cultural factors. However, due to insufficient explanation of these factors, the need for new approaches emerged.

The method of solving regional disparities differs according to the dominant economic approach in the world economy. Although many differences, controversies, conflicts and renewable theories could be observed from the 1930's to the mid-1970's, the common aim of all approaches was to emphasise the necessity of implementation of active public intervention to eliminate income inequalities and to boost economic and regional development. During this period, due to the hegemony of Keynesian economics, the widespread solution of inequalities was based on government intervention and planned development (Karaçay-Çakmak and Erden, 2004; Kadıoğlu, 2007; Pirili, 2011).

However, at the end of the 1970's, traditional regional development approaches started to lose their hegemony. This was due to Keynesian economics having failed to find solutions for consecutive economic crises, and the globalisation trends which emerged with the rapid improvement of technology, which also affected regional development aspects. Secondly, the unsuccessful results of the traditional regional development policies for reducing the income gap between developed and developing countries and the regions in the 1950's and 60's weakened the fundamental basis of active and planned regional policies. Moreover, countries could not afford to finance regional planning policies due to economic crises. Therefore, the Keynesian approach, government intervention in economic development and thus the implementation of public investments and incentives were abandoned, and the Neo-Classical economic policies which advocated the shrinking of government in every field of the economy were revived. In this context, the subjects of economic stabilisation, deregulation, privatisation and economic efficiency started to be discussed. However, although the intensive use of regional planning, public investments and investment incentives decreased, they continued to be used (Karaçay-Çakmak and Erden, 2004; Pirili, 2011). At the end of the 1970's, with the effect of the Neo-Classical paradigm and globalisation, a new regional development approach started to arise. Instead of a government controlled development model, the new model - called 'endogenous regional development' - was based on regional or local entrepreneurship and self-developed mechanisms.

However, since the 1990's, the importance of regional development differences and the implementation of active regional policies in general and the necessity of public intervention have revived again. Following these developments, the reasons of emerging new aspect - called 'new regionalism' - can be classified as follows: especially since the mid-1990's, the local unit-based approach to regional or local entrepreneurship was not effective in less developed countries and regions due to limited resources and inadequate opportunities. The new regionalism and the new role of the government were also evaluated in the EU's regional development policies. Throughout the enlargement process of the EU, with the integration of less developed countries and regions, the significant income gap between regions started to threaten the economic and social integration of the EU. For this reason, and to reduce income disparities, the implementation of regional development policies and thus the need for public policies became important (Buton, 1998; Pirili, 2011). Under the framework of EU regional development policies, the EU adopted the obligation of using public funds to boost economic activities for private investment and entrepreneurship in less developed regions parallel with a new regionalism approach (Karaçay-Çakmak and Erden, 2004). Therefore, in the 1990's a

new regional development approach was formed with the contribution of the 'new economic geography', which adopted the theoretical and technical propositions of the endogenous growth model to the spatial and regional level (Krugman, 1991a; Krugman, 1991b; Porter, 1990) and the Neo-Shumpeterian approach (see also Pirili, 2011).

Within this framework, the regions with efficient infrastructure and human capital and sufficient institutions contributing technological improvement and innovation would develop and grow more than other regions. Therefore, the importance of the government's contribution or the effect of public policies in regional economic development became important. In this context, this study focuses on the effectiveness of two significant public policy tools, public investments and investment incentives, in the economic development of regions and, therefore, in employment.

Public investments are one of the most preferred tools for governments to reduce disparities between regions and to boost economic development (Sturm, Jacobs and Groote, 1999). Public investments are composed of various types of physical investment, such as transportation, energy, water and social investments (human capital investments) such as health, education and services. In this context, the types and the geographic distribution of public investment projects are two of the most controversial issues in regional development.

Due to less developed regions lagging behind, they cannot boost economic activities by themselves with their limited resources. The main characteristic of the less developed regions is the low income level because of the lack of employment-creating economic activities. In this case, to improve the environment for entrepreneurship and to attract new investment into less developed regions, the government should apply some facilities and advantages to the entrepreneurs that prefer to invest in these regions. Therefore, public investments support the physical and social development of the regions and increase the attractiveness of the regions for investment. As a result, a region with adequate infrastructure, low cost energy and effective human capital will attract investments, increase economic activities and therefore create employment. Another significant tool used to reduce disparities among regions is investment incentives.

Investment incentives are another important regional development tool that has been used in many countries. As a public policy, investment incentives play a crucial role in boosting the economic activities in the less developed regions, as well as public investment. Incentive is the financial or non-financial support, aid or encouragement that is applied by the government with the aim of providing more and faster development of specific economic activities. One of the objectives of investment incentive policies is to implement specific incentive policies with a view to speeding up the development of economically and socially underdeveloped regions (Özaslan, Dinçer and Özgür, 2006). Incentives can be stated as grants in aid, subsidies, transfer expenditures to producers, premiums and supports (Kadıoğlu, 2007). Without contradicting international obligations and in accordance with the foreseen targets of the development plans and annual programmes, incentive is the support and the lead of investments to eliminate regional disparities, to create employment, to use advanced, suitable and high value added technologies and to provide international competitiveness. The efficiency of incentive tools and the incentive implementations that are used to eliminate regional disparities can differ according to the development programmes and the economic and social characteristics of countries (Ildırar, 2004).

Challenges of the Modern World - Contemporary Economy and Globalization

Incentives (classical incentives) can be classified according to three groups: financial incentives, tax incentives and indirect financial incentives. Financial incentives are grants, loans and loan guarantees and insurance provided by the government. The aim of the implementation of tax incentives is to increase investments and employment in less developed regions, and to support specific sectors and economic activities. The principal and most common tax incentives are tax holidays, accelerated depreciation implementation, investment allowances and tax credits, income and corporate tax reductions, indirect tax exemptions and free zones. In this context, by using these incentives, the plant location choice of entrepreneurships tries to be conducted to less developed regions. By providing these facilities, less developed regions try to become advantageous for starting a new business or decreasing production costs. Indirect financial incentives can be classified as regulatory incentives to improve environment, health, labour and safety standards, and to give education-based incentives for entrepreneurs regarding the infrastructure and pre-investment technical issues, giving priority to public procurement in some sectors or types of investment, protection against imports, and supporting investments that increase exports. In recent years, incentives have been used not only for investment, employment and exports but also to promote R&D and innovation in firms. Through the gaining importance of the development of the small- and medium-sized enterprises (SMEs) and the increase of competition with the support of new initiatives, the components of the incentives expanded to the 'new generation incentives', such as providing information and consultancy activities for SMEs, incubator centres, employment training, suporting R&D centres (Eser, 2011).

Both in the developed and developing countries the ultimate aim of public policies is economic development. In the developed countries, the public policies such as public investments and incentives are applied to develop the lagging regions, to decrease unemployment, to sustain technological improvement and to increase productivity in certain activities. But in the developing countries the importance and the need for public policies increases due to common economic problems such as high inflation, unemployment, high interest rates, increasing debt burden and inequality in income distribution (Özkök, 2009). In the developing countries, public policies play a crucial role in reducing regional disparities, in creating employment, in stimulating the production of value added products, industrialisation, increasing international competitiveness and, therefore, the economic development of the country.

3   REGIONAL DEVELOPMENT POLICIES IN TURKEY

Turkey is composed of different regions with different economic, social and cultural characteristics. Thus, reducing the regional disparities between the regions of Turkey has been an important issue in terms of regional economic policies since the foundation of the Republic of Turkey. In this context, the regional development policies can be evaluated between two separate periods, before and after the 1990's (see also Eser, 2011).

The special importance and the aim of reducing development differences among regions has been attributed to the planned era. The elimination of the imbalance between regions has been one of the priority areas in all development plans devised (Özaslan, Dinçer and Özgür, 2006). From the first development plan (applied between 1963 and 1967) to 1999, development plans have been based on national development rather than regional development. Regional development was considered within the narrow scope of public development planning and evaluated within the framework of an integrated approach including physical, social and economic dimensions. With the initiation of the planned period since the 1960s, regional

policy has been mainly shaped by development efforts focused on growth centres. Especially after the 1980's, following the rise of endogenous development theories in regional economy, the incentives for enhancing local potentials in PRD and supporting local entrepreneurship and local actors have assumed an important place in the regional policy of Turkey (http://research.sabanciuniv.edu/8875/1/MILESTONES_OF_REGIONAL_POLICY_IN_TU RKEY.doc). Priority has been given to underdeveloped territories in the distribution of public investments in all plans and programmes. Through PRD policies the priority was given to the less developed east and south-east Anatolia regions and Black Sea regions. However, except the South-eastern Anatolia Project (SEAP), one the most important of these plans, other integrated regional development policies[1], could not achieve a considerable success. These precautions were not sufficient to eliminate regional differences, migration, and rapid population increase in large cities. The late 1990s and early 2000s, significant developments experienced for regional development incentives. Since the 1990's, Turkey has tried to develop its regional policy in compliance with EU regional policy, introducing structural reforms for reducing regional disparities in the country (http://research.sabanciuniv.edu/8875/1/MILESTONES_OF_REGIONAL_POLICY_IN_TU RKEY.doc). Between these years, direct policies (such as to provide credit facilities) applied to the regions to continue the uncompleted investments in the less developed regions (with Law No. 96/8905 dated 07.11.1996) and with Law No. 4325 dated 23.01.1998 the PRD was identified and incentive policies were introduced for these areas. Also, with Law No. 99/12478 dated 26.02.1999, electrical energy support was provided for investments located in the less developed regions.

3.1 Law No. 5084

In recent years, to reduce regional disparities, incentive policies have become prominent. To speed up the investments and employment and to increase the contribution of the private sector to the regional development, new incentive policies started to be used in 2004. Law No. 5084, enacted in 2004, which comprises incentives for regional investment and employment, is the most comprehensive and the most recent regulation in Turkey (Eser, 2011). The aim of the law is to increase investment and employment in the less developed provinces by implementing tax and insurance premium incentives, giving energy support and providing free investment place allocation. Law No. 5084 comprises 49 provinces.

In the first version of Law No. 5084 in 2004, 36[2] provinces were selected according to the following criteria: The per capita GDP level was lower than 1,500US$ in 2001 and provinces were evaluated in the PDAs. The private firms located in these provinces could benefit from the income tax being withheld from the wages of new personnel, treasury's contribution to the employers' social insurance payments, energy support and the investment place free of charge. In 2005, with Law No. 5350, 13[3] provinces whose social economic development index as

---

[1] Other regional policies: Eastern Marmara Planning Project, Antalya Region Project, Çukurova Region Project, South-eastern Anatolia Project (SEAP), Zonguldak-Bartın-Karabük Regional Development Project, Eastern Anatolia Project, Eastern Black Sea Regional Development Plan and Yeşilırmak Basin Development Project.

[2] 36 provinces were included in the investment incentives under Law No. 5084 in 2004: Adıyaman, Afyon, Ağrı, Aksaray, Amasya, Ardahan, Batman, Bartın, Bayburt, Bingöl, Bitlis, Çankırı, Diyarbakır, Düzce, Erzincan, Erzurum, Giresun, Gümüşhane, Hakkari, Iğdır, Kars, Kırşehir, Malatya, Mardin, Muş, Ordu, Osmaniye, Siirt, Sinop, Sivas, Şanlıurfa, Şırnak, Tokat, Uşak, Van and Yozgat.

[3] 13 provinces were included in the investment incentives under Law No. 5350 in 2005: Kilis, Tunceli, Kastamonu, Niğde, Kahramanmaraş, Çorum, Artvin, Kütahya, Trabzon, Rize, Elazığ, Karaman and Nevşehir.

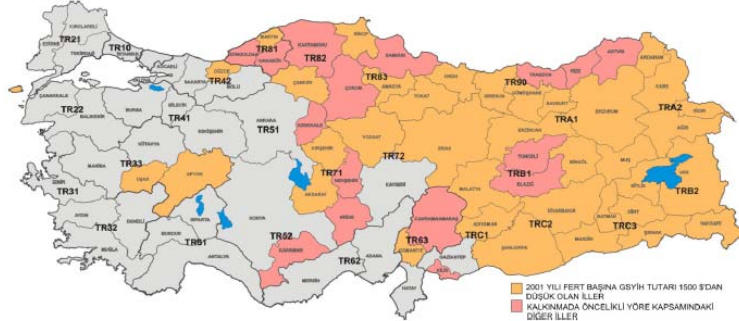
determined by the State Planning Organisation (SPO) was found to be negative in 2003, were included in the scope of the classification. Moreover, with Law No. 5615, the Gökçeada and Bozcaada districts of Çanakkale[4] were included within the scope of the incentives (http://ekutup.dpt.gov.tr/plan/plan9.pdf).


Figure 1: Provinces under the Law no 5084 (Eser, 2011)

According to Figure 1, except for Gaziantep, nearly all the provinces in east and south-east Anatolia were included in the scope of Law No. 5084. In the western part of Anatolia only Kütahya, Uşak, Afyon and Düzce and the Bozcaada ve Gökçeada districts of Çanakkale were included. In Figure 1, the significant development differences can be observed between the eastern and western parts of Turkey, therefore the aim of Law No. 5084 was to eliminate this disparity.

To this end, the incentives applied within the framework of Law No. 5084 comprise an income tax withholding incentive, employer's contributions in insurance premium incentive, free investment place allocation and energy support (http://www.gib.gov.tr/index.php?id=820). The investment incentive Law No. 5084 which is analysed in this study comprises social insurance payment of employers' contributions by the treasury. According to the law, on the condition that firms locate in the determined provinces and provide all requirements, the treasury will contribute the total share of employers' social security premium payments if the private firms' located in the organised industrial zones, otherwise the treasury will contribute the 80% of the share of employers' social security premium payments if firms locate in other places. However, to cope with the latest financial crisis in 2008, the implementation of Law No. 5084 extended until 31.12.2012 for all incentives except energy support (http://uye.yaklasim.com/filezone/yaklasim/tummevzuat/sgk_genelgeleri/6408866.htm).

4   EMPIRICAL MODEL AND THE DATA
This study tries to reveal the effectiveness of public investments and firm-based investment incentives on employment. Public investments comprise investments for infrastructure and education which can motivate private sector employment. The investment incentive is the incentive of social security premium payments to the private firms which locate in the less developed provinces of Turkey. Hence, a panel data analysis was used by employing data over 10 years.

---

[4] Due to their not being provinces, these small districts are not included in the analyses.

In order to assess the quantitative analysis of the effects of the public policy instruments (public investments and the firm-based investment incentives) on regional employment for the period 2002- 2011, a simple panel regression can take the following form:

$$LogEMP_{it} = \beta_0 + \beta_2 INVINC_{it} + \beta_3 LogEDU_{it} + \beta_4 LogINF_{it} + \varepsilon_{it} \qquad (1)$$

where $LogEMP_{it}$ is the log of the number of compulsory insured persons in the private sector in province i at time t, $INVINC_{it}$ is the dummy variable taking the value one if firm-based investment incentives are applied in province i at time t and otherwise zero. A significant positive value indicates that the firm-based investment incentive has a positive effect on regional/provincial employment. $LogEDU_{it}$ is the log of the public investments for education in province i at time t, $LogINF_{it}$ is the log of the public investments for infrastructure in province i at time t.

The annual data on employment, public investments for education and infrastructure and firm-based investment incentives data at provincial levels were employed for the aim of the study. The data set covers the time period of 2002–2011 for the NUTS 3 regional level (eighty one provinces) of Turkey. The total number of compulsory insured person in the private sector was used as a proxy for employment. The data was taken from the Social Security Institutions (SSI) for each province. The data for the public investments were taken from the SPO. Instead of using total public investment, public investments for education and infrastructure were included in the model to analyse the impact of specific public policy in stimulating regional employment creation. The infrastructural investments were found by the calculation of energy and transportation investments which are related to output growth and then employment creation in the provinces. The variables were converted into real values using various investment indices. Investment deflators were also obtained from the SPO for the entire period. All the variables are used in logarithmic forms in the study. In order to analyse the effect of firm-based investment incentives within the context of Law No. 5084 a dummy variable was formed for a total of 49 provinces that takes a value of 1 for 36 provinces from 2004 to 2011 and for 13 provinces from 2005 to 2011 after the extension of the law in 2005.

5   ESTIMATION RESULTS

The model (1) was estimated using the panel data regression with one-way fixed effects. Fixed-effect estimation is preferred because the analysis covers the overall provinces and accounts for time-invariant, unobservable heterogeneity among provinces. This choice also corresponded to the results of the F test, which is employed to determine whether to use the fixed-effect estimator or pooled ordinary least squares (OLS). The Hausman (1978) specification test also confirms the presence of fixed-effect model estimation (within estimator). A Hausman specification test shows that the individual effects and the explanatory variables are correlated, therefore indicating that a fixed effects model should be used since a random effects model would be biased (Krumm and Strotmann, 2012; Wooldridge, 2010). During the estimation process, an autocorrelation problem was detected. For this reason, to eliminate the autocorrelation problem, the AR (1) term was included in the equation estimation. The AR (1) term is found to be statistically significant, showing the series does not contain any unit root (Maddala and Wu, 1999; Choi, 2001; Levin, Lin and Chu, 2002). Table 1 summarises the fixed-effects estimation outcomes of the effects of investment incentives and public investments on employment in NUTS 3 regional level (provinces).

Notes: * and ** denotes 1% and 5% levels respectively

The results in Table 1 suggest that, as expected, all the estimated coefficients that affect the employment in NUTS 3 regional level (81 provinces) of Turkey are positive and significant at the 1% and 5% levels of significance. Thus, the results suggest that both public investments and incentive investment have a positive impact on employment. Moreover, the estimation results show that provinces where firm-based incentive investment was applied within the context of Law No. 5084 indicate a significantly better effect on employment in the following year. In line with the expectation, the investment incentive which was given to private firms in the less developed provinces to support the share of employers' social security premium payments is significantly effective on employment. Considering that the total number of compulsory insured persons in the private sector is a proxy for employment, this positive relationship is meaningful. Although the employment growth rate was higher in the provinces under the scope of Law No. 5084 than other provinces also stated in (Eser, 2011), it is important to consider that Law No. 5084 is a firm-based investment incentive and firms, under the condition of at least employing 10 employees and locating in the less developed provinces, can benefit from the insurance premium incentives. In this context, because the employment data that was used in this study comprises the total number of compulsory insured persons in the private sector, it is important to take notice of the increased number of insurance registered workers. Also, as stated in Eser (2011) and Turkish Employment Agency, it was found that some firms try to use Law No. 5084 illegally. To benefit from the advantages of the incentive, by employing at least 10 employees, some firms recorded employees that work informally or else, without working, some firms recorded their relatives to provide insurance facilities. For this reason, although during the interpretation of the analysis it is difficult to prove, it is important to take this special issue into consideration.

The second variable - public investment for infrastructure - is also positively related to employment. A sufficient infrastructure system in the region will attract private firms and individuals and then, by increasing production and employment, it will boost regional development. According to the new economic geography, transportation infrastructure is the basic factor which determines firms' location decisions and the scale of economic activities (Krugman, 1991a; Venables, 1996). Firms will agglomerate in the regions where low energy costs and transportation facilities are provided. Regions which provide lower energy costs will attract more investment and then create employment. To cope with global competitiveness, firms should consider low cost production, productivity and access to large

markets (Demir and Sever, 2008). In this case, especially in the less developed countries, not only aiming to boost national development but also aiming to reduce regional disparities by providing a sufficient infrastructure system will attract private investment, create employment and increase development.

Another significant variable that has a positive impact on employment is public investment in education. Returns on investment in education based on human capital theory have been estimated since the late 1950's (Psacharopoulos and Patrinos, 2002). Human capital theory puts forward the concept that investments in education increase future productivity. In this context, public investments on education indirectly affect the private sector by increasing the productivity and the efficiency of labour and also contribute to the reduction of regional disparities. Educated, productive, skilful, capable of using high technology and highly qualified workers will affect the production, income and development of the regions and therefore countries. Especially in the less developed regions, through public investment on education, different individual opportunities to generate income will converge and boost the employment of labour.

6   CONCLUSION

In this study, the effect of public investments and investment incentives on the private sector employment at the NUTS 3 regional level (81 provinces) in Turkey was analysed. Turkey, as a developing country with unbalanced economic development among its regions, uses various public policies such as public investments and investment incentives to reduce regional disparities and to boost private sector performance. Investment incentives and public investments can be considered important public policy tools explaining the spatial distribution of economic activity, and therefore of employment.

In this context, there are two significant public policy tools: public investments (infrastructure and education) which can motivate private sector employment and firm-based investment incentives which are insurance premium incentives applied to private firms which locate to the less developed provinces of Turkey. Within this framework, in the analysis, the implementation of Law No. 5084 which enacted in 2004 is taken into consideration. Law No. 5084 is the most comprehensive and the most recent regulation in Turkey and comprises the incentive of regional investment and employment. Therefore, the effectiveness of the investment incentives was analysed under the scope of Law No. 5084 which was applied in 49 less developed provinces. Thereby, the panel data analysis was used by employing data for the period of 2002-2011.

The results indicate that both public investments and incentive investment have a positive impact on employment. Moreover, the estimation results show that provinces where firm-based incentive investment was applied within the context of Law No. 5084 indicate a significantly better effect on employment in the following year. However, during the interpretation of the analysis one should also take into account the faults of the implementation. On the other hand, public investment for infrastructure and education also affected employment positively.

Moreover, the results of the study imply that the presence of public policies, public investments and investment incentives give rise to increase employment in less developed provinces. Although the implementation of investment incentives has been the most debatable issue in Turkey, investment incentives are found to be influential in the less developed

provinces. It can be concluded that, provided they are monitored strictly, public investments and incentives could be directed towards less developed regions in order to create employment.

ABSTRACT
Economic growth has been interesting subject for society policymakers during last two centuries. Although growth process caused increase society welfare, but in the long run, it will bring destruction and conversion of natural resources. Economic and social developments, lead to loss the natural habitat for other organisms. One of the destruction signs, conversion of natural grasslands to agricultural land. In this study by investigating of natural habitat of St. John's Wort, Hypericum perforatum, in Mazandaran province we measured importance of human activities on decrease of its natural habitat. In this direction, Economic Assessment process is carried out. Data are gathered from official statistics of the Ministry of Agriculture. Methodology used is social cost-benefit ratio. The results showed that by real prices, with changing from natural habitat of this plant to farmland has caused Community disadvantage and against the sustainability objectives.

Keywords: Cost-benefit, Hypericum perforatum, Ratio, St. John's Wort, Sustainable development

1 INTRODUCTION

The genus *Hypericum* L. belongs to family *Guttiferae* and includes about 450 species (Robson, 2003). *Hypericum* species have been used as medicinal plants for centuries and have an important place among medicinal plants.

The economic importance of the genus *Hypericum* resides largely in a wide range of medicinal effects exhibited by *Hypericum perforatum* L. such as anti-inflammatory, antiviral, antimicrobial, antifungal, cytotoxic, and antidepressant activity (Pilepić et al., 2010). In external use for skin wound healing and burn treatments is used. Recently, much attention has been given to this plant for the treatment of AIDS.

Hypericum species contain a number of biologically active compounds such as hypericin, pseudohypericin, hyperforin, adhyperforin, xanthones, flavonoids, biflavonoids, tannins, and phenolic acids (Greeson et al., 2001). *H. perforatum* is the most important and commercially recognized representative species among *Hypericum* species (Karioti and Bilia, 2010). *H.*

perforatum was among the top 10 best-selling herbal dietary supplements sold in the food, drug, and mass market channel in the United States for 2008, with sales of about $8.2 million (Cavaliere et al., 2009). The production, consumption, and international trade in medicinal plants and phytomedicine (herbal medicine) have grown and are expected to grow further in the future.

Human population growth and the subsequent increase in demand have led to reduce coverage and density of medicinal plants. As the main reasons, Excessive harvesting, conversion of forests and grasslands to Arable land caused destruction of herb natural habitat. This destruction is incompatible with sustainable development and costs, such as soil erosion, increased runoff, reduced wildlife populations, extinction of species of wild plants and generally adverse effect on the ecosystem in the long-term will be imposed on society. One of the ways to preserve forests and pastures is understand those economic interests. In this regard, the estimation of economic benefits of herbs can be useful in protecting it. The purpose of this paper is economic evaluation of Hypericum species that exist in pastures of Mazandaran province and compared with the region dominant crop (rice).

2   DATA AND METHODOLOGY

The research data was obtained through the Questionnaire. Because rice and citrus are as two major crops in the region, in this study, economic return of the two products plus *Hypericum* were considered. 106 Rice- producers and 150 citrus-growers were selected. Questionnaire information included costs, and production level and income. The costs of production were divided into two sections: Annual costs and overhead costs. Annual costs included labour (family and workman), chemical input (Types of pesticides and fertilizers), machines (planting and harvesting), seed (in rice) and Sundries (Freight, repairs, workers lunch, and bags). The overhead costs include land (equal by rent) and depreciation (machines building and other fixed asset).

For assessing cropping patterns, the benefit- cost ratio was applied. In this Criterion, the gross income (average) per hectare is divided on annum value of the fixed cost. If one pattern that its ratio is more than the rest patterns, than it will be priority.

$$\frac{Benefit}{Cost} = \frac{Annual\ income - Annual\ cost}{Annual\ equivalent\ of\ fix\ cost}$$

The B/C ratio indicates how much benefit can get with one unit of fix cost (investment).

3   RESULTS AND DISCUSSION

Rice and citrus fruits (especially orange and tangerine) as the main crops are grown in the region. In this section, the profitability of these agricultural products is compared with the net income from natural habitat of the plant of *Hypericum*. Tables 1 and 2 show the analysis of the cost, income and benefit of rice and citrus respectively.

According to table 1, rice production is very labour-intensive. More than one- third of the total cost is related to labour force. Also, about one- half of cost price of rice is related the overhead. High land prices in the area (extreme land limitation and high demand) causes the expensive land opportunity cost. Since the land quality and production technology in the region are non-homogeneous, the range of the variation of production costs is very extensive.

Challenges of the Modern World - Contemporary Economy and Globalization

However, rice production in all areas is regarded an economic activity (profitable). The average B/C ratio is estimated about 1.4.

Table 1: Cost analysis of rice production per ha in Mazandaran province unit: $US

Type of cost	Mean	Min	Max	Share
Labour	840.1	477.2	1183.5	35.3
Chemical inputs	75.9	15.1	136.9	3.2
Machines	236.9	121.3	313.9	9.9
seed	65.5	35.5	82	2.7
Sundries (others)	41	23	70	1.7
Total variable cost	**1259.4**	**672.1**	**1786.3**	**52.8**
Land	634.6	255	1144	26.6
Depreciation	489	235	1168	20.5
Total cost	**2383**	**1162.1**	**4098.3**	**100**
Total revenue (gross)	3983	2500	6100	
benefit	1600	1337.9	2001.7	

Table 2 shows a similar analysis for the citrus. According to this table, the labour-intensive is less than rice, but the overhead cost is more than rice. Gardens of citrus require several items of costs before economic fruiting. For example, ground preparation, fencing, buying and planting trees, growing period costs for 4 to 7 years. Most heterogeneity of gardens financial balance is due to differences in overhead costs. Citrus production turnover is more than rice. The average B / C ratio is estimated about 3.

Table 2: Cost analysis of citrus production per ha in Mazandaran province unit: $US

Type of cost	Mean	Min	Max	Share
Labour	154.4	53	261	11.9
Chemical inputs	135.9	82	15	10.5
Machines	35	0	66	2.7
Sundries (others)	24.1	12	54	1.9
Total variable cost	**349.4**	**147**	**396**	**27**
Land	634.6	255	1144	49
Depreciation	310	112	580	24
Total cost	**1294**	**514**	**2120**	**100**
Total revenue (gross)	5184	3200	7000	
benefit	3890	2686	4880	

In Table 3, the available benefits in each ha of *Hypericum* are estimated. Since this plant isn't produced now (as an agronomy plant), only the benefit of wild plant in its natural habitat is calculated. In the first step, yield of *Hypericum*, (fresh and dried forms) is measured. Then, using the technical coefficients obtained from Georgeta study (2001), the amount of the valuable material of Hypericin is estimated. Finally, considering the average price of 3% Hypericin concentration, the gross profit is calculated. Certainly by human intervention in growing and maintaining of the plant, the amount of technical and economic return will increase. Because *Hypericum* as a wildlife plant has no production costs, there is no item in

the denominator of ratio when the B/C ratio is calculated. So the only cost is the land opportunity cost which is equated with land rent for rice and citrus. With this assumption, the ratio of B/C in the plant is 4.7 that are more than rice and citrus.

Table 3: Gross income of per ha of Hypericum

Description	Mean	Min	Max
Herb yield per ha (Kg)	14998.3	12431.7	17565
Dry herb yield (Kg)	8999	7459	10539
Dry inflorescence yield (Kg)	18.2	10.2	26.4
Hypericin content (mg)	18.2	10.2	26.4
Hypericin value ($US)*	6333.6	3549.6	9187.2

*1Kg of hypericin (3%) = 10$US

In Chart 1, the B/C ratio of three alternatives products are shown. Conversion of farm land (rice) to garden land (citrus) is a confirmation of these results. But since there aren't any units of Extractor hypericin in region, the interests of *Hypericum* is unknown for public. By investing in the processing and extracting industries of the plant, we can expect maintained pastures will be economic for the community, and this event is in the same line with sustainable development. By sensitivity analysis, if the price of Hypericin decreased to $ 0.63 instead of $1, Hypericum still has profit advantage to citrus production.
Chart 1: The B/C if three alternative product

ABSTRACT
The debt-to-equity choice has always been one of the crucial decisions of the firm's management. The capital structure is vital for the appropriate development of relationships among the company's stakeholders. The conflicts of interests between management and shareholders and creditors as well as conflicts between other groups of stakeholders lead to the appearance of agency costs that decrease the corporate value. The role of agency costs is even higher in emerging markets due to higher information asymmetry, lower development of legal system, investors' protection rights and corporate governance. Our paper contributes to the literature by analyzing the agency costs and capital structure choice on the data of emerging markets companies. Our sample consists of more than 150 companies from BRICS and Eastern Europe within 2000-2010. By conducting the empirical analysis based on both linear panel data regressions as well as simultaneous modeling of leverage choice and management shareholding we obtain the following results. The agency costs are relevant for debt-to-equity choice in Russia, India, China and Eastern Europe but the results are not so obvious in Brazil where financing policy could be explained by trade-off theory. We found out the non-linear relationship between financial leverage and management shareholding which is also in line with agency costs significance. Moreover we revealed that agency costs define long-term leverage, but cannot explain short-term debt in emerging markets. Further, we concluded that debt ratios based on market value of equity are not affected by agency costs opposite to capital structure variables based on book value of equity.

Keywords: Agency costs, Capital structure, Emerging capital markets

1 INTRODUCTION

The choice of capital structure has always been one of the crucial elements of the financial architecture of any firm (Myers, 1999). As financial architecture includes debt–to–equity proportions, ownership structure, and internal corporate governance structures, capital structure becomes a key factor in a firm's value. The capital structure is also vital for the appropriate development of relationships among the company's stakeholders (Opler et al, 1997; Titman et al., 1988). The conflicts of interests between management and shareholders, management and bondholders as well as conflicts between other groups of stakeholders lead to the appearance of agency costs that decrease the value of the company. The role of agency costs in capital structure choice was therefore carefully examined by the researchers in developed markets (Rajan and Zingales, 1995; Vilasuso and Minkler, 2001; Smart et al., 2007). We believe that the role of agency costs is even higher in emerging markets due to higher information asymmetry, weaker legal system and corporate governance mechanisms. However the papers devoted to the agency costs and capital structure interaction in emerging markets are still rare (Chakraborty, 2010; Chen et al, 1997; Icke and Ivgen, 2011; Delcoure,

2007; Deari and Deari, 2009). Thus we contribute to the literature by explaining agency role of financing strategies of the firms in large emerging markets: Brazil, Russia, Eastern Europe, India, South Africa and China.

The paper is organized as follows. We start with the description of agency costs relevance in capital structure choice. We continue with the literature review of empirical papers on agency theory predictions tests to present a set of hypotheses. In the next paragraph we provide the details of the sample and methodology. After that the results of the research are presented and interpreted. Conclusion summarizes the results obtained.

2   AGENCY COSTS AND CAPITAL STRUCTURE: THEORY AND PRACTICE

Agency costs related to capital structure choice were first introduced by Jensen and Meckling (1976). These costs appear as a result of ownership and management functions separation. Samuels (1997) and co-authors define agency costs as direct and indirect expenses that the firm should face to stimulate the management to act in the interests of shareholders and creditors, thus in the interests of all investors.

The influence of agency costs related to shareholder-creditor conflicts on capital structure choice was carefully examined but the results are rather controversial. On the one hand Leland (1998), Moyen (2000), Parrino and Weisbach (1999) concluded that these costs are relatively low and thus have no significant influence on leverage, moreover these costs are insignificant in comparison with the costs that arise from management-shareholders conflicts. On the other hand Childs and co-authors stated that this type of agency costs has a great influence on capital structure choice (Childs et al., 2005).

The degree of management-shareholders agency costs is mostly related to the percentage of shares in management ownership. Several papers revealed the dependence of capital structure and payout policies on the degree of management ownership (Crutchley and Hansen, 1989; Berger et al., 1997; Johnson, 1997). However there could be different explanations of the relationship between the level of chosen debt and management shareholding.

Agrawal and Mandelker (1987) found the direct relationship between the debt level and management ownership. According to the authors the degree to which the management is willing to bear financial risks of the company rises with the management share in equity capital thus leading to the decrease of agency costs. Similar results were obtained by Leland, Pyle (1977) and Kim, Sorenson (1986).

Friend and Lang (1988) however got the opposite results. The authors concluded that the management ownership did not necessarily lead to the decrease of agency costs. Crutchley and Hansen (1989), Friend and Hasbrouck (1987), Jensen, Solberg and Zorn (Jensen et al., 1992) continue with the idea that the existence of costs of financial distress leads to the inverse relationship between debt level and management shareholding. Kim and Sorensen (1986) add that in highly leveraged firms it is easier for the management with substantial ownership degree to keep the control over the firm.

The intricate relationship of financing decisions, company's value and management shareholding led to the appearance of non-linear relationship assumption. Chen and Steiner (1999) empirically proved the non-linear character of the managament shareholding and debt

level relationship that was later also demonstrated by Brailsford and co-authors (Brailsford et al., 2002).

The capital structure in emerging markets has become the focus of academic research in the last decade. The majority of papers however are devoted to the capital structure determinants identification. Although agency costs determinants are also examined there are almost no papers aimed at the careful analysis of various types of agency costs and their influence on debt-to-equity choice.

As the emerging markets differ significantly in the level of institutional, macroeconomic and financial markets development, most papers are aimed at the examination of capital structure choice of a particular country or a group of similar countries Iran (Fathi et al., 2012), Indonesia (Mahadwartha, 2002), Ukraine (Stephan et al., 2011), Macedonia (Deari and Deari, 2009).

The research results do not allow making a final conclusion on the role of agency costs in debt-to-equity choice in emerging markets and vary greatly between countries, research period and methodology applied.

The variability of the results obtained on emerging markets leads to the necessity of thorough analysis of agency costs relevance through the detailed examination of different proxy variables as well as cross-country research. Thus our paper contributes to the literature by introducing the study of capital structure choice under agency costs pressure on emerging markets.

3 METHODOLOGY OF CAPITAL STRUCTURE RESEARCH IN EMERGING MARKETS

Our research model is based on the dynamic partial adjustment model and is constructed to test the following set of hypotheses associated with the role of the agency costs in the debt-to-equity choice:

Hypothesis 1. The higher are selling, general and advertising (SG&A) and R&D expenses the lower is the debt level.

Hypothesis 2. Companies with higher share of institutional investors' ownership tend to have higher debt ratios.

Hypothesis 3. Debt-to-equity ratio is lower in companies where CEO also acts as a Chair of the Board of Directors.

Hypothesis 4. Firms with higher growth opportunities tend to increase the debt level.

Hypothesis 5. There is a nonlinear relationship between managerial ownership and the debt ratio.

Hypothesis 6. The higher is the free cash flow (FCF) the higher is the debt level of the firm.

Our sample consists of large-scale firms from BRICS and Eastern Europe for the period of 2000-2010 financial years. We collected data from Bloomberg database to build panel data for more than 150 companies. We had to take the information from the audited accounting reports and annual reports allocated on the official sites of the companies as well the data provided by the stock exchanges to fulfill the gaps in the sample.

To conduct the research and check the results for robustness we introduce different measurers of capital structure and various proxies for agency costs levels as well as a number of control variables. The description of the variables is shown in the table 1 below.

Table 1: The description of the dependent and independent variables

MO		Managerial ownership share
SGA		The ratio of SG&A expenses to revenue
Instit		Institutional investors share of ownership
RD		The ratio of R&D expenses to revenue
Total5		The largest shareholders' ownership (with a share of more than 5%)
FCF		FCF=(OYBT + DEP – TAX PAID – DIV PAID)/ Book value of equity, where OYBT- operating earnings before tax, DEP-depreciation expenses, DIV-dividends
BOD		Dummy variable: 1 if the CEO is also chairman of the board of directors
Growth		The ratio of the market value of equity to book value of equity
Control variables	PPE	The share of fixed assets (Property, Plant, Equipment)in structure of the company's assets
	ROA	The ratio of net income to total assets
	Size	Natural logarithm of total assets at end of year

The following variables are used as a proxy for leverage:

LEV_T	Short and long-term debt to the sum of total debt and the book value of equity
LEV_TM	Short and long-term debt to the sum of total debt and the market value of equity
LEV_L	The ratio of long-term debt to long-term debt and the book value of equity
LEV_LM	The ratio of long-term debt to long-term debt and the market value of equity
LEV_TA	Short-term and long-term debt to total book value of assets
LEV_LA	The ratio of long-term debt to total book value of assets

The correlation between the independent variables used in the model as a proxy of agency costs, generally confirms the correctness of the variables choice and their consistency. Managerial shareholding is negatively correlated with the free cash flow, growth opportunities, selling, general and administrative expenses, which, being the indicators of agency conflict, should be negatively related to leverage. Share of the largest shareholders is negatively correlated with the SG&A expenses and the share of companies in which the CEO chairs the board of directors - variables that characterize the magnitude of agency costs which also validates the choice of the independent proxy variables.

To test our hypotheses the following panel data regression model was used:

$$LEV=\alpha+\beta_1*MO+\beta_2*MO2+\beta_3*Instit+\beta_4*SGA+\beta_5*Total5+\beta_6*FCF+\beta_7*BOD+\beta_8*Growth+ \beta_9*PPE+ \beta_{10}*ROA+ \beta_{11}*Size+year\_dummy+\epsilon_t \qquad (1)$$

We test random and fixed effects specifications, as well as pooled model of panel data. The choice between these specifications is based on the F-test, Breusch-Pagan and Hausman tests.

However, the possibility of endogeneity (Himmelberg, Hubbard, Palia; 1998; Demsetz, Lehn, 1985) of the managerial shareholding with respect to other characteristics of the company

leads to the necessity of two-step equation models introduction. In this paper a simultaneous equations approach is used to jointly model leverage choice and managerial share ownership:

$$LEV=\alpha+\beta_1*MO+\beta_2*MO2+\beta_3*Instit+\beta_4*SGA+\beta_5*Total5+\beta_6*FCF+\beta_7*BOD+\beta_8*Growth+$$
$$\beta_9*PPE+\beta_{10}*ROA+\beta_{11}*Size+yeardummy+\epsilon_t \quad MO=\alpha+\beta_1*RD+\beta_2*Growth+\beta_3*Size+\beta_4*Instit+\beta_5*LEV+yeardummy+\epsilon_t \quad (2)$$

4 THE RESULTS

The research was conducted separately for different for Chow test proved the impossibility of the samples combination.

For Russian companies the model with random effects was chosen, the results of which are presented in the table. On 5% significance level the managerial share ownership, the managerial share ownership squared, growth opportunities, the share of commercial and administrative costs and firm size revealed to be the determinants of debt-to-equity choice.

Table 2: The regression results for the Russian companies (random effects model)

The results generally confirm the agency theory predictions. The ratio of SG&A expenses to revenue, which approximates the agency costs, is negatively associated with the level of debt. Relatively high SG&A expenses show that there is an agency conflict: managers operate company resources inefficiently, using them to their advantage. Thus, the hypothesis of a negative relationship of agency costs and the level of debt cannot be rejected.

Growth opportunities are negatively related with the level of debt, which is also in line with the hypothesis and the agency theory from the side of both types of agency conflicts: future growth opportunities depend largely on the cost of research and development and advertising, which are not funded predominantly by debt.

The nonlinear relation between the managerial ownership and the debt level was revealed (Figure 1).

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 1: Dependence of the debt level and the managerial shareholding according to the results of the regression analysis for Russian companies

The relation of the level of debt and the managerial share ownership is quadratic. At first, they are positively related, corresponding to the assumptions of agency theory and the theory of Harris and Raviv (1991), turning-point occurs at the point with a share of managerial shareholding of 48%, after which the relation turns to negative. Breakpoint of 48% can be explained by the fact that at this point the managers actually have complete control over the corporation. Researchers note that the negative correlation at high proportion of management due to the fact that the acquisition of management control over the company is associated with the fact that there is no longer effective monitoring by other shareholders. In addition, the decline in the debt level allows them to concentrate control in their hands.

Insignificance of the Board of Directors dummy-variable and the share of institutional investors can be explained by the nature of the data: the average share of institutional investors in the sample is 4.6%, more than 70% of observations characterized by a zero share of institutional investors, the CEO is also a head of the board of directors in only 3% of cases.

Simultaneous estimations analysis of the managerial share ownership and companies' capital structure did not provide significant results for any variants of the debt level, as the variables which have been proposed significant for determination of managerial shareholding were not significant.

Results for China also failed to confirm the assumption of managerial shareholding's endogeneity, while the best model for capital structure determinants was also revealed to be random effects specification. The results of the regression analysis are presented below.

Table 3: The regression analysis results for Chinese companies (random effects model)

Challenges of the Modern World - Contemporary Economy and Globalization

For Chinese companies the hypothesis about the dependence of the capital structure on the share of selling, general and administrative expenses cannot be rejected: the high level of such costs, indicating higher agency costs, is negatively associated with the level of debt, thus supporting the predictions of agency theory. Other proxies for agency costs are not significant predictors for the Chinese public companies' leverage.

The signs of the control variables' coefficients allow to conclude that both the trade-off (the positive relationship between the provision and the level of debt), and the pecking order theory (a negative correlation between the level of debt and the return on assets and the size of the company) are fair on Chinese market.

For Eastern European companies simultaneous estimation also gave no significant results. Significant are the following variables (Arellano-Bond method):

Table 4: The analysis results for Eastern European companies (Arellano-Bond model)

				Wald chi2(7) = 68.76	Prob > chi2 = 0.000

Figure 2: Dependence of the debt level and the managerial shareholding according to the results of the regression analysis for Eastern European companies

For the Eastern European companies a nonlinear relationship between the level of debt and the share of managerial ownership was also confirmed, so it can be can neither accept nor reject the hypothesis of the importance of agency costs when making decisions on capital structure. Signs of significant control variables: negative correlation between debt level and return on asset and tangibility, a positive correlation between level of debt and the size of the company, confirm the significance of both trade-off and pecking order theories in financing decisions of Eastern European companies.

Challenges of the Modern World - Contemporary Economy and Globalization

For India, however, a model of simultaneous estimation of the debt level and managerial shareholding provides significant results:

Table 5: The regression analysis results for Indian companies (simultaneous estimation)

					LEV_L R-sq=0.4823 MO R-sq=0.1749	
LEV_L	**Coef.**	**Std. Err.**	**z**	**P>|z|**	**(95% Conf. Interval)**

Growth	-0.00501	0.002651	-1.89	0.059	-0.0102	0.000189
Size	-0.03018	0.009648	-3.13	0.002	-0.04909	-0.01127
Cons	0.524565	0.112998	4.64	0.000	0.303093	0.746036

The results of simultaneous estimation confirmed the endogenous of the managerial share ownership with respect to firm characteristics: institutional ownership, growth opportunities and size.

The results confirm the presence of a nonlinear relationship between the level of debt and the managerial ownership, as in the case of Russia. However, the turning point occurs at significantly lower level than in Russia: about 22% of managerial ownership. This significant difference is due to differences in the ownership concentration: in India the concentration is much lower:
Figure 3: Dependence of the debt level and the managerial shareholding according to the results of the regression analysis for Eastern European companies

The level of debt is less in companies where the CEO chairs the board of directors, it does not reject the hypothesis that such duality reduces the pressure on managers, leading to the decline in the effectiveness of the control and monitoring from the board of director. The hypothesis about the significance of the share of institutional investors' ownership was not rejected: institutional investors carry more qualified monitoring and control, reducing agency costs and increasing debt levels.

For Brazilian companies simultaneous estimation of the level of debt and managerial shareholding gave no significant results. The model with the robust results is following:

Table 6: The regression analysis results for Brazilian companies (model with random effect)

		Wald chi2(4)	**= 604.14**	**Prob > chi2**	**= 0.0000**	
LEV_TM	Coef.	Std. Err.	z	P>|z|	(95% Conf. Interval)	
PPE	0.245084	0.100357	2.44	0.015	0.048387	0.441781
ROA	-1.24189	0.17704	-7.01	0.000	-1.58888	-0.8949
Growth	-0.01394	-0.00446	3.12	0.002	-0.02269	-0.0052
Size	0.038418	0.005846	6.57	0.000	0.02696	0.049877

Most of the variables used in the model as a proxy for agency costs were not significant. Growth opportunities are negatively related to the level of debt, it in line with the hypothesis put forward earlier, but on the basis of single variable's significance it could not be concluded whether or not agency costs have influence on the capital structure decisions of Brazilian companies.

Based on the signs of the significant variables' coefficients (tangibility, growth opportunities and the size) it can be concluded that trade-off theory of capital structure are fair for Brazilian listed companies. However, the negative coefficient of the return on assets (ROA) is not consistent with the trade-off theory: it confirms pecking order theory.

Insignificant results related to agency costs predictions were also obtained for South African companies:

Table 7: The regression analysis results for Brazilian companies (model with random effect)

				LR chi2(6)	**= 27.65**	
				Prob > chi2	**= 0.0001**	
LEV_TM	**Coef.**	**Std. Err.**	**z**	**P>|z|**	**[95% Conf. Interval]**	
ROA	-0.3089	0.127993	-2.41	0.016	-0.55976	-0.05804
PPE	0.952931	0.348704	2.73	0.006	0 .2694839	1.636379
y2008	-0.15847	0.067421	-2.35	0.019	-0.29061	-0.02632
Size	-0.5245	0.126342	-4.15	0.000	-0.77213	-0.27688
cons	4.157454	0.940405	4.42	0.000	2.314294	6.000613

Based on the signs of significant coefficients it can be concluded that trade-off (negative coefficient of the profitability and size), and pecking order theories (positive coefficient on - proxy-level security) are fair for South African companies.

Summarizing the results of hypotheses testing on different markets, it can be concluded that agency costs play an important role in defining the capital structure of Russian and Indian corporations. The majority of proxies for agency costs are not significant for companies in China and South Africa, but, it would be incorrect to make a definite conclusion about the

unimportance of agency costs in determining the capital structure in China, as SG&A expenses volume is a significant determinant of leverage.

The next step of analysis was to determine whether or not the impact of agency costs varies for overleveraged and underleveraged firms. According to results obtained in previous stages of analysis the target level of debt was imputed on the basis of the regression coefficients for each group of companies. Then the separate regressions were calculated for two groups of firms for countries where agency costs were found significant in financing policy determination.

Table 8: The signs of the significant variables' coefficients in the final model

	Russia (LEV_LA)		Eastern Europe (LEV_L)		India (LEV_L)	
	Overleveraged	Underleveraged	Overleveraged	Underleveraged	Overleveraged	Underleveraged

Growth	-0.012112**	-0.014545**	1.59e-10***	1.09e-10*		
FCF					0.000048***	8.08e-06**
ROA			-0.000699***		-1.523441**	-0.411718**
Cons	0.530412***	0.199314***	2.656454***	2.642654**		

For Indian and Eastern European companies there are no considerable differences regarding the influence of agency costs proxies on the level of debt. For India dummy variable for companies where CEO is also a chair of Board of Directors is less significant in determining

the capital structure of overleveraged firms. The possible explanation is that high level of debt disciplines the management so the power of CEO is lower. There is difference in the influence of control variable tangibility (sign of PPE for India and significance of Growth and ROA for Eastern Europe).

For Russian companies there are significant differences in the influence of agency costs on the debt levels of over- and underleveraged firms. Firstly, for underleveraged firms managerial ownership has no influence on capital structure decisions. There can be two possible explanations. According to this results agency costs may have greater influence on capital structure decisions of overleveraged firms, so managerial ownership is insignificant and SGA expenses are significant determinants of capital structure. Other possible explanation is that managerial ownership is insignificant because of the low variability of this indicator. Secondly, control variable size is insignificant in the regression of underleveraged firms.

5 CONCLUSION

In this paper we present the results of agency costs and capital structure choice analysis on the data of emerging markets companies within 2000–2010. Our research was based on both linear panal data analysis and simultaneous modeling of leverage choice as well as management ownership share.

Our survey revealed the relevance of agency costs on the capital structure choice in Russia, Eastern Europe, India, but the results are not so obvious for Chinese companies, for South African, Brazilian companies the hypothethis about agency costs significance was not confirmed. The non-linear relationship between financial leverage and management shareholding was proved: as soon as the management shareholding is low its increase leads to the harmonization of interests between shareholders and management, but when the share of management's equity is high, there are almost no incentives for the management to act in the interests of other shareholders. We also revealed that agency costs define long-term debt, but cannot explain short-term debt variables.

The further research could be focused on the extention of the model into the data of other emerging markets, comparison of agency costs' influence on capital structure for large and medium size companies. The question of possible endogeneity should also be thoroughly examined.

ICT DECISION MAKING SUPPORT – CHOICE OF THE ADEQUATE PROGRAM FOR BUSINESS INTELLIGENCE

Tatjana Kovac
Faculty of Commercial and Business Sciences, Slovenia
tanja.kovac@fkpv.si

Bojan Kostanjsek
Cetis d.d., Slovenia
bojan.kostanjsek@gmail.com

ABSTRACT

In today's turbulent business environment, timely and high-quality business decisions are of vital importance. The effect of decision-making is transferred directly to the existence of a company, its performance and competitiveness. In the past, managers mostly made decisions based on their intuition. Due to different market conditions they then had opportunities to fix some errors made in the decision process. Nowadays the competition in the market is very rigorous and there are little or no opportunities for re-examination. Wrong business decisions are expensive in terms of poor results and can even ruin a company. Therefore, it is extremely important that the management is aware of various methods and techniques that support complex business decisions. In addition to models for decision-making processes, software solutions, also called decision support systems, are used to support management's work. One example is a program SidX (Simple Decision Expert, Pro Softlab, Slovenia), which offers a very simple user interface especially suitable for use in strategic decision-making situations. This paper deals with display methods for selecting the most appropriate software solution for business intelligence in a given company by using a decision support system SidX. The basic contribution to the business profession, presented in the paper, is the methodological approach to complex decision making.

Keywords: A quality decision, Business intelligence, Decision making, Decision support systems, Expert modelling

1 INTRODUCTION

The paper is based on a case study of an enterprise (Kostanjšek, 2012). ERP system in this enterprise daily creates a great amount of data and information, which are used as input for business intelligence (Figure 1). User requirements are constantly evolving and business intelligence system (BI) must continuously follow these requirements.

In general, we can say that a business intelligence system in an enterprise includes various tools and techniques that assist business users in making decisions and achieving their goals. Simplified model of BI is represented in Figure 2.

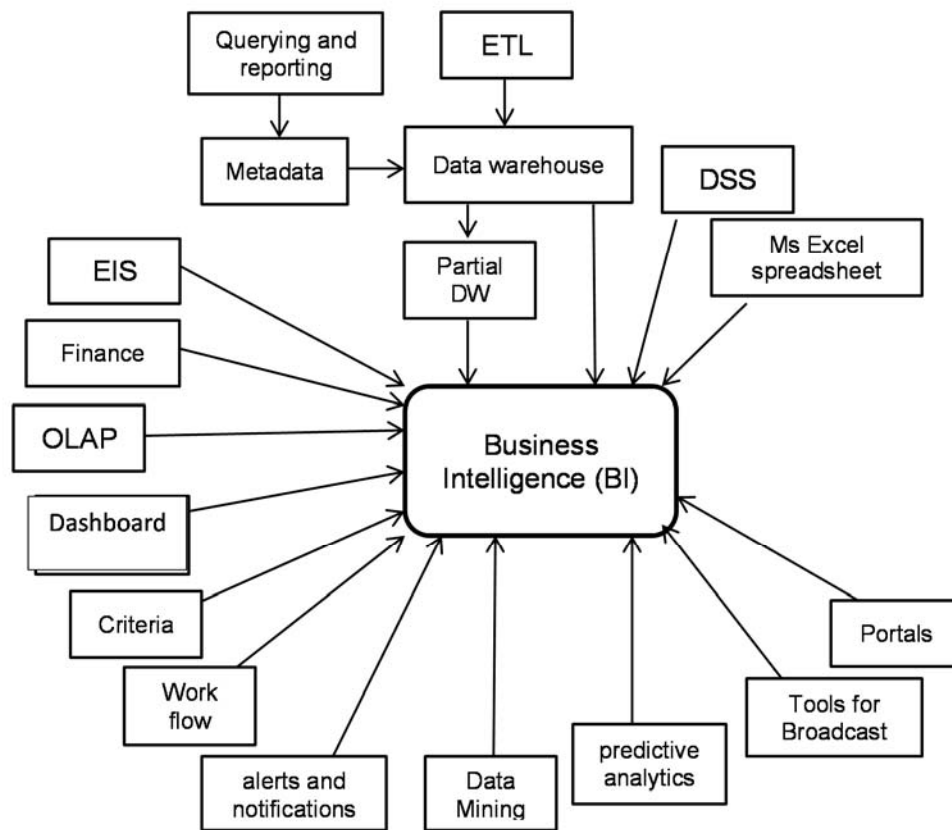
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 1: The System of Business Intelligence (Turban et al., 2011)
Figure 2: The simplified model of BI (RCL, 2012)

Users in each and every company have different business needs that vary depending on: their level (operational, tactical or strategic), the frequency of required information (regular, occasional, unique, etc...) and the mode of transmission of information (automatic or on request). Specific definitions of methods and processes or ICT solutions for business intelligence in general do not exist. Only the sole purpose of business intelligence is uniform and that is – to produce relevant information, on time and of high value (Scheps, 2008). The

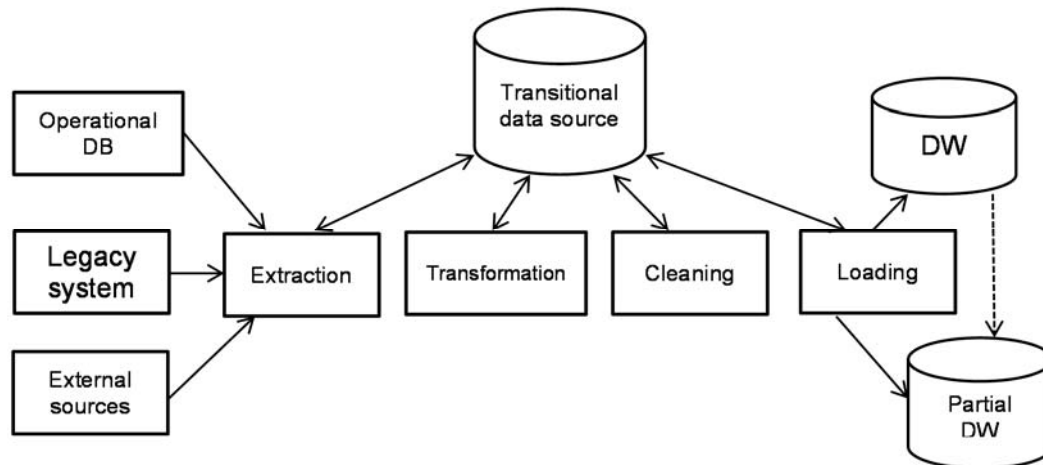
objectives of BI are therefore: to connect and integrate various business information systems, their data sources and methods for information processing in a unified and centralized system of business intelligence, optimized for management (Bobek, 2007). These objectives can be achieved by so-called ETL (Extract, Transform and Load) procedure. This is a process of cleaning, transforming and loading the data from operational databases into a single data warehouse (Figure 3).


Figure 3: ETL process (Turban et al., 2010)

In order to create reports from the data warehouse, tools based on data mining and OLAP system are needed.

To summarize: no standardized ICT solutions exist for business reporting. Companies need to build their own systems that will meet their user's and especially their management's needs.

2   ANALYSIS OF BUSINESS INTELLIGENCE IN OBSERVED ENTERPRISE

Business strategy of the observed enterprise is based on their desire to become the leader in the market. Their standard products are: various high security personal documents, lottery games tickets, a variety of printed labels, computer forms, promotional and advertising materials, flexible packaging, etc. In the beginning of 2007, the company implemented a new business information system - Hagen OA (EFI). American company EFI develops IT solutions for the printing industry. Later versions of the system are called Monarch. Information system Monarch uses the less known database Progress (http://www.progress.com/en/index.html).

Here are some examples of business reports that are generated from the information system:
- Accounts receivable reports (sales by market/country/product class, top customers, cash flow analysis etc.)
- Account payable reports (obligation to suppliers)
- Inventory Control reports (inventory items / materials, finished goods, inventory by warehouse etc.)
- Order fulfilments reports (purchase orders, shipping orders, shipment reports)
- Job Management reports (work in process, product cost sheets, work jobs, employee analysis reports etc.)

To display reports of business intelligence nature, the company uses Microsoft Excel. This is a very common and useful tool, but it is not primarily intended for business intelligence purposes because of the following limitations:

- Limited number of rows (depending on the version of MS Excel);
- Limited display of filter results;
- Slow refresh rate for new data;
- Slow file management for large files with multiple sheets;
- Some files are too large to send by e-mail.

The following is expected from new business intelligence system:

- The ability to display more than one million rows of data;
- Faster file open and refresh operations;
- The ability to display reports in tablet computers and smart phones;
- Distribution of quality information to the relevant users;
- The possibility of using dashboards.

Since the market offers a large variety of BI software solutions, we have to work systematically. First, we identified criteria that are important in choosing the right tools. Using the defined criteria we created an expert decision model in the program SidX. On the basis of good references we selected a few software tools from the market that seemed appropriate. We have included some relevant researches (Gartner Group and BARC BI Survey) and on the basis of their assessments evaluated our criteria. Expert model in SidX then suggested the best software solution for business intelligence according to our needs and requirements.

2.1 Introduction of the program SidX

Sidx (Simple Decision Expert) is based on the Decaid method (Brelih and Rajkovič 2008) but is upgraded in graphics and analyses. It is adapted for contemporary computer environment and offers a set of new functionalities and a user-friendly interface. The prototype was developed in Microsoft Visual Studio NET 2005 and is designed for Microsoft Windows environment. The program was developed by the Slovenian enterprise Prosoftlab (http://www.prosoftlab.com).

2.2 The method of collecting data

In this study we wanted to include the more established and well known software solutions for business intelligence. We used publicly available results of research organizations like BARC (Business Application Research Centre) and Gartner Research (Gartner surveys) from the beginning of the year 2012. Gartner's Magic Quadrant (Figure 4) shows the providers of business intelligence tools, which are classified based on the completeness of vision and the ability to execute. From the entire set of providers we chose the following companies: QlikTech, SAP, IBM, MicroStrategy and Tableau.

Challenges of the Modern World - Contemporary Economy and Globalization
Figure 3: Gartner Magic Quadrant (Gartner, 2012)

2.3   The criteria of assessment

Analysis of needs in the observed company shows that we have to choose a tool for Business Intelligence, which respects the following criteria:

- Reporting (completeness of reports, distribution to mobile devices, publishing to company intranet, automatic data refreshing);
- Quality of dashboards that display complex information, using a variety of graphical methods;
- Ad hoc queries, which allow users to create their own custom reports and analyses;
- Microsoft Office integration;
- Collaboration (ability for users to exchange business reports);
- Support for OLAP that allows users to quickly analyse and manipulate business data. In this case, there is a dedicated database, which enables users to make "what if" models and analyses;
- Support for interactive visualization that allows users to display multidimensional data;
- Predictive modelling and data mining. This allows users to search for new rules in data and to find new variables. It also provides the future values of these variables;
- The time needed to implement the program for business intelligence. This is the time from the purchase to actual use. Shorter time means lower costs;
- Satisfaction by customers, who already used the tools.

- Quality of tools. It is the customer's assessment of the problems they had with the tool (non-functioning, additional costs);
- Total cost of ownership (TCO). This criterion covers the entire costs of purchasing and owning the licensed software;
- Purchasing additional user licenses. This is also an indicator of satisfaction of customers who want to extend the use of the system to new users with additional licenses.

2.4 The process of assessment

Values for all criteria were obtained from two studies (Gartner Research 2011 and BARC BI Survey 10, 2011), which use different measurement scales. That is why we have to standardize all values on a uniform length of 100th. Table 1 shows corrected values for five selected software providers.

Table 1: Evaluation of Business Intelligence tool providers (Gartner, 2011; BARC BI Survey 10 2011)

Criteria	QlikTech	SAP Business-Objects	IBM Cognos	Micro-Strategy	Tableau
1. Reporting	79	82	87	89	90
2. Dashboards	90	75	78	87	92
3. Ad hoc queries	84	80	83	87	88
4. MS Office Integration	80	73	73	82	82
5. Collaboration	77	72	69	80	85
6. OLAP-analysis	87	68	80	87	88
7. Interactive Visualization	90	74	70	81	94
8. Predictive modelling and Data Mining	76	60	71	76	79
9. Implementation	47	9	9	15	47
10. Adequacy of tools	35	28	27	33	35
11. Quality of tools	48	23	13	38	48
12. Total cost of ownership	37	20	63	30	87
13. Additional licenses	47	35	32	40	48

2.5 Decision model and the choice of the adequate program for business intelligence

Decision model was created in the SidX based on selected criteria from Chapter 2.3. SidX user interface uses a wizard, which guides the user step by step in order to make a decision model. At the beginning, it is necessary to determine the number of options/variants from which we can choose. In our case, this means five providers of business intelligence tools. In the next step we have to enter the criteria, which used to assess these variants. It is very important that we determine the appropriate criteria weights (impact) and measurement scales (Figure 5) according to our needs and desires. The final step is evaluation of variants according to the criteria.

Challenges of the Modern World - Contemporary Economy and Globalization

Figure 5: Evaluation criteria and their weights

3 THE RESULTS OF DECISION PROCESS IN SidX

On the market there are a lot of providers for business intelligence software solutions. Each organization has to decide which is the most appropriate solution for them, according to their unique requirements and needs. Based on the results of our decision-making process (Figure 6), it was suggested that the best choice for the observed enterprise is the tool provided by the company Tableau Software.

Although the decision model finds and suggests the optimal solution, it is still only a proposal which can help users make a certain decision. The final decision is still in the hands of the users.

Challenges of the Modern World - Contemporary Economy and Globalization

Variants	Evaluation
QlikTech	67,92558 točke
SAP BusinessObjects	55,43629 točke
IBM Cognos	60,50153 točke
MicroStrategy	64,86137 točke
Tableau	76,13151 točke

Figure 6: The result of the evaluation of selected provider's tools for BI

4 CONCLUSION

In the presented company, the provider Tableau was chosen as the best BI solution, because it was the closest match for all the requirements.

After we have chosen the best provider for BI tools, the next question appeared: can the proposed BI system provide better support in business decision making in our company? Given the fact that the tool largely met selected criteria, we can estimate that its use can eliminate many initially introduced problems. However, the actual quality of the BI system will not be clear, until the software is implemented and tested on the real company data in real time. Improved business intelligence can lead to faster business decisions of higher quality. In any case, with the new BI tool, a greater competitive advantage in the market is also expected.

The use of BI tools is associated with the desire to make high quality information-based business decisions. Business intelligence tools assist in the management of data and the presentation of information to end users in the right way and at the right time. They play a key role in the quality of business decisions.

This paper emphasizes the importance of the choice of software tools for business intelligence. It is important that the company defines what to expect from such a tool, and to use appropriate methods and techniques to assist in the decision. We have presented an expert decision model for selecting the best provider of business intelligence tool. Such a model presents a knowledge base and can be used in solving similar problems in the future.

ABSTRACT
Concept of organizational culture has not been investigated broadly in Croatia. This paper focuses on assessment of organizational culture by business-students in Croatia. The purpose of this research is to assess the organizational culture in Croatia by business-students in neutral surrounding and to assess different aspects of organizational cultures in Croatia. We approached the topic of organizational culture from theoretical and empirical perspective. The paper identifies some of the most relevant factors and dimensions of organizational culture. The main method used in our empirical research is Denison model of organizational culture. Through this model, authors assessed the organizational culture through twelve dimension indices and four cultural traits of organizations: involvement, consistency, adaptability and mission. It seeks to show that there will be no differences in perception of organizational culture according to management role and business areas and company sector. This paper demonstrates assessment during Economic crisis in Croatia and certainly gives an overview how employed business-school students perceive organizational culture according to world famous model of questioning organizational culture.

Keywords: Corporate social responsibility, Denison model, Ethics, Management role, Organizational culture

1 INTRODUCTION
Organizational culture usually shows company efficiency as well as company functions. More successful enterprises differ from the less successful ones in the investments to creating their culture according to the way of firm's development. Opposite to that, it is often a case that organizational culture is taken for granted and companies often do not think about their culture. Croatian companies are often not aware of those internal settings. This paper will present theoretical and empirical approach to the organizational culture. It will explain the organizational culture through a cross-section of different models and applying one of them. In order to better identify the organizational culture we will clarify the definition and structure of the organization and why is organizational culture a key figure inside the organization work will show and explain some examples of organizational culture at home and abroad. This paper will use the latest research work with special emphasis on Denison model of organizational culture. The primary purpose of this study is to examine how business-school students assess the organizational culture in Croatia during the economic crisis through the Denison model of organizational culture.

Challenges of the Modern World - Contemporary Economy and Globalization

According to described aim and contribution, following hypotheses want to show that "There will be no differences in perceiving organizational culture in relation to managerial role of employed business-school students". We assume that there will be no differences in perceiving organizational culture among managerial roles in organizational culture dimensions. Though there might be the slight difference of perception due to employees and managerial view is not alike. The second hypothesis is that "Business areas of Management, Finance and Insurance will have better teamwork orientation then public Service and Education". We can presume that teamwork predominates among highly-skilled jobs because they have higher level of autonomy. The final third hypothesis is "There will be no differences in perceiving organizational culture among employed business-school students according to company sector". We can presume that company sector will not have influence on perception of organizational culture. We might expect some differences if candidates will tend to promote their department.

For the purpose of this research, authors conducted a research in which a planned sample was 300 and we achieved that goal. Sample was collected in three branches of University A in various cities. This sample was sufficient to make general conclusion for the research. Business-school students were chosen according to their employment status. Both undergraduate and graduate students were taken into consideration according to their employment status. Sample did not have age limitation. The sample was structured according to management role/position, working experience, business areas and business sector.

The instrument used for the purpose of this research was Denison questionnaire based on Denison model of organizational culture. Denison model of organizational culture comprises a total of 60 statements such as " Most employees are very dedicated to work", "There is a clear way of leadership and clear management methods", "Management focused on long-term goals " etc. Denison questionnaire was adapted according to hypotheses. The model measures four essential traits of all organizations: Mission, Adaptability, Involvement and Consistency. Each of these traits consists of three indices. There is a total of 12 indices. Responses of the chosen will be measured on a 5-point Likert scale that was ranged from 1 ("strongly disagree") to 5 ("strongly agree"). Business areas and sectors were listed according to Croatian National classification.

Data was collected through questionnaire. Questionnaire with full written and verbal instructions was submitted in classrooms of University A. Candidates were introduced in detail with the questionnaire and the aim of the research. Instructions in the article are printed on the front page of the questionnaire. Participants were told that the data provided exclusively used for scientific purposes. Completing the questionnaire took about 20 minutes in average. It was explained that filling in the questionnaire is voluntary and anonymous. It was also being explained that results of the research will be used only for the research purpose. Students placed the questionnaire in the empty box placed in the classroom. Questionnaires were archived. Candidates did not have the time limit for the questionnaire. Data processing: Data is presented and analyzed using computer program for statistical analysis SPSS V 18.0.

2 DEFINITION OF ORGANIZATIONAL CULTURE

Culture is something that surrounds us all the time, set of structures, routines, rules and norms that guide and constrain our behavior. Culture has many meanings and as a concept has had a long history. According to Edgar Schein, social psychologist, culture is defined as an example

of group that has learned shared basic assumptions and solved its problems externally and internally Edgar Schein sees that as something that considered valid and worked well and it can be taught to new members as an example how to perceive, think, and feel in relation to possible problems (Schein, 1992). This description sounds difficult at first, but it highlights several important things: culture belongs to a group, culture is learned and culture concerns critical assumptions shaping how group members perceive, think and feel about things. Charles Handy identifies four types of culture; the power culture, the role culture, the task culture and the person culture. The power culture has a power source which exercises control while in role culture that is controlled by procedures and rules. The task culture relies more on expert power and letting the right people to do their job. This type of culture promotes teamwork. In the person culture the individual has a key role and organization exists in order to assist and serve the individual (Armstrong and Stephens, 2005). Another definition is that organizational culture is a cognitive framework that is consisted of attitudes, different behavioral norms and various expectations shared by organizational members (Greenberg and Baron, 2003). Most definitions recognize the importance of shared norms and values that direct employees' behavior. Organizational culture is a complex phenomenon. Each organization has a unique way of doing things. Culture to an organization is insubstantial force and it has several roles in organizations such as sense of identity, commitment among employees, has purpose of clarifying and setting certain standards of behavior (Singh, 2009).

Sense of identity means that people are able to join together when there is clear what are the shared perception and vision inside the company. Sometimes it can be difficult for employees to feel that they are part of a company involved in the entire organization's work therefore it is important for culture to generate commitment among employees. Culture should guide employees' words and performances, making it clear what they should do or how to act in a given situation. In that sense it would unquestionably give stability to behavior (Singh, 2009).

2.1 Findings of organizational culture in Croatia's companies

Croatia made a significant economic advance and had fast growing economy. We can define Croatia as a rather small market and in last years it strives to conquer the foreign market. According to the Croatian Chamber of Economy, an institution that promotes and represents Croatian economy, Croatia needs restructuring of companies in order to attract foreign investors. According to Antoljak, general director of Sensa Consulting, there many good examples of corporate culture in the world from which one can learn a lot. Most successful Croatian companies still rely on outdated model of a corporate culture that is based more on hierarchical principles guided the organization of an authoritative work of managers or owners, very few of them have a flexible model of corporate culture. Successful Croatian companies continue to rely on a hierarchical organization led but believe that promote employee development (Antoljak, 2011). Every company has its own organizational culture; in some companies it is very transparent while in others it is underlying.

2.2 Denison model of organizational culture

Instrument which will be used for the purpose of this thesis is Denison model (Chart 1) of organizational culture developed by Daniel R. Denison and William S. Neale which have been used by over 5000 organizations worldwide Model has been developed after twenty years of research throughout thousand companies. This model is based on four cultural traits of organization: involvement, consistency, adaptability, and mission (Teegarden et al., 2011). The model is the basis for the Organizational Culture Survey and the Leadership Development Survey. As mentioned above, model will focus on four critical spots, degree to

Challenges of the Modern World - Contemporary Economy and Globalization

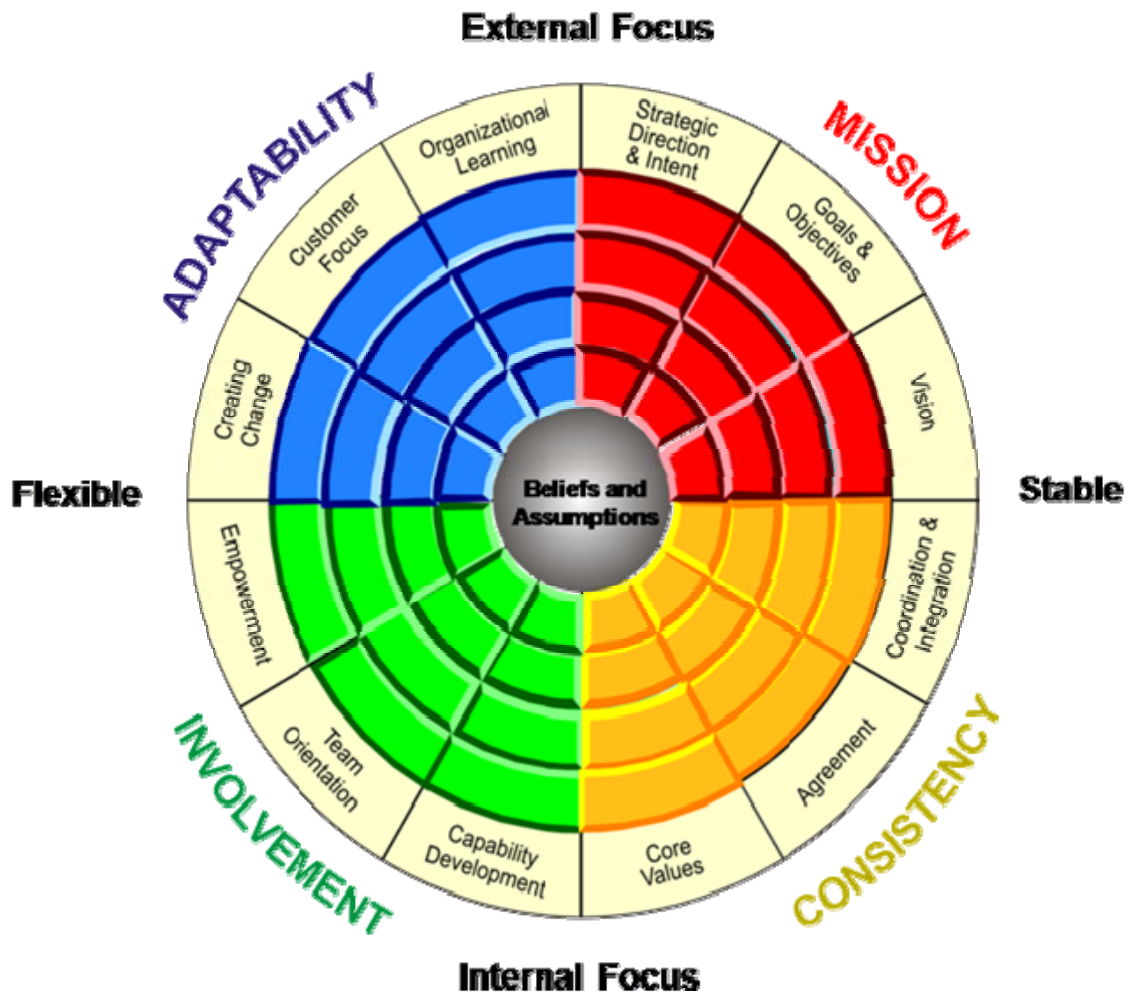
which employees are clear about their vision, goal; degree to which they think that organization has values, systems and processes that support vision and goals and whether employees are engaged and involved in helping move the organization forward (http://www.denisonconsulting.com/home/terms.aspx).


Chart 1: Denison model by its components
(http://www.denisonconsulting.com/advantage/researchModel/model.aspx)

2.2.1 Involvement

In this part of the model we observe whether members are committed to their work, and feel a strong sense of ownership. People at all levels feel that they have at least some input into decisions that will influence their work and feel that their work is directly connected to the goals of the organization (Dawson, 2010). This allows more informal control system and more voluntary and implicit control system. This part of the model consists of: empowerment, team orientation and capability development (Dawson, 2010). Empowerment represents employee's freedom to give inputs and make decisions on their own, team orientation means that employees support one another in their ideas and that this support results in accomplishing company's goals and lastly capability development which refers to employee's exposure to new tasks and given responsibilities. Those exposures are often through training and coaching

2.2.2 Consistency

Consistency provides a central source of integration, coordination and control. Consistent organizations have very committed employees, key central values, specific methods of doing business and predisposition to make clear which are the company rules; in a way that employees know what they can do and what they cannot. Consistency is a base ground for well-built culture based on a shared system of beliefs, values and symbols that are widely understood by members of an organization (Dawson, 2010). Consistency helps employees to react in a predictable way when they found themselves in unfamiliar situation. Consistency has three indices: core values, agreement and coordination and integration (C. Dawson, 2010). Core values have important role of guiding employees and leaders, following that core values are guidelines for them to make consistent decisions and behave according to them. Employees often found them in a situation when they need to have constructive dialogue and be able t achieve agreement and that is what agreement is, ability of every employee t achieve one when problems occur. Coordination and integration means how employees comprehend their work and impacts it has on others and turn round.

2.2.3 Adaptability

Three aspects of adaptability impact an organization's effectiveness:
- The ability to perceive and respond to the external environment; refers to a focus on customer;
- The ability to respond to internal customers, regardless of level, department or function
- The capacity to restructure and re-institutionalize a set of behaviours and processes that allow the organization to adapt. Without this ability to implement adaptive response, an organization cannot be effective.

Adaptability has three indices as well and they are creating change, customer focus and organizational learning. Creating changes is key issue in today's business and successful organizations are willing to accept new ideas and they have open approach to them. Customer focus refers to looking and creating new ways in order to meet customer expectations. This index has focus on whether employees recognize that they need to put customer as their priority. Organizational learning looks at whether employees are able to learn from their failures and turn failure into success (Dawson, 2010).

2.2.4 Mission

Every organization should have its own mission so employees know what the purpose of their work is, we looked at three indices: whether strategic direction and intent of the company is defined, are there goals and objectives clearly defined and whether mission creates shared vision (Dawson, 2010). Vision should be a guide t every employee, but it is often not clear enough, goals and objectives make employees more secure of criteria of performed work and equality in a way that everyone know what the goals are.

These four traits will help us in detecting student's opinion and view about organizational culture in companies where they work. We decided to choose Denison model of organizational culture because it is business oriented and applicable to all industries. Throughout our research and additional readings, we have found out that Denison model of organizational culture worked with organizations all over the world. Some of them are University of California, Deutsche Bank, 3M, and Henkel. We saw this model as something that Croatian companies could easily use and use it as a tool to promote corporate strategy and business interventions. Furthermore, Denison is a world famous model and been used by

companies all over the world, but not in Croatia. We used the opportunity to make Croatian translation and create new opportunity for Croatian companies. Denison model has been already translated into most of the major world languages.

3   RESULTS OF EMPIRILAC RESEARCH

Planned sample was 300 and we achieved that goal. Sample was collected in three branches of University A in various cities. This sample was sufficient to make general conclusion for the research. Business-school students were chosen according to their employment status. Both undergraduate and graduate students were taken into consideration according to their employment status. Sample did not have age limitation. The sample was structured according to gender, role/position, working experience, business areas and business sector. There was 133 (44, 3%) male subjects and 167 (55,7%) female candidates. We had 96 (32%) candidates on managerial positions and 194 (67%) on non managerial positions. There was 161 business-school students who work 1 up to 5 years (53,7%) and 139 who work 2 over 5 years (46,3%). Business areas were chosen according to Croatian National classification and were divided into following categories: Construction, Manufacturing and Transport, Tourism and Entertainment, Public Service and Education, Management, Finance and Insurance and Informatics and telecommunication.

- − Manufacturing and Transportation (N = 97, 32,3%)
- − Public Service and Education (N = 81, 2,3%)
- − Management, Finance and Insurance (N=78, 26%)

In this research, due to small number of participants, we did not include participants from:
- − Construction (N = 16)
- − Tourism and Entertainment (N = 12)
- − Informatics and Telecommunication (N = 7)

Data is presented and analyzed using computer program for statistical analysis SPSS V 18.0 (Statistical package for the social sciences). We will show basic statistical parameters of variables which were included for the purpose of this research and variance analysis in order to see structure of differences between different groups according to independent variables. We will also identify certain aspects of organizational structure that contribute in differentiating target groups. In Table 1 we will present characteristics of research participants.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Characteristics of research participants (Analysis of the authors)

		N	%
ROLE/POSITION	Managerial	96	32,0
	Non managerial	194	67,0
BUSINESS AREAS	Construction	16	5,3
	Manufacturing and Transport	97	32,3
	Tourism and Entertainment	12	4,0
	Public Service and Education	81	27,0
	Informatics and Telecommunications	7	2,3
SECTOR	Marketing and Sales	103	34,3
	Finance and Accounting	67	22,3
	Human Resources and Administration	64	21,3
	Informatics and Telecommunications	20	6,7
	Company management	14	4,7

Denison model is based around twelve organizational culture indices and four key traits – mission, adaptability, involvement and consistency. In Table 2 and Table 3 author will display twelve organizational culture indices and four key traits of Denison model of organizational culture for whole sample (N=300). In Table 2 each dimension has five items, for example empowerment is calculated by adding first five questions. Minimum and maximum represent average that every respondent answered for specific index (as mentioned above, they were answering on Lickert scale, 1("strongly disagree") to 5("strongly agree"). Results of our research showed that in the mean respondents were neutral. Mean ranged from 3,06 to 3,27. We can conclude that respondents did not have strong attitudes on any indices and they were neither in favor or opposed to it. These results were opposite to our expectations and we will include it in the discussion part of the thesis. We assumed that there will be higher differences in perception of specific dimensions of organizational culture. Highest arithmetic mean has indices Core-Values (M=3,27; SD=0,69), and lowest is for Vision (M=3, 06; SD=0,66). Core values means that respondents share a set of values which furthermore create a sense of identity and clear expectations. Vision corresponds to respondents' vision of organizational future and their perception of guidance and direction within the organization.

Table 2: Twelve indices of organizational culture, their arithmetic mean, minimum, maximum and standard deviation (N=300) (Analysis of the authors)

ORGANZATIONAL CULTURE DIMENSIONS INDICES	N	Minimum	Maximum	Mean	SD
Empowerment	300	1,20	4,60	3,07	,61588
Team_Orientation	300	1,40	5,00	3,08	,73085
Capability_Development	300	1,00	5,00	3,09	,70207
Core_Values	300	1,60	5,00	3,27	,69287
Agreement	300	1,20	4,80	3,10	,60155
Coordination_and_Integration	300	1,40	4,80	3,00	,58805
Creating_Change	300	1,00	5,00	3,13	,61225
Customer_Focus	300	1,00	5,00	3,19	,66168
Organizational_Learning	300	1,00	4,80	3,11	,67092
Strategic_Direction_and_Intent	300	1,00	5,00	3,18	,75309
Goals_and_Objectives	300	1,00	5,00	3,17	,73276
Vision	300	1,00	5,00	3,06	,66810

Chart 2 shows more clearly twelve indices of organizational culture and confirms results which showed that all employed business-school students had similar opinion towards twelve indices of organizational culture.
Chart 2: Twelve Indices of organizational culture – Arithmetic Means (N=300) (*Analysis of the authors)*

In Table 2 we looked at twelve organizational culture indices. In following table (Table 3) we will look at four traits of organizational culture for whole sample (N=300). Every trait has three items. Therefore minimum and maximum are calculated by adding those three items for every trait. For example Involvement is calculated by adding empowerment, team orientation and capability development. Minimum and maximum represent average that every respondent answered for specific trait (as mentioned above, they were answering on Lickert scale, 1

Challenges of the Modern World - Contemporary Economy and Globalization

("strongly disagree") to 5 ("strongly agree"). Results showed that Adaptability (M=3,14; SD=0,54) and Mission (M=3,14; SD=0,60) have identical arithmetic means. Adaptability looks at whether organization has the initiative to translate the demands of the organizational environment into action. In this four dimensional trait representation of organizational culture we can also see that candidates showed neutral attitude towards all four traits of organizational culture. Those results could be explained with the fact that some questions of candidates were inundated with desire not to discover 'their real opinion' so they were rather neutral. Even though the questionnaire was anonymous, it is possible that a certain number of candidates did not perceive it that way and that did not answer honestly. We assumed that there will be higher differences in perception of specific traits of organizational culture therefore we will continue interpreting findings in the discussion part.

Table 3: Four Traits of organizational culture - Arithmetic means (N=300) (Analysis of the authors)

ORGANZATIONAL CULTURE TRAITS	N	Min.	Max.	Mean	SD
Involvement	300	1,60	4,60	3,08	,55646
Consistency	300	1,53	4,60	3,12	,49110
Adaptability	300	1,00	4,87	3,14	,54908
Mission	300	1,00	4,87	3,14	,60419

Chart 3 shows more clearly four traits of organizational culture and confirms results which showed that there is no difference in attitudes of employed business-school students towards four traits of organizational culture.
Chart 3: Four Traits of organizational culture - Arithmetic means (N=300)(Analysis of the authors)

In order to check differences in candidate's perception towards organizational culture according to managerial role, gender, work experience, business areas and business sector, we tested statistical difference of their arithmetic means and for that purpose we used t-test for all 12 indices. Results are presented in the following tables.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 4: Twelve Indices of organizational culture – managerial and non managerial roles
(Analysis of the authors)

ORGANZATIONAL CULTURE INDICES	ROLE				t-test
	Managerial (N=96)		Non managerial (N=194)		
	Mean	SD	Mean	SD	
Empowerment	3,18	,557	3,03	,628	1,990*

Vision	3,12	,606	3,05	,687	0,864

*Remark of meanings: ** p<0, 01, * p<0, 05*

In Table 4 author researched, through twelve organizational culture indices of Denison model of organizational culture, differences according to different managerial roles and in Table 5 among four traits of organizational culture. Table 4 displays results according to managerial role through twelve organizational culture indices of Denison model of organizational culture. Managerial role was divided into two categories; managerial and non managerial. As we can see in the table, there were 96 managerial roles and 194 non managerial roles. According to this research we can see that Coordination and Integration (t=3,17; p<0,01) is the only dimension that is statistically significant with the risk less than one percent. According to this research there is statistical significance of less than one percent risk between managerial and non managerial roles. Empowerment (t=1,99; p<0,05), Capability Development (t=2,13; p<0,05), Agreement (t=2,03; p<0,05), Organizational Learning (t=2,44; p<0,05) and Strategic Direction (t-test=2,180 p<0,05) are statistically significant with less than five percent of the risk. From presented results and questions presented to respondents, we can conclude that managers are better in approach to doing business, they are more consistent and predictable, it is easier for them to coordinate projects across different parts of the organization. These results were expected because managerial role often has more authority to coordinate projects.

Challenges of the Modern World - Contemporary Economy and Globalization
*Chart 4: Twelve Indices of organizational culture – managerial and non managerial roles
(Analysis of the authors)*

From graphic display we can see that there is a difference between managerial and non managerial roles. Managerial role shows a trend towards higher average values. As it was already seen form the results in Table 4. it shows a statistically significant difference in the dimension Coordination and integration. Highest overlapping exists on dimension Core Values. Which means that both managerial and nom managerial roles have similar opinion about existence of characteristic management style and a distinct set of management practices and set of clear and consistent values that governs the way they do business. The values obtained are discussed and given according to four traits of organizational culture and shown in the following Table 5.

*Table 5: Four Traits of organizational culture for managerial and non managerial role
(Analysis of the authors)*

ORGANZATIONAL CULTURE TRAITS	ROLE				t-test
	Managerial (N=96)		Non managerial (N=194)		
	Mean	SD	Mean	SD

*Remark of meanings: ** p<0, 01, * p<0, 05*

In Table 4 author researched managerial roles through twelve organizational culture indices of Denison model of organizational culture and in Table 5 author will look at four traits of organizational culture. According to results in Table 5 there is statistical significance less than five percent in Involvement(t-=2,01; p<0,05) and Adaptability (t=2,01; p<0,05) we can see from results that managers scored higher mean on involvement(M=3,19) and adaptability (M=3,24).

We displayed graphical result as well in Chart 5. We can conclude that managers have higher mean in empowerment, team orientation and capability development, creating change,

customer focus and organizational learning. This was expected because managerial roles tend to have ability to work in teams, more authority to crate change and influence to customers.
Chart 5: Four Traits of organizational culture – managerial and non managerial roles (Analysis of the authors)

Part of the hypotheses related to the study of structure differences between different groups of participants, and establishing the independent variables that contribute to the distinction between the two groups. Accordingly, we examined the structure of differences between groups of participants with regard to the business areas and the company sector. With regard to the working area of test participants, the variable business areas included the Manufacturing and Transportation (N = 97 Public Service. While the company sector include Marketing and Sales (N = 103), Finance and Insurance (N = 78), Finance and Accounting (N = 87), Human Resources and Administration (N = 64) and Informatics and Telecommunications (N = 20). The initial hypothesis we assumed that it is reasonable to expect differences between the groups both in the field of business areas and in the company Sector. The presented results are analysis of variance for these two independent variables (business areas and business sector).

In Table 6 authors researched different business areas in which respondents are employed through twelve organizational culture indices of Denison model of organizational culture and in Table 7 same business area only between four traits of organizational culture. Table 6 displays results of business areas where respondents are employed through twelve organizational culture indices of Denison model of organizational culture. Business areas were divided into three categories: (1) Manufacturing and transportation, (2) Public service and Education and (3) Management, Finance and Insurance. These results indicate that there is a statistically significant difference between the two groups. It is registered on the dimension of team orientation (F = 3.638, p <0.05). Testing stat. significance between groups showed that groups of Public Service and Education and Management, Finance and Insurance significantly differentiate with a risk level of 5%. The arithmetic mean of the group Team Orientation for Public Service and Education is M=2.92 and the Group Management, Finance and Insurance M = 3.21. So, in the sector (3) Management, Finance and Insurance is in a greater extent present teamwork orientation then in the sector of Public Service and Education. For Capability Development we can see statistically significant F-ratio (F = 7.171; statistically is significant to the 1% risk). Testing statistical significance between groups showed that we have significant statistical difference in group (1) Manufacturing and

Challenges of the Modern World - Contemporary Economy and Globalization

Transportation and (3) Management, Finance and Insurance, with the risk level of 5%. (3) Management, Finance and Insurance (M=3,29) have higher arithmetic mean for Capability Development then Transportation and manufacturing sector (M=3,01). Results have shown that there is a significant statistical difference between groups (2) Public Service and Education and (3) Management, Finance and Insurance, with the risk level of 1%. The arithmetic mean of the Team orientation in the sector (3) Management, Finance and Insurance is a greater extent than present teamwork orientation in the sector of Public Service and Education. For all remaining dimensions between the two groups did not show a statistically significant difference.

For better visibility of the results from Table 6 we presented the results in the following Chart (Chart 6).

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 6: Indices of Organizational Culture according to Business Ares (Analysis of the authors)

Table 7 represents testing statistical significance between the groups in four dimensions. It shows that significantly different groups were Public Service and Education and Management, Finance and Insurance in two dimensions. On the dimension of Involvement (F = 5, 285, p <0.01) and Adaptability (F = 5, 088, p <0.01). Management, Finance and Insurance scored higher means for Involvement (M=3, 21) and Adaptability (M=3, 25), opposite to Public service and education (involvement M=2,94, Adaptability M=2,99).

In Table 8 author researched different company sectors in which respondents work through twelve organizational culture indices of Denison model of organizational culture and in Table 9 company areas were researched through four traits of organizational culture. Table 8 displays results of company sectors where respondents work through twelve organizational

culture indices of Denison model of organizational culture. Company sectors are divided into four categories: Marketing and sales (N=103), Finance and Accounting (N=87), Human resources management (N=64) and Informatics and Telecommunications (N=20). Testing statistical significance between groups showed that significantly different were groups of Finance and Accounting and Human Resources and Administration dimensions: Coordinating and Integration (F = 3.874, p <0.01) and the dimension of Creating Change (F = 4, 045 p <0.05). Coordinating dimension and Integration is more frequent in the group Finance and Accounting (M = 3.12) than in the group Human Resources and Administration (M = 2.82). Dimension of Creating Change was also more frequent for the Accounting and Finance group (M = 3.32). The arithmetic mean for the group Human Resources and Administration is 2, 98. One explanation for such data obtained most likely lies in the fact that in most organizations work tasks in the field of Finance and Accounting more specific than in the field of Human Resources and Administration.

Table 9: The results of analysis of variance on the four dimensions of organizational culture on the company sector variables for four groups of study participants (Analysis of the authors)

ORGANZATIONAL CULTURE TRAITS	COMPANY SECTOR								Stat. difference

Challenges of the Modern World - Contemporary Economy and Globalization

Chart 9: Four traits of Organizational Culture according to Sector within Company (Analysis of the authors)

The results obtained partially confirm the hypothesis. Hypotheses are discussed separately for the results obtained in our research.

First hypothesis; "There will be no differences in perceiving organizational culture according to managerial role of employed students". This hypothesis is confirmed, the fact proved to be statistically significant differences between perceptions of organizational culture according to managerial role of employed students. A statistically significant difference was found on the following dimensions: Coordination and Integration ($t = 3.17$, $p < 0.01$), Empowerment ($t = 1.99$, $p < 0.05$), Capability Development ($t = 2.13$; $p < 0.05$), Agreement ($t = 2.03$, $p < 0.05$), Organizational Learning ($t = 2.44$, $p < 0.05$) and Strategic Direction ($t = 2.180$ $p < 0.05$). It was also confirmed a significant difference for four trait model of Involvement ($t = 2.01$, $p < 0.05$) and adaptability ($t = 2.01$, $p < 0.05$).

Second hypothesis; "Management, Finance and Insurance will have better teamwork orientation then public Service and Education". Our results showed that the above hypothesis is confirmed. There was statistically significant difference in perceptions of team work between the orientation Management, Finance and Insurance and the Public Service and Education. The arithmetic mean of the group Team Orientation Public Service and Education is 2.92 and the Group Management, Finance and Insurance M = 3.21. So, in the sector (3) Management, Finance and Insurance in a greater extent than present teamwork orientation in the sector of Public Service and Education.

Third hypothesis; "There will be no differences in perceiving organizational culture according to company". Results showed that different sectors will perceive organizational Culture differently. According to results we there is statistically significant difference between sector of Finance and Accounting and Human Resources and Administration at following dimensions: Coordinating and Integration (F = 3.874, p < 0.01) and the dimension of the Creating Change (F = 4, 045, p < 0.05). Coordinating dimension and Integration is more frequent in the group Finance and Accounting (M = 3.12) than in the group Human Resources and Administration (M = 2.82). As for the four traits of organizational culture there were no statistically significant differences. Thus, according to results of four traits organizational culture hypothesis was confirmed, but if we take into account the 12 dimensional indices mentioned hypothesis is not confirmed.

4   CONCLUSION

In this paper we investigated organizational culture among employed business-school students according to Denison model of organizational culture; with presumption that employed business-school students will have some working experience, different managerial role and work in various business areas and company sectors. We researched theoretical background of organizational roots and assessment. Organizational culture was assessed in Croatia by three hundred employed business-school students in Croatia. In comparison to other approaches of organizational culture Denison model gave us the opportunity to look at many dimensions indices and traits at the same time and question how respondents differ in answers according to their, managerial role, business area and company sector. For the purpose of the research author used Denison model. Model was translated to Croatian. When we researched different approaches we came to conclusion that Denison approach is different in a way that it has flexibility to choose which segment would author like to assess.

We had seen the great advantage in assessing employee's business-school students outside of their work environment. Overall results showed that there was no difference in perceiving organizational culture for 300 respondents. All of them neither strongly agree nor disagree about organizational culture. On the whole the respondents did not have strong attitudes at any organizational culture dimension index. This result could be explained with assumption that some respondents are too short in their company in order to make general conclusion. Another explanation could be that the result indicates that respondents did not take enough time to differentiate choices. Furthermore it is also possible that respondents were afraid for anonymity of the questionnaire even though it was clearly stated that everything they write is completely anonymous. When it comes to managerial role we were not surprised with results, according to results managers scored higher in approach to business and they are more consistent and predictable. It is often the case that hierarchy defines approach to business. It seems logical that managerial position will have more authority to make business steps and due to their position they have easier approach to information which makes them in a better position for approaching business. At the same time it is interesting to see that there were is difference between managerial and non managerial roles in involvement and adaptability. Denison did similar research in Henkel and results showed that top managers and middle managers differentiate in their perception of mission and core values (Denison consulting, 2011). In our research we assumed that business sectors will differentiate in approach to team work and we predicted well because Management, Finance and Insurance scored higher mean for teamwork orientation then Public service and Education. After our research we came to conclusion that Denison model would be better for specific organization, it could be more detailed. Denison models gives opportunity to see progress. In this research we looked at present situation, further advice would be to do a research in specific Croatian companies. Denison model application on Henkel case showed that there were several cycles of assessing organizational culture and that confirmed our suggestion for repeating the research after the economic crisis (Denison consulting, 2011). After doing the research we came to the conclusion that model should perhaps use 7 point Lickert scale in order to give candidates more choices. Another point is that the way data was gathered was too long. The main purpose of this research was to assess employed business students during period of economic crisis in order to could be repeated in forthcoming period of economic revival.

MONETARY REGIME, FINANCIAL DEVELOPMENT AND THE PROCESS OF MONEY MULTIPLICATION IN THE EUROPEAN TRANSITION COUNTRIES

selena.begovic@efsa.unsa.ba

ABSTRACT
The aim of this paper is to investigate the effect of the type of monetary regime and the depth of financial development on the dynamics of money multipliers. It is usually argued that countries with strict monetary regimes and undeveloped financial sectors are more likely to have lower money multipliers than countries with discretionary monetary policies and developed financial markets. However, some countries have rather strict monetary regimes (e.g. Singapore) and very developed financial markets and high (broad) money multipliers. This finding suggests that the level of financial development might be more relevant for the money multiplication process and that the rigidity of monetary policy is not the impediment for the development of the financial sector and increase in the broad money. In order to be able to compare the differences in financial development between developed and developing countries, as well as between countries with different monetary policy regimes, the financial market development indicator (FMDI), created by the World Economic Forum (WEF), is used in this paper. This indicator suggests that the level of financial market development is rather low in European transition countries. Beside underdeveloped financial market and slow reforms (particularly in Bosnia and Herzegovina) another constraint in the region is a high asset share of foreign-owned banks and the dependence of money multiplication process on foreign financial markets. This foreign dependence does not allow complete utilisation of national resources. By diversifying and developing the structure of local financial markets and institutions national resources could be used more efficiently for a country. This could be done by creation and development of the appropriate debt-securities market for investment of short (and longer) term funds. An additional improvement of the institutional infrastructure could be made by establishment of, for example, the development bank, which could be used by government to: initiate and attract development funding; implement a selective credit policy for some strategic area of development. Moreover, government could also affect the interest rate by using the development bank (if appropriate funding is assured), external crisis and shocks could be buffered and local customers better protected.

Keywords: Financial development, Monetary regime, Money multiplication, Transition countries

1 INTRODUCTION

It is usually argued that countries with strict monetary regimes and undeveloped financial sectors are more likely to have lower money multipliers than countries with discretionary monetary policies and developed financial markets. However, some countries have rather strict monetary regimes (e.g. Singapore) and very high (broad) money multipliers. This finding suggests that the level of financial development (which is exceptionally high in

Singapore, as indicated by the financial market development index measured by the World Economic Forum) might be more relevant for the money multiplication process and that the rigidity of monetary policy is not the (necessarily) impediment for the development of the financial sector and increase in the broad money. This might be relevant indicator for some small countries with strict monetary regimes (such as Bosnia and Herzegovina, Bulgaria and Croatia) that the money multiplication might be enhanced even when the passive monetary policy is maintained. This is extremely important since the passive monetary policies in these countries contribute credibility of the monetary authority and enhance macroeconomic stability and therefore should not be fundamentally changed.

At the same time, we must respect the fact that the money as a specific good, which is being used as an exchange medium for any other good, should be as much efficiently used as possible. As other resources, money created by a central bank - high powered money - has been processed and transformed into more sophisticated and valuable forms/products by using increasingly sophisticated technology through the banking and non-banking financial industry. After the creation of the high powered money it is further being "technically processed" within the money flows between the financial institutions and clients/customers by money/deposits multiplication process. Accordingly, this process is fundamentally important to create appropriate monetary aggregates and responding money multipliers illustrate the development of financial system and its institutional infrastructure, which is needed for the (efficient) satisfaction of the everyday increased customers' and economies' needs and requirements.

Since the local financial markets in CBA counties are un(der)developed the money multiplication process is currently being implemented largely by using the foreign markets. However, this is proved to be highly expensive, since more assets first have to outflow (as a short-term funds), than inflow (as a longer-term funds) into these [developing (low- and medium- income)] countries and since foreign banks are charging extremely high interest rates for these transactions. This process limits the development of the real sectors in the Western Balkan countries. Moreover, very scarce instruments for mitigating the effects of shocks are currently available. In this paper, we suggest the introduction of new channels of money multiplication through domestic markets, which could use scarce financial resources more effectively for developing national economies and could be utilised as a buffer against the shocks.

After the short introduction, in the first section the explanation about money as a specific good is given. In the second section we investigate different financial development indicators used as proxies for the financial development. The second section is basically needed for understanding of monetary aggregates and money multiplication process which are discussed in the section three, followed by the analysis of correlation between the financial development and the process of money multiplication, in section four. We finish our analysis by representing the current issues and giving policy proposals for Bosnia and Herzegovina. At the end of the paper we give a short conclusion.

2   MONEY AS A SPECIFIC GOOD
Money is a specific good that has a number of specific functions: medium of (international) exchange, unit of account, store of value and standard of deferred payment, which determines its price – the interest rates (see more in: Keynes, 1987, pp. 133–144; Perišin and Šokman, 1988, pp. 9–44; Božina, 2003, pp. 3–208). Even though nowadays money is manipulated by

the usage of monetary policy instruments, as well as by the money multiplication process, money remains inextricably linked to the deepest nature of its historic origin. Therefore, money is not and can never be separated from its deepest essence of a specific good. Historically, money was, at one point of the commodity production development, "extracted" as the most convenient and efficient economic good able to overtake the function of common/exclusive medium of price expression and the function of smoothing a process of exchange. This selection of a specific good was not made once and for all in a particular historical moment. Namely, money can be observed as a specific good/medium that has been appearing in different forms through history: from the precious metals to fiat money (see more in: Galbraith, 1997; Galbraith, 1995, pp. 104–114; Ferguson, 2009). At one point, when money was represented by precious metals, mainly gold, it was indeed a universal medium of exchange in the international trade and payments. Today, although not as universal as the gold was, this role has the U.S. dollar.

In the process of development of societies and technologies there has been a continuous need for the money transformation and regulation. This is basically being driven by the same forces that led the whole process of capital reproduction, from the liberalism, through interventionism, to repeated (neo)liberalism and (new) globalisation, where we currently are. Since money is a specific good in a function of common unit of value it should be used as effectively and efficiently as possible. Money is universal representation of any other value and consequently can be used easily and without losses for an exchange of any other good. Therefore, handling the money allows capital turnover in any other (productive) form. That, consequently, results in lending from those that have money at disposal (loans' approval) to those that need money for the capital turnover, and charging/earning the interest rate for the loans approved (part of the income/profit) that has been created through capital turnover.

In order to allow smooth mechanism of credit relationship and productive and profitable usage of the specific good - money - it is necessary to create appropriate institutional infrastructure (of banking and non-banking financial institutions; see more: Božina, 2003, pp. 244–306, Mishkin and Eakins, 2012; Ferguson, 2009). Basically, we are talking about the creation and usage of a specific technology that allows money turnover, namely the establishment of the reduced form of the capital turnover → M-M', that can be derived from the general capital turnover M-G-P-G'-M'[1](see Perišin and Šokman, 1988, pp. 89–100, 150–182, 187–192). Thus, money available for loans/investments (basically savings) can be efficiently allocated in the turnover process of any functioning capital in order to generate additional profit. Naturally, the appropriate part of the newly created income/profit necessarily belongs to the borrowed capital (in a form of the interest rate). The loans support the capital turnover in the production and are further expanded for the consumption with the intention of facilitate, foster and extend the process of reproduction. This technology is equally important as any other (productive) technology and its usage, consequently, underlies the well-known principles of productivity, efficiency and profitability.

Historical development and sophistication of institutional infrastructure in the domain of financial institutions structure and operational capacity efficiency is therefore a natural course of events in the progress of society and its general capacity to increase the manufacturing base in order to increase the productivity, cost effectiveness and profitability of production process. For better understanding of this process let observe the example of evolutionary development

---

[1]The turnover of capital in production: Money → Goods → Production → Goods (increased value relative to inputs) → Money (increased value after the sale of manufactured goods)

in the wood processing. As a raw material from nature we get the wood by harvesting in the form of wooden logs. Already at this stage we get a large quantity of by-products (lateral branches, bark, and part of the waste wood) that were only later, when imposed by increased needs and enabled by the technological development, began processing of the briquettes for heating and/or wood-pulp and paper manufacturing. Wooden logs are then being processed/cut and prepared for use in the construction industry or in the production of joinery (doors, windows ...), furniture, decoration, luxury yachts and cars, art objects, etc. The final waste wood during this process may be used in the power station, making the briquettes, etc. Another line of technological processing of wood is chemical. We have already mentioned wood-pulp and paper production, but here, in a broader sense, we can mention the production of charcoal, as well as other commodities produced through distillation of wood (a gas that can be used as energy, tars, acetic acid...). All described shows, the starting raw material taken from nature, timber, after passing through increasingly sophisticated technology and complex processing stages, gets progressively diverse production that meets the increasingly differentiated and sophisticated customers' needs, as the society as a whole develops. Certainly, in these processes people are continuously striving to achieve maximum productivity, efficiency and profitability of the available resources and to foster and increase turnover. As a consequence we have cheaper, yet more diverse, quality and extensive production.

Over time, new possibilities are introduced and new materials, such as metal and plastic, are increasingly being used as a substitute for the originally used material – wood. This progress aims to satisfy new and/or transformed needs through new products. For example, a horse and carriage had been replaced with a car. This development process requires more and more investments and discovery of new solutions and technologies in production, enabled by the increased income (and consequently increased savings for necessary investments).

The same can be applied to the historical development of money. We can observe money as a specific good which has been developing and changing forms through development of institutional infrastructure of financial sector, as well as technology. The rationale behind this development is again the achievement of universal principles of goods' production: productivity, efficiency and profitability (cost cutting and turnover increasing through using increasingly advanced technology). Consequently, money as a specific good, which is being used as an exchange medium for any other good, should be as much efficiently used as possible. As other resources, ("raw-material") money created by a central bank, high powered money (reserve money, monetary base - MB) has been processed and transformed into more sophisticated and valuable forms/products by using increasingly sophisticated technology through the banking industry. After the creation of the high powered money it is further being "technically processed" within the money flows between the financial institutions and clients/customers (forming M1, M2 and broader monetary aggregates; see more: Perišin and Šokman, 1988, pp. 47–86; Ćirović, 1987, pp. 3–68; Ćirović, 1976, pp. 217–290). As customers' needs and money flows increases the financial institutions' balances increases as well, similar to the increase of value of capital invested in raw materials and technologies in the production sector. Over time, and with the development of the financial system of a country, these, every day more developed and more extensive balance of financial institutions, impose the need to define and quantify the different monetary aggregates: money supply M1, and broader aggregate M2, M3. Consequently, progress and development of a whole financial mechanism can be observed through money multipliers (m1, m2, m3) (see more in: Havrilesky and Boorman, 1978; Havrilesky and Boorman 1976; Ćirović, 1976, pp.

217–290; Ćirović, 1987, pp. 29–68), which shows the increase of the "financial pyramid" with regards to the monetary base (m1=M1/MB; m2=M2/MB; m3=M3/MB). These monetary aggregates and responding multipliers illustrate the development of financial system and its institutional infrastructure, which is needed for the (efficient) satisfaction of the increased customers' and economies' needs and requirements. Additionally, these monetary variables indicate a need for maintaining a stable value of money, liquidity and efficacy in the increasingly complex financial structure.

By defining the relationship between the total balance of the monetary-financial institutions in relation to the country's GDP, and the extent to which there has been the development of certain monetary aggregates (e.g. in Bosnia and Herzegovina, BH, there is a statistical tracking no more than M1 and M2, while M3, which is targeted in monetary policy by EMU, BH recent developments does not recognize), one can get a basic insight about the extent to which a country's financial system and its institutional infrastructure can efficiently use the available resource of the reserve money (generated by the central bank). Comparing BH, Croatia, Czech Republic and Lithuania with EMU, we found this parameter between 2.8 (Czech Republic, 2010) and 3.9 (BH, 2010) for EMU MFIs` (Table 1).

Table 1: The broadest monetary aggregates and MFIs' assets/GDP (Countries' national (central banks') statistics; Eurostat; DG-ECFIN for the data on the EMU)

Country	BH	Croatia	Czech Republic	Lithuania	EMU
The broadest monetary aggregate:	M2	M4	M3	M3	M3
MFIs' assets/GDP per years	MFIs' assets /GDP	MFIs' assets /GDP	MFIs' assets /GDP	MFIs' assets /GDP	MFIs' assets /GDP
2006			1.00	0.86	2.98
2007	0.90	1.08	1.07	0.96	3.19
2008	0.85	1.08	1.14	0.92	3.05
2009	0.87	1.15	1.18	1.11	3.33
2010	0.86	1.17	1.20	1.06	3.38
2011	0.86	1.19		0.94	

However, in studies which deal with the financial development issues more comprehensive and more complex indicators/proxies for the financial development are used. Therefore, after the short analysis of these different measures used in the literature, we will determine and analyse some potentially relevant indicators for the countries of interest.

3 FINANCIAL DEVELOPMENT INDICATORS

Since there is/are no universally accepted proxy/ies for the financial development different studies used different indicators. Those indicators consider the depth, size, access, efficiency and stability of financial system by assessing banks and other financial institutions, stock and bond markets, as well as institutional environment in a country (laws and regulations). Consequently, most studies used more than one indicator/proxy in order to capture all elements of financial development. Caporale et al. (2009) consider several indicators: the ratio of credit to the private sector to GDP as a measure of financial depth; indicators of the size of

stock markets as stock market capitalisation (as a percentage of GDP); monetisation variables such as the ratio of broad money to GDP as a measure of the size of the financial sector; indicators of the efficiency and competitiveness of the financial system such as the margin between lending and deposit interest rates and the EBRD transition index of financial institutional development. Antzoulatos et al. (2008) formed financial development indices based upon four categories: banks, financial institutions, stock and bond market indices. However, all these indices are created for a certain year (or some time period, but not the most recent one) and do not include all countries of our interest. In order to be able to compare the changes in financial development and between developed and developing, as well as countries with different monetary policy regimes, we used the financial market development indicator (FMDI) created by the World Economic Forum (WEF). Although there is a more comprehensive financial development index (FDI)[2] created also by the WEF, we used FMDI, which is somewhat narrower indicator, since the FDI is not available for the countries of interest. The FMDI assesses the following factors: availability of financial services, affordability of financial services, financing through local equity market, ease of access to loans, venture capital availability, soundness of banks, regulation of securities exchanges and legal rights index based on a executive opinion survey.

Although the focus is on the European transition countries we also observe developed countries, for comparison (and more obvious illustration of some relations). The FMDI implies that, as expected, Switzerland, Singapore and the United Kingdom have higher level of the financial market development than European transition countries. Chart 1 also indicates that Poland and Turkey (which have had proactive monetary policies) actually have had improvement in the financial markets development at the beginning of the crisis, while financial markets in all other countries deteriorated in this period.

Additionally, for the transition countries we can observe the EBRD financial sector indicators for the reform in banking (Chart 2) and non-banking financial sector[3] (Chart 3). From the following charts we can notice that Czech Republic and Croatia have the highest score for the banking sector reform, while the "leading" positions for the non-banking reform belong to Poland and again Czech Republic (which is after 2008 not considered a transition country). On the other side, Bosnia and Herzegovina has the lowest reform scores in both banking and non-banking sector.

---

[2] WEF's FDI is consisted on the basis of seven main pillars of financial elements, whcih include institutional environment, business environment, financial stability, banks, non banks, financial markets, size, depth, and access.

[3] These indicators comprises of the following features: number of foreign-owned banks, asset share of state-owned banks (%), asset share of foreign-owned banks (%), non-performing loans (% total loans), domestic credit to private sector (% GDP), domestic credit to households (% GDP), mortgage lending (% GDP), stock market capitalisation (% GDP), stock trading volume (% market capitalisation), eurobond issuance (% GDP).

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 1: Financial market development indicator

Chart 2: EBRD index of banking sector reform
(http://www.ebrd.com/pages/research/economics/data/macro.shtml#structural)

*Note: There is no data for Czech Republic after 2008, since the EBRD do not consider it a transition country after this point. Index for Turkey exist after 2008
*Chart 3: EBRD index of reform of non-bank financial institutions
(http://www.ebrd.com/pages/research/economics/data/macro.shtml#structural)*

*Note: There is no data for Czech Republic after 2008, since the EBRD do not consider it a transition country after this point. Index for Turkey exist after 2008

4   MONETARY AGGREGATES AND MONEY MULTIPLICATION PROCESS

Another way to observe the differences in the depth of financial system development is by observing the differences in the (broadest) money multipliers among countries (Chart 4). Again, the most developed countries, Singapore, Switzerland and United Kingdom are well above other observed countries. It is also evident that in 2008-2009 there is extremely high drop of money multiplier in the United Kingdom. This is partially result of different recording since, as noted in the IMF IFS documentation, beginning July 2009, refers to M4 excluding intermediate OFCs (M4ex). Another reason for this, as well as other, drops of money multiplier after 2007-2008 is a financial crisis.
Chart 4: Money multiplier (mm) for selected transition and developed countries (Based upon the calculation of money multipliers according to the data for the monetary aggregated from IMF's International Financial Statistics and WB's World Development Indicator databases)

*Note: The broad money is different monetary aggregate in different countries (see IFS Documentation at http://esds80.mcc.ac.uk/wds_ifs/TableViewer/document.aspx?ReportId=47036)

If we exclude countries with the highest money multipliers and observe only transition countries differences between those (European transition) countries is more evident (Chart 5).
Chart 5: Money multiplier (mm) for European transition countries (Based upon the calculation of money multipliers according to the data for the monetary aggregated from IMF's International Financial Statistics and WB's World Development Indicator databases)

Challenges of the Modern World - Contemporary Economy and Globalization

Again, Bosnia and Herzegovina is "at the bottom", with the lowest money multiplier (calculated as a ratio between the broadest monetary aggregate and monetary base). Other countries with a currency board regime have also low money multipliers (Bulgaria, Lithuania and Croatia, whose monetary regime is usually described as a currency board-like). However, it has to be noted that those countries also have had the greatest stability of both monetary and financial sectors, probably due to strict rules and full coverage monetary base (which increase monetary credibility and confidence in monetary and financial system). Again, Czech Republic, Poland and Turkey (which have more discretion in the implementation of monetary policy, and are also more developed than other European transition countries observed) have the greatest money multipliers. It can be noticed that countries with low banks' (MFIs') assets/GDP ratio also have low money multipliers, which might be indicating that more developed financial system uses money as a resource more efficiently.

5 CORRELATION BETWEEN THE FINANCIAL DEVELOPMENT AND THE PROCESS OF MONEY MULTIPLICATION

From the above analysis, it can be perceived that countries with more strict monetary regimes have lower financial development. Even though most of the countries are directly or indirectly connected to the euro (as can be noted from the *de facto* exchange rate classification shown in Table 2), there are differences among the countries in the types of monetary regime and the level of discretion in the way how monetary authorities operate.

Table 2: Exchange rate regimes in countries (Ilzetski et al., 2010)

Country	Period	Exchange rate regime	
Bosnia and Herzegovina	Jan. 1999 – Dec. 2010	Currency board/Peg to euro	
Bulgaria	Jan. 1999 – Dec. 2010	Currency board/Peg to euro	
Croatia	Jan.1999 – Dec. 2010	De facto band around euro	+/- 2% band.
Czech Republic	Jan. 2002 – Dec. 2010	De facto crawling band around Euro	+/- 5%
Lithuania	Feb. 2002 – Dec. 2010	De facto band around the euro.	Band is +/- 2%. Joined ERM II on June 28, 2004. En route to joining the euro zone in 2010
Poland	April 2000 – Dec. 2010	Managed floating/de facto band around euro	+/- 5% band. Fluctuations have remained consistently inside this band at least 95% of the time. Significant depreciation during 2008Q4 to 2009Q1.
Singapore	June 1973 – Dec. 2010	De facto moving band around the US dollar	+/- 2% band. Officially adjusted on the basis of a basket of currencies
Switzerland	Jan. 1999 – Dec. 2010	De facto moving band around euro	+/- 2% band.
Turkey	April 2003 – July 2007	Freely floating	
	Aug. 2007 – Dec.2010	Managed floating/De facto band around US dollar	Band is /-5%. Significant depreciation in October 2008, accompanied with annualized inflation nearing 40%.
United Kingdom	Jan. 2001 – Dec. 2008	De facto moving band around the euro	+/-2% band
	Jan. 2009 – Dec. 2010	Managed float	

In order to observe the correlation between the money multiplier and the level of financial development, next we observe the two in one chart (Chart 6). As this chart implies more developed financial systems tend to have higher money multipliers. Again, three developed countries (United Kingdom, Switzerland and Singapore) are above European transition countries. Czech Republic, Poland and Turkey follow, while CBA(like) [4] countries (Bosnia and Herzegovina, Croatia, Bulgaria and Lithuania) have low-grade performance (the inferior progress in money "processing" process).
Chart 6: Money multiplier and FMDI (2010) (STATA12 printout based on the data on money multipliers and FMDI discussed and investigated above)

Simple univariate analysis also indicates that the financial market development significantly and positively affects the money multiplier (Appendix 1). However, the correlation coefficient between the two variables is high, which indicates the problem of high multicorrelation. This simple analysis is conducted not to make any statistical inference (since we do not control for other potential determinants) but only to indicate high positive correlation between the two variables. Since Bosnia and Herzegovina is a transition country, which is going through the process of development, it needs as much funds as possible. However, according to the above analysis it can be notice that it has the lowest scores for both financial development and money multiplication. Therefore, we will investigate reasons for such a bad performance in more detail and give some recommendations for increasing these

---

[4] Under a currency board arrangemnet (CBA) a country fixes its nominal exchange rate to some foreign currency and maintains 100 percent backing of its monetary base with the selected stable foreign currency. Moreover, the monetary authority cannot use the usual monetary policy instruments and is usually described as non-discretionary. BH's CBA deviates from the orthodox rules by using the reserve requirements as a policy instrument, while CBAs' in Bulgaria and Lithuania are even more flexible. The monetary regime in Croatia have been described as CBA-like due to high (more than 100%) coverage of monetary base with foreign reserves and limited use of monetary policy instruments.

scores, but without violating the stable pillar of monetary policy, established by the currency board arrangement.

6 CURRENT ISSUES AND POLICY PROPOSITIONS FOR BOSNIA AND HERZEGOVINA

Beside underdeveloped financial market and slow reforms in Bosnia and Herzegovina another constraint is a high asset share of foreign-owned banks (see Chart 7) and the dependence of money multiplication process on foreign financial markets. Namely, the problem of maturity mismatching between deposits and loans and inability to take over the risk of maturity matching is evident, mostly due to strict regulations. The maturity matching under CBA(-like) regimes (which is essential for satisfying the time-structure of credit demand adequately) is possible only by depositing short-term assets abroad and withdrawing the long-term liabilities from abroad, allowing higher supply of needed longer-term loans (as well as additional increase of the monetary and credit multiplication), as illustrated by Chart 8 (for more details see Kreso and Begovic, 2012). This approach is proved to be an expensive method for overcoming the maturity mismatching, since foreign banks charge high prices for the conversion of short-term deposits into longer-term loans. Actually, the "raw material" (short-term deposits) is exported and "processed" outside the country and then send back as long-term loans (from foreign banks to Bosnia and Herzegovina). This is not only the issue in Bosnia and Herzegovina, but due to the lowest level of development of financial markets and institutions and strict rules imposed by the currency board (like) arrangement it is the most pronounced in the region (in the transition countries). Moreover, there is no buffer against the shocks, since monetary policy is passive (and Central Bank cannot act as a lender of last resort) and foreign banks are primarily focused on profits and may withdraw their funds from the country when they consider it insufficiently profitable, which makes the financial system relied on foreign banks even more fragile.
Chart 7: Assets share of foreign-owned banks (in percent) (EBRD)
Chart 8: Maturity matching process in Bosnia and Herzegovina (Authors' illustration)

This resembles the export of energy, timber, iron, etc., which we are not able to adequately process by using the available national industrial capacity, so we then import wood panels and furniture, a variety of industrial and food products, automobiles, etc. It is certain that we could have had more gain for the economy and society with the higher and faster development by using our own capacity. However, in the field of finance, the question is how can this process be improved without violation of the currency board functioning[5]. What is the potential role of government and whether it can (and should) be more proactive in these processes?

By diversifying and developing the structure of local financial markets and institutions the maturity matching requirement could be satisfied less costly for the country. Namely, creation and development of the appropriate debt-securities market for investment of short (and longer) term funds (trough issuance of short and longer-term securities by state, then followed by companies) would allow short (and longer) term deposits from the BH banks` to be more intensively invested in these debt-securities market. This competition between State of BH and banks in BH would (and should) make more efficient usage of national financial resources. Under the condition of liquid markets, households and companies would buy government and corporate bonds, treasury bills and commercial papers, potentially earning more compared to depositing money in the banks. This would increase the competition with respect to the banking sector which is currently the pre-dominant agent for investing and borrowing in the observed countries. Additionally, this should initiate better dynamic at the local financial market and could be expected to increase the liquidity as well. This should also result in more effective use of domestic money sources in domestic economy (matching of demand and supply through local financial market). This could also be achieved through government support of local commercial banks (particularly small(er) banks). Another proposition for "processing" money and lowering costs of money "conversion" (short term deposit to long(er) term) is the improvement of the institutional infrastructure by government, through establishment e.g. of the development bank. This Bank, adequately/professionally govern, could solve few problems:
1. It could initiate and attract development funding for infrastructure and create programmes for investment – to issue the securities and guaranty their liquidity. This

---

[5] Since the CBA in Bosnia and Herzegovina is proved to be a source of monetary credibility and stability the other ways of fostering this progress are proposed.

institution should be supported by government, e.g. issuance of warranty from the government, by holding the budget reserves at the development bank's accounts;
2. Selective developing credit policy (for example for agriculture) which is not any more popular as a monetary policy instrument, but again government should proactively be involved in these programmes (attracting cheap funds or any other kind of support, such as subsidising the interest rates by the government, for loans granted through the development bank)[6]
3. Previously issued securities could be a base for government to buy and sell securities (but these should be based on the reserves previously deposited e.g. at the Central Bank). By doing this government could affect the interest rate and be a some kind of substitute for Central Bank`s open market operations, which does not have this ability under the CBA. Once again, these operations should be based on reserves since "ex nihilo" issuance is not allowed under a CBA. This approach necessarily requires forming of reserves and/or finding and attracting cheap credit lines and warranties.
4. The consequences of external crisis and shocks could be buffered and the local customers better protected.

7 CONCLUSION

Money is a specific good and, even though nowadays it is manipulated by the usage of monetary policy instruments, money remains inextricably linked to the deepest nature of its historic origin. The money available for loans/investments (basically savings) can be efficiently allocated in the turnover process of any capital operation in order to generate an additional profit. It is the main reason for money to be used as effectively as possible. This is extremely important, particularly for non-developed and transition countries, since it should provide progress of society and build up its general capacity to increase the manufacturing base. In order to allow smooth mechanism of credit relationship and productive and profitable usage of money, it is necessary to create an appropriate institutional infrastructure (of banking and non-banking financial institutions).

One can get a basic insight about the extent to which a country's financial system and its institutional infrastructure can efficiently use the available resource of the reserve money (generated by the central bank) by defining the ratio between the total balance of the monetary-financial institutions to the country's GDP. Comparing this ratio in BH, Croatia, Czech Republic and Lithuania with the one in EMU it is noted that it is much higher in EMU (in 2010 it was around 1 in the transition countries, while in the EMU it was 3.38). Financial market development indicator (FMDI) created by the World Economic Forum indicate lower development of financial markets in countries with less active monetary policies. Another way to observe the differences in the depth of financial system is by observing the differences in the (broadest) money multipliers among countries. By analysing the monetary aggregates and money multipliers we may conclude that countries with a CBR(-like) regime have rather low money multipliers (Bosnia and Herzegovina, Bulgaria, Lithuania and Croatia). However, it has to be noted that those countries also have had the greatest stability of both monetary and financial sectors, most likely due to strict rules and full coverage monetary base (which increase monetary credibility and confidence in monetary and financial system).

---

[6] For example, we can mention the International Rice Research Institute (IRRI) whcih is a nonprofit organization, which means that any funds received go directly toward achieving goals of reducing poverty and hunger, improving the health of rice farmers and consumers, and ensuring that rice production is environmentally sustainable.

Beside underdeveloped financial market and slow reforms another constraint in the European transition countries (particularly in Bosnia and Herzegovina) is a high asset share of foreign-owned banks and the dependence of money multiplication process on foreign financial markets. This foreign dependence does not allow complete utilisation of national resources. By diversifying and developing the structure of local financial markets and institutions national resources could be used more efficiently for a country. This could be done by creation and development of the appropriate debt-securities market for investment of short (and longer) term funds. An additional improvement of the institutional infrastructure could be made by establishment of, for example, the development bank, which could be used by government to: initiate and attract development funding; implement a selective credit policy for some strategic area of development. Moreover, government could also affect the interest rate by using the development bank (if appropriate funding is assured), external crisis and shocks could be buffered and the local customers better protected.

ABSTRACT

Transfer pricing in related-party transactions, represent one of the most actual area in contemporary business. It's different from prices that are arranged between unrelated companies for comparable transaction in equal circumstances. It's used in profit transferring for minimazing tax burden and maximizing consolidate profit. In 1995 OECD established transfer pricing guidelines for multinational companies and tax administrations on international level. From tax aspect, the most important matter is to document and determine transfer prices with appropriate method because of proving the arm's lenght principle. Worldwide, the focus is on their audit and control (North and Latin America, Asia-Pacifik). The most important procedures for dispute resolution are cost sharing agreements, advance pricing agreements and mutual agreement procedures. Tax administrations in European Union also strengthen transfer pricing audits by adopting Codes of conduct. Joint transfer pricing forum works on consensus principle in order to resolve transfer pricing practical problems. In Republic of Croatia, first transfer pricing regulation is established in 2005. OECD guidelines are implemented in corporate tax law, it's regulation and common tax law, but also in 2009. Tax administration published Manual for transfer pricing audit. The purpose of this paper is to analyze transfer pricing, which can not be cancelled, but it's necessary more detailed and concrete transfer pricing institucional determine.

Keywords: Associated Companies, Croatia, Double Taxation, EU, Oecd Guidelines, Transfer Pricing

1 INTRODUCTION

Transfer pricing represents one of the most significant and up-to-date areas in modern business operations. Initially, transfer pricing was understood exclusively as the pricing of the transactions performed among single organizational parts and the company's responsibility centres, the company owners this way achieving different objectives. Today, companies are crossing national borders creating affiliated companies based on capital, management and control rights, so that with the globalization of businesses, transfer pricing is getting a new dimension and significance. The notion of transfer pricing in modern business environment is, therefore, considerably broader and more complex and connected with business merging at the international level.

The modern definition of transfer pricing describes it as the pricing at which transactions among mutually affiliated companies, that is companies that are group members, are conducted. Such pricing is not stipulated in the free market and can vary from the pricing stipulated by non-affiliated companies in a comparable transaction and under the same

circumstances. They generate accounting and taxation effects which are manifested when profit is being declared. Transfer pricing affects the process of business decision making as for the input and output and this way affects profit taxation and investment return rates. Since the members of the international group operate in different tax systems, transfer pricing represents an attempt to transfer the profit from group members operating in high tax burden systems to group members operating in lower tax burden systems. This way, it is possible to decrease the tax burden and consequently to stimulate the maximization of consolidated profit. As more than two thirds of international trade worldwide are related to multinational companies, transfer pricing represents one of the most important tax problems globally.

The spreading of multinational companies' businesses is simultaneously followed by the development of tax regulations in the sense of transfer pricing. So, the tax authorities determine such transfer pricing which conveys the right value of a transaction among affiliated companies by concluding contracts on double taxation avoidance, bilateral contracts and national legislation. In order to prevent manipulations with transfer pricing on the part of groups at the international level, OECD has issued directives on transfer pricing for multinational companies and tax administrations and they are a widely accepted way of how to regulate transfer pricing at the international level. Most countries implement those directives into their legislative regulations to establish a unique treatment for transfer pricing defining, monitoring and controlling in internationally affiliated companies.

2   TREATMENT AND REGULATIONS OF TRANSFER PRICING

The first attempts to regulate multinational companies appeared in 1976, when the OECD directives for multinational companies were adopted and they represented recommendations intended for governments and the companies themselves. In 2000 they were reviewed and their implementation was improved. They consist of voluntary principles and standards for responsible company management according to the laws in force. The directives' objective is to have such companies do business in accordance with the government policy, to improve mutual trust among the companies and societies they are operating in, to improve the climate and environment for foreign investment and also to contribute to sustainable development. The directives regulate numerous issues such as concepts and principles, general measures and policies, information disclosure, employment and industry relations, the environment, corruption fighting, protection of consumers' interests, science and technology, competition and taxation. The directives related to the transfer pricing issue are enclosed in the section dealing with taxation, information and data disclosure. It is important that companies make their contributions to the public finances of the state they are operating in by meeting their tax obligations regularly and on time (OECD Library, 2012). The companies have to respect the tax laws and regulations in all the countries they are doing business in and have to operate accordingly. They should also provide all relevant information to the authorities about their activities, structure, financial situation and business operations in order to precisely determine their tax obligations on the basis of their business activities. The companies should as well apply high standards concerning the disclosure of information, accounting and auditing.

In 1995, OECD published the directives which define transfer pricing for multinational companies and tax administrations with specific chapters about the principle of unbiased transaction, methods of defining transfer pricing, the administrative aspects of transfer pricing and the documentation, and in 1996 the directives were completed with chapters about intangible assets and services. Besides that, they include chapters about comparability analysis, administrative approaches on how to avoid and solve disputes, including also the

agreement on sharing common expenses. They represent an internationally accepted standard for transfer pricing determination and control in order to prevent manipulation by applying the principle of independence. The OECD directives are extensive so that some inconsistencies can be noticed and they therefore represent simply instructions on how to regulate the issue of transfer pricing in particular countries. There is an attempt to harmonize transfer pricing with OECD directives so as to make bilateral and multilateral agreements feasible and easier to conclude, and to reduce the risk of double taxation. Different methods are used to implement the principles of unbiased transaction, while transfer pricing is being determined. They have their foundation in classical methods of transfer pricing determination, but are adapted to tax administrations which carry out the transfer pricing control and the transactions among affiliated companies. Contrary to accounting methods, the methods of transfer pricing determination pursuant to the OECD directives are directed not only at the determining itself but also at the control and checking of transfer pricing at the international level.

2.1   Tax implications of transfer pricing

The purpose of transfer pricing can be observed depending on whether there is one subject which has a decentralized organizational structure or there is a group made of the parent company and branches at the national or international level. From the tax aspect, transfer pricing is about the companies' proving in a well-documented manner the comparability of transfer pricing with the market pricing. Taxation is, actually, the environment factor the persons making decisions in the company have no influence on, but they can change the result of their activities. Otherwise, the taxation of the company itself depends on the principles existing in national legislations. Taxation, according to the world principles, means that the companies which have their seats in the parent country are subject to profit taxation independently of the area they are performing their activities in. Those subject to taxation by territorial principles are obliged to pay tax only on the profit made in a particular area. Companies organized in a group of companies doing business in more than one country have more room for manoeuvre regarding the possibility of tax reduction. In countries with high profit tax rate, the owners tend to move their businesses to countries with lower tax rates. Let us suppose the company has generated the profit before the taxation of 1 monetary unit and has to, along with the taxation of 40%, pay the state 0,40 monetary units for each monetary unit of the profit, which means that there are 0,60 monetary units left to the company. Then, let us suppose that the total balance of 0,60 m.u. is divided among the shareholders in the form of dividends, which are taxed again. If the taxation rate for the dividends is 50%, that means the shareholder has to pay the tax in the amount of 0,30 m.u. and that out of the initial 1 m.u. there is 0,30 m.u. left to the shareholder.

For that reason, the companies establish their companies, branches or other organizational forms in more tax favourable foreign countries, in which case transfer pricing emerges having multiple effects at the multinational group level. They have an immediate impact on how high is the business result of the group members in the offer chain, and the consequence is also a different profit tax level as well as the taxation of the distributed profit of the group members in different countries. In other words, the profit from countries with high tax rates is transferred to countries with lower profit tax rates, which affects the increase of profit in the countries with lower profit tax rates. On the other hand, transfer pricing can have a controlling role too, if, for example, the parent company wants its branch to pay them dividends, and the branch can not do that due to legislation limits, the parent company will then artificially increase their profit and reduce the branch profit. The most important reasons for the

application of transfer pricing are because of the estimation of profit – the increase of consolidated profit and decrease of tax obligation, determination of expenses, then control and responsibility assessment.

The application of transfer pricing to minimize tax obligations at the group level is possible with groups whose societies act in different tax systems in which way the advantages and disadvantages of the same are made use of. There is a misuse of transfer pricing policy if the profit and expenditure are improperly allocated in order to reduce the taxable profit. The manipulative effect of transfer pricing at the international level is achieved in the way that the affiliated companies acting under unfavourable tax conditions charge low transfer prices for the deliveries of their goods and services to the members operating under more favourable tax conditions, and the members operating under more favourable tax conditions charge high transfer prices for the deliveries of their goods and services to the members doing businesses under more unfavourable tax conditions.[1] On the assumption that there is an equal tax base of profit tax, the profit is transferred with transfer pricing from group members operating in the country with high profit tax rate to the members operating in the country with a lower profit tax rate. Some other economic objectives can be achieved with the application of transfer pricing: a better competitive position in a particular market, development stimulation of a certain subject, risk minimization of currency rate change and so on. Such transfer pricing manipulation is prevented with the application of a unique taxation treatment of transfer pricing at the international level and the application of the principle of independence. According to that principle, regulated by contracts on double taxation avoidance, affiliated companies have to determine transfer pricing in the amount of the market prices which would be charged for the same type of transaction and under the same conditions to non-affiliated companies or third persons outside the group. The problem of transfer pricing can be solved by stipulating adequate methods for their determination and by concluding the agreement on double taxation avoidance. Taxes become important for decision making when in the evaluation of mutually exclusive alternatives they impact the business decision making and when the non taking of taxation into consideration would result in a decision which would not be in accordance with the company basic objective, and that is the maximization of profit. Affiliated companies performing mutual transactions try to obtain the most favourable tax burden through transfer pricing. Tax on profit can influence the monetary flows of the company and reduce the sheer cash flow so that the company has to be informed about its influence and manage it accordingly.

2.2   Regulation of transfer pricing

The European Union directives regulating the areas of international taxation comprise the directives aligned and passed by the Council in the mid 1990s. The first Directive is about the parent and dependent company and is being applied to cross-border divisions of profit among the parent and dependent companies residents of the countries members of the European Union. Its objective is to eliminate double taxation which occurs at the distribution of profit among the parent and dependent companies. In this connection, the parent company is considered the company which has at least 20% of ownership share in the dependent company.[2] The Directive does not apply to cases in which the company resident of an EU

---

[1] Manipulating with transfer pricing, or the praxis of 'parking profit', that is to assure that the profit is taxed in a jurisdiction with an as low as possible tax rate attracted the attention of the tax authorities worldwide.

[2] The so called qualifying participation (15% from 1st January 2007, that is 10% from 1st January 2003).

member, according to the regulations of the contract on double taxation avoidance concluded with a third country, is considered resident of that third country. The second refers to the Directive on mergers and acquisitions (M&A)[3] and is applied to mergers, divisions and transfers of assets and exchange of shares among the companies from two or more countries EU members. The basic point of the directive is to create conditions of a single market when companies get into business reconstruction and reorganization processes, and that at the same time the protection of financial interests of the countries members is taken care of (Kukić and Švaljek, 2007). The directive provisions will be applied only under the condition that the assets and obligations of the company transferring the assets and obligations stay truly connected with the permanent place of business of the company receiving the assets and obligations, and which is in the same EU member country where there is the transferring company and that the assets and obligations being transferred take part in the formation of profit/loss taken into account while calculating tax base. Also, the company receiving the assets and obligations is not allowed to change the tax base of the received assets and obligations, that is, the value of the received assets and obligations has to, for taxation purposes, stay the same which means that the regulations of the country where the seat of the transferring company is have to be applied, just as if the business combination has not occurred.

Although there is no precise information on the proportions of tax evasion in the EU, the estimated value is between 2 and 2,5% of EU GDP or between 200 and 250 billion EURO (Matei and Pirvu, 2011). For that reason, the EU tax administrations are increasingly monitoring the transactions, especially the financial ones, where transfer pricing occurs. In addition, the formatting of documentation about transfer pricing is required for its protection as well as the explanations of allocation principles for the risks taken over and the effects of business restructuring. In 2006, that was consolidated in the 'Codex of Behaviour' on transfer pricing documentation for harmonization purposes. In the project analysis about tax profit, the European Commission has pointed out the importance of tax problems regarding transfer pricing, and that as an issue at the level of internal market. Although the countries EU members have recognized and adopted the OECD directives for transfer pricing, their different interpretations offer scope for international debates and disputes which affects the functioning of internal market and causes additional expenses for companies and national tax administrations. Solutions for tax problems solving are defined and given within the Joint Transfer Pricing Forum are established by the European Commission in 2002 to reduce high coordination costs and to avoid double taxation often occurring with international inter-group transactions.[4] The number of EU countries which have become members of advance price agreements and joint consulting procedures has increased. Despite that, there are still EU members which do not have legislative regulations for transfer pricing sorted out (Malta) or requests submitted for the preparing of documentation (Luxemburg). The European Parliament has also put forward the possibility of introducing a jointly consolidated profit tax base which should solve the problem of double taxation and transfer pricing in the EU.

---

[3] In 1997, in the ECOFIN conclusions the Codex of Behaviour was passed for business taxation in order to prevent harmful tax competition. As one of the criteria to determine tax harmful measures, there was also outlined the determination of the company profit in the multinational group pursuant to internationally accepted rules, especially those approved by the OECD.

[4] According to the estimations of the European Commissions from 2001, the expenses of transfer pricing adjustments for the European companies were 4-5,5 bill. Euro per year, that is, 1,9 % of the amount of the paid profit tax.

Challenges of the Modern World - Contemporary Economy and Globalization

Transfer pricing related to international transactions has become an important issue globally. Tax administrations have to cope with the consequences of the financial crisis leading to difficult financial burdens and losses in the chain of values, and resulting in an increasing number of conflicts to preserve the previous levels of taxable profit. In the opinion of many scientists, transfer pricing represents the best way of avoiding tax payment, that is tax evasion. Following the OECD study 'Promoting Transparency and Information Exchange for Tax Purposes' from 2010, it has been estimated that the business praxis of avoiding tax payment generates the loss of tax income in the value of 100 billion USD to the American economy, and more billion EURO for many EU countries. In the research 'A Christian Aid Report, carried out in 2009, it is estimated that the developing countries have an annual loss of 365 billion USD due to transfer pricing manipulation, so that the governments of those countries are not able to provide adequate education, health care, water supply, transport and other indispensable services.[5] Because of transfer pricing manipulation on the part of multinational companies it was estimated that Papua New Guinea lost between 9 and 17 mil. USD in 1999. In Great Britain, in the period going from 2003 to 2007, the tax authorities were implementing transfer pricing coordination which resulted in the increase of tax income of 1,1 mil. GBP, and in the period from 2007 to 2009 in an additional increase of 2,1 mil. GBP. The transfer pricing monitoring carried out in Australia enabled the tax authorities to increase incomes for as much as 2,5 bil. AUD in the period of five years until 2005. The introduction of strict monitoring of transfer pricing in China after 2005 had as a consequence an increase of tax income of 460 mil. Yuan (CNY), while in 2007 there was recorded an increase of 987 mil. Yuan of tax income (Sikka and Willmott, 2010).

If we observe Europe, most Western European countries introduced the regulation of transfer pricing except for Belgium and Ireland (up to 2010), and Norway and Switzerland. Prior to the financial crisis, the transfer pricing monitoring was increasingly carried out, and currently it is being intensified even more. In countries where the transfer pricing regimes were established much earlier, like in Great Britain, Germany and the Netherlands, those subject to profit tax encounter highly specialized tax inspection experts (PwC, 2010). The monitoring often focuses on business restructuring, the status of net operative loss and intangible assets with a highlight on the comparison of transactions with publicly accessible information. In the Eastern and Mid-European countries, the risk of transfer pricing manipulation emerged due to the opening of their economies, political stabilization, the attracting of foreign investments as well as lower tax rates and the non-existence of pricing regulation. Therefore, some improvement can be noticed in those countries, especially for the preparing of documentation which is becoming a rule. Tax inspectors do not focus any longer exclusively on transaction estimation through a contract, but also take into account the local characteristics and the reality of the business itself. The tax authorities in those countries require the preparation of specific local documentation to provide a benchmark, while some countries also require the documentation to be translated into the official language. More and more frequently, the tax authorities use the tools for information exchange stipulated in the agreements on double taxation and EU directives. In some countries like, for example, Russia and Kazakhstan the rules on transfer pricing can differ from OECD directives since the rules in those countries are valid also for the relations with disjointed parties (PwC, 2010). Otherwise, in most countries,

---

[5] The developing countries are attractive destinations for foreign multinational companies' investments which represents a challenge of transfer pricing manipulation resulting in outflow of capital towards the developed countries.

the request for the conclusion of advance pricing agreements guarantees safety in intercompany transactions.

Transfer pricing is a priority issue in the USA and Canada which is why there is a greater implementation of monitoring. The USA has one of the oldest and most developed regimes regulating the issue of transfer pricing. The application of the principles of independence for transfer pricing dates from 1934, and the IRS has published additional rules over the last three decades. The IRS investigates regularly the pricing among companies and transfer pricing policies upon the tax payment of multinational companies, and the investigation becomes more extensive when there is a suspicion of an attempt to avoid tax payment. The American regulation of transfer pricing is consistent with the OECD directives for the choice of the best method, transaction methods, comparability analysis, market penetration strategies which make it possible to influence transfer pricing, principles of independence, treatment of intangible assets, services and documentation, and possible sanctions. Canada is known as a country with strong transfer pricing monitoring. CRA (Canada Revenue Agency) made one of its more significant successes in 2008 when it won a suit at the Tax Court relating transfer pricing in a dispute with a company. The USA, Canada and Mexico have been intensifying their monitoring activities over the last few years as well as the concluding of various agreements and arrangements with countries without regulated double taxation.

For two decades, Latin America was a free zone for transfer pricing regulations. Today, ten countries in that region have instituted relatively new regulations based on the OECD directives. Various tax bodies' attitude to transfer pricing is changing, except for Brazil which is not implementing the principle of independence. Mexico, Argentina and Venezuela have recorded a greater transfer pricing monitoring and also the range of tax estimations which are the result of alignment and coordination of the tax bases. Tax administrations in countries like Peru, Colombia and Ecuador are increasing internal funds for the monitoring process. Due to that, multinational companies operating in Latin America are now more than ever exposed to interrogations by authorities and are aware of the accessible instruments for avoiding disputes and conflicts among tax authorities, which generates the presence of double taxation avoidance. Most Latin American countries have signed many agreements with trading partners worldwide, except with the USA. The conclusion of advance pricing agreements is made possible for many Latin American countries, but not for Brazil and Argentina. Although the benefits of those agreements are recognized, they are still something new for those countries with the exception of Mexico which takes part in numerous unilateral and bilateral agreements.

In the countries of Asia and Pacific, because of a wide range of cross-border transactions, tax authorities are starting implementing the coordination procedures, and funds for investigation of transfer pricing from a different perspective are being increased. Also, their legislation stipulates the corresponding documentation which is useful for achieving monitoring objectives from the tax administrations point of view. Indian and Chinese tax administrations have recorded an increase in the number of transfer pricing experts, while Indonesia and the Philippines have launched the monitoring initiative. In China and India, the implementation of transfer pricing reform resulted in the increase of transfer pricing coordination and in the decrease of the number of cases, and an increase in concluded APA programmes has been recorded, while the required time for the agreement conclusion records an increase (KPMG, 2011). The tax authorities of the region Asia-Pacific were in 2010 the most rigorous authorities as for transfer pricing.

As a rule, developing countries are behind the developed ones which are more experienced in transfer pricing monitoring and have more developed regulatory rules. With the opening of their economies through trade liberalization, the developing countries generate the need for the establishment of a stable tax system being, at the same time, the foundation for the development of the legislation related to transfer pricing. Before the introduction and implementation of the transfer pricing reform the national tax system needs to meet certain preconditions and basic requirements. The preconditions can be divided into three main categories (PwC, 2011): economic, political and legislative preconditions, as well as tax administration (with the emphasis on organization and capacity). In those countries multinational companies also have a significant role and take part in one third of their domestic product. Their investments in the banking sector, real estate, mining, transport and communications are particularly significant. In order to stimulate direct foreign investments, they started the implementation of tax stimuli and special tax regimes. The countries which have introduced necessary regulatory rules have also taken into consideration the requirements for documentation. Those countries are also inexperienced as for the implementation of investigation and transfer pricing monitoring. Therefore, some general recommendations and measures have been suggested to each country, depending on the met preconditions.

The number of projects aimed at dispute solving was relatively constant until 2008, when there was recorded a significant increase of transfer pricing monitoring with the growth index of 180%. After 850 cross-border companies in 24 countries worldwide had been surveyed, in 2008 KPMG in the conducted research showed an increased importance of the transfer pricing issue. In addition, there should be mentioned an improvement in the area of conclusion of advance pricing agreements, especially for the countries of the Asia-Pacific region. Japan used to conclude a 100 bilateral APA per year, Australia and Korea about 20 and 30 respectively, while the USA concluded about a 100 APA, after which that number went to 70 APA in 2008. In Malaysia and India there have been major breakthroughs on the APA programmes. Concerning the mutual agreement procedures (MAP), in 2010 Japan and Germany had more than 250 and 500 procedures respectively, and every year the two countries solve one 100 procedures. On the other hand, the Netherlands solves 90% of procedures over the period of two years (PwC, 2011).

3   TRANSFER PRICING IN THE REPUBLIC OF CROATIA

The Republic of Croatia has adopted the OECD transfer pricing directives and has implemented them into its legislative regulations. The regulation of transfer pricing in the Republic of Croatia is relatively recent, being in existence since January 1st 2005, but in addition to that it is necessary for the transfer pricing to undergo more detailed regulation in the sense of structure and contents of the documentation, procedure of the transfer pricing control and advance pricing agreements.[6] In Croatia, there is an ever stronger impact of transfer pricing because the foreign investors (majority owners of companies, banks and insurance companies) are trying to transfer, that is to increase the profit of their Croatian branches due to the relatively low profit tax rate. For that reason, the tax administration pays more and more attention to the monitoring of transfer pricing. In addition, the Republic of Croatia has signed numerous agreements on double taxation avoidance, which determine the

---

[6] In the Republic of Croatia there is no possibility, that is – there is no procedure for concluding advance pricing agreements (APA).

issue of double taxation and they also determine the affiliated companies, define transfer pricing and the principle of independence.

In 2009, the Ministry of Finance published the Guidelines for Supervising Transfer Pricing which includes the latest version of OECD directives. Expert teams of auditing houses such as PwC and Deloitte & Touche are helping out the Croatian companies reduce the risks through alignment of practical solutions for transfer pricing with overall global business operations and targets, and they also help with the strategic documentation which supports the transfer pricing praxes and solves disputes efficiently. Their services include transfer prices planning, the drawing up of strategy, policy and documentation and the tax optimization of business processes. They also check the clients' internal information and connect them to publicly accessible resources and researches with the aim of explaining the client the economic basics of the implicated intercompany transactions. That includes the checking and the risk estimation of allocations for intercompany arrangements in accordance with the industrial analysis, application of methods and instructions from the national tax rules and OECD directives. The legislative regulations in Croatia do not stipulate the concrete contents and the structure of the transfer pricing documentation and there is no procedure for advance pricing agreements. Therefore, more detailed and more specific institutional definition of transfer pricing is needed for the Tax administration to be able to implement the transfer pricing in a more serious and effective manner.

4 CONCLUSION

In today's conditions of globalization and internationalization of doing business, transfer pricing is the means of conducting transactions among the affiliated companies within the group at the international level. The use of transfer pricing makes numerous benefits possible: tax payment at lower rates, profit transfer, withdrawal of funds out of the foreign branches and their strengthening, gaining of competitive advantage in relation to non-affiliated companies and overcoming of unfavourable situations in the local market.

It is necessary to monitor and control transfer pricing to obtain the objectivity when taxing the affiliated companies. As transfer pricing has become an important issue at the global level, the tax administrations are facing a number of challenges, and more and more attention is directed to monitoring and control of transfer pricing. In order to avoid transfer pricing manipulations for the purpose of profit decrease and overflow and to protect the countries' fiscal interests, OECD has set the transfer pricing directives for multinational companies and tax administrations in order to unify the tax treatment and control transfer pricing at the international level and to minimize the double taxation of the companies. There is as well a considerable increase in the number of agreements on division of common costs, advance pricing agreements (APA) and mutual agreement procedures (MAP). Although a considerable and constant effort has been put into prevention of transfer pricing malpractice worldwide, there are still numerous countries which insufficiently control and sanction the malpractices, and that is especially the case with the developing countries. The issue of transfer pricing is still the problematic area, because it cannot be abolished, so the problem remains unsolved globally. Therefore, in the future there can be expected an even stronger competition of the tax bodies in that area, as well as their connecting with the tax bodies in other countries with the aim of determining the proper tax base.

Challenges of the Modern World - Contemporary Economy and Globalization

A DEMOCRACY AND ECONOMIC DEVELOPMENT IN WESTERN BALKAN

Katarzyna Kubiszewska

Gdańsk University of Technology, Faculty of Management and Economics, Poland
katarzyna.kubiszewska@zie.pg.gda.pl

ABSTRACT

One of the key issues in empirical studies within political economy is the relations between the process of democratization and the problem of implementing market economy. Literature on the subject is abundant. Authors discuss the relations between democracy and various aspects of economy, GDP per capita, implementation of market economy, threat of bankruptcy in the financial crisis. This problem is crucial for countries transforming their economies since the process is costly in social, economic and demographic aspects. In Europe there are still countries which deal with both implementation of democracy and market economy. These are Western Balkan countries, mainly deriving from the Socialist Federal Republic of Yugoslavia (SFRY), which declared their independence in the 90. and 00.: Croatia, Slovenia, Macedonia, Bosnia and Herzegovina, Montenegro, Kosovo. After sanguinary inter-ethnic conflicts which led to breakup of the SFRY, the countries had to rebuild and heal their economies, including all institutions and implement market economy with all its pros and cons. The article addresses the issue of simultaneous democratization and transforming the economy. It does not study the relation between democracy and economic development but searches the answer to the question whether the countries which originate from the same political system and expericenced very similar economic situation in the late 90. achieved a comparable level of democratization and economic development after nearly 20-year process. The following research methods to gather the qualitative and quantitative data were used: document review, literature review and international study. The author collected various documents, reports, analyses covering the performance of the countries in scope of democratization and economic development. The review of literature is based on materials which are publicly available and include academic journals, books, conference presentations, news media articles and web sites. The study involves international literature with focus on international comparative studies.

Keywords: Democracy, Economic Development, Western Balkan

1 INTRODUCTION

The problem of the relation between democracy and the process of implementing market economy has been discussed for a long time. The vivid discussions among economists and policymakers concern various aspects of the problem: whether democracy improves the economic growth or if the process is contrary, meaning that market economy is the precondition for the democratization processes. Researchers study the correlation between democracy and various aspects of economy, i.e. GDP per capita, implementing market economy or the threat of bankruptcy in the financial crisis.

The study of this complex problem is crucial for countries transforming their economies since the process is costly in social, economic and demographic aspects. In Europe there are still a few countries which have not reached the market economy. These are Western Balkan countries, originating from former Socialist Federal Republic of Yugoslavia. The countires are on different stages of democratization process as well as the economy trasformation.

The article addresses the issue of simultaneous democratization and transforming the economy. It searches the answer to the question whether the countries which origin from the same political system and experienced very similar economic situation in the late 90. achieved a comparable level of democratization and economic development after almost 20-year process.

There following research methods to gather the qualitative and quantitative data were used: document review, literature review and international study. The author collected various documents, reports, analyses covering the performance of the countries in scope of democratization and economic development. The review of literature is based on materials which are publicly available and include academic journals, books, conference presentations, news media articles and web sites. The study involves international literature focused on international comparative studies.

2 INTERDEPENDENCE OF DEMOCRACY AND ECONOMIC DEVELOPMENT – LITERATURE REVIEW

Although there is no one general definition of democracy, the literature provides the list of its features. Democracy includes organization, principles, culture and behavior. Kimber (1989, pp. 199–219) names a few norms that are required by the democracy. These are upward control, political equality, and social principle. Since ancient times democracy has been described by its crucial features, among which the most important ones are equality and freedom (Piotrowicz and Szymańska, 2003, p. 230). They are reflected in the fact that all eligible citizens are equal before the law and have equal access to legislative processes, as well as citizens' freedom is secured by legitimized rights protected by a constitution (Dahl et al., 2003, p. 35). The literature also points out that the democracy leads to transparency and far-sighted environment of economic activities and supports stability, which is the precondition for expansion of the economic activities.

And economic stability is a key issue during the process of market economy implementation. Therefore, the problem of the mutual relations between political regimes and economic development has resulted in a vivid discussion in the scientific literature. Two contrary views clash in an extensive discussion. On one hand, some authors believe that efficient functioning of economy without democracy is possible, on the other hand – there is a group of researchers who believe that the democracy is the key determinant to guarantee the economic growth. According to J. Kornai (1998), investors appreciate stability of democracy as well as stability of a dictatorial rule. The most disincentive economic system – from the investors' perspective - is a weak democracy since it does not ensure stability. The examples to illustrate the idea are: the annual economic growth of 6% in Bulgaria between 50-ies and 60-ies or the period between 1976 – 1998 in China with annual economic growth of 8%. Other examples are: favorable economic situation in Spain during the rule of Franco or in Chile while Pinochet was the President. A very similar view is presented by Gerring et al. (2005, pp. 323–364), who believe that a positive influence of democracy on GDP increase is arguable. The authors state that quick economic growth is also possible in countries with authoritarian political systems. Simultaneously the opinion of favorable indirect effect of democracy, thanks to greater stability or more extensive property rights, is not rejected.

A contrary opinion is presented by Olson (1993, pp. 567–576) who points out that democracy provides security of property and contract rights. He states that autocracies will rarely gain a good economic performance for more than one generation. According to Nelson (1994, p.

105), democratic organizations and activities affect the economy and capability to grow in multidimensional way. A very close view have Clague et al. (1996, pp. 243–276) stating that democracy is better to protect property rights and it provides more incentives to investment, which leads to the conclusion that democracy determines economic well-being. The opinion that democratization goes together with growth is supported by Robert J. Barro (1999, p. 160), who claims: "Increases in various measures of the standard of living forecast a gradual rise in democracy. In contrast, democracies that arise without prior economic development … tend not to last." According to Kołodko (1999), there are some major issues to discuss here. They are freedom that must be connected with business and democracy, which creates foundations for effective economy and supports the ability for expansion. The freedom is understood as capacity to decide about purchase and sale, manufacture and competition, savings and investments. It is a force driving towards economic growth. In this context, development policy and market mechanics are complementary factors. Democratic governance and market discipline are elements of the mix which enables sustainable increase of economy. In 1960 only 37 countries could be described as democratic. In 1998 the number tripled – 117. There is a positive correlation between development of democracy and acceleration of economic growth during the last decades of the 20th century.

Among advocates of the relation between level of democracy and economic growth there is no consensus on direction of this link. Heo and Tan (2001, pp. 463–473) study the issue in 32 developing countries. The results of their survey lead to equivocal findings: it is as likely that economic growth supports democracy as that democracy supports economic growth.

There are various surveys on this interdependence carried out in different countries. Narayan and Smyth (2006, pp. 81–98) consider the relations between democracy and economic growth in China in a long and short term. Their study confirms that in the long run the lack of democracy in China has had a statistically significant negative effect on real income, while in the short run democracy has had a statistically insignificant effect on economic growth. Their findings suggest that in the long run growth in capital, labor and democracy influence positively granger cause economic growth, while in the short-run there is mutual positive influence between democracy and economic growth. Mahmood et al. (2010, pp. 77–86) examine the possibility of links between democracy and economic growth in Pakistan. This study aims to find out whether or not a type of regime affects economic growth . Their findings demonstrate that democracy plays a noteworthy role in the economic prosperity in Pakistan.

There is another group of authors claiming that it is economic growth that conditions democratic changes. For example, Helliwell (1994, pp. 225–248) studies this problem in 125 countries in the period of 25 years between 1960 and 1985. He concludes that countries at higher income levels are more likely to have democratic forms of governments. Persson and Tabellini (2006) support the latter opinion that richer countries are generally democratic and there is no evidence that democratization yields consequent economic growth.

3 DEMOCRACY AND ECONOMIC DEVELOPMENT DURING ECONOMIC TRANSFORMATION

Regarding the nature and speed of changes, both in political and economic systems, studies carried out on democracy and economic development lead to the opinion that during the process of economic transformation there is a feedback between these two aspects. The study carried out by Freedom House (Shor, 1997) supports this assumption. It concerns complex

aspects of both changes which could be witnessed in 25 countries. In the study, democratization process was described by various elements, like electoral freedom, political pluralism, citizens' participation in public life, labor unions' autonomy, independent media, national democratic governance; legislative and administrative transparency. For economic changes the following factors were considered: privatization process, property law, independent central bank and freedom of market entry.

According to Williamson (1993, pp. 1329–1336) the more sophisticated market system is, the faster democracy is implemented. But at a certain stage, the process reverses – democracy supports further economic growth. It leads to a conclusion that when the economy grows, it is easier to achieve the positive feedback between both processes. The more economy grows, the more advanced democratization is.

During economic transformation mutual interdependence between democracy and economic development is evolving. A few elements play a key role for economic growth in this process: freedom of entering the market and liberalization of regulations, allocation of resources towards private sector that improves its efficiency, and privatization.

Some authors claim that better economic output during transformation can be linked to culture rather than economic factors. Progress within culture character of democracy can be achieved by model of "learning by doing". A new model of culture behaviors and a new model of policy-making are essential in this process.
Economic democracy means:
1. freedom of entering the market
2. involvement of employees into decision-making process (Nuti, 1998, pp. 7–16),
3. territory administration decentralization
4. minimum wage policy and minimum income policy.

Economic democracy can also be associated with factor which is essential for allocation to be more effective and "pro-growth". All these elements play a key role in shaping relation between implementing democracy and introducing market economy.

4 DEMOCRACY AND ECONOMIC DEVELOPMENT IN WESTERN BALKANS

After the World War II the SFRY was a republic which consisted of six provinces: the Socialist Republic of Bosnia and Herzegovina, the Socialist Republic of Croatia, the Socialist Republic of Macedonia, the Socialist Republic of Montenegro, the Socialist Republic of Serbia and the Socialist Republic of Slovenia. Till 1980 the country was governed by Marshal Josip Broz Tito. Thanks to his strong political leadership, and the estrangement from the USSR in 1948 the SFRY could expect support via the Marshall Plan from the West. Tito with a hard line on government ruled in a dictatorial way. The SFRY was constructed by the communists as a formally federal country but stayed outside the Soviet bloc.

The country had always been a home to a very diverse population, both in terms of national and religious affiliations. Two biggest national groups were Serbs and Croats respectively accounting for almost 40% in 1971 (over 36% in 1981) and over 22% (almost 20% in 1981). The other 28% in 1971 (30% in 1981) consisting of 4 dominating groups: Muslims, Slovenians, Albanians and Macedonians. Last but not least came the fifth group with a tiny share of over 1% - Montenegrins. Religious differences among Orthodox Christian Serbs, Catholic Croats, and Muslim Bosnians and the rise of nationalism contributed to the collapse

of Yugoslavia. (Kubiszewska, 2013) In the 80. in consequence of inter-ethnic conflict which developed into open war the former Republics of the SFRY declared their independence: Croatia, Slovenia and Macedonia (in 1991), Bosnia and Herzegovina (in 1992), Montenegro (in 2006), Kosovo (in 2008). After sanguinary conflicts the countries needed to heal their economies and had to rebuilt all institutions and implement market economy with all its pros and cons. These countries present different attitude towards access to the European Union (EU). After Slovenia, Croatia is the second country, to enter the EU in 2013. Serbia declares the will to start negotiations with EU, therefore it is interested in clarifying its relations with Kosovo. In 2012 Serbia became the official candidate to the EU. Although Montenegro presents officially its will to continue the negotiations with the EU, the country has made little to improve the citizens' rights and justice system, which are of key importance.

The research carried out by Freedom House is based on analysis of a several aspects of democratization, which involve independent media, electoral process, civil society, national and local democratic governance, judicial system independence and corruption level. The overall scores show that between 2002 and 2011 the process of democratization is being supported and implemented in the selected countries. Bosnia and Herzegovina together with Serbia achieved the best scores in 2007. In 2008 both countries carried out elections: parliamentary in Serbia and local in B&H. The results did not change much in public policy, furthermore - in B&H the democratization process was withheld. Interestingly, though the situation in 2011 seems to be much better than a decade before. B&H has witnessed the considerable progress in democratic reform comparing to other countries.

The remaining countries also went through a periodical slowdown what was caused by unstable political situation. According to data gathered by Heritage Foundation, exceptional positive progress is visible in corruption decrease in Bosnia and Herzegovina, Serbia and Montenegro. They also achieved visible progress in democratization, which is presented in the Chart 1.
Chart 1: Democratization in selected Western Balkan countries (Author's calculation based on Nations in Transit 2012, Freedom House, 2012)

Challenges of the Modern World - Contemporary Economy and Globalization

According to the authors of the report Bosnia and Herzegovina is described as transitional governance and the other countries as recognized as semi-consolidated democracies. This leads to conclusion that situation in respect of democracy in Croatia, Serbia and Montenegro is relatively similar, while Bosnia and Herzegovina still fails in this process.

When the economy is considered, the situation will be presented from two perspectives: GDP per capita and quality of life presented in Charts 2 and 3, respectively. Both indices illustrate the economic growth. GDP indicates the increasing value of economy and index of life quality shows the situation of households. To present progress in implementation of the market economy, the index of economic freedom will be used (Chart 4).
Chart 2: GDP per capita in selected Western Balkan countries (in USD) (Author's calculation based on CIA World Factbook)
Chart 3: Quality of life in selected Western Balkan countries (Author's calculation based on International Living's Quality of Life Index, 2011)

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 4: Economic Freedom score in selected Western Balkan countries (Author's calculation based on Economic Freedom score Heritage Foundation, 2012)

GDP per capita is based on data from CIA World Factbook. Annual life quality index prepared by IL magazine (www.http://internationalliving.com) takes into consideration various aspects of living, like cost of living, culture, economy, environment, freedom, health, infrastructure, safety and risk and climate. The higher the score, the better the living conditions in a country. Economic Freedom score has been elaborated by Heritage Foundation (http://www.heritage.org) and the Wall Street Journal and presented since 1995. There are 10 factors which are included in general score and which statistics are based on data from the World Bank, the International Monetary Fund and the Economist Intelligence Unit. The factors are business freedom, trade freedom, monetary freedom, government size/spending. fiscal freedom, property rights, investment, , financial and labor freedom, freedom from corruption.

The economic data confirm that the best economic situation among the selected countries is observed in Croatia. Economic freedom reaches the highest scores as well as GDP per capita is much higher than in neighboring countries. This leads to reasonably better living conditions.

Situation in other countries is similar. Although GDP per capita in B&H is slightly lower than in Montenegro and Serbia, overall quality of life is scored higher. It must be mentioned that due to favorable institutional reform in B&H back in 2006 this country reached level of economic freedom similar to the one in Croatia. Regrettably, because of later unstable political situation this effect has not improved.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: GDP growth in % (Author's calculation based on Eurostat and IMF data)

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Bosnia & Herzegovina	2,36	5,05	3,86	6,26	3,87	5,95	6,12	5,58	2,91	0,72
Croatia	3,66	4,88	5,37	4,13	4,28	4,94	5,06	2,17	-5,99	-1,19
Montenegro	1,10	1,90	2,50	4,40	4,20	8,60	10,70	6,90	-5,70	2,50
Serbia	5,30	4,30	2,50	9,30	5,40	3,60	5,40	3,80	-3,50	1,00

Balkan countries experienced the growth of GDP between 2002 and 2007 reaching the level of over 10%, as it is presented in the Table no 1. According to the IMF (2009), the nominal GDP of Montenegro was 4.822 billion USD in 2008. GDP grew at an impressive pace of 10.7% in 2007 and 7.5% in 2008. According to Eurostat data (2009), the Montenegrian GDP per capita stood at 46% of the EU average in 2008 that was the first year of the decrease. All three graphs show the decline of indices in 2008-2009. One year after the crisis all Balkan countries experienced decrease of GDP. Croatia suffered most, as the GDP declined in 2009 by almost 6% y/y. Year 2009 turned out to be the first year when Montenegro experienced dramatic drop in GDP. In the consequence of global crisis, Montenegrial GDP dropped by 5.3% in 2009. The country was expected to exit the recession in mid-2010, with GDP growth predicted at around 0.5% (Tanner, 2009). Successfully at the end of 2010, GDP growth reached the level of 1,1% y/y.

Another consequence is the decline of GDP per capita, presented in Chart 2. The changes influenced the quality of life and economic freedom, which indices dropped in 2009. In 2010 the slight improvement of situation was noticed.

5 CONCLUSION

The review of the literature shows that the problem of mutual relations between democratization process and market economy implementation is very complex and up-to-date. The studies imply that there is correlation in both ways: from democratization to economy growth and reversely. There is evidence that it is possible for economy to grow in other than democratic systems. Yet, it must be emphasized that although democratic procedures support rational economic activities they do not ensure them.

This problem is exceptionally important during political and economical transformation, because a change of these systems brings high costs for the society, both in social and financial aspects.

The analysis presented in the article shows that the countries which originate from the same political and economic background can achieve different results. The various conditions of development, like economic potential, attitude to the EU access influence the final score. The best situation, both in democracy and economy aspects, is in Croatia. The country is recognized as the economic tiger of the region achieving the best ranks in the regional ratings. Although the situation in Bosnia and Herzegovina seems to be the worst, both in political and economical fields, it must be stressed that the country has made the most impressive progress.

During an economic transformation, political disputes and conflicts are much more intensive than the ones in established democratic systems. It must be emphasized that despite many

disadvantages and huge costs of transformation process, there is no post-SFRY country where either process of democratization or market economy implementation would be given up. There might appear some delays in introducing institutional reforms, but the processes have never been abandoned (Kołodko, 1999).

ABSTRACT
Integration of national vocational education into international educational community and entering into international market of educational services raised the task of promoting international cooperation of Russian universities. The main purpose of international activities in the field of higher education, as well as that of scientific and technical ties, is a full-scale integration of Russia, as an equal partner, in the global educational environment, improvement, and building the prestige of the national education system based on international experience. Due to the nature and specifics of the educational institutions of higher education the most important condition for success of international projects is human capital. New priorities determine the necessity of transition towards student-oriented approach to high-school management and require that managers and researchers address the intellectual capital of the faculty as one of the most important factors in the competitiveness of the university. Many scientific studies are carried out within the framework of large-scale programs funded by the state or the community of nations in the form of joint projects and, for the most part, by using the potential of the multinational consortium. Participation in intentional project suggests that the scientists possess certain competencies to establish long-term contracts with foreign partners. Due to high spiritual, intellectual and creative content of work, the faculty becomes the main competitive wealth to help achieve the strategic goals of the university. Analysis of the level of human capital development and comparative analysis of secondary employment allow finding out the disadvantages of using the human capital of the higher education institution and identify the areas to address these deficiencies, which affects the efficiency of international projects at the university. The extent, to which the human capital of the higher education institution is utilized, can be evaluated using the methodology developed by the author, which includes an assessment of key criteria such as competence, adaptability, and corporatism.

Keywords: *Evaluation of human capital, Human capital, Intellectual capacity, Organisational and economic factors*

1 INTRODUCTION

In the second half of the 1980s and early 1990s the new concepts of economic growth based on the ideas of human capital accumulation emerged. Theodore Schultz and Gary Becker defined human capital as an important factor of economic growth, which is regarded as a category that includes items such as a stock of professional knowledge and skills, congenital

and acquired abilities, motivation, energy, and health that an individual uses in his/her work. In the post-industrial (innovative) society financial capital superseded human capital, which is viewed from the perspective of a strategic resource. Assessing the current state and evolution of the high school the last decade, it should be noted that the trends in its development are driven by the process of integration of education, science, industry, and business, and serve as the basis for innovative development of society. Specifics of formation, use, and development of human capital in the sector of higher education at present is that expansion of opportunities has increased the responsibility of educational institutions for performance results and meeting the demands of the labor market, and the degree of professional training directly depends on the quality of the employees of educational institutions.

Higher vocational education is an integral part of Russia's innovation system, which is necessary for development of proactive training and retraining for innovation across the whole national economy. This requires constant reproduction of the human capital of the higher education itself, creating scientific and educational base for the teaching of subjects that form the framework for the formation of an innovative creative thinking in graduates.

The strategy of socio-economic development of the Russian Federation up to 2020 sets the task of transition of the economy to an innovative way of development, placing it on the path of rapid and sustained growth based on advanced technologies. At present, modern, high-quality education directly contributes to building a society with highly developed economy. Human resources are the most important intellectual and professional resource for socio-economic development of the country, region, and enterprise. The transition to innovation model of economic development is impossible without modernization of higher education.

Integration of the national vocational education in the global educational space and entering the international market of educational services made relevant the task of promoting international cooperation of Russian universities. Main goal of international activities in higher education, as well as that of scientific and technical communication, is the full integration of Russia as an equal partner into the world's educational space, improving and strengthening the credibility of the national education system based on international experience. Due to the nature and specifics of the educational institutions of higher professional education the human capital becomes the most essential condition for success of international projects. Because of high spiritual, intellectual and creative content of work the faculty is becoming a major competitive asset helping to achieve the strategic goals of the university.

Transition of Russian universities to the mode of stable strategic development is determined by their capacity for innovation, quality of educational and research processes, and ability to create new products that meet the requirements of the market. The ability of universities to bring about innovations and innovation activities depends on the level and degree of development of its innovative potential. Formation of innovative potential of high school is the result of interaction between the elements of external and internal environment of an educational institution. The author's block diagram of an institution's innovative potential is presented in Figure 1.

2   THE HUMAN CAPITAL OF HIGHER EDUCATIONAL INSTITUTION

Human capital in the innovation capacity of the higher educational institution is considered by the author as a combination of physical, intellectual, and social properties inherent to the

Challenges of the Modern World - Contemporary Economy and Globalization

human resources of the organisation, form a part of its employment potential and intellectual capital, and are used in its innovation activities and provide revenue to the owners of these properties through creation of new valuables.

Managing human capital of the organisation, one should assume that technological progress leads to cyclical renewal of all the factors and elements of production. The purpose of the organisation's management in these conditions is to minimize the proportion of unused potential of employees. In general, human capital management involves three main phases: formation, development and use.

New priorities need to define the transition to student-oriented approach in management of higher education and require managers and researchers to refer to the intellectual capital of the faculty as one of the most important factors in the competitiveness of the university. The utilization of intellectual capital is determined by the scope of university research, teaching methods, and extracurricular activities that are necessary to achieve the required standards of education, consumer demand, and international projects. Many scientific studies are carried out within the framework of large-scale programs funded by the state or the community of nations in the form of joint projects and, more often than not, by multinational consortia. Participation in international projects calls for certain competencies in academic staff to establish long-term contacts with foreign partners.

Innovative development of the university is based on new scientific research and its introduction to the economy. The education system in an innovative higher education institution should be open to new scientific research and modern economy. Substantial rise of the level of university research, ensuring its relationship to the economy, can and should be enhanced through the creation of conditions for implementation of the projects.

To assess the level of human capital a study of the level of satisfaction with the organisational and economic conditions of work motivation for the faculty of the university was used.

2.1   Research methods

Author proposes to assess the conditions for formation, development, and utilization of human capital C hc by using following formula:

$$Chc = C_1\alpha_1 + C_2\alpha_2 + C_3\alpha_3 + C_4\alpha_4 + C_5\alpha_5 + ... + C_{10}\alpha_{10},$$

where $\alpha_1...\alpha_8$ are weighting the coefficients of significance of conditions for human capital utilization, defined by an expert.

where C_1 – level of qualification of staff; уровень квалификации сотрудников;

C_2 – cooperation agreements with enterprises;

C_3 – competitiveness of the university;

C_4 – carrying out conferences and seminars and their level;

C_5 – collaboration of faculty. Research teams of the university;

C_6 – presence of cross cultural communication skills

C_7 – research and pedagogical internships

C_8 – motivational potential of the university's staff;

C_9 - signed agreements with international partners;

C_{10} - applications for international projects

Distribution of satisfaction coefficients (C sat), and significance (C sign) of the weights of components (α) by groups of organisational factors is presented in Table 1.

For assessment of the level of human capital the author proposes to consider the criterion of competence as the most important because indicators of this criterion are influenced by the level of two other criteria: creativity and corporatism. The levels of creativity and corporatism are in direct proportion to each other and, in this particular case, have an equal impact on the level of human capital development.

Offered evaluation system makes it possible to determine the deficiencies in utilization of the human capital and outline the measures needed to eliminate such deficiencies, i.e. the ways of its most full development and universal use.

Applying the proposed methodology, the author evaluated the level and outlined the direction of development of human capital in international projects using the example of such institutions of the Samara region as Samara State Technical University, Samara State Economic University, and the Samara State University of Telecommunications and Informatics.

2.2 Results

As a result, the assessment of each criterion produced the following conclusions.

Competence. Analysis of the job and the qualification structure of the faculty shows the training opportunities, and thus possibly higher social status and self-esteem level. The increase in income encourages the employee and stimulates the desire for self-education and self-realization.

Adaptability. Considering the dynamics of R & D carried out we can talk about the demand for services. Material reward received by the employees from the administrative structures, demonstrates the interest towards scientific developments and also promotes self-esteem and academic status of the employees. The number of patents awarded, the amount and level of publications of research results indicate effectiveness of scientific research personnel in the framework of international projects.

Corporatism. Having analyzed the activities in implementation of international projects in terms of level of human capital and their influence on the state of the higher education institution's team as a whole, it can be concluded the result was positive. This is reflected in established stable structure and the results of joint research work of teachers and students.

Table 1: Distribution of the coefficients of satisfaction (K sat), and the importance (K sign) of the weights of components (α) by criteria groups

Criteria	Samara State Technical University			Samara State Economic University			Volga State University of Telecommunications and Informatics		
	C sat	C sign	α	C sat	C sign	α	C sat	C sign	α
Criterion № 1 **Competence** describes the possibility to increase the level of human capital in implementation of the international projects									
Staff's qualification level	0,63	0,87	0,064	0,58	0,88	0,064	0,68	0,88	0,064
2. Agreement on cooperation with Russian enterprises	0,79	0,71	0,104	0,93	0,77	0,104	0,70	0,84	0,104
3. Agreements with international partners	0,65	0,73	0,12	0,55	0,53	0,22	0,45	0,33	0,12
4. Competitiveness of the university	0,53	0,68	0,09	0,53	0,68	0,09	0,42	0,48	0,09
Criterion № 2. **Adaptability** characterizes creativity and flexibility of staff in implementation of international projects									
5. Conferences and seminars and their level	0,44	0,75	0,08	0,42	0,83	0,08	0,89	0,60	0,08
6. Motivational potential of university staff	0,74	0,71	0,06	0,71	0,74	0,06	0,54	0,64	0,06
7. Applications for international projects	0,39	0,89	0,067	0,45	0,85	0,053	0,36	0,89	0,05
Criterion № 3. **Corporatism,** characterized by development of research teams									
8. Research and pedagogical internships	0,32	0,98	0,071	0,27	0,98	0,071	0,27	0,98	0,071
9. Collaboration of faculty. Research teams of the university;	0,54	0,50	0,072	0,54	0,46	0,072	0,54	0,46	0,072
10. Presence of cross cultural communication skills	0,40	0,81	0,037	0,31	0,88	0,037	0,40	0,55	0,037

Summary results are presented in Table 2.

Table 2: The results of assessment of the human capital level for international projects at the university

Name of the university	Criteria										Chc
	C_1	C_2	C_3	C_4	C_5	C_6	C_7	C_8	C_9	C_{10}	
Samara State Technical University	1,02	1,01	1,11	1,13	1,15	1,07	1,25	1,46	1,22	1,54	2,35

3 RECOMMENDATIONS

To reveal the organisational-economic mechanism of the human capital management in the university through development of motivation it seems to be necessary to give a description of the relationship implemented inside the phases (Fig. 1).

The first phase detects the need to develop innovative potential of higher education institution and forms a strategy for its development. To do this it is advisable, at the evaluation stage of the innovation capacity of universities, to return to the stage of the development strategy of the university, build on the results of the analysis, correct the direction of change in transformation strategy, and articulate the main goal and objectives. This provides feedback between the first and the second stages.

High reliability of evaluation of innovative capacity determines the timeliness and competence of management decisions. As a rule, the assessment of innovative capacity is ambiguous and time consuming, and therefore may require additional diagnostic studies of the components of the internal environment of an educational institution, which ensures the feedback between the third and second stages.

The implementation phase of the effort to develop an incentive system of employment of human resources may necessitate the improvement of the program for the purpose of additional measures, the need for implementation of which has become apparent only at the stage of practical implementation of the measures.

Also, stage of arrangements may reveal the need for additional diagnostic work to supplement or clarify the strategy for developing human resources. Recently, very common references are made to the fundraising programs, which develop at least in the following areas: development and promotion services for graduates, development and promotion services for employers, building communities of business partners of the university. Carefully thought-out system of fundraising

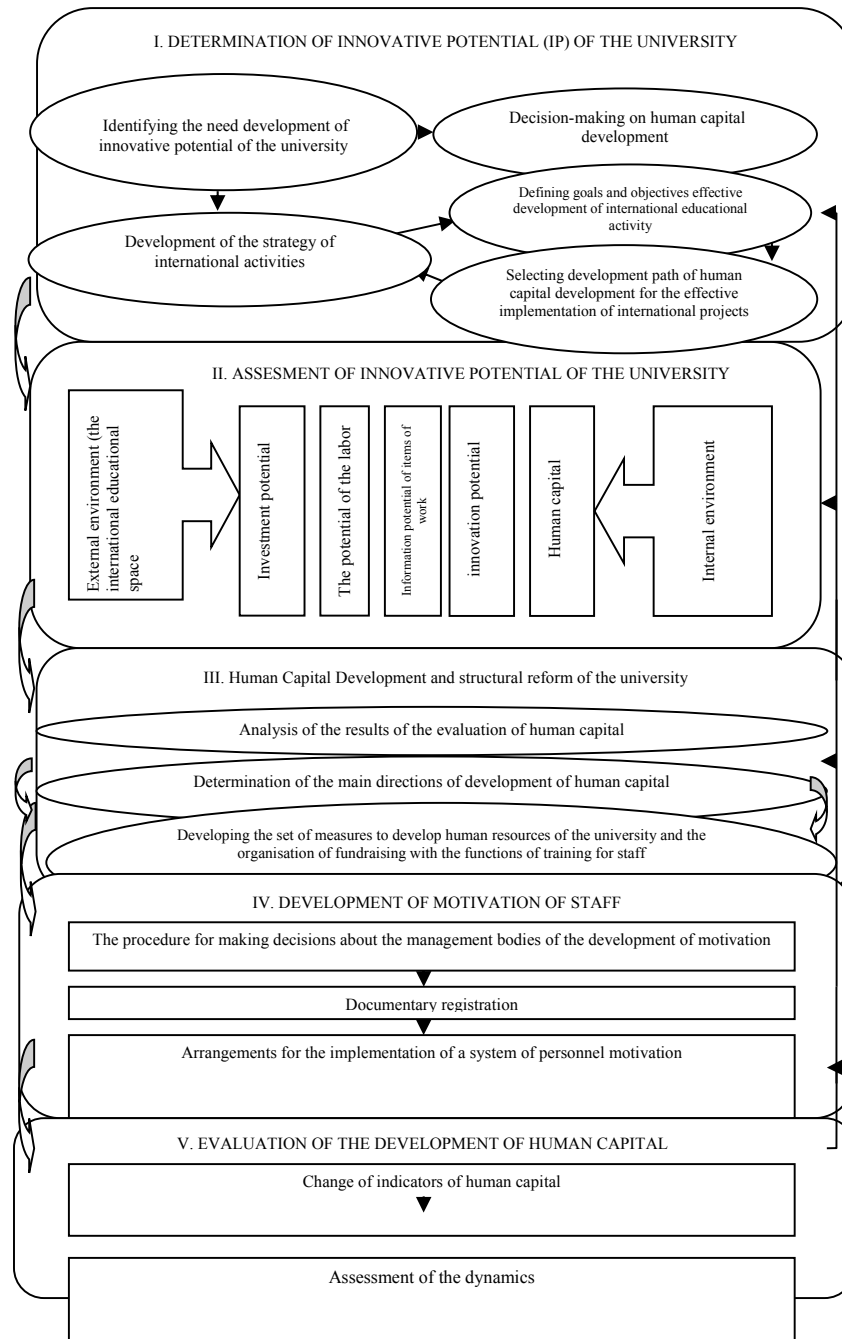
in an educational institution can not only be a powerful source of co-financing, but also ensure the effectiveness of institutions in the labor market and education due to the feedback it gets from business, government, and its graduates.


Figure 1: Organisational - economic model of development of innovation potential of higher education institution

This is exactly the approach which allows the university to play its role of "social lift" for students and graduates in the best way, thus providing a source of constantly renewed national elite of Russia.

At the last stage, which provides the assessment of the results of innovative potential of higher education institution, you may need to repeat or conduct a more thorough activity to develop and implement a system of personnel motivation. Therefore, it is expedient to define the relationship of the fourth and fifth stages.

4 CONCLUSION

Using the proposed method, we can analyze and assess the extent to which the human capital is used as a result of the implementation of international projects. Annual analysis of the level of human capital development and comparative analysis of secondary employment allows determining the disadvantages in use of the human capital of higher education institution and identifying the areas to address these deficiencies, which affects the efficiency of the implementation of international projects in higher education institution.

TRANSITION AND PERSONAL INCOME TAXATION: CASES OF SELECTED WESTERN BALKAN COUNTRIES

Lejla Lazovic-Pita

University of Sarajevo, School of Economics and Business, Bosnia and Herzegovina
lejla.lazovic@efsa.unsa.ba

ABSTRACT

This paper deals with the issue of transition and personal income taxation based on the 'flat tax' model. Unlike most transition countries, Western Balkan countries faced transition at the end of 20th and beginning of 21st century which brought about a new set of taxation related issues. In most literature, this mainly refers to the fact that former transition countries (primarily the Baltic States and Slovak Republic) that applied the 'flat tax' have set personal income tax rates quite high whereas Western Balkan countries have been 'racing to the bottom' in regards to personal income tax rates. Three 'flat tax' Western Balkan countries will be analysed: FYR Macedonia, Montenegro and Bosnia and Herzegovina. Based upon the experience of former transition countries in transformation of the personal income tax system, suggestions and recommendations for a successful tax reform will be given. Even though it might seem straight forward, further analysis of the three Western Balkan countries show that general recommendations cannot be given easily. This mainly refers to the fact that all three Western Balkan countries have been facing high unemployment rates and high labour costs. Both facts highlight the significance of a successful personal income tax reform as well as tax reform in general especially in the last few years.

Keywords: Elasticity of Personal Income Tax, Flat Tax, Tax Wedge, Transition

1 INTRODUCTION

A generally accepted milestone regarding the beginning of the transition and hence the establishment of transition countries started after the fall of the Iron curtain in the late 1980's. Since there are many perspectives from which transition can be defined (social, economic, political, etc.), definition of a transition country in this paper will refer to an economy which is changing from a centrally planned economy or a socialist state[1] to a free market or market oriented. In literature, the Washington Consensus is a milestone when discussing the beginning of the transition process. Even though Washington Consensus emerged from a different set of conditions, it argues that 'one-size-fits-all' market-oriented reforms are appropriate to any setting, including the post socialist transition countries.

Economists around the world tend to define transition countries as 'emerging market economies' (Svejnar, 2001, p. 32) or 'New European Union members' or 'New Member States (NMS)', all the countries analysed will be referred to as transition countries. This is mainly due to the fact that not all transition countries analysed started transition period at the same time (e.g. ex Yugoslav countries due to Yugoslav war) even though most gained independence in early 1990's. For most European transition countries which are analysed in this paper, transition ended or will end when they join(ed) European Union (hereafter: EU). However, due to complexity of transition, and no clear-cut line when the transition ends, most countries still face problems related to (pre) transition period which can easily be seen in the past few years caused by global financial turmoil. Moreover, external factors such as

---

[1] This refers to former Yugoslav states.

globalisation affect the success of transition. What remains explicit regarding transition is that all transition countries undergo economic liberalization and macroeconomic stabilization. Macroeconomic stabilization, inter alia, meant that high level of inflation should be brought under control, but also that privatization and restructuring should take place in order to create a financial sector and move from public to private ownership of resources. These changes lead to increased inequality of incomes and wealth, dramatic inflation and a fall of GDP (Tanzi, IMF, 1999).

According to Havrylyshyn and Wolf (1999), transition implies:
- liberalizing economic activity, prices, and market operations, along with reallocating resources to their most efficient use;
- developing indirect, market-oriented instruments for macroeconomic stabilization;
- achieving effective enterprise management and economic efficiency, usually through privatization;
- imposing hard budget constraints, which provides incentives to improve efficiency;
- establishing an institutional and legal framework to secure property rights, the rule of law, and transparent market-entry regulations.

Hence, transition is a challenging period for any country. Strategies offered and implemented by the policymakers in the transition countries took two forms: the so called 'big bang' reform vs. gradual reform (Svejnar, 2001, p. 4; Vazquez-Martinez and McNab, 2000, p. 21). The 'big bang' reform concentrated on macroeconomic stabilization, price liberalization and dismantling the institutions of the communist system. Not surprisingly, in terms of the speed of the radical reforms, this approach is often referred to as the 'big bang' or 'shock therapy' view of transition (Turley, 2006, p. 2). Moreover, Tanzi suggested that tax reforms in such countries cannot be "big bang" solutions since the required changes, "even when mistakes are avoided, they cannot be made overnight" (OECD, 1991, p. 21). The macroeconomic strategy emphasized restrictive fiscal and monetary policies, wage controls, and in most cases a fixed exchange rate. Moreover, the focus of the reform was on price liberalization, apart from energy, housing and basic consumption goods which mainly remained controlled along with wages and exchange rates. This strategy proved to be relatively sustainable in the Baltic States, some countries of the former USSR and the Balkans (Svejnar, 2001, p. 5). The gradual reform focused on the development and enforcement of laws, regulations and institutions that would ensure a successful market-oriented economy (e.g. Slovenia). These included privatisation of the state-owned enterprises, banks, etc.

Regardless of what transition strategy a country chooses, all transition countries faced the same transitional problems. The size and scope of these issues may differ and might be strengthen or eased by the chosen type of reform. According to Tanzi, in the transformation process from centrally-planned to market-oriented economy, transition countries will most certainly face a fall in GDP[2], a fall in tax revenues and hence a fall in ratio of tax revenue to GDP (Tanzi, IMF, 1999).

---

[2] Special care is needed when GDP prior to tax reform is discussed since all centrally-planned economies used a measure of 'gross material product' as a measure of GDP. This measure excluded the production of services. Yugoslavian statistical office used the same measure (Svejnar, 2001, p. 9; Yugoslav Statistical Yearbook, 1991).

2   TAX REFORMS IN TRANSITION COUNTRIES

Transformation that transition countries have to undertake includes a number of reforms in all areas. Reforming a tax system is just one task put in front of transition countries. In addition, reforming a tax system is a challenging task for both developed and transition countries. Raghbendra (1998, p. 384) highlights general characteristics of tax reforms:

- significant reduction in the top rates of a certain tax
- remarkable reduction in the number of slabs in the tax scale
- broadening of the tax base
- changes in the tax mix: the reduction of one specific tax can be compensated by the rise of other sorts of taxation
- strengthening of the tax administration.

Highly felt dissatisfaction with existing tax systems is a starting point for tax reforms in any country, developed or transitional. Dissatisfaction can result from serious disincentive effects from high marginal tax rates on savings, entrepreneurship and labour supply, failure of reducing or eliminating inequalities of income or wealth, drastic political changes, complexity of the existing system in administrative terms and greatly exaggerated governmental taxing and spending. Basically, tax system cannot fulfil the functions of the fiscal system so reform is needed. For example, Blueprints for Basic Tax Reform in the USA or Meade Committee and Mirrlees Report in the United Kingdom are documents which evident the need for tax reform in developed countries. In case of transition countries, such documents unfortunately do not exist, but rather suggestions and recommendations from the IMF staff or the World Bank staff.

All transition countries had to undertake serious set of reforms in the area of taxation. For most transition countries the contraction in output in the early stages of transition led to substantial decline in the traditional tax base and as a result, government tax revenues fell sharply. In most transition economies, "private sector started growing, other sectors were declining, (e.g. agriculture) but overall due to tax administration weaknesses, including various exemptions that eroded the tax base and the failure to bring a large portion of informal sector into the tax net, tax revenues fell" (Stepanyan, 2003, p. 10). As early as 1991, Tanzi dealt with the issue of the tax system of transition countries by focusing on the structure of the tax revenues before the reform. Tax systems in centrally-planned economies could not survive due to the liberalization of prices and of the methods of payments, the privatization of state enterprises and a large increase in private sector activities especially in the service area (OECD, 1991, p. 21). Moreover, the level of tax revenues to GDP in transition countries were significantly lower than in developed countries (see Tanzi, 1991, p. 3).

A fall in tax revenues to GDP is a signal to undertake a tax reform in both developed and transition countries. Unlike developed countries, in transition countries, tax reforms were designed and implemented as a part of an overall transformation process. According to Mitra and Stern (2003, p. 21−22), tax reforms in transition countries lead to:

- a fall in the tax revenue-to-GDP ratio, a significant part of which was accounted for by a decline in revenue from the corporate income tax, the latter arising from the loss of revenue from profits of publicly-owned enterprises (McKinnon, 1991);
- a fall in the public expenditures to GDP ratio caused by the need to reduce fiscal deficits in order to stabilize inflation;

- a decline in the importance of income taxes, mainly accounted for by the fall in the share of corporate income taxes (since the vast majority of taxes, namely enterprise profit tax, turnover tax and payroll tax, were all collected from enterprises);
- a decline in the importance of social security contributions-cum-payroll taxes in the transition countries; a rise in the share of individual income taxes;
- a sharp increase in the importance of domestic indirect taxes in tax revenue-both VAT/sales/turnover taxes and excises- reflecting in part the decline in the role of direct taxes.

In practice, all transition countries started reforming their tax system by firstly reforming indirect taxes, namely, by introduction of the European style Value added tax (hereafter: VAT). Moreover, a fall in customs and other turnover taxes meant that the main source of tax revenues from indirect taxes would rely on VAT. General standard suggestions of the IMF regarding tax reforms – single, simple VAT rates varying between 15−20 percent, simple, single rate personal income tax (hereafter: PIT), corporate income tax (hereafter: CIT) with special care for small businesses (Keen et al., 2006, pp. 5−6). Similarly, profit taxes, payroll taxes and personal income taxes also needed a reform. What most transition countries had to do in the area of personal income taxation was to reduce the number of tax rates and again, adopt clear laws which regulate the area of personal income taxation. Personal income taxation played relatively small role in the tax system of most transition countries (see Tanzi, 1991, p. 3). Regarding personal income taxation, according to Tanzi, transition countries could have chosen from Anglo-Saxon global income tax approach or older Latin/Mediterranean schedular approach. IMF gave a general advice to all transition countries (Stepanyan, 2003, p. 5): "An administratively simple form of personal income tax with limited deductions, a moderate top marginal rat, an exemption large enough to exclude persons with modest incomes, and a substantial reliance on withholding". However, as seen later, transition countries have applied a variety of personal income tax approaches with flat tax being the most applicable one. PIT was firstly reformed in Hungary and Poland with the introduction of mildly progressive tax rates (e.g. Hungary in 1988, Poland in 1991 and the Czech Republic in 1993). The most progressive tax rate went up to 50 percent, but in most countries the top statutory tax rate did not exceed 40 percent. Global personal income tax was not introduced fully such as in developed countries but rather a "hybrid" base; a combination of consumption and income based income tax.

3 THEORETICAL ASPECTS OF THE FLAT TAX

In most literature flat tax is classified as a variant of the expenditure tax since savings remain untaxed. The first idea of the flat tax model was introduced to the wider public in 1981 in the USA. At that time in the USA, Goode et al. (1984) wrote that the current income tax has become unfair and complicated[3]. Hence, movement towards a simpler model of income taxation was a logical proposal. The idea of the flat tax consists of two different taxes (Parthasarathi, 1995, p. 53):
   a) An individual income tax on labour earnings that can be made progressive
   b) A business cash-flow tax similar to an accounts-based VAT with wages being deducted.

---

[3] As proof of the complexity of American tax system is the fact that the 1950's, only 10−15% of Americans asked for professional help of tax advisors whereas in the 1980's more than 50% of Americans needed tax advisors' help (Jelcic, 1998, p. 41−60).

Contemporary idea of the flat tax was firstly introduced by Hall and Rabushka. However, English Channel islands have been applying flat tax since 1940's. According to Hall and Rabushka (2007, p. 41), this type of flat tax (also called a uniform, proportional, or single-rate tax) satisfies the principle of horizontal equity. Furthermore, the justification for such claim they have found in the works of philosopher John Rawls, (1971, p. 278) who states that "a proportional expenditure tax may be ... the best tax scheme." As incomes double, triple, or grow tenfold, tax obligations double, triple, or rise tenfold. For the lowest income earners, Hall and Rabushka propose personal allowance. In regards to vertical equity, Hall and Rabushka discuss the current inefficiency of comprehensive income tax in regards to vertical equity (e.g. the presence of loopholes or unequal treatment of income earned through government/municipal bonds). The progressivity of the flat tax model is achieved through the system of personal allowance, i.e. when the average tax rate rises with income. The flat tax system should be revenue-neutral which means that the flat tax should earn the same amount of revenues as the comprehensive income tax system (Hall and Rabushka, 2007, p. 52). They propose a flat-rate of 19 percent which will raise the same amount of revenues as multiple tax rates applied. Moreover, revenue-neutrality will be achieved through compensation of an increased revenues from business taxation and falling revenues from individual taxation.

3.1 Flat tax 'silver' anniversary

Twenty years after the first idea of the flat tax model, the so called transition countries started adopting this way of taxation heavily. Chart 1 shows increasing number of flat tax regimes in the last twenty five years.
Chart 1: Growing number of flat tax regimes, (Mitchell, 2008, p. 1)

In the period of ten years (1998−2008) the number of flat tax regimes has tripled. Most of countries that have adopted it were transition countries and ex USSR countries. The logical question that arises is why have transition countries applied the flat tax? Several answers are possible: to attract foreign direct investments and to increase employment, to stimulate domestic investment through increased savings, to promote economic growth, to show openness of their economies, etc. Another significant reason is that transition period is, by itself, a complex process which therefore requires a simplified taxation system which will then boost and stimulate the transition period. So what have transition countries in terms of tax rates applied? There is an array of tax rates among transition countries: from quite high

Challenges of the Modern World - Contemporary Economy and Globalization

PIT rates in the Baltic States to very low rates in the Western Balkan states which is sometimes referred to as a 'race to the bottom'.

One has to be careful when drawing conclusions regarding the application of the flat tax in transition countries. Sometimes, it might be even incorrect to use the term flat tax for some countries since they do not apply any of the theoretical assumptions of the model or they have moved away from it. Some authors (e.g. Blazic) have been asking the following question: What is, apart from uniform tax rate, left from the flat tax? OECD (2006, p. 85) on the other hand has defined four main types the flat tax can be interpreted:

- Single rate, no basic tax allowance. All (positive) income is taxed at a flat rate;
- Single rate, with a basic tax allowance. All (positive) income above a basic allowance is taxed at a flat rate;
- All (positive) payments to employees above a basic allowance are taxed at a flat rate. In addition, the same flat tax rate is levied on all business income (incorporated and unincorporated business income). The base of the business tax is value added, which is calculated on a cash-flow basis, less the payments to employees. This is equivalent to a consumption tax with a basic allowance, and is often referred to as the Hall-Rabushka's flat tax proposal. Consequently, the income from savings and investments is not taxed under this flat tax proposal;
- Single rate, with a non-wastable tax credit (basic income). This non-wastable tax credit is of equal value to all individuals, regardless of their income levels (thus, it is in practice a negative income tax at low-income levels). This is often called the "basic income flat tax", where the basic income is supposed to replace all social security benefits. In addition, a flat tax rate is levied on personal income. This is equivalent to the Atkinson (1995) flat tax proposal.

The flat tax can be based on income or consumption. Also, flat tax can include only personal income or personal income and business income. Depending on the personal allowance, personal income tax can either be progressive or proportional. All transition countries apply the first two cases of the flat tax.

In selected transition countries, flat tax rates vary and have generally been decreasing over the years (e.g. Estonia, Lithuania). Some countries have been changing tax rates over the past few years as a result of financial turmoil (e.g. Latvia, Montenegro) whereas others (e.g. Estonia, FYR Macedonia) have introduced the possibility of decreasing personal income tax rates in the year of reform. Moreover, several countries/entities (e.g. Montenegro, Republic of Srpska) have been applying to progressive taxation in several years, but have moved back to flat tax. This is significant since in those years tax revenues have not been increasing due to progressive taxation (National Statistics at World Economic Outlook database). Table 1 shows flat tax rates in selected transition countries over the years.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Personal income tax rates in selected transition countries (Gray et al. 2006, p. 257; IBFD European tax handbook 2008; Taxation trends in the EU, 2012; Arandarenko et al., 2008; National Personal income tax laws)

Country	Year of personal income tax reform	Personal income tax rate in the year of introduction (in %)	Personal income tax rate in 2012 (in %)
Estonia	1994	23	21
Lithuania	1994	33	15
Latvia	1995	25	25
Slovak Republic	2004	19	19
Montenegro	2001	19	9
FYR Macedonia	2007	12	10
Federation of B&H	2009	10	10
Republic of Srpska	2006	10	10

Table 1 shows that personal income tax rates in selected transition countries are quite different, from as high as 25 percent (Latvia) to as low as 9 percent (Montenegro). Moreover, in some countries/entities (e.g. Montenegro, Republic of Srpska), progressiveness of the personal income tax system enabled through the mechanism of personal allowances has been abolished in recent years. Hence, most countries apply the second type of the flat tax.

4 APPLICATION OF THE FLAT TAX IN TRANSITION COUNTRIES

As already mentioned above, flat tax has been applied in variety of forms. Since the idea of this paper is to justify the application of the flat tax in transition countries, tax wedge as a generally accepted measure of the labour tax burden is given in table 2 for three Baltic States with Slovak Republic and three analysed Western Balkan states. Tax wedge is a measure of the labour tax burden and it calculated as a sum of personal income tax, employee plus employer social security contributions together with any payroll tax less cash transfers, expressed as a percentage of labour costs (OECD, 2010, p. 483). In addition, tax wedge is calculated using methodology introduced in OECD publication "Taxing wages".

Table 2: Tax wedge in selected transition countries for a single worker at two-thirds of average earnings in % (Taxation trends in the EU, 2012, p. 34; Arandarenko et al., 2008, p. 50; Author's calculation based on National Statistics of Western Balkan states)

Country	2006	2007	2008	2009	2010
Estonia	37,3	37,6	37	37,7	38,6
Latvia	41,8	41,1	39,9	41,5	41,5
Lithuania	40,6	41,2	40,3	38,9	38,9
Slovak Rep.	35,2	35,5	36	34,4	34,5
Montenegro	39,3	39,3	34,8	34,9	37
FYR Macedonia	39,2	37,6	36,8	31,6	30,9
RS	34,2	31,6	31,6	33	33,5
FB&H	29,3	29,3	29,3	28,6	28,6
Average	37,1	36,7	35,7	35,1	35,4

N.B. Data for Montenegro for years 2006 and 2007 show tax wedge with included fringe benefits (fb): hot meal allowance and transport allowance; Bosnia and Herzegovina consists of two entities[4]: Federation of Bosnia and Herzegovina (FB&H) and Republic of Srpska (RS). Since legislation in two entities is different in regards to social security contributions and personal income tax, tax wedge is calculated separately. Moreover, in FB&H fringe benefits are not taxable whereas in RS they are included in the tax base.

As shown in table 2, tax wedge in selected transition countries has a downward trend especially if one looks at data from the three Baltic states and Slovak Republic from 2000-2010 (Taxation trends in the EU, 2012 edition, p. 34). The three selected Western Balkan states have the tax wedge on average in line with the three Baltic States and Slovak Republic. Only FB&H has tax wedge lower than all other countries. However, since fringe benefits are not taxable and they increase the net wage, tax wedge is quite low. Nonetheless, if fringe benefits are excluded, tax wedge in FB&H amounted to 40.3 percent from 2009 onwards for a single worker at two-thirds of average earnings. Moreover, since the introduction of the flat tax in selected transition countries, tax rates have been decreasing (e.g. Estonia, Montenegro) as well as social security contributions rates (e.g. Montenegro, FYR Macedonia, FB&H).

Tax wedge shows several important facts:
- total labour tax burden in transition countries is quite high;
- social security contributions take most of the tax wedge (especially in countries where there are social security contributions paid by employee and employer)
- social security contributions remain high in transition countries and with progressive taxation similar to those in developed countries, tax wedge would be very high (e.g. Hungary)
- gross income in transition countries especially Western Balkan states is quite low compared to developed countries. Hence, the tax base for calculating the tax wedge is quite low.

Low gross income in transition countries could imply the following: there is a high tax evasion so the tax base has been lowered through the system of so called 'envelope salaries'. Significance of shadow economy and high unemployment rates especially in the Western Balkan countries also contribute to high tax evasion of those who are employed. Hence, World Bank staff suggests that in order to improve compliance and tax discipline, personal income taxation should be based on flat tax due to the fact that simplicity and compliance are the 'selling points' of the flat tax. Moreover, most selected transition countries that have been using progressive income taxation replaced it for the flat tax in order to improve simplicity and compliance of the tax system. A measure used by the World Bank staff that partially shows an improvement in compliance (in the absence of policy changes, i.e. changes in tax base or rate, or both) is PIT elasticity to wages. PIT elasticity to wages is calculated as (Gray et al., 2006, p. 286):

$$\varepsilon_i = \frac{(\%\Delta PIT collection)}{(\%\Delta Taxbase(wages))} \tag{1}$$

---

[4] Brcko district will not be included due to scope of this paper.

PIT elasticity to wages will be calculated for two cases: Slovak Republic and Federation of B&H since these two examples have not been changing either tax base and tax rates in the past years. Charts 2 and 3 shows PIT elasticity to wages for the two cases.

	2003	2004	2005	2006
Elasticity	1,5207	-0,7751	0,8148	0,9617
Chart 2: PIT revenue elasticity to wages in Slovak Republic (ILO database, Taxation trends in the EU, 2012; World Economic Outlook database; Author's calculation)

	2006	2007	2008	2009	2010	2011
Elasticity	0,2414	1,7768	1,9686	-2,0576	1,9198	4,8581
Chart 3: PIT revenue elasticity to wages in FB&H (ILO database, B&H Directorate for Economic Planning; Author's calculation)

As expected, in the year of reform there is a fall in PIT elasticity to wages in both cases. However, in the year after the PIT reform, there is an increase in PIT elasticity to wages which shows, even rudimentary, an improvement in compliance. This is significant since in the case of Slovak Republic flat tax replaced progressive taxation and therefore justified its 'selling point' which is increased compliance/simplicity. In the case of FB&H, similar conclusion could be drawn.

5 CONSLUSION

The aim of this paper was to analyse personal income tax reform in selected transition countries which based their reform on so called 'flat tax' model. Brief analysis of the transition highlighted the issues all transition countries face regarding general transformation process towards market-oriented economy. In times of transformation, reforming a tax system becomes even more challenging task. A brief analysis of the personal tax system based upon a 'flat' tax shows that transition countries have been successful in reforming their personal tax system. Moreover, personal income tax rates have been decreasing in the past few years, tax base has been changing and some countries have moved towards progressive taxation but shortly afterwards reintroduced flat tax. Empirically, in all selected transition countries, mainly due to high social security contributions, tax wedge as a measure of labour burden is quite high. In addition, it has been decreasing over the years as the tax rates and/or social security contributions have been decreasing. Another useful measure regarding compliance of the personal income tax system is used. PIT elasticity to wages reveals that in the year of reform, a fall in PIT elasticity to wages. However, if in the year(s) after the reform elasticity is greater than one, an improvement in compliance could be expected. This could be seen in the case of FB&H.

ABSTRACT
At present, Russian-Chinese cooperation in the sphere of tourism is being actively developed. One of the most important directions of this cooperation is medical and recreational tourism. Specific factors of tourism development in the Novosibirsk Region (Russia) and in the Guangxi Zhuang Autonomous Region (People's Republic of China) are investigated by the authors. In order to facilitate this cooperation, it is important to reveal problems, hindering the development of inbound medical and recreational tourism, and to look for ways of solving these problems. The authors offer to apply the methodology of problem analysis of the inbound medical and recreational tourism development. This methodology is based on the Logical Framework Approach, that allows to elaborate concrete projects directed at solving the problems revealed. The proposed methodology includes the following steps:
  1. *To establish a Problem Tree based on the cause-effect logic.*
  2. *To convert the Problem Tree into an Objective Tree (showing means-ends hierarchy).*
  3. *To analise and select a strategy(-ies) of achieving the objectives.*
  4. *To prepare a Logical Framework Matrix of the project.*
  5. *To elaborate Activity, Resource and Cost Schedules of the project to be implemented.*
  6. *Project monitoring.*
The proposed methodology has been tested in the Novosibirsk Region of Russia and in the Guangxi Zhuang Autonomous Region of the People's Republic of China.

Keywords: *Logical framework approach, Medical and recreational tourism, People's Republic of China, Problem analysis, Russian Federation*

1 INTRODUCTION

At present, tourism is one of the most profitable branches of industry, and, consequently, a very attractive one. Its share accounts for (Kryukova, 2010, p. 8):
- about 10% of the world gross income;
- 8% of the world export;
- 30-35% of the world services provided.

The current world tourism sector development is characterised by progressing increase. Activation of economic processes in the sphere of tourism makes for this increase, when countries and regions give priority to development of inbound and domestic tourism, trying to

Challenges of the Modern World - Contemporary Economy and Globalization

increase import of foreign capital and currency savings of foreing citizens, with the aim to improve their balance of payments.

Direct inter-regional relations of the Russian regions and provinces of the People's Republic of China play an important role in the tourism development. The authors of the paper give characteristic of the tourist potential of the Novosibirsk Region of the Russian Federation (NR-RF) and of the Guangxi Zhuang Autonomous Region of the People's Republic of China (GZAR-PRC). In the paper there are proposals concerning analysis of problems, hindering increase of the competitiveness of inbound medical and recreational tourism in the NR-RF and GZAR-PRC, as well as recommendations concerning solving these problems with the help of the Logical Framework Approach.

2 INBOUND AND OUTBOUND TOURISM IN RUSSIA AND CHINA: FIGURES AND FACTS

Economic attractiveness of tourism is a challenging factor for intensive development of the tourist sector in Russia and China. The data below convincingly prove the fact that both countries make efforts to increase activities in this direction, and the achieved positive results reflect it. Tables 1 and 2 below characterise the state of outbound and inbound tourism in Russia.

Challenges of the Modern World - Contemporary Economy and Globalization

Table1: Outbound Tourism in Russia (Analytical Service ATOR,2011)

Country	Data of the Russian Federal State Statistics Service		Data of Tourist Operators Average change in 2011 (%)
	January-September 2011	Percentage of change (%)	
Turkey	2 471 039	+14.1%	+27%
China	1 098 939	+8.9%	+5%
Egypt	905 623	-39.5%	-40%
Finland	681 449	+32.4%	+15%
Greece	568 226	+58.0%	+50%
Spain	563 811	+58.8%	+50%
Germany	527 876	+51.2%	+30%
Thailand	514 844	+95.0%	+40%
Italy	465 268	+28.6%	+15%
Bulgaria	323 366	+28.4%	+20%
Cyprus	272 492	+40.5%	+20%
Czeck Republic	267 722	+35.2%	+25%
The United Arab Emirates	244 051	+32,4%	+25%
Ukraine	225 700	+32,8%	+30%
France	201 706	+16.3%	+15%
Israel	162 334	+31.4%	+25%
Montenegro	154 300	+16.1%	+10%
Austria	144 122	+41.8%	+20%
Tunisia	128 038	-17.9%	-25%
Great Britain	118 603	+30.1%	+15%
Switzerland	112 130	+18.6%	+15%
Croatia	103 970	+7.6%	+30%
All countries	11 366 224	+16.2%	+20%

Table2: Inbound Tourism in Russia (Analytical Service ATOR,2011)

From the country:	Number of Tourist Arrivals		Percentage of Change (%)
	January-September, 2010	January-September,2011	
Germany	306 261	306 872	0.2
China	127 944	195 907	53.1
The United States	145 290	150 683	3.7
Great Britain	145 290	110 152	-24.2
Finland	109 789	109 737	0.0
Italy	105 913	107 103	1.1
Spain	79 697	92 277	15.8
France	79 714	80 902	1.5
Israel	47 485	59 358	25.0
Turkey	40 862	58 463	43.1
South Korea	36 006	41 440	15.1
Japan	35 585	32 050	-9.9
The Netherlands	29 243	31 601	8.1
Canada	28 238	30 683	8.7
Latvia	28 345	26 207	-7.5
Estonia	27 950	25 991	-7.0
Poland	21 343	25 598	19.9
Austria	25 179	24 535	-2.6
Sweden	18 204	23 030	26.5
Switzerland	20 739	22 784	9.9
Australia	18 747	22 186	18.3
Norway	19 169	19 748	3.0
Total	**1 807 086**	**1 975 783**	**9.3**

As the Table 1 shows, China takes the second place in terms of arrivals of Russian tourists. At the same time, judging by the data of 2010 and 2011 (see Table 2), the same is true in terms of Chinese tourists visited Russia. Moreover, popularity of Russia is rapidly growing among the Chinese: the number of Chinese tourists in 2011 has increased by 53.1% as compared with the preceding year. It can be proved also by the data of the year 2011 published in the Tourism Reference Book TOURest (Tourism Statistics in Russia, 2011).

The situation on the China outbound tourism market is illustrated by the Charts 1 and 2, showing a steady growth of number of arrivals during the period of 17 years, since 1993 till 2009.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 1: Dynamics of the Outbound Tourism Market in China (China Tourism Statistics)
Chart 2: China Tourism Flock Abroad (China Tourism Statistics)

Volume of the China inbound tourism is characterised by the fact, that despite the fact that by the end-September 2011 China received foreign tourists by 1% less, than in 2010, the total number of them made up an impressive number of 100 million persons, bringing in 35 billion US dollars of income (that is 2% more as compared with the same period of the preceding year).

Table 3 summarises data of foreign tourists hosted by various provinces and cities of China in 2011 as compared with the year 2010. Russia takes the third place on the China inbound tourism market. According to the forecast of the World Tourism Organisation, it is foreseen, that number of foreign tourists visiting China would increase by 43 million persons per year in the near 20 years, coming up to 1.8 billion foreign tourists in 2030 (China Inbound Tourism in 2007).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Reception of Oversea Tourists and Tourism Revenue by Cities and Provinces of China (China Tourism Statistics, 2011)

№№	Provinces and Cities	Tourism Revenue (Unit in 100 Million US dollars)	Growth(%)	Reception of Tourists (Unit in 10,000 persons)	Growth (%)
01	Guangdong	100.28	9.30	2747.80	7.0
02	Shanghai	47.44	-4.58	533.39	1.3
03	Beijing	43.57	-2.30	412.51	8.8

31	Ningxia	0.04	47.16	1.45	25.3

3   TOURISM IN THE NOVOSIBIRSK REGION AND GUANGXI PROVINCE

3.1   Tourism in Guangxi Province

Guangxi Province, where the Guangxi Zhuang Autonomous Region is located, is an active operatoron the tourism market. Guangxi Provincetakes up the 13th position among the most important provinces and Cities of China. Its annual revenue from tourist services is about 643 Million of US dollars.

Department of Tourism of the Guangxi Zhuang Autonomous Region states the 21% growth of foreign tourists' arrival in 2011, compared to that in the previous year. The total number of man-tripsis more than 3 billion, with the revenue of 1 billion 51.875 million US dollars (increasing 30.32% from that in 2010). The following countries account for the majority market shares on the tourism markets of the Guangxi Province: Vietnam, Malaysia, South Korea, the USA, France, Singapore, Indonesia, Japan, Great Britain and Germany (The Rapid Development of Tourism Cooperation of Guangxi with ASEAN, 2012).

The Guangxi Provinces is active in making contacts with other countries, in order to increase inflows of tourist. Thus, in particular, it is planned to open a health resort in the Guangxi Zhuang Autonomous Region, with the aim to attract Russian tourists. Bilateral Russian-Chinese negotiations of this issue resulted in intention to create a Baekhaij Tourist Company, oriented to develop inbound tourism in Baekhaij and to improve tourist infrastructure of the City, in order to attract more tourists from Russia and other neighbouring countries (Guangxi Zhuang Autonomous Region of China Intends to Create a Resort Base Oriented to Russian Tourists, 2008). In practice it means mutual intention to develop such poorly developed sector of the Russian-Chinese cooperation, as medical and recreational tourism.

One of the crucial issues of the tourism development is training specialists for this sector of economy. Chinese educational institutions pay special attention to that issue. By the end of 2009, in China there were 1733 colleges of tourism, with the total number of students reaching 952,400.Taking into account rapid development of the Russian-Chinese cooperation in the tourism sector, Guangxi Province takes a special interest in widening cooperation with Russian higher educational institutions, including participation in international educational programmes provided by Russian higher educational institutions.

3.2   Tourism in the Novosibirsk Region

At present the Novosibirsk Region makes efforts to develop practically all types of tourism, including business tourism, medical, health and recreational tourism, sports tourism, educational tourism, scientific tourism, agritourism, hunting and fishing. There are 124 hotels, 31 recreation centres, more than 400 sanatoriums and health resorts, 11 modern mountain ski resorts, 26 hunting camps, and others (altogether more than 300 tourist-recreational units).

According to the National Rating Agency "Expere RA", the following negative trends are observed in the Novosibirsk Region: recession in investment attractiveness and in tourism potential (Concept of a Long-term Programme "Tourism Development in the Novosibirsk Region in 2012−2016 years", 2011). It should be stressed that only a quarter out of 240 Novosibirsk tourist companies deal with inbound tourism, meanwhile about 60% of companies deal with domestic tourism, at the same time, all companies are involved in outbound tourism (Tourism Development in the Novosibirsk Region, 2012, p. 55).

In 2011, in order to improve the situation, the Novosibirsk Regional Government elaborated a long-term Programme "Tourism Development in the Novosibirsk Region in 2012−2016" (Concept of a Long-term Programme "Tourism Development in the Novosibirsk Region in 2012−2016 years", 2011). The Programme notes, that tourism development in the Novosibirsk Region is constrained by the following factors:weak engineering infrastructure development, insufficient support to tourism business by local self-government institutions and others, as well as poor promoting of the tourism potential of the Novosibirsk Region (e.g. by means of Internet data bases and resources). The Programme is directed to use a target-

oriented approach. Thus, it is planned to provide conditions for development of a network of tourist-recreational units, to stimulate investment activity, and to create an Information System to promote tourism and recreational potential of the Novosibirsk region.

4   LOGICAL FRAMEWORK APPROACH TOWARDS SOLVING PROBLEMS OF TOURIST AND RECREATIONAL SERVICES

Activisation of tourist activities in the Novosibirsk Region and in the Guangxi Zhuang Autonomous Region implies elaboration and consistent implementation of a complex of projects, directed to strengthening competitiveness of medical and recreational services, financed by different sources.

While elaborating such projects, it is important to demonstrate visually: logic and strategy of activities; direction of the activities towards achievement of the concrete objectives; a system of key indicators to measure the extent of achievements of objectives; taking into consideration assumptions and risks that may impact on the project implementation, etc. All these aspects could be clear, when the Logical Framework Approach is used (Project Cycle Management, 2010). This method has two main stages:

1) **Analysis Stage.** This stage includes the following phases:
   - Stakeholder Analysis(identification and assessment of the main "players"),
   - Problem Analysis (identification of key problems and their cause and effect relations - current negative situation),
   - Objective Analysis (transformation of problems into objectives and indentification of means and end relations – desirable/improved situation),
   - Strategy Analysis (how to address the current negative situation in order to achieve the planned results, and to select the most appropriate strategy for the project implementation).

2) **Planning Stage.**This stage includes the following phases:
   - Developing a Logical Framework Matrix (LFM) of a project. This tool helps to define a project logical structure, to check its inner logic, to define project objectives, taking into account measurable indicators of the project success, to reveal assumptions and risks (factors outside the project management's control).
   - Scheduling Project Activities. Using the project LFM, we can determine the sequence of activities and their dependency; estimate duration of the activities; divide activities into manageable tasks and assign responsibilities among the project players.
   - Developing Resource Plan. The resource plan can be drawn up on the basis of the Activity Plan. It defines necessary input resources (human, physical, etc.), schedule of their usage, and a project budget on the whole.

At the first stage, the problem analysis is the most crucial aspect of the project planning (Project Cycle Management, Trainers' Guidelines, 2010). A clear problem analysis provides as foundation on which to develop a set of relevant and focused project objectives. The result of the problem analysis is the so called Problem Tree, reflecting hierarchy of the causes and consequences of the problems identified. Then the Problem Tree is converted into an Objective Tree, reflecting means and ends hierarchy and showing the decide situation. Strategy Analysis helps to decide what should be included in the project,and what should not (Training Module on Project Cycle Management, 2010).

The results of the analyses carried out at the Analysis Stage are used to prepare a Logical Framework Matrix of the project. The Matrix is the most important product of the Planning Stage and it reflects the project summary (see Table 4). Then the LF Matrix will be used for preparinga detailed Plan of Project Activities and the project budget.

Table 4: Logical Framework Matrix of a Project (Project Cycle Management Guidelines, 2004, p. 73)

Project Description	Indicators	Sources of Verification	Assumptions
Overall Objective: The broad development impact to which the project contributes – at a national or sectoral level (provides the link to the policy and/or sector programme context)	Measures the extent to which a contribution to the overall objective has been made. Used during evaluation. However, it is often not appropriate for the project itself to try and collect this information.	Sources of information and methods to be used to collect and report it (including who and when/how frequently).	
Purpose: The development outcome at the end of the project – more specifically the expected benefits to the target group(s)	Helps answer the question 'How will we know if the purpose has been achieved'? Should include appropriate details of quantity, quality and time.	Sources of information and methods to be used to collect and report it (including who and when/how frequently)	Assumptions (factors outside project management's control) that may impact on the purpose-objective linkage
Results: The direct/tangible results (good and services) that the project delivers, and which are largely under project management's control	Helps answer the question 'How will we know if the results have been delivered'? Should include appropriate details of quantity, quality and time.	Sources of information and methods to be used to collect and report it (including who and when/how frequently)	Assumptions (factors outside project management's control) that may impact on the result-purpose linkage
Activities: The tasks (work programme) that need to be carried out to deliver the planned results (optional within the matrix itself)	**Means:** The resources required to carry out the activities (human, physical, etc.)	**Costs**: Real costs	Assumptions (factors outside project management's control) that may impact on the activity-result linkage

Analysis of problems, that the medical and recreational tourism sector in the Novosibirsk Oblast (NO) and in the Guangxi Zhuang Autonomous Region (GZAR) face, was carried out

with the help of the Logical Framework Approach. The subsequent steps helped to define the following objectives:

- conservation and protective development of the unique peculiarities of both Regions in a long-range perspective;
- development of the medical and recreational infrastructure and systems of information and transport communications in the NO and GZAR;
- stimulation of investments into the tourism sector of industry in the NO and GZAR;
- coordinated training of highly qualified specialists for the tourism sector, enhancement and development of the system of life-long and supplementary education;
- development of innovation approaches to management of medical and recreational tourism, introduction and improvement of a system of assessment and monitoring of tourist services in the both Regions;
- intensification of integration processes in development of medical and recreational tourism in the NO and GZAR, with the aim of widening tourist services export, rebranding and mutual promoting of tourism potential of each other.

If these objectives are achieved, the situation in the tourism sector would be sufficiently improved. At the same time, the scale of these objectives leads up to the following conclusion: in order to achieve each of the above mentioned objectives, it is important to solve a complex of complicated tasks, integrated into one or several projects.

5 CONSLUSION

Support to the tourism sector on the national and regional levels, availability of stimulating programmes may facilitate active development of medical and recreational tourism. However, rise in competitive ability and attractiveness of the regions as providers of quality medical and recreational services requires thorough elaboration of a package of comprehensive and complementary projects. Logical Framework Approach should be used as a methodological base for elaboration of such projects. Logical Framework Approachis a very effective analytical and managerial tool. It supposes systematic consideration and analysis of concrete problems, SMART objectives, based on the carried out analyses, well-grounded strategies, and so on. This results in a concrete, logically verified operational work plan, taking into account possible risks, resources constraints and measures ensuring control of the results obtained; operational budget, which is explicitly linked to the planned activities and results; as well as efficient project management.

Considering the range of problems, arising from the development of medical and recreational tourism in the Novosibirsk Region and in the Guangxi Zhuang Autonomous Region, a two-stage system of analysis can be recommended. At first, problem analysis and formulation of objectives are carried out on the macro-level, meaning identifying of target spheres (e.g. infrastructure development, educational system development, training of specialists, etc.). Then all stages of the Logical Framework Approach are carried out in application to the defined target spheres. As a result a package of system-interrelated complementary projects can be generated. Implementation of these projects would be directed exactly on solving overall problems.

THE COMPARATIVE ANALYSIS OF HIGHER EDUCATION GOVERNANCE INDICATORS AND ITS EFFECTIVENESS IN EUROPEAN COUNTRIES

Agnese Ligotne
University of Latvia, Riga, Latvia
agnese.ligotne@lu.lv

ABSTRACT
During the last twenty years higher education systems of European countries have gone trough different challenges: expansion, privatization and internationalization, which have affected and changed the higher education governance systems. These challenges highlighted the question of quality assurance and encouraged development of higher education management. The increasing interest of society in higher education quality forces the universities to demonstrate their effectiveness and usefulness. Various ranks of world universities and ratings of scientific publications are useful for higher education accountability to society. The purpose for this paper is to compare European countries' higher education governance indicators and to analyze their effectiveness. Author uses such national statistic data as number of students and universities and public expenditure on higher education. To investigate effectiveness author uses world's university rank and SJR indicator, what characterizes prestige of scientific publications. Methods used in the research are mathematical statistics, correlation and regression analysis to detect common and distinctive features between governance indicators in European countries. Results of the research allow identifying most successful higher education governance models in Europe.

Keywords: *Accountability, Comparative analysis, Correlation analysis, Effectiveness of governance, Governance of higher education, Regression analysis*

1 INTRODUCTION

There have occurred a lot of changes in the higher education sector during the last decades, which has affected the study quality and higher education management. Austrian researcher A.Bernhard distinguishes four stages for the higher education process of changes within more than 60 years: higher education expansion, diversification, privatisation and internationalisation (Bernhard, 2011, p. 300). This has affected both higher education governance and study quality. In the course of time higher education management has changed from classical form, when everything was set by government, to the form, where different interested sides and their politics try to manage the higher education system (Leisyte, 2007, p. 427).

European Union (ES-27) has about four thousand higher education institutions and more than 19 million students (Europe at figures, 2011, p. 699). In this article the author makes comparative analyse for the there main indicators characterising the governance of higher education systems in 24 European countries: number of students, number of higher education institutions and amount of public funding. The author compares these criteria within the selected European countries, in addition of that looking at each country's main goals of higher education funding and also strategies of *Europe 2020* goals in education (Supporting growth and jobs, 2011, p. 32). In the first part of this article the author's conclusions are based on the comparative analysis and interpretation of quantitative and qualitative indicators, not

researching deeply into the development of higher education system of a separate country, or its demographical status, or history.

Nowadays higher education quality has become the main discussion object of interested sides. More and more often the society wants to be ensured that the higher education offered to it by the institutions is qualitative and the investments are worthwhile. It means that accountability to interests sides comes to one of most important tasks for higher education. In its turn, this promotes the popularity of different ranks of world universities and scientific publications prestige in the eyes of society and other interested sides. Therefore, in addition to statistical data, the author sees the necessity to analyse the achievements of European countries in the world's university and scientific prestige ranks to prove effectiveness of higher education governance. In the second part of this article the author uses the correlation and regression analysis to investigate, if and how the governance indicators and funding goals affect the institution assessments in university and publication prestige ranks.

2 THE COMPARATIVE ANALYSE OF HIGHER EDUCATION CHARACTERISING GOVERNANCE INDICATORS

To compare the higher education governance in European countries, the author considers it to be necessary to analyse three quantitative indicators: number of students, amount of public funding and number of higher education institutions. Traditionally, to compare and characterise higher education systems of different countries internationally, as the indicators are used the number of students and public funding. Also, both of these indicators are included in the Index of Human Development as education characterising indicators (Latvia: Human Development Report 2010/2011, p. 154). The number of students characterises the distribution and availability of higher education, which is one of the goals of the strategy *Europe 2020* (Supporting growth and jobs, 2011, p. 32). It is also said there that state funding has to be the basis of long-term higher education. Lepori points, that the way how the government allocates funding for higher education is one of the main ways of higher education steering (Lepori, 2007, pp. 85–111). The author adds one more quantitative indicator characterising higher education management – number of higher education institutions. They are the only implementers of higher education, in the author's opinion, this indicator characterises state higher education governance, and also the availability and diversity of higher education. Many European countries as well as Latvia have a lot of discussions about the number of higher education institutions and about their usability and goals.

To compare the countries, there will be calculated relative figures of these quantitative indicators. Each higher education governance indicator will be set "European average" assessment limits by the author within one standard deviation from the calculated average. Therefore, basing on the normal distribution, the author identifies those countries, which differ from „European average". At the end of comparative analyse author identify different higher education governance systems, it is the ones which have two out of three indicators outside the limits of „European average".

The selected higher education governance quantitative indicators are investigated by the author in context of the strategy *Europe 2020* education goals. The author also considers it to be necessary to analyse the main goals of European countries' politics for higher education funding together with the governance indicators mentioned above (Modernization of Higher

Education in Europe, 2010, p. 120). These goals explain and justify the differences of quantitative indicators among the included European countries.

Eurydice report distinguishes six main goals:
- *Increase the number of students* (chosen 14 countries out of 24),
- *Increase student diversity* (7 countries),
- *Quality in studies and research* (22 countries),
- *Development of excellence centres* (19 countries),
- *Diversification of higher education institutions* (11 countries),
- *Increase the number of graduates* (17 countries).

Most European countries choose to support financially the *quality in studies and research*, *development of excellence centres*, and *increase the number of graduates*. All these goals are connected with the inner quality of higher education, as they require improvement. In their turn, outer − social − dimension goals are less popular, which is understandable in the current conditions of restricted funding. However, social dimension goals also affect both higher education governance and its quality.

The analysis includes in total 24 European countries[1], of which all except Norway are members of European Union (EU). Some of EU countries (Greece, Turkey, Malta and Luxembourg) were not included in the analysis, because the information necessary for the research about them is not available. The data used in the research are taken from different sources: *Eurostat* data base and several *Eurydice* reports. Information about the number of higher education institutions in European countries is available only for the year 2009; therefore the other data used in the analysis have been chosen exactly for this year.

Number of students. Number of students is one of the characterising indicators of higher education availability, which simultaneously characterises the intellectual potential of the particular country as well. To compare the number of students among different European countries, using the year 2009 data by *Eurostat*, the author calculates the relative indicator: *proportion of students in population aged 20−39.* The selection of this particular age range the author bases on the European statistics data summary, which shows that young people get involved into higher education, starting with the age of 19, but in Scandinavian countries at about 21. Also, the period which a student is at higher education is increased and exceeds the age of 34 (Eurostat, Statistic in focus, Nr 54/2011).

Average in Europe, 15.5% of population aged 20−39 get involved into higher education. Among countries the proportion of students varies from 11%−23%, but the calculated standard deviation is 3.1%. Basing on the normal distribution, „European average" proportion of students is from 12.3% - 18.6% (see Chart 1). The main educational goal of strategy *Europe 2020* is: by 2020 to achieve that 40% of young people not only get involved into higher education, but also graduate from it. In more than a half (14 out of 24) countries the *increase of student number* has been chosen as one of the higher education funding goal (see in Chart 1 darker coloured columns).

---

[1] 24 European countries: Austria (AT), Belgium (BE), Bulgaria (BG), Czech Republic (CZ), Germany (DE), Denmark (DK), Estonia (EE), Spain (ES), Finland (FI), France (FR), Hungary (HU), Ireland (IE), Italy (IT), Lithuania (LT), Latvia (LV), Netherlands (NL), Norway (NO), Poland (PL), Portugal (PT), Romania (RO), Sweden (SE), Slovenia (SI), Slovakia (SK) and United Kingdom (UK).

Challenges of the Modern World - Contemporary Economy and Globalization
*Chart 1: Proportion of students in population aged 20−39
(Calculated by author using Eurostat data)*

Two European countries, Germany and Portugal have lower proportion of students, accordingly, 11.1% and 12.2%. However, in funding goals the increase of student number is indicated only for Germany. In their turn, high proportion of students is in four countries: Latvia, Slovenia, Lithuania and Finland, accordingly, 18.7%, 19.5%, 21.8% and 22.6%. Increase of student number in funding goals is included for all except Lithuania.

Amount of funding characterises the amount of funding allocated by state to cover the expenses of higher education. European higher education institutions are mostly funded by states. There can be detected four types of higher education funding: based on input indicators, based on performance indicators, funding of particular aims (for example, a state order) and funding a contract. (Modernization of Higher Education in Europe, 2010, p.120) In Europe the most popular ones are the first two funding types, but in most cases countries have the set of mixed types. At the same time it must be taken into account that the different funding types have negative effect on the equality of European higher education.

To compare the funding amount in different European countries, the author uses *Eurostat* data of year 2009 relative indicator: *public expenditures on tertiary level of education as % of GDP*.(Eurostat: Main data tables) Average in Europe in 2009, countries spend 1.5% of GDP for higher education; this indicator varies from 0.79%−2.41%. Calculated standard deviation is 0.5%, this determines the limits of the average indicator − average in Europe countries spend from 0.9%−1.8% of GDP for higher education (see Chart 2).
Chart 2: Public expenditures on tertiary level of education as % of GDP (Calculated by author using Eurostat data)

In comparison with 2007, the indicator has increased by almost half percent, it was 1.12% of GDP in 2007 (Modernization of Higher Education in Europe, 2010, p. 120). This increase is bigger if compared with 2000, when average Europe allocated 1.05% of GDP for higher

education. However, there is still the tendency that Northern countries spend more for higher education, but Bulgaria, Italy, Latvia, Slovakia and United Kingdom's allocated funding is less than 1% of GDP. Also, in 2009 data, four countries: Latvia, United Kingdom, Slovakia and Italy have comparatively low state funding, accordingly, 0.79%, 0.81%, 0.81% and 0.86% of GDP. In their turn, comparatively high state support for higher education continues to exist for Sweden, Finland, Norway and Denmark, accordingly 2.04%, 2.16%, 2.23% and 2.41% of GDP. Therefore, these countries are united not only by common geographical location, but also by stable economics and similar priorities in higher education development.

Number of higher education institutions characterises state politics concerning higher education governance. Big or small number of higher education institutions testifies of certain state goals concerning higher education availability and quality. Strategy *Europe 2020* determines that the main task of higher education institutions is to promote the prosperity of Europe by educating qualified workforce. Strategy points that: „Europe needs a wide range of higher education institutions" (Supporting growth and jobs, 2011, p. 32). So, big number of higher education institutions is justified if higher education funding goals are to diversify higher education institutions, to involve as big number of students as possible and make it available for everyone.

To analyse the number of higher education institutions in European countries, the author uses *Eurydice* summary data and calculates the relative indicator: *number of students (thousand) average per university* (Focus on Higher Education in Europe, 2010, p. 160). Involved European countries have 5.5 thousand students average per one university. This indicator varies from 0.5 to 14.7 thousand per one university, and the standard deviation is 3.1. The wide range and standard distribution testify that European countries do not have united policy for the governance of the number of higher education institutions. Main political goals of higher education funding are different - only 11 countries as one of the goals consider the diversification of higher education institutions (Modernization of Higher Education in Europe, 2010, p. 120) – see in Chart 3 darker coloured columns.
Chart 3: Number of students (thousand) average per university
(Calculated by author using Eurydice and Eurostat data)

The limit of „European average" assessment is 2.3 to 8.6 thousand students per one university (see Chart 2). Comparatively smaller number of students per one university is in France, Estonia and Denmark, accordingly 0.5, 2.0 and 2.1 thousand students per one university. It means that the above mentioned countries have bigger number of higher education institutions than in the majority of European countries. It has increased as a result of higher education expansion, because there have been no limits set for that within the state. Looking at the funding goals of these countries, the author considers that the number of higher education institutions is justifiable. France, where the number of higher education institutions is

particularly big, has indicated both goals as the main ones: increase of student number and diversification of higher education institutions. In its turn, Denmark shows as important the increase of student number (not diversification of higher education institutions), but Estonia - diversification of higher education institutions (not increase of student number).

Remarkably big number of students per one university is in United Kingdom: 14.7 thousand students per one university. This, in author's opinion, testifies for the determined higher education policy and resource management. Italy and Spain also have comparatively few universities, accordingly 9.2 and 9 thousand students per one university. The higher education funding goal of „quality in studies and research" is included for all above mentioned countries.

Generally evaluating the above described quantitative higher education governance indicators, the author considers that we can call such governance systems different, which have at least two out of three indicators outside the set limits of European average. That can be seen most outstandingly in Finland and United Kingdom. Finland has the biggest proportion of students and the third biggest public funding for higher education % of GDP. In its turn, United Kingdom has second lowest public funding and the smallest number of higher education institutions, if calculating the number of students. We can consider as different also the higher education systems in Denmark and Sweden, because they have bigger public funding for higher education than the average in Europe and also the number of higher education institutions is outside the European average. Sweden has in average 8.6 thousand students per one university, which means that there are relatively few universities, but in Denmark there are 2.1 thousand students per one university, which means that there are relatively many universities. For the other involved countries at least two indicators are within the set limits of European average. In the opinion of the author, these differences must be taken into account when doing a deeper analysis of higher education governance indicators.

3 FACTORS INFLUENCING THE ACHIEVEMENTS OF EUROPEAN COUNTRIES IN UNIVERSITY RANKS AND PUBLICATION SCIENTIFIC PRESTIGE

To evaluate the influence of higher education governance quantitative indicators and higher education funding goals, the author considers it to be necessary to analyse the countries' achievements in university and publication prestige ranks. This could be the way how to analyse effectiveness of governance and helps to higher education institutions accountable to society.

Nowadays different higher education ranks acquire more and more popularity, especially in the society, as they demonstrate which country has the best higher education or best universities. Some of European universities are among the most prestige of the world. Most often, the society is not interested in the methodological justification of these ranks; it wants to see evidence for the fact that the resources invested in the higher education are worthwhile. In this part of the article the author investigates the relationships between the above described higher education governance characterising indicators and socially recognised higher education ranks. Founded relationships describe effectiveness of higher education governance. There are examined two ranks: *Webometric* world university rank, where the author counts how many higher education institutions from each European country are included in the world university rank, and *SJR SCImago Journal & Country Rang* scientific journal rank, which uses country's H-index as the comparative indicator. Using statistical

techniques for estimating relationships among variables, the author checks if governance indicators and higher education funding goals affect country's achievements in these ranks. To evaluate country's achievements in these ranks and investigate the relationships, the author uses correlation and regression analysis in two steps. The first step analysis includes 24 in first part of article mentioned European countries. But the second step - 20 European countries, not including the ones which have at least two out of three governance indicators outside the calculated „European average" assessment. In each of the steps the author, at first, makes the correlation analysis to find out if there are statistically essential relationships between factorial and the selected resulting features. In case there could exist such relationships, it must clear out if there is the multicolinearity problem. After that, the author makes the regression analysis separately for each resulting feature, according to the results of correlation analysis.

As factorial features the author uses three above described higher education governance characterising quantitative indicators (relative values) and the six goals of higher education funding:

X_1 – *proportion of students in population aged 20-39;*
X_2 – *average number of students (thousand) per one university;*
X_3 – *state funding for higher education % of GDP;*
X_4 – *goal: increase the number of students;*
X_5 – *goal: increase student diversity;*
X_6 – *goal: ensure quality;*
X_7 – *goal: excellence centre development;*
X_8 – *goal: diversification of higher education institutions;*
X_9 - *goal: increase the number of graduates.*

The author detects two result features:

Y_1 – *number of universities included in Webometric world university rank;*
Y_2 – *H-index which characterises country's scientific publications prestige.*

Step 1: In the first step the relationships are investigated, using 24 European countries mentioned in the previous part. First step correlation coefficients are shown in Table 1.
According to the correlation analysis, statistically significant medium-close relationships exist only for *number of universities included in Webometric world university rank* Y_1 resulting feature with X_1 and X_2 factorial features, correlation coefficients accordingly *-0.430* and *0.502*. Between features X_1 and X_2 there isn't a close and statistically significant correlation (r = -*0,105)*, it testifies that the multicolinearity problem does not exist. It means that both features do not exclude each other and we can do two-factor regression analysis. Correlation coefficients show that we can increase the number of higher education institutions which get into the world university ranks by decreasing the proportion of students or by increasing the number of students per one university, which can be done in two ways. First, by increasing the number of students, but this solution contradicts with the direction of X_1 factorial feature correlation coefficient, which is negative. Second variant is to increase the number of students per one university, by decreasing the number of universities at the existing or smaller number of students.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Correlation coefficients for the first step of the analyse (calculated by author)

Factorial features	X_1	X_2	X_3	X_4	X_5	X_6	X_7	X_8	X_9
X_1	1								
X_2	-0,105	1							
X_3	0,376	-0,323	1						
X_4	0,001	0,048	0,262	1					
X_5	0,006	0,091	0,009	0,239	1				
X_6	0,088	0,361	0,004	**0,447***	0,267	1			
X_7	-0,091	0,050	-0,244	0,387	**0,454***	**0,589***	1		
X_8	-0,078	-0,023	0,058	0,099	**0,414***	0,095	**0,406***	1	
X_9	-0,265	-0,002	0,207	**0,478***	0,125	0,247	0,130	0,118	1
Resulting features									
Y_1	**-0,430***	**0,502***	-0,226	0,199	0,013	0,127	0,048	0,139	0,317
Y_2	-0,338	0,345	0,159	0,195	0,095	0,080	-0,123	0,051	0,316

*Correlation coefficient is statistically significant with probability 0,95

For the second resulting feature – country scientific publication prestige (Y_2) - at the first step there were not found statistically significant relationships with factorial features, therefore further analyse for estimating relationships is not done.

Statistically significant correlation coefficients were found between country higher education funding goals. Comparatively closer correlations exist between the goals *ensure quality* and *develop excellence centres*, correlation coefficient is 0.589. There are medium close relationships between the goals *ensure quality* and *increase the number of students*, correlation coefficient 0.447, and also between the goals *increase the number of students* and *increase the number of graduates*, correlation coefficient 0.478. In its turn, the goal *increase student diversity* has relationships with the goals *develop excellence centres* and *diversify higher education institutions*, correlation coefficients accordingly 0.454 and 0.414. The found relationships show the complexity and mutual cooperation of higher education goals. Relationships point to the necessity for the higher education systems to work simultaneously in several directions. This complicated situation has been formed taking into account the diverse needs and wishes of the interested sides in higher education (government, ministries, quality assurance agencies, higher education institutions, students, employers and overall society). Also, in political documents, for example, the goals for education in Bologna process work and strategy *Europe 2020* differ.

In the second part of the first step the author does two-factor regression analysis to investigate if the decrease of student proportion (X_1) and the increase of the number of students per one

Challenges of the Modern World - Contemporary Economy and Globalization

university (X_2) affects the inclusion of higher education institutions in the world university rank tops (Y_1).

Results of regression analysis shows, that, linear two-factor regression model is statistically significant (F-test p-value is 0.05). It explains 39.6% of countries' achievements in university rank tops. Also, both coefficients of regression equation are significant with 95% probability, it means that both proportion of students and numbers of students per one university explain the changes of resulting feature values (Y_1). Calculated regression equation is:

$$Y_1 = 34{,}62 - 225{,}6\,X_1 + 2{,}75\,X_2$$

This regression equity explains the integrated effect of the decrease of the number of students and the number of universities on university prestige ranks. So, simultaneously limiting the number of universities and students, it is possible to attain that higher education gets involved only the most appropriate entrants and there are offered just good quality studies. In the author's opinion, such conditions would allow the higher education institutions to achieve excellent results and get appreciated in the world's university ranks. Consequently, decreasing the proportion of students and increasing the proportion of students per one university, which means the decrease of the number of universities, increase the possibilities for country universities to get into world's university rank tops. Also such conditions would allow to governance higher education more effectively and more accountability for society.

Step 2: In the second step the relationships are analysed and investigated using 20 European countries. Unlike the first step, in the second step there were not included United Kingdom, Finland, Denmark and Sweden, because they had two out of three indicators outside the set limits of „European average". Correlation coefficients for the second step are shown in Table 2.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: Correlation coefficients for the second step of the analyse (calculated by author)

Factorial features	X_1	X_2	X_3	X_4	X_5	X_6	X_7	X_8	X_9
X_1	1								
X_2	-0,263	1							
X_3	0,101	-0,428	1						
X_4	-0,075	0,006	0,361	1					
X_5	0,174	-0,107	0,41	0,242	1				
X_6	0,03	0,429	-0,122	**0,464***	0,308	1			
X_7	0,164	0,186	-0,075	0,406	0,424	**0,728***	1		
X_8	0,04	-0,083	0,213	0,01	0,39	0,099	0,29	1	
X_9	-0,383	-0,028	0,332	0,39	0,099	0,279	0,061	0,0312	1
Resulting features									
Y_1	**-0,521***	0,259	-0,046	0,148	-0,228	0,117	-0,062	0,017	0,318
Y_2	**-0,522***	0,015	0,282	0,161	-0,005	0,017	-0,172	-0,051	0,35

*Correlation coefficient is statistically significant with probability 0,95

Statistically significant medium close relationships exist for both, (Y_1) and (Y_2), resulting features with the factorial feature (X_1), and correlation coefficients accordingly are *-0,521* and *-0,522*. Therefore, by decreasing the proportion of students, it is possible to increase the number of higher education institutions in world's university ranks and country scientific publication prestige.

Similarly to the first step, the second step also detected statistically significant relationships between country's higher education funding goals, which, in the author's opinion, points to the connection of these goals with European countries higher education governance. The goal *ensure quality* has relationships with two other goals *develop excellence centres* and *increase the number of students*, correlation coefficients accordingly 0.728 and 0.464. Although both correlation coefficients are statistically significant, we can perceive the tendency in European higher education to connect the quality closer with excellence and honours, not with the increase of the number of students.

In the second part of the second step there are done two one-factor regression analyses, separately for each resulting feature: *firstly*, to clear out, how the decrease of student proportion affects country's achievements in university ranks; *secondly*, to clear out, how the decrease of student proportion affects country's scientific publication prestige.

One-factor linear regression model on country's achievements in university ranks explains 27.1 %, but on country's scientific publication prestige 27.3%. Both regression models are statistically significant, it can be seen by F-test p-value, which is 0.018 for both models. In their turn, both calculated regression coefficients are not statistically significant with probability 0.95. Therefore the hypotheses supposed in the second step for the regression

analysis are denied. Taking into account the results of second step regression analysis, the author concludes that country's achievements in university ranks (Y_1) and changes in country's scientific publication prestige (Y_2) cannot be linearly explained by the decrease of the proportion of students. In the author's opinion, such results of the second step regression analysis can be explained by the differences in European countries' higher education managements, which were discussed in the first part of this article.

As a result of correlation and regression analysis, the author finds out that achievements in science are not connected with higher education management. It can probably be affected by other factors which are not connected with higher education governance, for example, the number of scientific researchers or institutions, or the public funding for science and research.

4   CONCLUSION

At the end of comparative analyses the author conclude, that there are essential differences among the higher education systems of European countries, which can be seen by the wide ranges of quantitative indicators described above. The range of the proportion of students is comparatively the smallest – the indicator varies 1.5 - 2 times. But the range of public funding is slightly bigger: 2-3 times. The biggest range is in the relative indicator of higher education institutions, not taking into account France and United Kingdom, the number of students average per one university varies 4 - 5 times. Analysing the described higher education governance indicators, the author does not see the opportunity to group the countries, because there are no common features among the countries. The higher education governance of European countries has been differently affected by various processes both in higher education and the development of national economy. However, it did not disturb the formation of united European Higher Education Space in 2010 (Eurostat yearbook, 2011, pp. 193–227). Also, there are accepted and implemented international political documents, for example, European Standards and Guidelines for higher education quality provision, which determines united principles of higher education implementation and quality assurance, but not for higher education governance (Standards and Guidelines for Quality Assurance, 2009, p. 41).

As a result of correlation and regression analysis, the author finds out that changes of countries' achievements in university ranks (Y_1) 39.6% can explain the decrease of student proportion and the number of higher education institutions. Such conditions could be possible to implement if the country limited the number of higher education institutions, but the higher education institutions increased the requirements for the entrants. Such restrictions would allow higher education institutions to increase the overall study quality, acquire higher study results and achieve excellence. And also such conditions would allow to governance higher education more effectively and more accountability for society. However, such conditions contradict with one of the main directions of Bologna process, which states that higher education must be available for everyone. Also, the main goal of strategy *Europe 2020* claims that 40% of young people must get higher education.

The results of the regression analysis prove that the goals of university rank tops are not conformed to the goals of European higher education social dimension development. In the author's opinion, this situation creates misunderstanding in the society and other interested sides in higher education. Looking at it from the point of higher education quality assurance, the author admits that higher education expansion and availability create threats to its quality. Also, Tartu University (*Estonia*) professor T. Maimet admits that excellence and education

availability exclude each other, especially, in small countries with restricted resources (Maimet, 2011, pp. 20). The author agrees with the professor who admits that the achievement of both is a very ambitious goal. It is also proved by the author's research. The goals of European higher education challenge each other and higher education institutions have to do the impossible. They have to ensure high quality studies, which could be available for everyone, having restricted resources. This, naturally, creates discussions about higher education quality and the ability of higher education institutions to ensure that. Such situation intensifies the responsibility of higher education institutions for quality assurance and its demonstration to the society. In the author's opinion, higher education quality must be the question of honour for every higher education institution, because only that way it is possible to aspire to both excellence and availability to all at the same time.

Challenges of the Modern World - Contemporary Economy and Globalization

MANAGING GEN Y IN THE UNITED ARAB EMIRATES: CHALLENGES IN A UNIQUE LABOR MARKET

Hwee Ling Lim
The Petroleum Institute, Sas Al Nakheel Campus, UAE
hlim@pi.ac.ae

ABSTRACT

The demographic trends of the United Arab Emirates (UAE) herald the entry of a large Generation Y (Gen Y) segment into the country's workforce that occurs in tandem with the retirement of the Generation X. Companies in the UAE need to attract and retain talented human resources hence this trend has implications for the continued economic growth of the country. However, little is known about Gen Y in the UAE since research on this young cohort has largely been conducted outside the Arabian Gulf. Furthermore, the asymmetric distributions of the UAE population and labor force by nationality, which are positively skewed for expatriate residents, present a diverse population that poses further challenges in understanding the motivations of this generation. This study examined the life priorities and work preferences of Gen Y Emiratis and expatriates in the UAE to further understand their motivations, strengths and aptitudes that could guide organizations in forming strategies to effectively recruit, retain and integrate this new generation into the nation's workforce. Survey and interview results were analyzed for correspondence between choices made for life priorities and work preferences, as well as differences in the preferences of Emirati and expatriate respondents. Recommendations for the effective recruitment and retention of Gen Y were provided to help organizations manage this young generation who are central to the future of the Middle-East region.

Keywords: Generation Y, Generational studies, Human resource management, Motivation

1 INTRODUCTION

The United Arab Emirates (UAE) population demographics indicate the imminent entry of a large Generation Y (born 1980–1999) segment into its workforce. The country's continued economic growth depends on its ability to attract and retain this new cohort of talented human resources. However, little is known about Generation Y (Gen Y) in the UAE since research on this group has largely been done outside the Arabian Gulf region. Moreover, the asymmetric distribution of the UAE labor force by nationality, which is positively skewed for expatriate residents, presents a diverse and unique workforce composition that poses challenges to understanding the motivations of this generation. This study examines the life priorities and work preferences of Gen Y Emiratis and expatriates in the UAE. It also provides recommendations to organizations for the effective recruitment and retention of Gen Y workers. The findings would provide greater insight into Gen Y motivations, strengths and aptitudes that would help companies organizations manage this young generation who are central to the future of the Middle-East region.

2 LITERATURE REVIEW

2.1 UAE demographic and workforce generations

A *generation* is a cohort of individuals grouped by its age, and shares the historical and social experiences, behavior and beliefs that are common to that time (Kupperschmidt, 2001). There are five commonly accepted generations (Rajan, 2007) grouped by birth years: *Traditionalists*

(1925–1945); *Baby Boomers* (1946–1964); *Generation X* (1965–1979); *Generation Y* (1965–1979); and *Generation Z* (from 2000), all of which are present in the UAE population.

In 2011, the UAE population was estimated at 5.1 million with 19% nationals (Emiratis) and 81% expatriates. The 2010 labor force displayed a similar pattern with 15% Emiratis and 85% expatriates (CIA-The World Factbook, 2011). Table 1 shows the whole population distributed by generation, which indicates that in 2010, Gen X and Y were the two largest demographic groups (35%; 36%) followed by Gen Z (16%). However, by 2015, Gen Y will be the largest group (45%) whereas Gen X will have declined (26%). As official UAE labor force statistics distributed by both generation and nationality are not available, an extrapolation of the population figures to the workforce suggests that the retirement of Gen X will have a large impact in terms of worker replacement numbers and knowledge transfer. Of special concern is Gen Y's entry into the labor market as they will overtake Gen X in sheer numbers by 2015.

Table 1: UAE population, 2005–2015 by generations (US Census Bureau, 2012)

Generation	2005	2010	2015
Traditionalist 1925-1945	70,360 2%	45,057 1%	29,784 1%
Baby Boomer 1946-1964	758,786 19%	567,243 11%	383,721 7%
Generation X 1965-1979	1,682,728 41%	1,752,082 35%	1,513,689 26%
Generation Y 1980-1999	1,190,636 29%	1,811,635 36%	2,588,396 45%
Generation Z from 2000	384,092 9%	799,576 16%	1,264,170 22%
Total	4,086,602	4,975,593	5,779,760

A generation is more than a group of individuals within the same age range. Each cohort is bound by shared experiences of the political, economic and social events of that time, that shape the generation's values, attitudes and behavior (Crumpacker and Crumpacker, 2007). If that is the case, the Gen Y cohort would have shared experiences of life events in the UAE that shaped their values and attitudes. However, it may not be possible to assume that they are a homogenous group who had undergone critical development periods together in the same time and place, and therefore have similar life and work motivations. While Emiratis are citizens; born and mostly raised in the UAE, the expatriates are from diverse countries who had mainly migrated to the UAE for work. With this unique labor market composition, there is likely to differences in life values and work attitudes between the Emirati and expatriate Gen Y workers. A better understanding of these differences from this study would help companies in the UAE recruit and integrate this heterogeneous cohort into its existing workforce.

2.2 Values and motivation: Concepts and instruments from the literature

Values are "desirable states, objects, goals, or behaviors, transcending specific situations and applied as normative standards to judge and to choose among alternative modes of behavior" (Busacca, Beebe and Toman, 2010, p. 3). Schwartz's (1994) values theory defines 10 life values by their underlying motivation.

The theory assumes that
   a) individuals differ in importance placed on values;
   b) values are a basis for judging appropriate behavior;
   c) values provide a sense of future goals individuals would like to achieve.

The *Schwartz Value Inventory* (SVI) measures an individual's assessment of the importance of 10 life values grouped into four dimensions:
   - Self enhancement (values: achievement, power, hedonism)
   - Self-transcendence (values: universalism, benevolence)
   - Conservation (values: security, tradition, conformity)
   - Openness to change (values: stimulation, self-direction, hedonism)

Motivation refers to forces acting on or within an individual to direct behavior (Gibson, Ivancevich, Donnelly, Jr. and Konopaskeet, 2006). In the context of work, motivation describes the internal and external factors affecting employee productivity. According to Herzberg's (1968) *two-factor theory*, job satisfaction is affected by extrinsic and intrinsic factors. *Extrinsic* (hygiene) factors do not necessarily motivate a person in his job, but their absence would result in dissatisfaction. *Intrinsic* factors include feelings of achievement, responsibility, recognition. Their absence may not result in dissatisfaction, but their presence increases motivation. Herzberg's theory assumes that hygiene factors must be present to avoid employee dissatisfaction before intrinsic motivators can be used to stimulate work performance.

Herzberg's distinction between extrinsic and intrinsic factors forms the basis for understanding Twenge, Campbell, Hoffman and Lanceet's (2010) model used here to measure work preferences on five motivational dimensions:
   - *Extrinsic* work motivators are tangible rewards such as salary, benefits, promotion opportunities, status of job title.
   - *Intrinsic* work motivators are intangible rewards that reflect an inherent interest in the work that lead individuals to being motivated to work for its own sake.
   - *Leisure* work motivators are rewards that enable a work-life balance such as having flexible work hours and independence from direct supervision.
   - *Social/Affiliation* work motivators are emotional rewards that satisfy the need to be connected to others such as interpersonal relationships with members in work teams.
   - *Altruistic* work motivators are intangible rewards that satisfy the need to help others and contribute to the wider society.

The SVI and Twenge et al.'s motivational model were used here with the assumption that work preferences are the means by which life priorities could be achieved. In other words, individuals who regard *Self-enhancement* (focus on self) as an important life priority are likely to also regard the values of *Achievement, Power* and *Hedonism* as important. Hence, they would be more motivated by *extrinsic* work motivators such as having a job that offers a high salary, status and promotion opportunities.

3   METHODOLOGY

3.1   Sample and instruments
Purposive sampling (Patton, 2002) was used to select participants with the following characteristics: Emiratis; expatriates; aged 20–30 (in 2010); both genders; working adults and

university students from engineering and business fields. Face-to-face surveys and interviews (individual; focus group) were conducted with a self-administered paper-based survey questionnaire and an interview questionnaire. The closed and open-ended questions covered demographics, life priorities, work preferences, and suggestions on strategies for Gen Y recruitment and retention. The quantitative and qualitative data obtained were statistically and interpretively analyzed, respectively. This mixed-methods design enabled method triangulation: when the same questions were asked in both the survey and interview, it compensated for the weaknesses present in using only one method, thus strengthening the validity of the study.

The sample size was 166 respondents of which 79 respondents were surveyed and 87 respondents interviewed (Table 2). 9 surveys and two individual interviews were discarded. The usable datasets were 70 survey returns, 70 individual interviews and 5 focus group interviews (n=15). The results presented here are based on 155 respondents. In this research, ethical issues of confidentiality and participant protection were ensured by deleting participant identifying details and replacing actual names with codes in data processing and publication. Informed consent was handled by explaining to participants the topic being researched, what was expected and that they could withdraw from the study at any time, without penalty.

Table 2: Datasets

Datasets	Usable	Discarded	Total
Survey returns	70	9	79
Individual interviews	70	2	72
Focus group interviews	5 x 3* (n=15)	0	15
Final datasets	**155**	11	166

*5 focus groups with 3 respondents each

3.2 Constructs and measures

Life priorities refer to the guiding principles in life by which individuals assess the importance of 10 personal values combined into four inter-related and interacting groups (Schwartz, 1994). The *Schwartz Value Inventory* (SVI) was adapted to measure an individual's assessment of the importance of 10 life priorities on four dimensions (section 2.2). Table 3 lists the questions that are the operationalized measures of the construct.

Work preferences are the beliefs and motivators that influence employee behavior at work (Dose, 1997). Twenge et al.'s (2010) model was used to measure the importance of work preferences on five motivational dimensions (Table 4). These measures assume that work preferences are the means by which life priorities could be achieved.

Table 3: Life priorities questions

Dimensions	Personal Values*	Measures as survey questions (Q12)**
Self enhancement *(focus on self)*	Power, Achievement, Hedonism	a) Being successful in a high-paying career or profession e) Having lots of free time to relax or do things you want to do f) Being famous
Self-transcendence *(focus on non-self)*	Universalism, Benevolence	c) Living a very religious life d) Being a good parent g) Helping other people who are in need
Conservation *(seeking stability)*	Security, Tradition, Conformity	b) Having a successful marriage c) Living a very religious life d) Being a good parent h) Owning your own home
Openness to change *(seeking change)*	Stimulation, Self-direction, Hedonism	e) Having lots of free time to relax or do things you want to do

*Certain options may overlap values and dimensions. For example, choice of option *c. living a very religious life*, may imply valuing *Benevolence* or *Tradition*.

**Q.12 To what extent are the following goals in life important to you personally on a scale of 5 (One of the Most Important) -1 (Don't Know)?

Table 4: Work preferences questions

Motivational dimensions	Measures as survey questions (Q17)*
Extrinsic	a) Having a job with high salary, status and chances for promotion
Intrinsic	b) Having a job where I can learn new skills and be creative
Leisure	c) Having a job that leaves a lot of time for other things in my life
Social/Affiliation	d) Having a job where I can meet a lot of people
Altruistic	e) Having a job where I can help society directly

*Q.17 To what extent are the following aspects about your job important to you personally on a scale of 5-1(One of the Most Important) -1 (Don't Know)?

4 RESULTS AND DISCUSSION

The demographic data showed that the 155 respondents consisted of Emiratis (42%) and expatriates (58%) who were mainly single, male, in their early 20s (20–24 years), employed (42%) or university students (54%). The Emirati and expatriate respondents differed most in their income and living arrangement. More expatriates declared a lower average monthly income (below USD 5,172) and were more likely to live alone.

4.1 Findings: Life priorities and work preferences

Respondents ranked the importance of a set of personal life values that were represented by 8 statements (Table 3) on a 5-point scale *(One of the Most Important [5] - Not Important [2], Don't Know [1])*. The common most important life dimension to Emirati and expatriate respondents was *Conservation*: valuing Security, Tradition, and Conformity. Although *Self-*

transcendence (valuing Universalism, Benevolence) was the second most important life dimension to Emiratis, it was least important to the expatriates (Table 5).

Table 5: Most important life priorities: Emirati and expatriates

Life priorities			
Emirati		**Expatriate**	
Conservation (seeking stability)	56.5%	Conservation (seeking stability)	39.2%
Self-transcendence (focus on non-self)	47.7%	Self enhancement (focus on self)	31.9%
Self enhancement (focus on self)	31.8%	Openness to change (seeking change)	30.0%
Openness to change (seeking change)	29.2%	Self-transcendence (focus on non-self)	27.8%

For work preferences, five work motivational dimensions were ranked based on Twenge et al.'s model (Table 4). Each dimension was represented by a statement, on the same 5-point scale. No differences were found in work preferences ranking between the nationality groups (Table 6). Both Emiratis and expatriates regarded *extrinsic* work motivator as most important and the *altruistic* work motivator as least important. This finding was consistent with the expatriates' low ranking of *Self-transcendence*. However, Emiratis regarded *Self-transcendence* as the second most important life dimension. Hence, it is surprising that they did not desire *a job where I can help society directly.*

Table 6: Work Preferences: Most Important

Work Preferences	**Emirati**	**Expatriate**
Extrinsic motivator	63.1%	67.8%
Intrinsic motivator	46.2%	43.3%
Leisure motivator	30.8%	23.3%
Social/affiliation motivator	21.5%	15.6%
Altruistic motivator	18.5%	12.2%

4.2   Discussion of findings

This study held three main assumptions: (a) individuals value 10 basic priorities in life and their work preferences indicate the means by which they choose to achieve these life goals; (b) there would be a correspondence between life priorities and work preference choices. Hence, the study assumes that individuals who regard the *Self-enhancement* life dimension as most important would value highly *power, achievement*, and *hedonism*. To attain self-enhancement, they would prefer jobs offering *extrinsic* motivators that provide tangible rewards towards that life goal (section 2.2). Also, given the unique UAE labor force composition, with a highly heterogeneous workforce in terms of nationality, culture and background, a third assumption was held: (c) differences are present in the life priorities and work preferences of Emirati and expatriate respondents.

The assumption of a correspondence between choices for life priorities and work preferences was partly supported. *Conservation* was the most important life dimension to both Emiratis and expatriates (Table 5) and they were most motivated by *extrinsic* rewards which is

consistent with the chosen life dimension. To further explain: since respondents seek *stability* in life domains such as family (marriage, home ownership, parenting) and spirituality (religious life), it was expected (and found in the results) that the *extrinsic* motivator was also most desired as it enables the material means to attain such stability.

Interestingly, expatriates ranked both *Self-transcendence* and *altruistic* work motivator as least importance which matched the life priorities and work preferences choices. However, this consistency was absent in the Emirati results. Emiratis regarded *Self-transcendence* as the second most important life dimension yet did not desire *a job where I can help society directly*. This pattern could be an effect of the instrument since only one of three measures for *Self-transcendence* (Q.12g. helping other people who are in need) corresponded directly to the *altruistic* motivator (Q.17e. having a job where I can help society directly) which could have weakened the association. It could also be due to economic factors in the UAE as the country had experienced rapid inflation in the recent years.

The assumption that Emirati and expatriate respondents would show differences in life priorities was also partly supported. Although *Conservation* was most important to both groups, there were differences in the ranking of the other life dimensions. In particular, the second most important life dimension was *Self-transcendence* for Emiratis but it was *Self-enhancement* for expatriates. This pattern could be due to a demographically heterogeneous workforce: Emiratis are citizens with strong familial/societal roots in their own country and their values of Universalism/Benevolence are manifested in the extension of care and concern to the wider local community. However, the expatriates had migrated to the UAE for work and would subsequently return to their countries of origin. Hence, *self-enhancement* or the egocentric needs to achieve career success and be independent are naturally high priorities.

Contrary to the assumption of differences in work motivators between Emirati and expatriate respondents, no differences were found in their ranking of all work preferences (Table 6). Since differences were found in the ranking of life dimensions (besides *conservation*), work preferences were expected to show differences as well. This symmetrical prioritization of work preferences by both groups could be due to factors beyond life values held. The importance placed on *extrinsic* work motivators could be due to the recent high inflationary pressures in the UAE. The rising cost of living would have impacted all residents regardless of nationality.

The importance placed on *intrinsic* work motivators by expatriate respondents was expected since foreign workers are mainly recruited for their strong job skills and work ethics. Hence, having a job with opportunities for career and skills development would be vital to the continued employability of expatriates. However, the same importance given to *intrinsic* work motivators by Emiratis was unexpected. In contrast to the negative stereotyping of Emirati workers by private sector employers as under skilled, unmotivated and unproductive (Mashood, Verhoeven and Chansarkar, 2009), the Emirati respondents seek jobs that offer training and career development prospects. This could be explained by forthcoming changes to employment opportunities for nationals. As public sector employment for nationals reaches saturation (Al Ali, 2008), Emirati Gen Ys would face greater competition for government jobs especially when the cohort becomes the largest demographic group by 2015. Hence, the Emirati Gen Ys would need to develop strong work skills to effectively participate in the private sector job market.

5   CONCLUSION AND RECOMMENDATIONS

In the interviews, respondents were asked for strategies that UAE employers could adopt to recruit and retain Gen Y workers. The main themes from the suggestions indicated that the extrinsic motivator is a factor in both recruitment and retention but the intrinsic motivator seems to gain importance in retention. Hence, this study offers the following recommendations:

- *offer competitive salaries and benefits* so that future/current employees would feel financially secure hence enabling them to fulfill their most important life priority of seeking stability and meeting their need for extrinsic work motivators.
- *offer professional training programs* so that Gen Y employees would feel that they are learning new skills and benefiting from working in the company. They may also regard their important life goal of seeking stability as achievable when they feel that the organization is investing in their career development that enhances their employability.
- *allow creative space and less direct supervision* so that Gen Y employees would have opportunities to bear greater responsibilities and prove themselves. This would fulfill their need for interesting and challenging work that provides intrinsic satisfaction.

With a small purposive sample, this study had presented a limited picture of the unique labor market challenges in the UAE that is not claimed to be statistically generalizable to wider populations. Hence, avenues for future research may include the following: use a larger and more varied sample that includes other occupational types which would capture a more representative Gen Y cohort. Also, as more Emirati females enter the country's workforce, a comparative study on motivators of male and female Emirati Gen Y could reveal different patterns in work preferences that could inform better managerial practices in the UAE.

ABSTRACT
The transitional process which lasted for twenty years in Central and Southeast European countries was full of challenges. An effective model for globally oriented development would pursue an export oriented economy, based on knowledge and continuity in improvement of quality of life for citizens and oriented around effective competition. Today, in more and more open and integrated world economy, the problem of the competitiveness undoubtedly occupies central position. Actually, it emerged that more and more intensive competition equally threats to the survival, of both, companies that are not able to transform itself, to be innovative, productive and able to respond to the presses from the environment and whole economy. The fact that problem of competitiveness according to its importance has "over-national" character we can see in example of adoption of so called Lisbon agenda, what presents certain reaction of The European Union (EU) to recognized lagging behind USA and other fast-developing countries from Asia. It adopted in European council in Lisbon 2000 in order that "EU by 2010 become most competitive and dynamic economy in the world, based on knowledge and able for sustained economic improvement with bigger number and with quality work positions and higher social cohesion"and "Europe 2020". In this paper, we start from key knowledge that level of national competitiveness also reflects level of competencies of some country to enable its population to improve their prosperity, what means adequate balance between accomplishments of micro and macro-competitiveness.

Keywords: Competitiveness, Factors of Competition, Stage of Development, Transition

1 INTRODUCTION

The process of transition that was present for almost twenty years in Central and Southeastern Europe countries represented the aim full of challenges. If we place behind so called "privatization fury" especially in its first phase, the transition has been observed as the evolutionary and one-dimension process with clear view on starting and ending points as well

as on trajectory. Therefore, transitional process was mostly executed on the basis of fast and consistent changes with the principle of so -called "Washington consensus"[1]. However, it becomes obvious very quickly that formal change, for example, concerning the law about ownership arrangement or ownership rights, did not signify rooted changes in the practice. Hence, it could be argued that the creation of the appropriated institutions for market is very slow and difficult process. Therefore, the entire achievement, if we can talk about positive progress, can be attained decades and not in years. In that sense it comes true that it was not enough only to "give up" communism, although, objectively observed, process failed to provide desired level of social development for all citizens. Hence, the need for complete transformation of economy in countries of transition, into one efficient, more adequate to market worlds, is still considered as an imperative. That would, especially if we take into account causes, bases and characters of current global financial crisis, mean also "giving up" already mentioned principle of "Washington consensus", what is radical opponent characterized as final breakdown of neo- liberalism. Shortly, this is oriented to an economy that would be directed to export and based on knowledge, followed by continual efforts related to increment of total quality of life and this is, after all, reduced to demand for rise of competitiveness level of certain national economies.

In this paper, we start from key knowledge that level of national competitiveness also reflects level of competencies of some country to enable its population to improve their prosperity, what means adequate balance between accomplishments of micro and macro-competitiveness. In that sense, starting hypothesis in this paper can be described in a manner that the competitiveness of national economy conditioned by the multiply factors, having in mind that, on the basis of experience of developed countries, one can conclude that the factors based on knowledge and innovativeness, so called non-pricing factors of competitiveness more and more increase level of their importance.

2 THE NEED FOR COMPLETE UNDRESTANDING OF NACIONAL COMPETITIVE ADVANTAGE FOR COUNTRIES IN TRANSITION

Today, in more and more open and integrated world economy, the problem of the competitiveness undoubtedly occupies central position. Actually, it emerged that more and more intensive competition equally threats to the survival, of both, companies that are not able to transform itself, to be innovative, productive and able to respond to the presses from the environment and whole economy.

The development strategy of modern countries and whole regions are presented by the level of competitive advatages. Actually, for hundred years the economists tried to understand the richeness of the country. Adam Smith considered that improvement and work share drive to considerable improvement of the productivity. Neo-classical economists of the 20th century underlined the importance of the investment in capital and infrastructure. However, many countries, even that have been investing in infrastructure did not register the growth. It was shown that investment in physical capital is not sufficient for economical development. The economist analyzed other mechanisms: education and training (human capital, called by modern economist), technological improvement (implemented or created by the country), innovation, entrepreneurship behaviour, macro-economical stability, good state

---

[1] The model has been developed by J. Williamson from the Institute for international economy from Washington. Some economists marked it as a manifest of "market fundamentalism", saying that this model is supported neo-liberal economic school of opinions and it primarily was indented to be model of development of countries from Latin America.

administration, role of law, transparent institution that are functioning good, lack of corruption, market orientation, responsible government, sophisticated countries, condition of demand, the size of the market, etc.

Question of state competitiveness especially gets attention in the conditions of full globalization that characterize modern business flows what represents rude reality which faced all transition countries, with more or less success. Actually, the globalization as more and more present and intensive process of innovations that reaches to the borders of imaginable technologic development have as a consequence important change of rules on the international market. This underlines the need for rooted changes in business orientation of firms, so "the fight" for preserving existing market and customers becomes more and more aggressive and reckless. These aspects, according to brief findings by Hammer, relating to pre-globalization period, are consisted of (see more; Hammer and Champy, 1994, p. 11):

- Competition become (is becoming) more harsh,
- Various forms of competition are emerging,
- It is evident the occurrence of competition in the framework of niche where similar goods on different markets have been sold on the completely different competition bases,
- Performances that determine most competitive participants on the market quickly become imperative and standards for other participants,
- Initiators companies (start-up companies) no longer are in competition according to the rules but they are able to write quite "new" rules of the game,
- All new technologies change the nature of competition in the way that companies do not expect.

Therefore, the conclusion is that advantages over competition and possible occupying of leading position in certain countries in particular industrial branches or their segments, are hardly and harder highlighted, but experience shows that, by the rule, these aspects last long. Also, practical experiences show that leading positions in international competition often were accomplished only in several branches or companies that succeed to develop such properties.

3 FACTOR OF COMPETITIVNESS, COMPARATIVE AND COMPETITIVE ADVANTAGE OF NATIONAL ECONOMY

Understanding the term and essence of competitiveness concept actually means understanding of essence of prosperity of one country. Better said, this is ability of certain national economy to succeed on the international market what, at the end, should result in better living standard for everybody. Actually, it has been shown that the level of competitiveness of national economy depends on different factors. The same aspects are also related to company level, followed by favorable business environment that triggers introduction of new products and processes and investments. In that sense, we can speak today about so called information economy and the need of giving up paradigmatic base of mass economy. Actually, modern economy represents coexistence of two different kinds of economies: **a)** mass economy and **b)** information economy. Mass economy accepted as a key principle the "volume economy" and was based on two fundamental determinants: a) in production of volume economy and mass exploitation of energetic ingredient such are oil, coal, gas etc; b) mass consumption of material goods and accumulation of material wealth (real assets, capital, luxurious good, etc) for the difference of this.

Contrary, economy of knowledge or information economy is based on the principle of "economy of diversity" with usage of quite less energy, raw materials and labor but accomplishes incomparable better results in economic sense thanks to used additional knowledge, intellectual capital, namely information about production. New quality of products is reflected in entire range of properties such are: design, usability and functionality, duration, products are "more intelligent", spend less energy etc. Looking at whole, difference is reflected between "mass" and "informatics" that is produced in economy, because what today makes additional value is a new quality that emerges with applications of knowledge and information. "Economy of information is fundamentally different from economy of "things" says professor V. Milićević and further states that "traditional companies must change their way of business if they want to stay competitive in new contexts (see more; V. Milićević, 2002, p. 11). These new "rules of the game" that are emphasized by author demand velocity, flexibility and innovativeness, namely, it is focused on "adaptive ability" i.e. competence to innovate, constant learning and changes of productive sense.

Today, in more and more complex environment, companies compete on the basis of knowledge and, on that basis, they acquire key competitive advantage, what objectively induces situation in transition countries more complex. Revised Lisbon strategy[2] is in conditions when it was already obvious that its aim would not be accomplished. In fact, this focus of attention was moved toward the questions that are emphasized here and demand is reflected in a following manner: to ensure knowledge and innovations what could increase and improve investments into researches and development, trigger innovations ICT and sustainable use of resources etc. Hence, through the prism of questions that are considered in this paper, we can almost certainly say that key factors that placed themselves into spotlight are those of non-pricing nature. The contexts that complement the picture about the need of more complete study and integration of "knowledge management" into nowadays businesses are the following[3]:

- "Faster[4], better, cheaper "are key demands in business environment these days; today markets become more and more or almost perfectly competitive and velocity of innovation emerging are more visible (so called innovation leads economies).
- More and more stronger pressure of competition reduces the number of those, i.e. labor, that retain precious knowledge.
- It is evident the improvement of number and varieties of technological and technical innovations what causes giving up of "old" and needs for new occupations.
- Length of time interval dedicated to the experience and knowledge adoption is shortened significantly and decisions must be given immediately; early pensioning and rise of labor mobility lead to faster lost of acquired experience and knowledge.
- The question, any longer, is not if the crisis will come but when it will come; hence the companies often are enforced to go out of the area of primary activity besides that necessary and frequent changes in business strategy, by the rule, result in the loss of knowledge in the area where the company was oriented.

---

[2] Today, when the deadline expired, we obviously see that the accomplishments of mentioned strategic aims are still far from planned ones.

[3] "Knowledge management" can be defined as a systematical and organized effort to enable knowledge used in order to improve all business performances of the company.

[4] "In the future, we will have only two kinds of companies-fast and dead". D. Vice (Northern Telecom).

- Most of jobs today is based on so called "soft" factors and company becomes "producer" of information; products and services are more and more complex, encompassed with important information component which is mostly found in prices for products and services.
- Competition race is additionally complicated with the change of "consumer patterns" on one side, while, on the other side, shortage of energy, more and more present poverty are very visible.

For more comprehensive understanding of the problem, namely of the importance of difference among comparative and competitive advantage we consider stances by two authors M. Ferbenks and S. Lindsay[5], that, when we talk about developing countries, found that the reason of those countries stagnation and lagging behind developed countries lies in the fact that the traditional way of competition (see more, Ferbenks and Lindsay, 2003, pp. 25–45). Mentioned authors recommend that existing patterns of market competition must be abolished if these countries wish to use their huge and hidden possibilities. Previous success in developing countries mostly was based on some combination of reach natural resources or other domestic resources, government aid, cheap working force or some other inherited advantage, that we mostly mark as a comparative[6]. However, business in contemporary context shows that in time comparative advantages that certain countries have, are no longer enough to achieve and maintenance high living standard. Besides that, efforts in transformation of comparative advantages, that is easy to support, into competitive fail and it can be seen in a list of global competitiveness (WEF), where many countries rich with natural resources ranked near the bottom. In this sense, previously mentioned key properties that are related to differences between comparative and competitive advantages can be defined in a following way:

- Comparative advantages are, basically inherited[7] i.e. they derive from the availability of natural, namely production factors of a country, inherited economic structures etc, so we can say that they are by their character, static and can be changed only in longer time interval.
- For the difference from previous, competition advantages are dynamic, easy for transformation unlike comparative ones and we can also say that one can influence on these advantages by various state strategies such as: improvement of innovations and technical-technological progress of industrial strategies, by business prone context and taxation policy, improvement of entrepreneurship, management development, income policy and others.
- Competitive advantages are planned and it is necessary and very important role of a state in creation of competitive advantage (so-called "visible hand" of the state).

---

5 "Oranje mora; podsticanje skrivenih izvora rasta u zemljama u ravoju"; Translation

6 For example, comparative advantages of Columbia are reach soil, cheal land and cheap working force and, nevertheless, it is second largest exporter of flowers. Exporter number one is Holland that has a little comparative advantages, but Holland obviously has well developed techniques of research and development, sophisticated technology of production and efficient and fast paths for flowers distribution, big local demands etc. Therefore, Columbia has comparative advantages but Holland has competitive advantage, (Ferbenks and Lindsay, 2003, p. 38).

7 Natural contexts lose their importance and it can be proved with one sentence by P. Drucker : "Base resources in economy now are not the capital, natural resources nor working force…this is and will be knowledge" ; (Post capitalist Society)

We also have two constituents of one same process so that comparative advantages can represent good base and support competition and, if well composed, these other advantages can be derived from them.

4 REVIEW OF ACCOMPLISHED LEVEL OF COMPETITIVNESS IN MONTENEGRO COMPARING DEVELOPPED COUNTRIES

Competitiveness is not now limited only to these with prestigious inheritance. "Nations chose prosperity if create such politics, laws and institutions that support the increase of productivity" says M.E. Porter[8]. Global economy enters in new period of acceleration as a result of faster and faster development and penetration of information communication technologies (ICT). World economic forum (WEF) has been studying the competitiveness of the countries for more than three decades. WFI defines national competitiveness as a collection of indicators, institutions and factors which determines productivity levels of one state and establishes feasible current and middle-term level of economic prosperity[9]. Global report about competitiveness examines parameters of economies in order to analyze and direct economic development for long time frameworks[10].

Table 1 presents classification of certain countries by particular phases:

---

[8] The Competitive Advantage of Nations (M. Porter, guru of strategic management and professor in Harvard Business School, although sometimes he is called world "management academic". His book "Competitive strategy" written in 1980 had 53 editions and is translated into 17 languages. General conclusion is that this book had changed the approach to executive management to it businesses and industries and still is considered as The Bible of all strategically – oriented managers. After ten years he wrote new "big" book "Competitive nation" where Porter applied his ideas into whole economy.

[9] World Economic Forum, http://www.gcr.weforum.org/, The Global Competitiveness Report, 2009–2010.

[10] Since 1979 WEF has measured competitiveness of group of countries and their companies through the index of global competitiveness (Global Competitiveness Index-GCI). Beside that, World bank 2004 with its own methodology performs researches that are used for ranking of countries by "easiness of business"- Doing Business Report. In second decade, the report of renowned IMD center from Lozano appeared that for the time being comprises 57 countries (IMD World report Competitiveness ranking).

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Countries/economies concerning development level reached 2010-2011 (Global Competitiveness Report; The World Economic Forum)

PHASE 1 Economies leaded by factors (38 Countries)	TRANZITION From Phase 1 into Phase 2 (17 countries)	PHASE 2 Economies based on investment (33 countries)	TRANZITION From Phase 2 into Phase 3 (21 countries)	PHASE 3 Economies based on innovation (35 countries)

For more comprehensive insight into state in relation to accomplished level of competitiveness in the region, we give comparison of accomplished level of competitiveness for Montenegro compared to other countries in the refion, table 5.

Table 5:   Comparison of competitivness rank; Montenegro compared to other countries in the region for 2012-2013

Zemlja/Godina	GCI 2009-2010 (133)	GCI 2010-2011 (139)	GCI 2011-2012 (142)	GCI 2012 -2013 (144)
Slovenia	37	45	57	56
Montenegro	**62**	**49**	**60**	**72**
Croatia	72	77	76	81
Srbia	93	79	95	95
Bosnia and Hercg.	109	96	100	88
Macedonia	84	88	79	80
Albania	96	102	78	89

Based on data from tables 1; 2; 3; 4; and 5, and corresponding to underlined aim of this study, we may conclude :

- Report for this year (2012) is most comprehensive of this sort and it comprises 144 countries;
- According to this report, Switzerland occupies top of the scale for the fourth year, followed by Sweden which was on the third position last year, Singapore kept position from the last year-second one, Finland went back for one position, USA lost two positions, Germany kept second position, etc.
- Group of „old members"of EU is followed by Sweden , then Finland, Danmark, Holland etc.; while Estonia from the 11th position, this year arrived on 12th position (as the best renked country in transition that entered EU), Slovenia is on the 13th position, Polland on 14th position and on the bottom of the rank we observe Romania and Bulgeria.

- Estonia (34th position), leading country among transition countries, advanced for two position, Czech felt down from 38st to 39th place, Hungury felt for 12 positions, etc.
- Montenegro felt down and from 60th position felt to the 72nd position in 2012; while best ranked country from ex Yugoslavia, Slovenia, is on 56th place (it increases from last year its position for one place), the worst ranked country is Bosnia and Herzegovina on the 88th position and Serbia on 95th position.
- Montenegro based on „pillars of competitiveness"achieved best note concerning financial market sophistication (40), then institution (44), then higher education and development (56) while the lowest note relates the market size (130).
- Comparing to countries that almost join EU or are candidates (Croatia, Iceland, Macedonia, Serbia, Turkey), Montenegro has after Iceland best note of 4, 39.
- Concerning reached developing phase, countries from this region are differently ranked; **a)** from transition countries in group of countries lead by innovations we have Slovenia, Slovakia, Czech Republic together with USA, Japan, Sweden, Germany and others most developed countries; **b)** in group of countries crossing transition line from "phase 2" into "phase 3" there is Estonia, Hungary, Lithuania, Croatia, Poland, Russia but also Turkey and others; **c)** in group of economies based on investments there is Montenegro, Bulgaria, Ukraine, Albania, Bosnia and Herzogovina, Serbia, Macedonia and others.

5   CONCLUSION

For more comprehensive understanding of purpose of tracing and making of reports about the competitiveness we start from the fact that numerous researches obviously prove that competitive atmosphere in the future, taking as a unit, shapes the following key trends that have a character of discontinuity in relation to the present; a) globalization that enforces the need of competitive advantage creation on the global level; b) privatization; c) unstable character of almost all the industries; d) convergence of various technologies; e) non-determinacy of industrial borders; f) business based on standards; g) reduction of number of mediators; h) sustainable development; i) ecological sensitiveness.

When talking about transition countries, especially those from "domestic" environment, and in the function of necessary shift in relation to different understanding of competitiveness, it is important to know the following; a) the transition from industrial into information era, b) that companies more and more sell information, knowledge, "smart" products and services, what have as a consequence changes of organizational structure and transactions in and among companies; c) that the globalization of the business has a consequence in form of changes inside the process of international work division process in a way that dominance from industrial is being taken over from "nations oriented to the knowledge", while physical, namely work intensive activities "export" to less developed countries, most often in transition countries.

BASIC COMPARATIVE MACROECONOMIC ANALYSIS USING DIFFERENTIAL GEOMETRY APPROACH[1]

Ladislav Lukas

University of West Bohemia, Faculty of Economics, Deptartment of Economic and Quantitative Methods Pilsen, Czech Republik
lukasl@kem.zcu.cz

ABSTRACT
Paper presents a comparative macroeconomic analysis based upon GDP, inflation and stock exchange index time series of Visegrad countries within the period 1997Q1 till 2010Q4. Parametric representation of data in 3-D state space enables to tackle the macroeconomic development as a curve. Based upon differential geometry approach, Frenet frames are constructed at selected set of discrete points along the curve. Investigation of frame translations provides both incremental and accumulated curve lengths, whereas frame rotations may generate traces on unit sphere. Numerical results together with corresponding macroeconomic interpretations of these quantities generated are discussed in detail, and computer implementation is presented, too.

Keywords: *GDP, Inflation, Macroeconomic data analysis, Stock exchange index, Time series analysis*

1 INTRODUCTION

Macroeconomic analysis is a very attractive field of research. Sure, there is also a lot of literature and references devoted to the topic and based upon various techniques and methods. Some of them are focused on summarizing data and monitoring facts, other ones concern theoretical modelling and are based upon various theoretical reasoning, e.g. the New Keynesian approach being the most popular recently, see e.g. (Telínová, 2011), and there are also works and studies which try to apply new sights and different methods. Our paper belongs to this third category.

We are concerned with a comparative macroeconomic analysis based upon GDP, inflation and stock exchange index time series of Visegrad countries within the period 1997Q1 till 2010Q4. A particular analysis of an evolution of the monetary policy transmission mechanisms of V4 countries is presented in (Bartóková, 2010).

Reasoning about the length of investigated period was motivated with three intuitive aspects – first, to eliminate prospective transient development of economy after 1989, second, to include period of relative stable and progressive economic development, and third, to involve periods which were impacted by global financial crisis, too. Parametric representation of data in 3-D state space enables to tackle the macroeconomic developments as curves in the state space. We do believe that our non-traditional approach provides new insights to macroeconomic analysis and is able to build new characteristics.

---

2   MACROECONOMIC DATA PROCESSING

We have used the data accumulated and presented in (Telínová, 2004), which had been downloaded from Eurostat, OECD databases and public databases of Stock exchanges of the V4 countries, i.e. Czech republic, Hungary, Poland and Slovak republic, in abbreviation CZ, HU, PL, and SK, respectively. As we have focused our analysis upon three important macroeconomic quantities – GDP, inflation and national stock exchange index, so in total, we have got four sets of three time series with 52 entries each.

Let $_k x$ denotes a 3-D vector time series for k-th country, $k=1,2,3,4$, where the prefix k values are induced by lexicographical ordering of countries, i.e. $k=1 \sim$ CZ, $k=2 \sim$ HU, $k=3 \sim$ PL, $k=4 \sim$ SK. Each $_k x$ has three 1-D time series components denoted $_k x_n$, $n =1,2,3$, where $n=1 \sim$ stock exchange index, $n=2 \sim$ GDP, $n=3 \sim$ inflation rate. Since each of them has 52 entries, we need even more subtle notation to identify any particular entry.

Let $_k x_{n,m}$, $m =1,2,\ldots,52$ denote individual entries. However, for some purposes we need to identify a particulatr year and quarter, too. Hence, we adopt the following notation $_k x_{n,m(i,j)}$, where the index function is $m(i,j)=4(i-1)+j$, where $i=1,2,..,13$ denotes sequence of years 1997, 1998,.., 2010, and $j=1,2,3,4$ stands for quarters of year Q1,..,Q4.

Raw data downloaded for V4 countries are denoted $_k y$ and their entries $_k y_{n,m}$, $m=1,2,\ldots,52$, respectively. However, such data are given in their natural units, which are rather different in their numerical values. In order to make them suitable for our analysis based on differential geometry the raw data $_k y$ have been scaled and transfered into $_k x$ by procedure given by (1) and (2).

$$_k r_n = \sum_{j=1}^{4} {_k y_{n,m(9,j)}} , \quad k=1,2,3,4, \text{ and } n=1,2,3,$$

$$(1)$$

where index function $m(9,j)$, $j =1,2,3,4$, $i=9$, gives values $\{33,34,35,36\}$.

Quantities $_k r_n$ represent the scaling factors and give averaged values for corresponding V4 countries macroeconomic time series. In a role of reference year we have selected the year 2005, hence $i=9$, since we simply accepted this year as a break-year between 'stable development' and period accused by global financial crisis. Of course, it could be a matter of discussion, but the scaling procedure is rather flexible and could be applied for any other selected basis year, a quarter, or another period averaged.

Vector time series $_k x$ with their components are given by (2), where $^\text{T}$ stands for transposition.

$$_k x_{n,m,} = {_k y_{n,m}} /{_k r_n}, \quad m=1,2,\ldots,52, \text{ and } k=1,2,3,4, \ n=1,2,3,$$
$$_k x = \left({_k x_{1,m}}, \ {_k x_{2,m}}, \ {_k x_{3,m}} \right)^\text{T}.$$

$$(2)$$

3   DIFFERENTIAL GEOMETRY APPROACH AND RESULTS

We refer (Chern, Chen and Lam) and (Gray, Abbena and Salamon, 2006) for more details on differential geometry as being short and individual reference selection only. In general, differential geometry deals with curves, surfaces or more general manifolds in analytic way. Hence in order to get a curve, our first step is to define interpolants of $_k x$. First, we choose piecewise linear interpolation, and the second one is cubic spline interpolation, which both provide continuous functions.

Challenges of the Modern World - Contemporary Economy and Globalization

Let $_kp(t)$, $_kq(t)$ denote piecewise linear and cubic spline interpolants of vector time series $_kx$ defined on interval [1,52] given by (3a) and (3b), respectively. Let d be a time series with m entries, then $s_1(t;d)$ and $s_3(t;d)$ stand for scalar piecewise linear and cubic spline interpolants, respectively, defined on interval [1,m], and built by well-known procedures.

$$_kp(t) = (s_1(t;_kx_{1,m}),\ s_1(t;_kx_{2,m}),\ s_1(t;_kx_{3,m}))^{\mathrm{T}},$$

(3a)

$$_kq(t) = (s_3(t;_kx_{1,m}),\ s_3(t;_kx_{2,m}),\ s_3(t;_kx_{3,m}))^{\mathrm{T}}.$$

(3b)

.

3.1 First result

On upper parts of Figures 1-4 we present curves in 3-D space, on the left $_kp(t)$, on the right $_kq(t)$, representing pathes of macroeconomic development of V4 countries (CZ, HU, PL, and SK) using data $_kx$. The points on the curves are located at the following quarters 1997Q1, 1999Q1, 2001Q1, 2003Q1, 2005Q1, 2007Q1, 2009Q1 and 2010Q4, thus giving better insight to movement along the whole time span [1997Q1,2010Q4]. We may conclude that there is not a great difference between piecewise linear and cubic spline interpolants in all V4 countries, at the first sight.

3.2 Second result

Figures 5 and 6 present plots of all four curves in 3-D space. The piecewise linear interpolants $_kp(t)$, $k=1,2,3,4$ of macroeconomic development of V4 countries is given on the Fig. 5, whereas the Fig. 6 brings a bunch of $_kq(t)$. Since we have selected the averaged macroeconomic data of the year 2005 as a reference ones, we add corresponding points at 2005Q1,Q2,Q3 and Q4 to plotted curves, too. Here, we are already ready to see the differences, and these have also motivated us to further analysis, which is presented as the third result. Anyway, a straight-sight and common "U-shape" development of all V4 countries is rather interesting, too. The paper limited space prevent us to give more graphical outputs under various rotations angles.

All computations were performed by sw Mathematica 7.0, WolframResearch Inc., and outputs were in color.

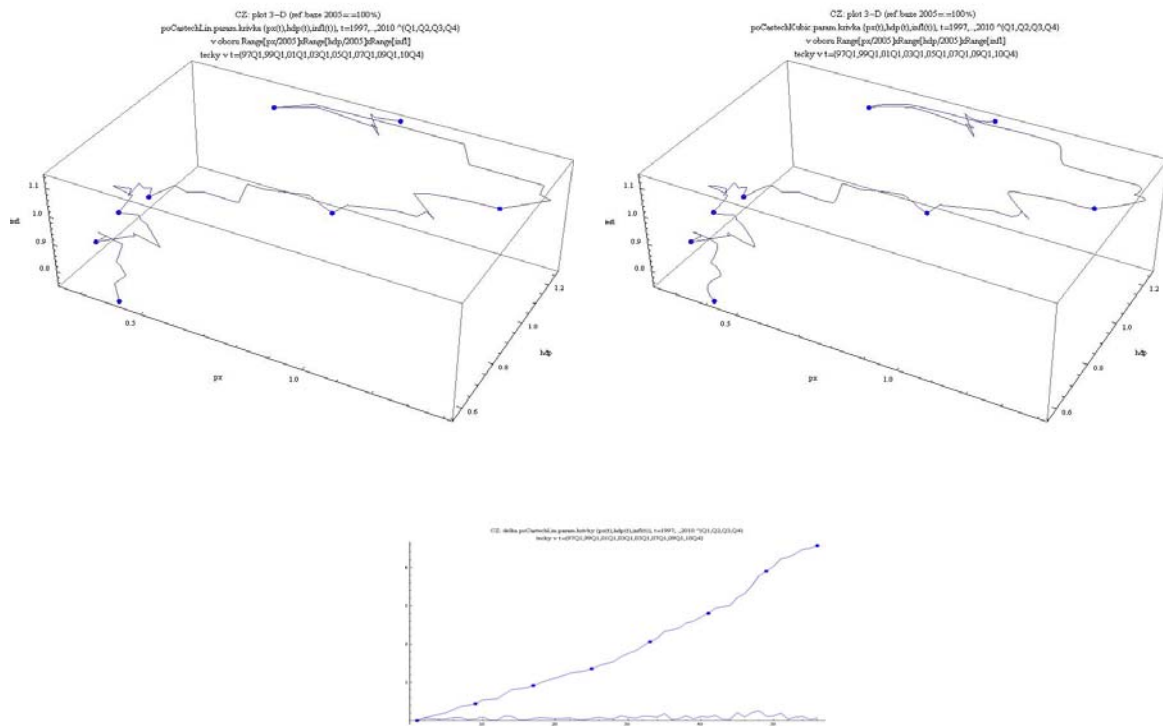
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 1: CZ – piecewise linear $_1p(t)$, cubic spline $_1q(t)$, length of $_1p(t)$
Figure 2: HU – piecewise linear $_2p(t)$, cubic spline $_2q(t)$, length of $_2p(t)$

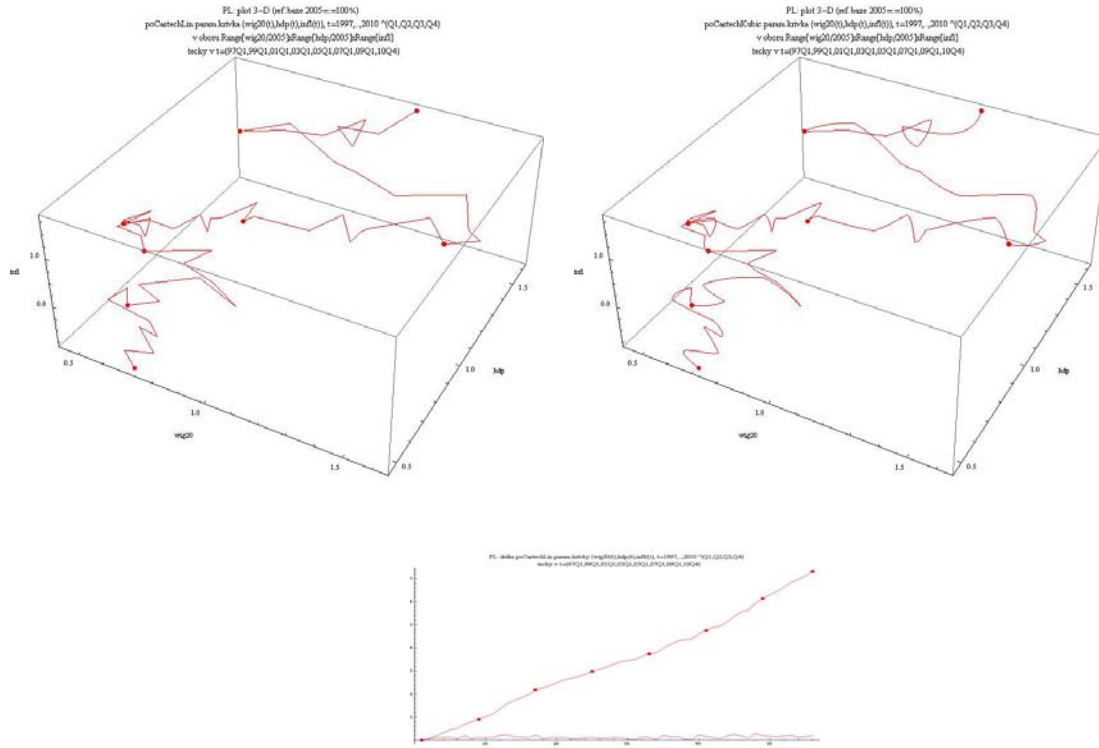
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 3: PL – piecewise linear ₃p(t), cubic spline ₃q(t), length of ₃p(t)
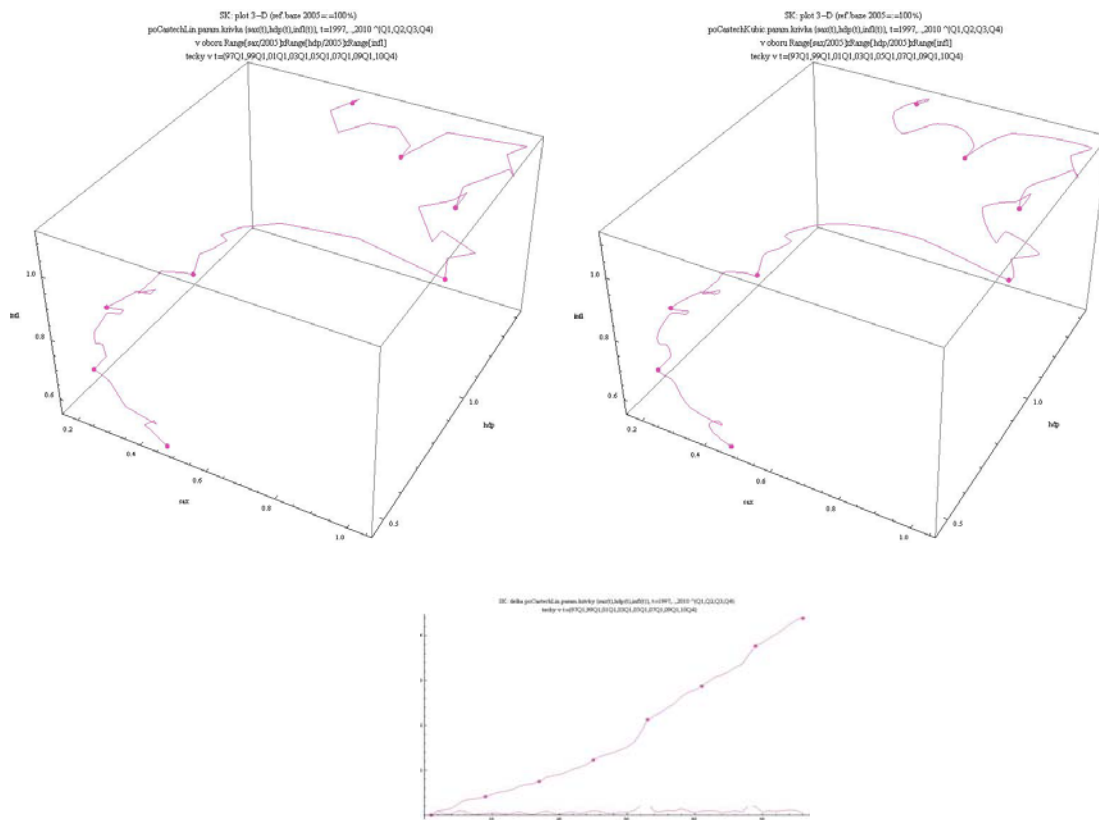

Figure 4: SK – piecewise linear ₄p(t), cubic spline ₄q(t), length of ₄p(t)

530

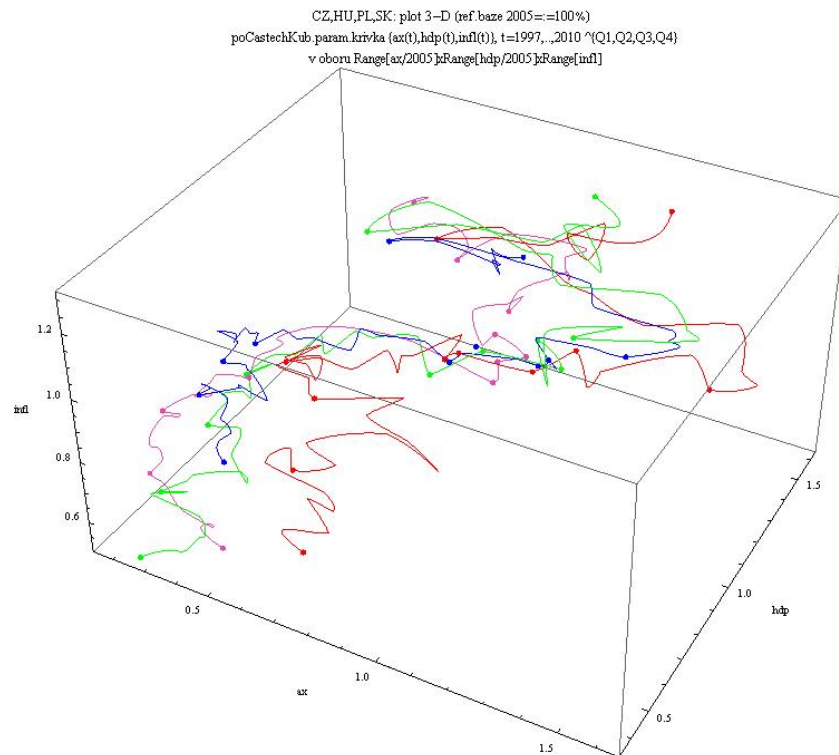
Challenges of the Modern World - Contemporary Economy and Globalization
Figure 5: CZ-HU-PL-SK – {₁p(t), ₂p(t), ₃p(t), ₄p(t)}with 2005 Q1,2,3,4 dots


Figure 6: CZ-HU-PL-SK − {₁q(t), ₂q(t), ₃q(t), ₄q(t)}with 2005 Q1,2,3,4 dots

3.3 Third result

Lower parts of Figures 1-4 present lengths of curves $_k\boldsymbol{p}(t)$, and Fig. 7 shows all lengths of {CZ, HU, PL, SK} macroeconomic development curves $_k\boldsymbol{p}(t)$, k=1,2,3,4. The longest curve belongs to HU, the second one as to the lenght has PL, and finally CZ an SK curves are very similar at all. However, inspecting precisely the global lengths by elevation of the 2010Q4 points we identify the shortest path belongs to SK and the length of CZ curve is a little bit longer. Just above time axis t the length increments between adjacent quarter data are depicted. The total length of $_k\boldsymbol{p}(t)$ is calculated simply by addition of corresponding increments.

Differential geometry introduces moving Frenet frame along a curve and provides definition of curve length in 3-D. Let $\mathbf{z}(t)=(z_1(t),\,z_2(t),\,z_3(t))^T$ be a smooth curve defined over an interval [a,b]. Its length $l(a,b)$ is given by (4).

$$l(a,b) = \int_a^b \|\dot{\mathbf{z}}(t)\|dt\,,\quad \dot{\mathbf{z}}(t)=(\dot{z}_1(t),\,\dot{z}_2(t),\,\dot{z}_3(t))^T\,,\quad \dot{z}_n(t)=\frac{dz_n(t)}{dt}\,,\ n=1,2,3. \tag{4}$$
Figure 7: CZ-HU-PL-SK – lengths of {$_1\boldsymbol{p}(t)$, $_2\boldsymbol{p}(t)$, $_3\boldsymbol{p}(t)$, $_4\boldsymbol{p}(t)$}

4 CONCLUSION

We have analyzed some macroeconomic development curves of V4 countries and their lengths by differential geometry approach. We consider the analysis interesting and promising and further research is ongoing.

ABSTRACT

In the context of the increasing complexity of modern societies, the challenge of programs in education represents a management challenge the multitude of knowledge included directly in the training programs, knowledge related to the local context of each school and, above all, a challenge of construction common by the actors of the school system, a coherent approach in the exploitation of these multiple of the knowledge and knowledge practical for the good of all actors involved in this process. In this regard, we are engaged, since the application of the methodology of «competence approach» in research to two objectives, one hand the realization a diagnosis established across interviews and questionnaire with the aim devalue the degree maturity of the application of competence approach by the actors of educational system in terms of knowledge sharing and knowledge management, the other hand the realization of a knowledge mapping related to trades of the old of teaching methods and identify the risks to lose. These two missions have led to recommendations enabling a better valorization and transfer of know-how of trades' experts in the sector of education.

Keywords: Competence approach, Knowledge capitalization, Knowledge formalization, Knowledge management, Knowledge mapping, Transfer and sharing of knowledge

1 INTRODUCTION

According to Drucker (1993) the management of human resources is a major challenge for organizations that must meet market logic (*short term*) with development logic (*long-term*), by relying on their most important resource: their collaborators and networks of competencies where latters create acquire and disseminate knowledge. Beyond, the development of competences and knowledge requiring for demarches of long-term associating recruitment career, evolution of careers or training, the Resources Departments have focused in recent years on a prospective management of Human Resources accompanying of development of the organization learning Plan (Sellin, 2011). For it, knowledge management is an important tool to support human resources management because it is connected with the ability to create values and to generate competitive advantage (Seitan, 2009). The knowledge management process provides knowledge in a focused, relevant, cost-effective and timely manner for human resources success with the highest level of professional knowledge. Capturing and subsequent dissemination of knowledge at an appropriate time to the individual who needs it with less search cost is the essence of knowledge management (Seitan, 2009). Several steps have been identified in a process of knowledge management: This is the explanation of tacit

knowledge identified as crucial to organization, sharing of knowledge capital rendered explicit to the form of memory, of the appropriation and of exploitation of a part of such knowledge by the actors of the organization (Nonaka and Takeuchi, 1995) (see Figure 1).
Figure 1: Four modes of creation and knowledge transfer (Nonaka and Takeuchi, 1995)

The primary objective of knowledge management is to preserve the heritage strategic of knowledge, developed over its existence but which remains little explicit and remains tacit at the actors of trades. For this purpose, there are a certain number of methods that are today available to formalize this strategic knowledge heritage. Our aim in this paper is to study one of these methods: knowledge mapping.

In this paper, we are interested, on one hand, on a mapping domains know how of educational carried out by our team in the Normal Superior School of Technological Educational in Oran (*ENSET of Oran - Algeria*) in collaboration with the Directorate of Education of wilaya of Oran in Algeria and on the other hand a diagnostic study by interview and questionnaire to devalue the maturity degree of application competence approach by actors in the educational system and for knowledge sharing.

2   BACKGROUNDS
This section consists in two parts: **knowledge mapping and competency approach.**

2.1   Knowledge Mapping (Knowledge Cartography)
The knowledge cartographed can be acquired, to monitor, to create, to share and finally to capitalize and transfer. Knowledge mapping is a Knowledge Management System described by Aubertin et al. (2007) as «an identification of the heritage of knowledge» that allows «organizations willing to manage their heritage of knowledge to make a detailed useful analysis to their strategy, what is the knowledge they must perpetuate, develop, abandon etc.. Mapping has become a tool decision aid». Effectively the primary finality of these cartographies is the identification of knowledge. Knowledge mapping allows visualizing the knowledge domains of organization within a comprehensible framework (Speel et al., 1999).

In this sense these cartographies enrol in the first steps specific to the valorisation of organizations knowledge: identify the heritage of knowledge and any particularly the knowledge domains upon which the Knowledge Management approach is a priority to obtain

a sustainable competitive advantage (Dudezert, 2008). Moreover, the field of the knowledge mapping presents itself as a research area into emerging where work is identified through the literature (Ermine et al., 2006). There are various approaches to organizing the cognitive resources of an enterprise or agency. We can distinguish however two types of approaches cartographic the first focuses on the classification by process and the classification by domains which organizes the knowledge around the subjects, objects or purposes of common interest which are identified in the organization. In the classification by process (Ermine et al., 2006) classify the method GAMETH (Grundstein, 2003) or the method of (Tseng and Huang, 2005). These approaches are especially developed in activities of design of products. In particular, they have been tested with organizations in France like PSA Peugeot Citroën (Saad et al., 2003) or the SNCF. Subsequently, the classification said by «domains» that start from the analysis of representations of the business on its heritage of knowledge (reference documents and / or testimony of trades actors) and them regroups of the knowledge through domains of expertise and in visualizing them form of map in a conventional and static manner. We distinguish, through our bibliographic research, three approaches in this classification, the knowledge tree method (Authier et Levy, 1992), the method of (Pomian et Roche, 2002) and the method M3C (Tounkara et al., 2005). The latter proposes in parallel to formalize the strategy and to identify strategic competencies and others by achieving a criticality analysis of knowledge domains with the trades. The evaluation of the latter is elaborated on the basis of a library of the criteria or a grid CFK (*Critical Knowledge Factor*) elaborated by the Knowledge Management Club and tested various contexts. The alignment strategic allows cross the two points of view and of identify strategic actions to improve the performance of the organization.

These latest approaches have given rise to numerous applications in enterprises at various levels, through this article, we will fly over five:
Aubertin et al. (2007) have proposed three different approaches for the realization of a mapping by functional classification, which respectively use the organization chart, a classification by process and a classification by domains. Matta et al. (2003) have conducted a project for mapping the knowledge and the technical competence critical within the direction of innovation and research of the INRS. Ermine J. L. (2006) has completed a project in Chronopost International (observatory of trades) which relies on two objectives, firstly, identify the know-how of trades affected by the strategy and, secondly, consider the evolution of critical skills in the future. For this, Ermine JL has elaborated the project in several phases: the first phase is the realization of a mapping business actions strategy by the graphical model approach «a map of knowledge domains» The second phase consists of an analysis of the know-how of trades critical through the use of criticality criteria taking into account the specifics of Chronopost International. Chabot J. L. (2006) has proposed a complete mapping of the different areas of expertise to the company HYDRO-Quebec. However, the primary objective was to identify on the one hand, the areas of knowledge, and on the other hand, to do a study to bring out the critical knowledge domains with the help of the French Society Kadrant. Barroso et al. (2005) have conducted a project in the center of radio pharmacy in Sao Paulo (IPEN). Since the nuclear domain suffers from problems related to this considerable accumulation of the knowledge: such as the risk of non-preservation, the difficulty of transfer, etc... They have developed the project in several steps by using a process approach. The process was described in a conventional manner in the form of flow diagrams linking activities in process. This article positions the knowledge mapping from a perspective of knowledge transfer to introducing a space for sharing and dynamic creation around knowledge.

2.2   Competency Approach

Whenever the term competency is mentioned, a *«know-how – to act»* process is implied. Because of its global and integrating characteristics, acquiring a competency requires learning in motor, affective and cognitive fields. A competency is a system of conceptual and procedural parts of knowledge organized into operating schemes that help identify a problem-task and its solution through an efficient action within a set of situations (Nguyen et al., 2007) (see Figure 2).
Figure 2: The principle of competency approach

In other words, a competency involves the necessary knowledge and capacities that a given solution requires. As it is possible to evaluate a competency through performance, then a competency is the final stage of a cycle, a period, and determines intermediate and long terms prospects of the learner's development (Scallon, 2004; Tardif, 2006). According to the Minister of Education in Algeria, Establishing a program based on logic that is centered on competencies fits in a set of instructions commissioned by the Ministry of Education. These instructions are based on worldwide research that highlights the importance of the links between learning and context of use, thus helping the learners in making learning meaningful. According to an analysis document published by ELT Algeria (website *created for educators all over the world*) (Louznadji, 2012), competencies have been used in the educational field. Since emphasis is put on the learner's social and personal development, the aim is to make him reinvest his knowledge while performing tasks at school level as well as at social and professional levels. The program has been conceived with the purpose of ensuring sustainable and viable learning.

Although the competency program is a novelty, its objectives are not new. Actually, educationists have always been interested in developing general "know- how" processes and in fixing knowledge acquired in class. This program will allow the Algerian learner to develop his capacity to think and act according to a vision of a world that he will construct day by day.

Through our Bibliographic Research we can highlight the major benefits using practical terms — using a Competency Approach has (1) selection benefits — by defining one candidate as more effective and superior than another thus creating a better fit; (2) provides performance benefits — by clarifying and raising the bar on what is expected; and (3) provides developmental benefits — by setting individual goals that employees can strive to reach that are aligned with the business strategy (Lasnier, 2000).

Challenges of the Modern World - Contemporary Economy and Globalization

In this context, the Algerian school must prepare its students for a society increasingly complex, a labor market increasingly demanding, characterized by international competition. To this, it needs to ensure that every young person acquire the essential skills he needs to be able to continue to learn after that it is to be out to the school, to learn throughout life. Similarly, an overhaul global of the school system is imposed in order to allow the school to be performance, effective and meet the many challenges of our century characterized by globalization of the economy and the amazing of scientific development and technology. Recourse to TIC as part of school learning, all the more that the tool computer is now part, and parcel of the everyday life of the learner. Criteria of skills and qualifications are, from then, more than ever privileged.

3   APPROACH PROPOSED

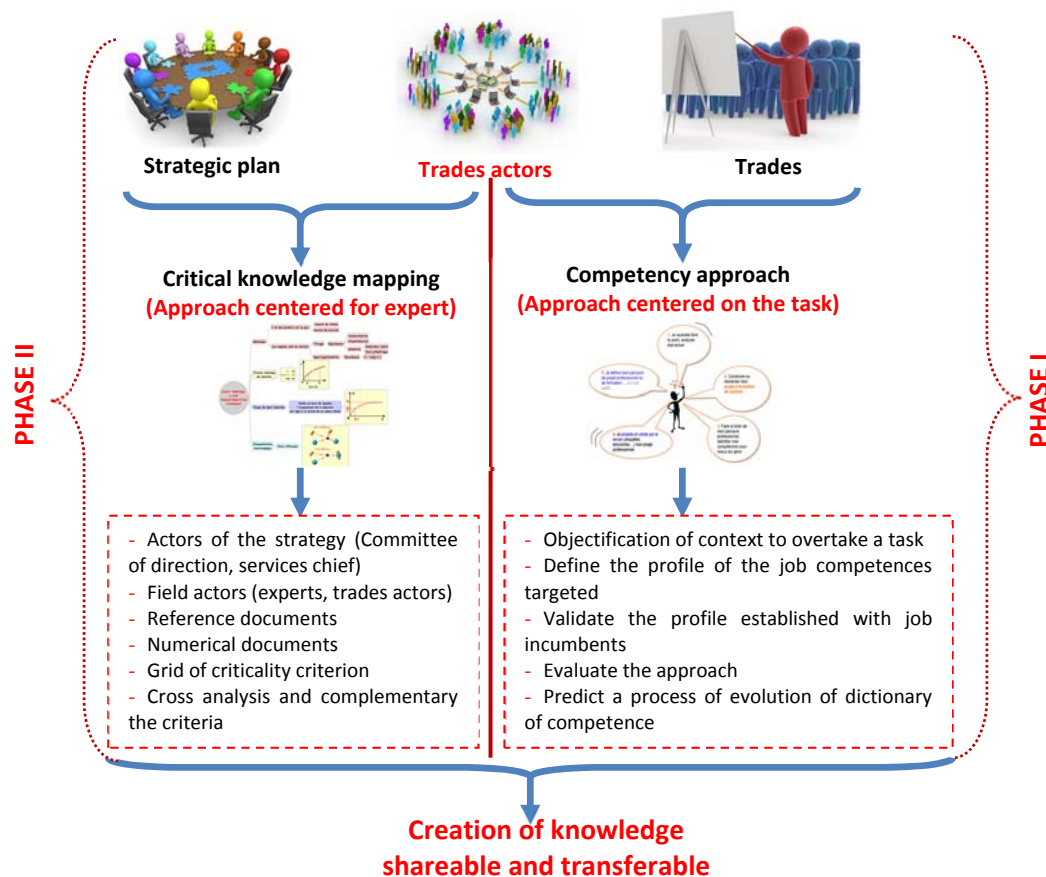
The objective of our approach, illustrated in Figure 3, is twofold: on one hand, the construction of the map of the Directorate for Education and evaluation of different domains of know-how critical trades teaching in be basing on a work of extracting of knowledge from experts (*teachers, educational advisers, inspectors, etc.*). For this construction, we have used two methods of modeling and knowledge representation, the method GAMETH (Grundstein, 2000, 2003) and MASK II (Aubertin et al., 2007; Ermine, 2006). Other hand, implant a competency approach which emphasizes on the use of tools allowing organization and evaluation / regulation of learning activities.


Figure 3: General architecture of the proposed approach

Challenges of the Modern World - Contemporary Economy and Globalization

3.1   Competency approach (PHASE I)

Since a few years, enterprises and professional training have used the competency approach because she aims at the acquisition of knowledge and operationalization of competence specific to a practice. In contrast, education and continuing education, competency approach is gaining ground with increased of the offers training opened, e-learning, training and throughout life e-portfolios. Thus, the competency approach lets you create the link between knowledge, to mobilize its knowledge and resources for realize a task, solve a problem, engage in a project. It does come not only «*apply or return*» as it is often the case in the traditional system, but of a substantive work that allows to give meaning to knowledge acquis in developing its competencies professional.

In the literature, competency revolves around three different approaches (*behavioral approach, strategic approach and trades approach*). In this context, we are interested, in the phase II of our study see Figure 3, the trades approach. The major contribution of the trades approach is to introduce the concepts of expected result and achievement criteria. The approach has as objective aims to implant a competency approach trades in secondary schools of the wilaya of Oran in Algeria to facilitate the acquisition and valorization of competencies and finally maximize the transfer and sharing of knowledge. For it, we explore the organization of this implantation as follows:

1. Determine the objectives referred (**Develop pedagogical competency**)
2. Select the posts for build of the competency profiles (**Teachers of schools secondary**)
3. Define, in collaboration with the Directorate of Education, the competency profile of the target positions (**teachers**)
4. Validate the genre profile established with the incumbents of posts (**teachers**)
5. Define the competency profile of **teachers**
6. Evaluate the approach

According to Bédard et al. (2005), this risk approach, in certain situations, not to make stand out the sharp expertise by a group of employees or a lack of expertise in a critical area that would allow cope with the challenges of the future organization. Of more, this approach does not aim prioritize the competencies according to importance for organization. In this sense, knowledge mapping plays a fundamental role in our approach then that it allows enriching the competency profile of teachers in secondary schools.

3.2   Critical knowledge mapping (PHASE I)

The method of knowledge mapping which we have employee during interviews was initially elaborated by a training organization acted upon by the Director of Education in the wilaya of Oran. Through this study, we explore well the manner in which a method of mapping knowledge can contribute to this explicitation in the context of a transfer. We recall, in this step that the realization of the map was based on analysis of references documents (*organizational chart, description of the distributions of activity services, directory of staff activities, plan medium term (training), studies, balance sheet of training, etc.*) and interviews with trades experts (*teachers, educational advisers, inspectors, etc.*) and the responsible of the education sector (see Figure 4).

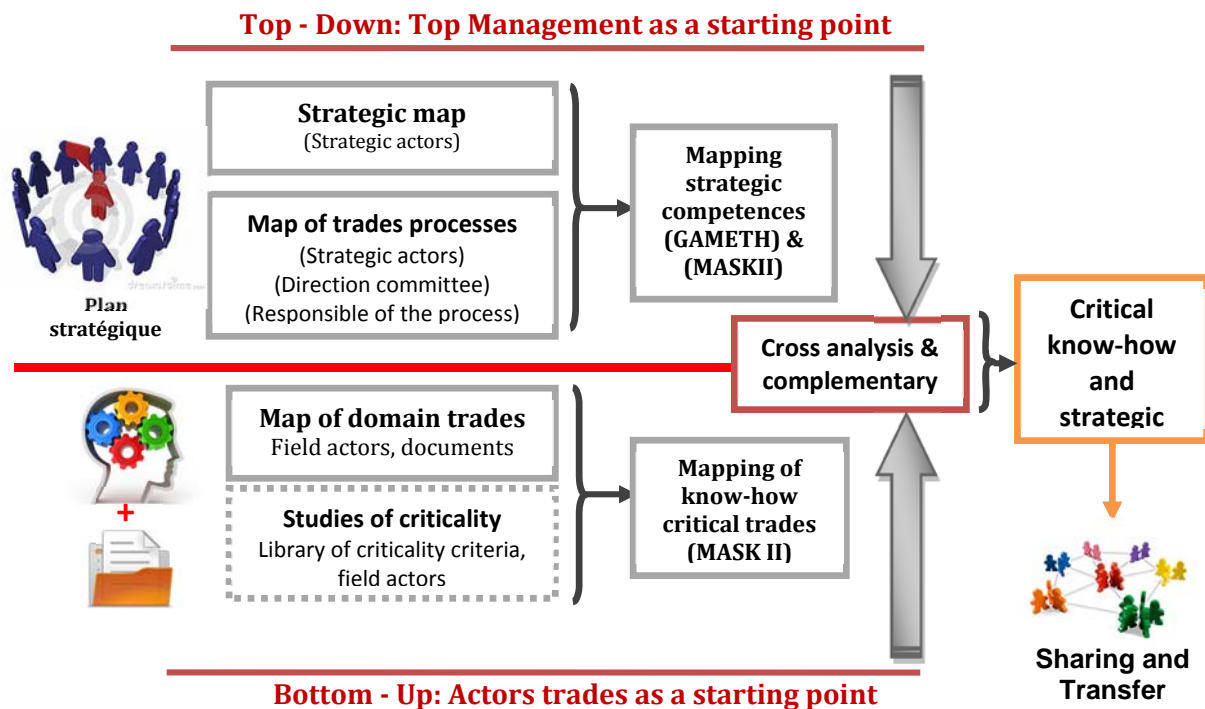
Top - Down: Top Management as a starting point


Figure 4: Process of the construction of knowledge mapping critical

3.1.1 Presentation of the Algerian education system

The Algerian educational system is divided into several levels: preparatory, fundamental (*primary and middle*), secondary and finally professional. In this context, and as we have already pointed out, we are interested in secondary education. The latter has as missions, in addition to continuing the general objectives of fundamental education: to consolidate and deepen the knowledge acquired in the various disciplines, to develop the methods and capabilities of personal work and of teamwork and cultivate the faculties of analysis, synthesis, reasoning, judgment, of communication and assumption of responsibility, to offer diversified route allowing the specialization progressive in the different sectors related the choices and the aptitudes of students, to prepare students for the pursuit of studies to reach higher training. For it, our mapping approach is twofold: firstly, to identify the trades knowledge impacted by strategy of the Ministry of Education. Other hand, think about the evolution of critical competency in the future of the Algerian educational system. In order to, provide a tool for visualization and analysis of knowledge / competency.

3.1.2 Developing a map of the strategy

The strategy map was carried in the first instance to document the strategy of the education system identified during a meeting with executives of the direction. It is then complemented and then validated with a few actors of the strategy (unit directors and / or members of the direction committee.

3.1.3 Developing a map of process

The purpose of this step is to present, in the form the process, the main activities of the Directorate. To develop this type of map, we have used the GAMETH approach, developed by Michel Grundstein in 2003. The latter aims to identify locate and characterize critical

knowledge of an organization. For this, the process map was achieved thanks to documents on the referential of competencies of the direction education. Then, this first version of the map has been validated by the actors of the strategy or responsible of training process.

3.1.4   The spotting and the construction of the critical knowledge mapping

This step consists, from reference documentations and optionally interviews, to bring out knowledge domains by the analyzing successive of training departments and their activities and projects.

The reference documentation necessary includes:
- The quality documents
- The documents on production (*publications, studies, activity reports ...*)
- The strategic documents (*Medium Term Plan, former medium-term plans, syntheses ...*)
- The organizational documents (*articles of association, flowchart, descriptive of the distributions of activity of departments, directory of staff activities ...*)

The previous step has allowed a work of analysis of the background on the activities of the Directorate of Education. One proceeds now to the shaping of this analytical work in the important goal of making it accessible and above all usable. In more, it allows building of an initial version of the mapping validated essentially by the operational managers.

From this map, a study, thought, criticality was realized, taking into account the specificities of SEMEP service and expected project mapping. The criteria presented are organized in 4 families:
1. *Difficulty to capture knowledge,*
2. *Difficulty of usage of the knowledge,*
3. *Rarity of the knowledge,*
4. *Utility of the knowledge.*

Each criterion is designed to be valued. For this we have established an evaluation scale for each criterion, based on the evaluation method developed by the Knowledge Management Club or Critical Knowledge Factors (CKF) (Speel et al., 1999; Balmisse, 2005; Ermine et al., 2006). We recall that critical knowledge is knowledge that has value but is difficult to exploit. In our case it is for each knowledge domain (*from interviews*), to assess the risks and opportunities related to the availability, nature, utility for the SEMEP and accessibility of know-how it covers.

From (Aubertin, 2006; Ermine et al., 2005), the criticality of a knowledge domain is to assign a score from 0 to 4 representing the degree of realization of the criterion of grid analysis for each domain. The criticality analysis, through the grid of criticality criteria is to objectively determine which knowledge domains are most critical for the future of the company and to recommend actions to prevent risks in these domains. The domain is more critical, more the note is strong. More the domain is critical within the meaning the criterion evaluated, higher the note is strong. Each evaluation of criterion rests on a synthesized question. When the respondent not knows the answer, a score of 0 is assigned. This note will not be taking into account during the analysis.

Challenges of the Modern World - Contemporary Economy and Globalization

A complementary analysis was conducted on the basis of combinations from the criterion and / or groups of criteria chosen by relation to the objectives of the study criticality; interest of this analysis is that it allows bringing out some specific for example the niches of expertise current / future domains to enhance the highly sensitive domains, etc. A tool (*of type Excel for example*) was used for the restitution of these results in graphical form, especially the form of radar chart (*Kiviat diagram*). The radar charts compare the values of criticalities of knowledge domains aggregated in multiple data series collected from different interviewed (see Fig 5).
Figure 5: Diagrams for the automatic analysis by Excel tool

The following table shows the advantages and inconveniences of these criticality analysis knowledge domains (see Table 1).

Table 1: Advantages and inconveniences of the automatic analysis

Advantages	Inconveniences

First global vision :
  ▪ **Less effort: « economical»**
  ▪ **A good basis for debate**
  ▪ **A good decision making**
	Does not take into account divergences due, for example, to:
	  ▪ An interpretation of criteria different from one expert to another
	  ▪ The level of expertise of people interviewed
	  ▪ The position and the role of experts (Short/Long term vision, teacher/manager, etc.)

The result is a map of areas of critical knowledge or map of know-how trades / strategic critical (Figure 6).
Figure 6: Critical knowledge mapping of the training direction

4 CONSLUSION

The objective of this article was to focus on few ways that allow the transfer and sharing of knowledge in the workplace (teaching). These means are integrated into a comprehensive strategy for knowledge management, as shown by the model illustrated in Figure 3. In this model, methods of mapping knowledge (GAMETH and MASK II) and competency approach aim to trace of the knowledge crucial and holders these last. This is from this analysis that the direction of education (the Secondary School Teachers) will be able to establish a plan to development and transfer of individual and collective of the knowledge. The results of our work offer many perspectives for further research at the theoretical and practical level. Whence, we cite, the following, succinctly few of these perspectives. The establishment means to the learning (*classroom training, e-learning, enterprise portal, knowledge servers, collaborative spaces, and communities of practice*).

ABSTRACT
On average, dividends have historically been treated less favorably than capital gains by the tax authorities in the world. The double taxation of dividends at the level of individual investors should have created a strong lack of encouragement to pay or to increase dividends by the companies. Taxes may affect the dividend payment decisions by companies which want to maximize market value. It is known that market value of company is determined by expected after cash flows and any differential tax treatment of capital gains relative to dividends might influence investors demand for dividend. As a result taxes might have important effects on personal investment decisions and corporate dividend policy. Recreantly in Croatia income from dividends was not taxable as of 1st January 2005. But from 1st of March 2012 tax on dividend has been implemented by changes in Income Tax Act. Accordingly to changes in Income Tax Act all dividend earned from 1st of January 2001 is taxed with a rate of 12%. While dividends are taxed, capital gains are not taxed at all. This kind of tax disadvantages can influence on preferences for individual investors to buy stocks of dividend paying companies listed on Zagreb stock exchange influencing on decrease of stock prices for dividend paying companies. The aim of this paper is to investigate what influence implementation of dividend taxation had on companies listed on Zagreb stock exchange. Did the number of dividend paying companies or dividend amount decline accordingly to changes in Income tax Act or there were no changes at all. Did the dividend paying companies adjust their dividend supply accordingly to demand of individual investors?

Keywords: Dividend policy, Dividends, Stock market, Taxes

1 INTRODUCTION

The basic rule of valuation of any asset (in this case stock) is that its value is equal to the present value of expected (after tax) cash flows. Fundamental value of company's stock is determinated by discounted expected after tax cash flows. Consequently, any differential tax treatment of dividend related to capital gains might influence investors' after tax returns and affect their demand for dividends. Accordingly, taxes may affect the dividend payment decisions of managers who desire to maximize market, thereby influencing the supply of dividends (Lease, John, Kalay, Loewenstein and Sarig, 2000, p. 51). Also, from the standpoint of a shareholder, under the assumption of rationality, when the tax rate on capital gains is less than the tax rate on dividends, a shareholder should prefer to receive income in the form of capital gains rather than dividends. Investors should prefer low dividend yield

stocks, and faced with investors' dividend aversion; company should avoid paying dividend or at lease reduce dividend payments. If the tax rate on capital gains is greater than the tax rate on dividends, shareholders should prefer to receive income in the form of dividends.

In contrast to the previously mentioned, one of the most important works on dividend policy, Miller and Modigliani (1961) dividend irrelevance theory, showed that in an ideal world characterized by perfect capital markets, rational behaviour and perfect certainty, dividend policy is irrelevant. Shareholders should be indifferent to receiving dividends or receiving capital gains. But we don't live in the perfect world described by Miller and Modigliani. On the contrary, market imperfections as taxes make dividend policy relevant. Inequity in taxation of dividends and capital gains can cause effect called dividend clientele effects. Dividend clientele effects can be defined as a set of investors who are attracted to the stocks of firms that have the dividend policy they prefer, based on their tax or liquidity circumstances (Ogden, Jen and O'Connor, 2003, p. 479). Company can increase the stock price by adopting a dividend policy that appeals to investors whose preferences are not met by other companies. Many studies examine the issue of dividend clientele but there is no academic consensus about dividend clientele. There are empirical studies which support dividend clientele theory, and empirical studies that provide contradictory evidence. There are two major approaches in testing a tax induced dividend clientele or in testing a tax induced correlation between dividend yield and risk adjusted returns.

The first approach is based on testing the relationship between dividend yield and risk adjusted return whose pioneer is Brennan work in which he made model variation of the capital asset pricing model (CAPM) (Brennan, 1970, pp. 417–429). He states that a security's pre-tax excess return is linearly and positively related to its systematic risk and to its dividend yield. Brennan model implies that higher dividend yield stocks will have lower prices, all else being equal. The two most influential empirical test of the Brennan model are Black and Scholes made in 1974 (Black and Scholes, 1974; referenced by Lease et al., 2000, p. 54) in which they found no evidence of a tax effect. Based on their evidence they advised investors to ignore dividends when forming their portfolios. Second influential empirical test of the Brennan model is Litzenberger and Ramaswamy made in 1979 (Litzenberger, Ramaswamy, 1979; referenced by Lease et al., 2000, p. 54) where they concluded that returns are positively related to dividend yield which can be interpreted as evidence of a dividend tax effect.

Second approach is based on examining the behaviour of stock price around the ex-dividend period. The theoretical analysis of stock price behaviour around the ex-dividend day compares the expected price drop to the dividend per stock. Using this approach Elton and Gruber (1970) examine price movements around the ex-dividend dates of stocks listed in the U.S. stock market. According to them, the equilibrium around the ex-dividend day is such that marginal stockholders are indifferent between selling the stocks with or without dividends. Elton and Gruber (1970) presented empirical evidence showing that the ex-dividend price drop is smaller than the dividend per stock. This evidence is consistent with the hypothesis that investors have a tax-induced preference for capital gains. Elton and Gruber (1970) provide a tax-based argument and stated that ex-dividend day stock prices are set in such a way that marginal long-term investors are indifferent between buying and/or selling before and after the ex-dividend day. Consequently, the ex-dividend day drop in stock price relative to dividends should reflect the differential taxation of dividends and capital gain of long-term investors. Because the tax rate in dividends generally exceeds the rate on long-term capital gains, the stock price does not need to drop by the full amount of the dividend on the ex-

dividend day (Baker, 2009, p. 133). In this paper we shall also examine behaviour of stock price around the ex-dividend day on Croatia capital market, i.e. Zagreb stock exchange. This kind of investigation will be presented in the third chapter of the paper. In the second part of this paper we shall investigate how companies adapted its dividend supply to changes in Income Tax Act where tax on dividend has been implemented. In the fourth chapter there is review of the constitutionality of new amendments to the Income Tax Law and the fifth chapter consists of the conclusion.

2 THE IMPACT OF CHANGES IN INCOME TAX LAW ON CORPORATION DIVIDEND SUPPLY IN CROATIA

Croatian stock market is a relatively young market and until recently, investors could earn a great amount of capital gain so dividends were not in the primary focus of individual investors. But now when the global market and Croatian stock market too, is not in a good position, investors are shifting their focus on dividend paying company. Since they are unsure whether they should trust the company or not, companies try to encourage investors (and to give a positive signal of company situation) to buy their stock with dividend payment. Table 1 shows the number of dividends paid in the previous five years and the amount of dividends paid in the previous five years.

Table 1: Number and the amount of dividends paid in 2008 - 2012 (www.skdd.hr)

Year	Number of dividends paid	Amount of dividends paid (in HRK)
2012 (I-III quarter)	102	896.724.077,29*
2011	93	1.431.335.144,28
2010	97	1.286.129.148,86
2009	108	1.162.570.889,17
2008	135	1.385.432.849,66

*Amount paid in the first three quarter of 2012

As it can be seen from Table 1, 2008 is the year in which the largest number of companies paid the dividend, but the greatest amount of dividends was paid in 2011.

In Croatia income from dividends was not taxable as of 1st January 2005. Dividends and capital gain were not taxable at all from the standpoint of personal investor. On 17 February 2012 the Croatian parliament has enacted amendments to tax legislation, amongst which were amendments to the Income Tax Law. Changes were in taxation of dividends. Receipts of dividends are considered to be capital income and all payments of dividends made on or after 1 March 2012 are taxable at source at the rate of 12%, except for dividends out of retained earnings realized before 31 December 2000. Dividends are not taxable capital income if those receipts were generated pursuant to ESOP program and if dividends are used to increase the

share capital of the company. Amendments have defined a non-taxable threshold for dividends of HRK 12000 per annum. Regardless of the fact that, on the annual level, personal income tax is not paid on receipts of dividends up to HRK 12000, payers are nevertheless obliged to withhold personal income tax at the rate of 12% plus city surtax (if any) on the total amount of dividends paid whilst the recipient of dividends is entitled to claim the non-taxable threshold upon submission of annual personal income tax return. This kind of changes during the year in which payments of dividends and as well as the payment of advance payments of dividend paid up to 29 February 2012, that is, before the Law on amendments on the Income Tax law became effective, where not subject to personal income tax, while all payments of dividends and paid after 29 February 2012 are subject to personal income tax can have influence in adjusting the company's dividend supply. Adapting a moment of dividend payments in 2012, the company may pay a dividend that is not taxed and thus enable the stockholder higher income with regard to pay dividends after 29 February 2012. In this way, adapting to the preferences of personal investors, companies can increase their value through the stock price increase. Large number of dividend paying companies on Zagreb Stock Exchange (ZSE) in 2012 adjusted their dividend policy what can be seen from Table 2.

Table 2: Dividend payment before Law on amendments on the Income Tax law became effective in 2012 (www.skdd.hr)

	Number of dividend payment	Number of advance payment of dividend	Total
January and February 2012	8	18	26
January and February 2011	1	0	1
January and February 2010	1	0	1
January and February 2009	1	0	1
January and February 2008	2	1	3

As it can be seen from Table 2 companies didn't pay dividends in January or February until 2012. With amendments to the Income Tax law according to which all payments of dividends made on or after 1 March 2012 are taxable at source at the rate of 12%, except for dividends given out of retained earnings realized before 31 December 2000, a great number of companies have changed their practice and paid dividends before amendments to the Income Tax Law became effective. In this way a large number of companies avoided paying tax on dividend payments. According to data from Central Depository and Clearing Company and from ZSE in 2012, 102 companies paid dividends, while 25,49% of them paid dividend during first two month of 2012. Companies that have paid dividends before 1 March 2012 have benefited its shareholders. In this way shareholders have received a larger amount of dividends which wouldn't be the case if dividends were paid after 29 February 2012. Companies' benefit from such a timely dividend payments is not the subject of this research, but it certainly represents one of the guidelines for future research.

3 BEHAVIOR OF STOCK PRICE AROUND THE EX-DIVIDEND PERIOD IN CROATIA

There are several important dates between the moment the company announces the dividend and the moment the dividend is actually paid. The first date is the dividend declaration date or the announcement day, the date when the amount of dividend that will be paid is declared for a certain period (usually a year). The next date is cum-dividend date, the last day when stock can be bought with claim to the dividend declared. Stock has to be bought before ex-dividend day if the investor wants to receive the dividend. On the ex-dividend day the stock price will usually fall to reflect the loss of claim to declared dividend. Few days after ex-dividend date is record date. On record date a company looks to see who its shareholders or "holders of record" are. These shareholders will receive the dividends. The final step is dividend payment date.

The tax rate on dividends can vary widely for different investors (individual, pension fund, mutual fund and corporation). It is thus difficult to look at a company's investor base and determine their preferences for dividends and capital gains. A simple way to measure the tax disadvantage associated with dividends is to measure the price change on the ex-dividend date and compare it to the actual dividend paid. As it was mentioned in introduction one of major approaches in testing a tax induced dividend clientele is based on examining the behaviour of stock price around the ex-dividend period. In a world without taxes, ignoring the time value of money, in the short period between the ex-dividend date and the last day with dividend, the stock price should drop by the value of dividend on a stock's ex-dividend day to prevent arbitrage. It is not clear, however, whether the price drop will be equal to the dividend if dividends and capital gains are taxed at different rates (Damodaran, 2011, p. 526).

If shareholder sells stock before a stock goes ex-dividend he will lose the right to the already announced dividend. If he sells the stock on the ex-dividend day he will retain the dividend but he should expect to sell it a lower price. In a rational market the price decrease on the ex-dividend day should reflect loss of claim to declared dividend (D). To see the relationship between price drop and tax rates of the marginal investor, assume that investor has bought stock at price P and that each investor in the company can either sell the stock before ex-dividend day at a price P_B or wait and sell it on ex-dividend day (or after) at a price P_A and that tax rate on dividends is t_D and on capital gain is t_C. The income (I) that investor will receive from selling before ex dividend is

$$I = P_B - (P_B - P)*t_C$$

In this case, by selling before the ex-dividend, the investor receives no dividend, but if the sale occurs after the ex-dividend the income that investor will receive is

$$I = P_A - (P_A - P)*t_C + D*(1- t_D)$$

If the income from selling before the ex-dividend day was greater than the income from selling after for all investors, they would all sell before, resulting in a drop in the stock price. Similarly, if the income from selling after the ex-dividend day was greater than the income from selling before for all investors, they would all sell after, resulting in a price drop after the ex-dividend day. To prevent either scenario, the marginal investors in the stock have to be indifferent between selling before or after the ex-dividend day (Damodaran, 2011, p. 526).

Challenges of the Modern World - Contemporary Economy and Globalization

This will occur only if the income from selling before is equal to the income from selling after:

$$P_B - (P_B - P)*t_C = P_A - (P_A - P)*t_C + D*(1- t_D)$$

Rearranging last equitation we get:

$$\frac{P_B - P_A}{D} = \frac{(1 - t_D)}{(1 - t_C)}$$

A necessary condition for the marginal investor to be indifferent between selling before and the after the ex-dividend day is that the price drop on the ex-dividend day must reflect the investor's tax differential between dividend and capital gains. The statistic $(P_B-P_A)/D$ reflects the marginal tax rate of the marginal stockholder. In particular:

$(P_B-P_A)/D > 1$ marginal investor is taxed more heavily on capital gains.
$(P_B-P_A)/D < 1$ marginal investor is taxed more heavily on dividends.
$(P_B-P_A)/D = 1$ marginal investor is indifferent between dividends and capital gains.

In order to measure the tax disadvantage associated with dividends we measured the price change on the ex-dividend date and compared it to the actual dividend paid. We examined the price behaviour of stocks listed on the ZSE that paid dividend after 29 February 2012 and were traded on ex-dividend day and one trading day before ex-dividend. A problem with research done on ZSE is that only few stocks are liquid enough to be included in sample and the same problem is present in this research where only 12 companies meet criteria in which their stock needs to be traded on ex-dividend day and one trading day before ex-dividend day. Table 3 shows the results of investigation where we used one sample t test to examine are the values (price change on the ex-dividend date compared to the dividend paid) statistically significant different from 1. As it can be seen from Table 3, average price drop was only 52% of the dividend paid after 29 February 2012 and the result is statistically significant at 1 percent level. From the results we can conclude that dividends are taxed more heavily than capital gains and investors on ZSE prefer getting their income from capital gain rather than dividends.

Table 3: One-sample statistics – absolute price change on the ex-dividend date compared to the dividend paid

Number of observations	Mean	Standard deviation	Sig. (2-tailed)
12	0,5249	0,5295	0,01

The influence of implications of dividend tax implementations after 29 February 2012 is evident in the fact that in 2011, when there was no dividend taxation, the average price drop on ex-dividend day, according to dividends paid, was 79% which is much more than it was in 2012.

4   REVIEW OF THE CONSTITUTIONALITY OF AMENDMENTS TO THE INCOME TAX LAW

Recent amendments to the Income Tax Law allowed taxation of dividends and retained profits earned in previous years which opened up the possibility for a request of a review of the constitutionality of these amendments at the Constitutional Court of the Republic of Croatia. The legal basis for such a demand stands is in the constitutional prohibition of retroactive application of the law, which is only permitted in exceptional social circumstances, which would not be the case here. Thus, recent changes which introduced taxation of dividends should refer to dividends paid out of profits earned after the entry into force of these amendments. However, contrary to this view, we outline the view that in this case there is no retroactivity in the taxation of dividends, because it does not exist until the General Assembly decides upon the profit allocation. Operating profit is nothing but the retained earnings, and may remain so until the General Assembly agrees to use it otherwise. According to the Companies Act, the General Assembly is, among other things, authorized to decide about profit allocation. However, that right is to some extent reduced, since the decision about profit allocation comes to the General Assembly via proposals from the board of directors and from a written report and opinion of the supervisory board. The General Assembly may either accept or reject such reports. Only when the board of directors does not submit such proposal or in case of a conflict between the board of directors and the supervisory board, the General Assembly acts as an independent authority and its decision is the sole decision about profit allocation. There are a few constraints arising from the Companies Act when it comes to making decisions about profit allocation. One constraint regards net profit from the current year. It firstly must be used to cover losses carried forward from previous years. Other constraints regard net profit which must be used for legal reserves, reserves for its own shares if the company acquired or intends to acquire them. The final constraint regards statutory reserves if the company has them. When all legal demands have been fulfilled only then can the General Assembly decide to pay dividend or to allocate profit to retained earnings. The legal right to pay-off retained earnings via dividends, realized since 2001 until 2011, presents a reason for conflict between government and management of companies.

It is our belief that there is no retroactivity of amendments to Income Tax Law application because dividend is formed after the decision of the General Assembly about net earning allocation and not before. Therefore the Constitutional Court of the Republic of Croatia, when deciding about possible actions concerning constitutionality, should reject the opinion stated above.

5   CONCLUSION

Investors in Croatia are turning to dividends as a potential income they could earn owning shares. Companies recognizing that are trying to cater demands of their shareholders. Paying dividend or probability to pay dividend has nowadays become a matter of a good company business recognition. Until recently, in Croatia, income from dividends was not taxable as of 1 January 2005. Dividends and capital gain were not taxable at all from the standpoint of an individual investor. On 17 February 2012 the Croatian parliament has enacted amendments to tax legislation, amongst which were amendments to the Income Tax Law. With amendments to the Income Tax law all payments of dividends made on or after 1 March 2012 are taxable at source at the rate of 12%, except for dividends given out of retained earnings realized before 31 December 2000. According to Income Tax Law changes, companies tried to cater investor demands which resulted in a large increase of dividend payment in the first two

months of 2012. Until 2012 only few companies (1% or 2% of dividend paying companies) were paying dividend in January or February. Companies usually paid their dividends in the second and the third quarter of the year. But in 2012, in order to avoid dividend taxation, 25,49% or 26 dividend paying companies paid their dividend before 1 March 2012. Research showed that, from individual investors' standpoint, dividend tax implementation increased dividend aversion evident in price behaviour around ex-dividend day. A simple way to measure the tax disadvantage associated with dividends is to measure the price change on the ex-dividend date and compare it to the actual dividend paid, what was done on ZSE for companies that paid dividend after dividend tax implementation. Results showed that average price drop was only 52% of the dividends paid after 29 February 2012 which implies that investors on ZSE still prefer getting their income from capital gain rather than from dividends and that capital income from taxation standpoint is still preferred to income from dividends.

GREEN SHAREHOLDER ACTIVISM AS A RESPONSE TO FINANCIAL CRISIS

Marina Milevskaya

National Research University "Higher School of Economics", Russia
marinamilevskaya@yahoo.fr

ABSTRACT
The growing presence of responsible investors among the shareholders raises the question of their impact on social and environmental policy of the company, in particular during the financial crisis. We discuss whether their activism has the power to change the standards of responsible business policy. In other words, to what extent these responsible investors able to influence, for example, the choice of size of an environmental pollution. The first objective of the paper is to provide an analytical framework of a stock market economy, in which the emergence of coalition of responsible investors with incentives to monitor and restructures companies can be discussed. In particular we introduce the factor of corporate reputation that influences the choice of investments and the factor of chocks of production that put businesses in uncertain conditions of their activity.

Keywords: Green investors, Ecological responsibility, Environmental economics, Financial markets, Socially responsible investing (SRI)

1 INTRODUCTION

The growing presence of responsible investors among the shareholders raises the question of their impact on social and environmental policy of the company, in particular during the financial crisis. We discuss whether their activism has the power to change the standards of responsible business policy. In other words, to what extent these responsible investors able to influence, for example, the choice of size of an environmental pollution. There is no theoretical model of an influence of responsible shareholders on company activity. This allows to examine their impact on the real economy, particularly in terms of the global financial crisis. The first objective of the paper is to provide an analytical framework of a stock market economy, in which the emergence of coalition of responsible investors with incentives to monitor and restructures companies can be discussed. At first we construct a simple model to show that the chosen compensation for environmental damage depends on the sensitivity of investors to the level of pollution. Uncoordinated all firms choose the same amount, so we can say that under conditions of insufficiency of financial resources of neutral agents, the choice of the responsible policy is optimal. Yet this condition is not realized in the real economy, where neutral investors can buy all stocks of polluting industries.

Then we construct an expanded model, where the functions of agents of this economy are rewritten, in particular we introduce the factor of corporate reputation that influences the choice of investments and the factor of chocks of production that put businesses in uncertain conditions of their activity. During the research we examine the model of environmentally responsible investor activism in the absence of the foreign sector (closed economy) and government (there is only the private sector). In previous studies there were two main effects: the direct effect of responsible investment and the effect of signaling. This paper examines another possible effect of the presence of responsible investors as the main shareholder of polluting industries; investors can vote for a modernization of production to reduce environmental

pollution. The existing literature does not offer modeling of this type of shareholder activism, although it could propose interesting and controversial results, such as green shareholders are not looking to supplant ordinary investors from the board of shareholders, another example: anyway all companies are interested in responsible policy, despite the additional costs. Moreover we examine the resistance to stress of responsible investors. They know that even with a reduction of production (as a consequence of the crisis), the company is safe for the environment, which gives a feeling of satisfaction, considered as one of the factors in the analyzed model. Furthermore it affects the reputation of the company, the other important factor of the model.

With regard to this specific factor model it should be noted, that there is no theoretical framework that introduces this aspect in the process of investors' decision-making. An example is the recent research paper of Puncheva Petya (2007) which takes an interdisciplinary approach to explain the role of corporate reputation and she finally proves that shareholders estimate the social and pragmatic legitimacy of the company and its reputation. In this paper we try to model and internalize this factor which enables stimulate the participation of company management in the non profit activity to improve its image.

As the problems of environmental pollution affects almost everyone economists seek to determine the motivation for companies to invest in its environmental policy without government pressure. One point of view is that customers are voting with their feet because they do not want to buy products of irresponsible company, it forces take the additional costs of production (to buy cleaner technologies) to avoid the reduction of sales and profit. But there are also other reasons of responsible policy. In this paper we develop the idea that the company can solve the problem of attraction of stable and loyal shareholders, who invest in the company with more enthusiasm and furthermore they demand smaller dividends, because they receive psychological gains from the collaboration with the ethical business. These shareholders are the reliable partners of the firm. However there is a problem, the reliability of the shareholders is not observable. A possible and practical decision is an application of signal methods. This means, for example, that the company can offers low level of dividends combined with a strong environmentally responsible policy (it is a non-financial compensation). In reality companies with different levels of responsibility can coexist.

2 DISCUSSION OF THE LITERATURE

The responsible investment funds (RIF) have specific traits, because responsible investors receive non-financial (psychological) gains. We model the new preferences of investors. The portfolio managers of RI have two objectives: financial and social. This character multitasking of managers may weaken incentives to receive the big risk-adjusted returns. There are two main approaches: either investors demand an extra return for investing in irresponsible corporations, either they get smaller yields of green investment. These two opposing requirements can influence the cost of business capital and investment decisions of financial institutions. The situation changes significantly from one country to another. In developed countries, for example, in France or the UK there were already a lot of green investment fund at the end of 2001 (38 and 62 respectively) and in emerging countries this practice begins to settle in the minds of investors, so for now its economic effects cannot be significant to change the economy.

The paper of Meir Statman (2000) describes two main effects of the actions of responsible investors:

1. Investment actions effect. Sell the securities of irresponsible companies (for example, those of alcohol producers) or do not buy them. This reduces the supply of capital. The cost of capital increases and new projects may be abandoned because of their non-profitability. But it must be emphasized that this effect depends strongly on the relative weight of ordinary and responsible investors.

2. Effect of policy. This effect is comparatively more important. In general the actions of investors aim to attract the attention of society and politicians, they understand that their direct impact on the cost of capital is not enough large. These actions include, for example, fiscal policy. Additional taxes can reduce the demand for capital.

The emergence of specific traits of responsible investors, who appreciate not only the financial gains, but also "psychological benefits", change traditional priorities of the investor and it influences the overall behavior. The strong positive emotion from the participation in environmental protection may be more important than the financial losses. In their paper (2005) Beal, Goyen and Phillips analyze the principal incentives of responsible investors. They prove that there is not principal motivation (for example, financial and non-financial gains or social changes) that can fully explain the behavior of a responsible investor. For some investors, there is always a compromise between these three motivations. The authors try to build the utility of SRI. It is said that SRI gives the feeling of satisfaction and social status. Finally the authors propose three methods for incorporating non-financial incentive in the classical model:

1. We consider the psychological gains of SRI as the equivalent of pleasure to participate in the game of chance where you can win or lose. The pleasure of participation is independent of the outcome of the game means that the investor receives at the same time the financial gains and utility of pleasure from the investment process. And if investments are not ethical, the investor receives less utility he could obtain without investment.

2. We include the level of "ethicalness" of investment in a utility function of the investor and we obtain the risk-return-ethicalness space. In this model the investor can receive smaller yield if the investment is more ethical. But this is not right for all responsible investors.

3. We consider the ethical investment psychic gains as the equivalent of happiness or well-being from pleasurable activities. In the latter case we can use tools developed by researchers of happiness. Ethical investments provide a flow of pleasure (happiness, psychic gains or experience utility).

In general there are three types of research that are the basis of this paper. The first models different possible effects of the presence of SRI in the economy, including the impact on the behavior of entrepreneurs. The second analyzes the activism of shareholders, their interaction with the managers of the company. And finally the third type of research is related to the reputation and image of the company that affect the traditional goals of the business (profit maximization).

Andrea Beltratti (2003) constructs a macroeconomic model to find the general equilibrium with SRI. The model has two heterogeneous agents, two periods and two types of securities (irresponsible stocks and "safe" bonds). It examines the impact of SRI on the price of the securities. Important factors in the model are wealth of responsible investor and

diversification opportunities. One way, the relative size of the wealth of economic agents is crucial. And another way if the company has the unique traits to become the subject of diversification, it has no strong incentive to be more responsible. The agent made the choice of consumption and investment. The author analyzes the impact of the heterogeneity of agents and externalities of production (as an indicator of corporate social responsibility). It is assumed that the production function depends directly on the loans and specific exogenous shock for each company (negative and positive). The authors consider the externality associated with the specificity of socially responsible investments, in this particular case they interpret it as the negative effect of demand of loans from the company A ("polluting industry") on the utility of agent i ("responsible investor"). The model is simple and it can not show any significant consequences. It concludes that SRI does not have strong impact when the number of responsible investors is small and there is a lot of possibilities for diversification.

Lammerdjan Dam (2007) proposes to construct the model of overlapping generations to complicate the previous model and adapt it to reality. It uses the model OLG (overlapping generations' model) of John Pecchenino and modify the choice of agents. Now it is a choice between "polluting" actions and obligations that are safe for the environment. Future generations will suffer the consequences of the current production of polluting firms. Moreover the environment is a public good therefore there is a free rider problem. In general to decide this problem the government uses fiscal measures. This paper offers the alternative mechanism. It analyzes the dynamic model and adds a parameter of quality of environment. Furthermore we consider two cases: the centrally planned economy and free competition. In conclusion one can note that the stock market can stimulate the responsible development. Lack of coordination between the current and future generations increases the level of pollution. The emergence of the market for property rights can be a good solution to the problem. When the stock market takes into consideration the future, its actions allow the negotiation of future capital, which includes the loss of well-being of future generations related to pollution.

Lammertjan Dam and Ben J. Heijdra (2010, 2011) provide the conception of "warm-glow effect" developed by James Andreoni in 1990 to explain impure altruism. Instead of being only motivated by an interest in the growth of welfare of recipients of investments, the "warm-glow investors" have also the utility of the act of giving, that is to say, they have a selfish motivation. This motivation can arise, for example, from the desire to have a reputation of socially responsible people or philanthropists. These papers analyze the impact of SRI on quality of environment and abatement economy. The authors examine whether environmental policy is effective when consumers themselves have an incentive lied to the "warm-glow motive" to internalize the environmental externalities in their functions. It is found that their responsible behavior partly ensure the positive effects on environmental quality of the abatement policy. The "warm-glow" motivation imposes an implicit tax on the value of the polluting company. It assumes that investors can choose only the "pure" bonds or stocks of irresponsible corporations. The effect of warm-glow requires a growth of premiums to induce them to purchase these shares. The paper assumes also that there is no risk, so the bonds and stocks are perfect substitutes and moreover it analyzes the consequences of two environmental chocks: (1) The continued growth of non-expected level of public abatement financed by taxes and (2) the temporal increase of "warm-glow" parameter.

In the 2001 Heinkel, Kraus and Zechner build the model of impact of the actions of investors on corporate policy. In economics with the boycott of stocks from irresponsible corporations, ordinary investors may receive compensation for these securities declined by responsible investors. There is also a risk of litigation that is related to social policy of the company. It is another cause of growth of securities returns from irresponsible corporations. Positive selection can in turn increase the supply of capital for responsible companies that promote investment in new projects. In this model we assume the existence of two types of investors (responsible and neutral) and companies (polluting and green). Also if the company wants to be reformed, it can attract the attention of green investors. The reforms are seen as the economic effect of the presence of ethical investors. The principal hypothesis affirms that the boycott of stocks increases the cost of capital and promotes the reforms if the refusal is significant and the losses are greater than the costs of corporate reorganization. Here, as in the Beltratti's paper (2003), the relative size of the wealth of economic responsible and neutral agents is very important because it determines the incentives for firms to be reformed. The authors examine the figures and find for them the critical threshold 25%. Empirical evidence shows that the real share of responsible investors do not exceed 10% which is not enough to change the state of the real economy.

The impact of the actions of responsible investors on business decisions and social policy is also examined by Amir Barnea, Robert Heinkel and Alan Kraus. There are three categories of companies: polluting, clean and reformed, and two types of investors: neutral and green. The authors find the Nash equilibrium for three levels of capital costs. When the costs of reform are small responsible investors can significantly change the economic situation, investments in irresponsible companies fall which reduces the total investment. If these costs are large, responsible investors lose power. If costs are middle, the economy receives the maximum of investment if there are only responsible or irresponsible investors.

3   MODEL OF ENVIRONMENTALLY RESPONSIBLE INVESTOR ACTIVISM

To better adapt the theoretical model to reality, we can introduce some conditions. We assume that responsible investors are more stable and loyal to the green company. To differentiate it says that during the financial crisis ordinary investment fund does not buy stocks due to stock market panic. The expanded model has T periods and the letter t is the period number. There are three types of companies: g (green), p (polluting) and r (reformed). The total number of firms is N ($E_g + E_p + E_R$). E_g uses only green capital K_g that brings no loss to the environment; E_p - only capital K_p (polluting technology) and E_R buys K_g and K_p. Suppose that the price of capital K_g is greater than K_p, if not the company E_p has already replaced it and become E_R. To focus on the choice of technology (green or polluting) in this model the labor market is not considered. For simplicity, it says the price of capital includes costs associated with its treatment.

K_p^{it} and K_g^{it} mean polluting and green capital of firm i. and their prices are P_{Kp}^t and P_{Kg}^t. There is the minimum level of capital that the company i has to pay: $K_p^{\min it}$

and $K_g^{\min it}$. This is explained by the existence of supply contracts to ensure continuity of production. One can choose the following contract: it must still pay 70% of the previous level (t-1) of capital. This helps avoid large fluctuations in output

$$CP^{it} = P_{Kp}^t * K_p^{it} + P_{Kg}^t * K_g^{it}$$ - The total cost of production of firm i.

$$CP^{it} = P_{Kp}^t * K_p^{it}$$ For polluting companies and $$CP^{it} = P_{Kg}^t * K_g^{it}$$ for green businesses. $Y^{it} = \Gamma^{it} * f(K_p^{it}, K_g^{it})$ - the final result of production of firm i (its price is equal to one). Γ^{it} is an exogenous shock that is subjective for each company. There are two production shocks: positive $\Gamma^{it} = (1+\theta)$ and negative $\Gamma^{it} = (1-\rho)$.

Finally we describe the function of profit: $\Pi^{it} = Y^{it} - P_{Kp}^t * K_p^{it} - P_{Kg}^t * K_g^{it}$.

DIV^{it} - total dividends paid by firm i. Here one may understand how the company compensates the environmental damage. We assume that to declare as reformed company the polluting company pays the fixed amount $S^{it} = S$. For example, this payment includes the price of the advertising campaign and the payment in fund of type of Greenpeace and so on. For simplicity it is the same for all firms and all periods of time. The purchase of K_g^{it} may be covered by the differences in dividends of green and neutral shareholders. By reducing their dividends shareholders may favor the modernization (through purchase of green capital) of production to reduce its negative impact on the environment. If the number of responsible investors increases, the company is becoming more ethical.

To finance the costs companies issue shares: X^{it} and P_x^t - the number and price of shares issued by firm i. $FD^{it} = P_x^t * X^{it}$ is the demand of financial resources which is equal to the supply of shares issued by the firm i. $FD^t = FD_p^t + FD_g^t + FD_R^t = P_x^t * (X_p^t + X_g^t + X_R^t)$ - the demand of financial resources of three types of firms (= total supply of shares).

$FD^{i0} = CP^{i0}$ it means that the demand of financial resources is equal to production costs of firm i in the period zero. In subsequent periods it satisfies this condition: $FD^{i(t+1)} = \max\{0, CP^{i(t+1)} - (\Pi^{it} - DIV^{it})\}$.

The number of investors is I. There are two types of investors: neutral investors, I_n, they may invest in polluting companies (I_n^p) and reformed (I_n^R) and green investors, I_g, they prefer green companies (I_g^g) and reformed (I_g^R).

$$FR^0 = FR_g^0 + FR_n^0$$ - the financial resources of green and neutral investors at time zero. At first it was the personal wealth of investors (eg, savings), then it includes dividends and difference between purchase and sales price.

To understand the state of the environment, there is PN^t, it is total environmental damage. In this model it is assumed that the ultimate goal of actions of green investors is improving the state of the environment. $PN^t = \sum PN^{it}\left(\underset{+}{K_p^{it}}, \underset{-}{K_g^{it}}\right) = \sum [J(K_p^{it} - K_g^{it})]$, where

J - the estimation of damage in euros.

To prove the necessity of reforms and investments in reformed companies, we write the necessary relationships and they are presented in Table 1:

1) $FD_g^t < FR_g^t$ - the part of green investors are motivated to invest in the reformed enterprises.

2) $FD_p^t > FR_n^t$ - neutral investor resources are insufficient to meet total demand of polluting firms, the share of polluting industries is motivated to be reformed.

We can assume the following scenario of business development. In the period (t-1) firm i suffers from negative exogenous shock of the production and a part of neutral investors sells their shares if the situation is serious (the crisis continues) the company may decide that it will require the additional resources of green investors $\Rightarrow$ it pays the amount S to give a signal positive $\Rightarrow$ E_p becomes $E_R \Rightarrow A_g^{it}\uparrow \Rightarrow (A_g^i / A_n^i)\uparrow \Rightarrow U_g^{kt}\uparrow$. If it creates the coalition, dividends fall to the minimum level and the company gains the full benefits of the presence of a coalition of loyal shareholders and it may invest more in the modernization of its production.

But if the negative shock lasts for several periods, responsible shareholders may leave the company and the firm began buy only the polluting capital K_p, because it is cheaper (transformation to E_p^i). If this company has not ultimately a failure, it must always increase dividends to attract neutral investors (for them it is a primary motivation).

If the company is reformed but there is no green coalition of shareholders, its state is the most dynamic. This is a case that must be analyzed in more detail.

<u>The dividend policy of each type of business.</u>
1) At first we should stress that green business can pay less dividends, because it offers to green investors psychological dividends. E_g does not pay a compensation for environmental damage because it does not harm the environment. So we can assume that the minimum level for the green company is 15% of profit: $div_g^{it} = 0,15 * \prod_g^{it}$.

2) E_p must pay the largest dividends because it uses only the neutral investors' capital. And E_p which lost the confidence of green investors (ex E_R) must pay the largest dividend to be sure that its costs are covered. Levels preferred by neutral investors are 35 and 40%.
$div_p^{it} = 0,35 (\text{ou } 0,40) * \prod_p^{it}$.

3) Regarding the reformed enterprises, with the presence of a coalition of shareholders, they propose finally only 20% of profit. Without coalition the desirable level of dividends is 25%.
The success of reforms of the company depends heavily on its green reputation; it must have enough responsible shareholders to buy the green capital, as these are the additional expenses. The likelihood of attracting new investors depends positively on the number of negative shocks of reformed enterprises already existing. This is the result of business rating by their level of attractiveness. The positive signal (payment of S at time t) will give its consequences only in the period (t +1), because green investors need to see, that the company does it. In addition these actions may attract ordinary investors, because the latter could decide that if the company after a negative shock (t-1) increases its costs, it has good prospects of its future development. So it may be noted here that the strong responsible policy is also good for the general reputation of the company and vice versa (refuse, it means discourage everybody, what is why a "new" polluting company pays more dividends). But it is a more complicated case, so in this model neutral agents consider only the history of shocks and the dynamics of dividends.

The consequences of this theoretical model will be considered for four periods: t = 0, t = 1, t = t (interim period) and t = T. Other periods will be ignored because the state of enterprises is very dynamic. The probabilities of production shocks are not known, they are random, the beginning (t = 0) all firms are identical (polluting companies and green businesses respectively), in the period T inversely all businesses have the differences, they can be easily differentiated by their reputation, by the level of production, or through the dividends, the polluting and green capital and so on. There are the best and worst companies for neutral and green agents. Let's start with the zero period:
Period t = 0:

Investors have the financial resources $FR = FR_g + FR_n$ and they buy the shares. Suppose that all firms offer the same number of shares. That is to say the company i receives $FD^i = FR / N$ and offers securities $P_x^0 * X^{i0} = FD^i$. At first there are only

polluting and green companies. After the issuance of securities the second stock market has to be to facilitate exchange of securities between investors.

Green businesses prefer responsible investors' capital, because they require only 15% of profit as dividends. Investors who do not buy stocks of green companies wait until the next period for the appearance of reformed enterprises, because they can not invest (this is a condition of aversion of polluting enterprises). Green businesses receive $P_x^0 * X^{i0} * E_g$.

And the rest of resource of green investors is ($FR_g - P_x^0 * X^{i0} * E_g$), the amount they can invest in reformed companies in the first period. The green company i bought K_g.

Production costs are $CP^{i0} = P_{Kg}^0 * K_g^{i0} = FD^i$. Profit and dividends are the following:

$$\Pi_g^{i0} = Y^{i0} - P_{Kg}^0 * K_g^{i0} = \Gamma^{i0} * f(K_g^{it}) - P_{Kg}^0 * K_g^{i0} \; ;$$

$$DIV_g^{i0} = 0,15 * \Pi_g^{i0} = 0,15 * (\Gamma^{i0} * f(K_g^{it}) - P_x^0 * X^{i0}).$$

Polluting companies can sell their shares only to neutral investors. They choose one of two possible strategies:

1. Either buy the capital K_p and stay polluting E_p in period t = 1.

2. Either buy K_p and pay S to become E_R and attract ethical agent resources.

If the polluting firm i prefer the first strategy, it receives: FR_n / E_p and purchases capital K_p. Production costs are $CP^{i0} = P_{Kp}^0 * K_p^{i0} = FR_n / E_p$. Profit and dividends are calculated:

$$\Pi_p^{i0} = Y^{i0} - P_{Kp}^0 * K_p^{i0} = \Gamma^{i0} * f(K_p^{it}) - P_{Kp}^0 * K_p^{i0} \; ;$$

$$DIV^{i0} = 0,35 * \Pi_p^{i0} = 0,35 * (\Gamma^{i0} * f(K_p^{it}) - FR_n / E_p).$$

If firm i want reforms and give the positive signal, it pays S. Production costs are $CP^{i0} = P_{Kp}^0 * K_p^{i0} + S = FR_n / E_p$. Profit and dividends are calculated:

$$\Pi_R^{i0} = Y^{i0} - P_{Kp}^0 * K_p^{i0} - S = \Gamma^{i0} * f(K_p^{it}) - P_{Kp}^0 * K_p^{i0} - S \; ;$$

$$DIV^{i0} = 0,35 * \Pi_R^{i0} = 0,35 * (\Gamma^{i0} * f(K_p^{it}) - FR_n / E_p).$$

Period 1:
In the beginning investors receive information on positive and negative shocks of companies and their strategies (pay or not the amount S). This compensation for pollution damage increases costs and partially discourages neutral shareholders. Suppose that at time zero b polluting enterprises were denied the reforms; δ polluting enterprises, η reformed enterprises and γ green businesses have suffered from negative consequences of the production shock.

Challenges of the Modern World - Contemporary Economy and Globalization

The total supply of capital at the beginning of the first period = [the rest of the financial resources of green investors] + [dividends received from polluters with a negative shock] + [dividends received from polluters with a positive shock] + [Dividends received from reformed companies with a negative shock] + [dividends received from reformed companies with a positive shock] + [dividends received from green companies with a negative shock] + [dividends received from green companies with a positive shock] = (FR_g -

$P_x^0 * X^{i0} * E_g$)+ E_p^0 *b*δ*0,35*[(1-ρ)* f(K_p^{i0})- $P_{Kp}^0 * K_p^{i0}$]+ E_p^0 *b*(1-δ)*0,35*[(1+θ)* f(K_p^{i0})- $P_{Kp}^0 * K_p^{i0}$]+ E_p^0 *(1-b)* η*[0,35*[(1-ρ)* f(K_p^{i0})- $P_{Kp}^0 * K_p^{i0}$ - S]+ E_p^0 *(1-b)*(1-η)*[0,35*[(1+θ)* f(K_p^{i0})- $P_{Kp}^0 * K_p^{i0}$ - S]+ E_g *γ*0,15*[(1-ρ)*f(K_g^{i0})- $P_{Kg}^0 * K_g^{i0}$]+ E_g *(1-γ)*0,15*[(1+θ)* f(K_g^{i0})- $P_{Kg}^0 * K_g^{i0}$].

We do not include secondary market transactions, because buying and selling securities are realized in the form of exchange, one receives the resources, but other loses them. The secondary capital market is important because it helps replace the ordinary shareholders by responsible investors. The demand for capital depends strongly on the shock.

The interim period:
After the arrival of responsible investors to the board of management of the company, they vote for the purchase of green capital, thus costs increase. But companies that have received an environmental coalition of shareholders decreases the rate of dividends and they can reinvest more in his production. Investors' strategies depend on the utility function, that is to say they look at past history, the strategies chosen and the number of shareholders ethical. If the parameter increases, the likelihood of the creation of a coalition becomes larger.

Investors have preferences. In this section we determine the factors of the utility function of investors. The functions are different for ordinary and green investors. When investors compare companies, it can use the following two factors: a factor of wealth received - the amount of dividends received from firm i and an intangible factor - the company's reputation, in other words, the past history of company, if it is good or bad. In addition the reputation reflects its values and performance in the areas of social responsibility, quality of products and services, the employment policy, financial market position, governance and management (http://bas.sagepub.com/content/47/3/272). Yet both types of investors consider the different parameters. For example, the neutral investor looks at the number of periods with positive and negative impacts of production, it helps understand the "success story" of the company. The company with the highest number of positive shocks is the most stable and it goes bankrupt with smaller probability than the other. And in addition ordinary investor receives only real benefits - dividends. During the economic crisis all dividends go down, but there are shareholders who earn over other investors. It can be applied by comparing dividend of firm i with its maximum at time t. All these conditions can be described formally:

Challenges of the Modern World - Contemporary Economy and Globalization

$$NRP^{it} = \varphi_1 * \frac{NP(\Gamma>1)^i}{NP(\Gamma<1)^i}$$, where $NP(\Gamma>1)^i$ and $NP(\Gamma<1)^i$ it means

respectively the number of periods with positive and negative shock of firm i. and NRP^{it} is the ordinary reputation of the firm i in the period t for neutral investors. The second parameter is the following:

$$d^{it} = \frac{div^{it}}{div^{\max t}}$$, where $div^{\max t}$ is the maximum of dividends in the period t.

Now we can write the utility function of investments in stocks of the neutral agent k.

$$U_n^{kt}\left(d^t, NRP^t\right) = a * \sum_{i=1}^{P} \left(d^{it}\right)^{\alpha} + b * \sum_{i=1}^{P} \left(NRP^{it}\right)^{\beta}$$, where P means the portfolio of shares purchased by the investor k.

Now we consider the ethical preferences of investors. We construct the business rating, for them in addition to the success story we examine the level of corporate responsibility in the eyes of environmental agents. It describes the parameters of the model below.

$$GRP^i = \varphi_1 * \frac{NP(\Gamma>1)^i}{NP(\Gamma<1)^i} + \varphi_2 * \frac{NP(A_g^t-A_g^{t-1}>0)^i}{NP(A_g^t-A_g^{t-1}<0)^i} + \varphi_3 * \frac{NP(S>0)^i}{NP(S=0)^i}.$$

The second factor allows analyzing the dynamics of green shareholders A_g^t in the board of the company, if their number is still increasing; this shows the stable trend of creation of strong coalition of ethical investors which can minimize environmental losses by modernization of production. To monitor and improve the policy of environment protection they vote for the replacement of K_p by K_g. We can ignore the dynamics of capital K_g in the above expression, because it directly depends on A_g^t. The third factor is related to the initiative of the company's managers, who want to reshape the company. They can pay S, even if production receives a negative shock. This underlines the great desire of the company to have environmentally responsible policy. It is a policy of signal. The opposite situation, that of denial of this policy is also quite possible.

It described the intangible factor of green reputation, now we look at the dividends received by responsible shareholders. The choice of green or reformed business brings to responsible investor the feeling of satisfaction ("happiness") that can even compensate financial losses

(e.g., reduction of dividends). Now we add the additional amount (psychological dividends) to ordinary dividends and the second parameter of the utility function takes the following form:

$$bd^{it} = \frac{div^{it} + bon^{it}}{div^{\max t} + bon^{\max t}}$$

, where $bon^{\max t}$ is the maximum level of psychological dividend in period t (this is a company with minimal environmental losses). And bon^{it} is the psychological dividends received from investment in firm i.

Now we construct the final formulation of the utility function of agent k:

$$U_g^{kt}\left(bd^t, GRP^t\right) = c * \sum_{i=1}^{P}\left(bd^{it}\right)^{\rho} + d * \sum_{i=1}^{P}\left(GRP^{it}\right)^{\phi}$$

, where P is the portfolio of shares purchased by the investor k.

The bonus can offset the losses of real dividends which explain the fact that during the crisis responsible shareholders are more resistant to the stock market panic, that is to say, to the massive sale of securities. They prefer to stay with his company and support the purchase of green capital not to push ahead for the environmental pollution.

In turn the company must compare these minimums costs with the existing resources. After purchasing the green capital the function of reformed companies obtains the following form:

$$\Pi_R^{it} = \Gamma^{it} * f(K_p^{it}, K_g^{it}) - P_{Kp}^0 * K_p^{i0} - P_{Kg}^0 * K_g^{i0} - S.$$

The choice of strategy depends on the following:
1) The past history, if there was enough negative shocks which decrease its ability to reinvest in its production costs and pay the minimum dividends. In addition adverse shocks discourage neutral agents, because they appreciate only this factor;
2) The number of other polluting companies with positive production shock. Because the company wants to be insured against bankruptcy, which becomes more real with the stronger competition for the resources of ordinary investors. The responsible policy allows to diversify and widen the choice of potential sources of investments, including those of ethical agents.

The strategy may take the following form:

Pay S if $\dfrac{E_p(\Gamma > 1)}{E} > h$ and $\dfrac{NP(\Gamma > 1)^i}{NP(\Gamma < 1)^i} < 1$, it means that the share of successful

polluting enterprises is more than the chosen parameter h and the company i do not have enough success.

The last period (t=T)
It is assumed that at the last period all possible coalitions are created. This means that this economy has the following state. Part of the reformed enterprises with coalitions produce the

minimum pollution and thanks to loyal shareholders, they may be more stable even during the crisis of production. Polluting companies, who can not reform or they have already rejected responsible policy, works only with the neutral part of investors that receive high dividends by saving on costs. The most volatile situation is in the rest of the reformed enterprises. Its shareholders include ordinary investors, who could not purchase the securities of polluting firms, and responsible green investors, whose number is not enough to create a new coalition. The latter case provides dynamic financial market in this hypothetical economy.

Suppose finally that there exists one and only one company from each reputation level. This means there is the best and worst companies for each type of investors. The best (by reputation level) reformed enterprises were able to attract the maximum resources of responsible investors, producing the minimum level of pollution and create all possible coalitions of green shareholders. The best polluting companies (with the maximum profit, because it is a main factor in the neutral reputation) are supported only by neutral investors, who have had the fortune to choose them in the conditions of uncertainty and random shocks of production. All green companies, except companies that have failed due to unfortunate history of negative shocks of production, use only the resources of green investors, because their level of dividends is very small for neutral agents.

4 CONCLUSION

The objective of this paper was to examine the influence of the presence of responsible shareholders on performance and policy of enterprise policy and the real economy. We built the theoretical model with responsible shareholders that concerns about corporate policy which allowed examining the consequences of the emergence of a coalition of green investors who have strong incentives to monitor pollution or modernize production. We present the model extended, where we introduced the factor of corporate reputation that influenced the choice of investments and the factor of production shocks that put businesses in uncertain conditions of their activity.

Regarding reputation, it should be noted that before this paper there was no theoretical framework that introduces this aspect in the process of decision making of responsible investors. In this paper we have internalized this factor which encouraged the participation of company managers in the non profitable activity to improve its image. In future work, we extend the model by introducing the public sector (government) and foreign funds of socially responsible investments. It is an open economy where the government may also become the major shareholder of companies and introduce ethical values.

ABSTRACT

India's economic liberalization in the 1990s provides scope for research on the effect of policy reforms on economic performance. This paper addresses the question of some of these policy changes and their impact on firms' productivity and efficiency. We test specifically the role of export and, import (total, intermediary and capital goods) policy, R&D, technology transfer and infrastructure endowment over the period 1994-2008. Result of the analysis suggests that infrastructure is a crucial determinant of manufacturing performance in India. This is true for a wide range of variables such as transport, energy and information & communication technology (ICT). This result is important in the Indian context of infrastructure bottlenecks. Empirical results also suggest that knowledge transfers through exports are more important than through imports. Other findings indicate that R&D is not a productivity-enhancing activity in India and that firms rely more on purchase of foreign technology. This outcome does not come as a surprise because Indian firms are known for low in-house research and innovation-oriented activities.

Keywords: India, Manufacturing, Technical Efficiency, Total Factor Productivity

1 INTRODUCTION

The role of productivity in determining income levels and economic performance, as well as issues concerning accurate measurement techniques, have attracted a large number of researches in India (see Goldar, 2004). Not too many studies, however, have attempted to answer the question of the determinants of productivity and efficiency over time. To fill this gap, this paper focuses on the manufacturing industry and examines the role of some of the important factors in explaining the productive performance in this sector.

A vital element of India's rapid economic growth since the early 1990s has been the improved performance of its manufacturing industry. Manufacturing is an important sector in terms of value added and earning of foreign exchange of the Indian economy, comprising about 31 % of the non-agricultural GDP (Natarajn and Duraisamy, 2008). This sector has gained in strength in many ways over the past twenty years, as a consequence of a liberalization of industrial controls, as well as a gradual integration with the world economy. The average

output growth rate was of 8 % in the last decade and targeted at around 12 % in the eleventh plan period (2007-08 to 2011-12) (Planning Commission, 2006).

In the reform era (since 1991) in India, the manufacturing sector has witnessed major policy changes, particularly in licensing, technology transfer and trade policies. Industrial de-licensing and removal of restrictions on foreign investment have modified the profile of this sector considerably. Successive trade policies have stimulated export and import, especially of intermediary and capital goods, since tariff rates have been reduced drastically and quantitative restrictions on imports by and large abolished. To encourage firms to innovate and conduct R&D activities, the government has developed a system of fiscal incentives and financial benefits (for details, see Sharma, 2012). Thus, factor cost advantages are being replaced by technology-related factors in determining international competitiveness of the Indian firms, such as zero-defect product quality and international certification of firms' quality assurance systems (UNIDO, 2005). These reforms aimed at making the Indian industry more efficient, technologically up-to-date and competitive. However, despite these policy changes, *TFP* growth of this sector declined to less than two % in the 1990s, from above five % in the 1980s (see Trivedi et al., 2000; Goldar and Kumari, 2003). Recent estimates indicate as well a marginal improvement in *TFP* growth in the manufacturing industries in the 2000s (Seghal and Sharma, 2010; Kathuria et al., 2010). Thus, it is relevant and important for policy point of view to ask if the recent reforms have had the expected impact on the Indian industrial performance. The present paper addresses this question.

In the literature, the role of export and import in promoting growth, through productivity gains in particular, has been debated extensively (see Balassa, 1988; Bhagwati, 1988, Krugman, 1994). International trade is considered as one key sources of the transmission and adoption of new technology (see Romer, 1987; Coe and Helpman, 1995; Barro, 1997; Frankel and Romer, 1999). This channel is particularly important for developing economies where new technology is relatively scarce and firms are dependent of high quality imported intermediate goods. On the one hand, imports are generally described as increasing competition for the domestic firms, inciting them to invest and be more productive. The positive effect of import is also associated with knowledge spillover between foreign and domestic goods, as developed by Aitken et al. (1997) and Keller (2004). On the other hand, imports of intermediary and capital goods are seen as stimulating productivity through technology transfer and better quality of products imported. As for exporting firms, international competition is a factor of innovation and investment in more productive technologies and organization as well. In the case of India, Chand and Sen (2002), Goldar and Kumari (2003), Sharma (2011), Mishra and Sharma (2012) confirm that trade and productivity are closely related.

Research and innovation have also been identified as another key channel of firms' productivity and income gains. Endogenous growth models explain that R&D expenditures, in addition to directly enhance firms' productivity through innovation, contribute to this process through their industry-wide spillover effect (see Grossman and Helpman, 1990; Romer; 1986). Most of the empirical studies have invariably found a significant and positive impact of R&D on firms' performance (see Griliches, 1979, 1986; Griffith et al., 2006; O'Mahony and Vecchi, 2009). But the success of the manufacturing sector has also been linked to foreign technology transfer. In India, Raut (1995) and Sharma (2012) have shown the role (however at varying degree) of innovation in productivity performance of firms.

Another important factor which has direct implications on manufacturing performance is physical infrastructure. In the related literature, infrastructure is considered to be a crucial factor of productivity and efficiency enhancement through external economies and complementarity with other factors of production (see Romer, 1986; Lucas, 1988; Barro and Sal-i-Martin, 1995; Anwar, 1995). In India, the infrastructure inadequacies have been recognized as a major constraining factor for the performance of firms (see Pinto, Zahir and Pang, 2006). In recent years, however, the Indian government has been putting in efforts to enhance the infrastructure services by liberalizing the related policies, encouraging the private sector in infrastructure projects through public private partnership (PPP), and directly investing in the infrastructure sector. Government expenditure, in particular, has been increased from 4.6% of GDP to a figure between 7 and 8% in the eleventh plan period (2007-08 to 2011-12) (Planning Commission, 2006). However, this is still far from China effort, which has invested between 15 and 20 % of its GDP since the mid-1990s. On the empirical side, Mitra et al. (2002 and 2011), Hulten et al. (2006), Sehgal and Sharma (2010) have shown that infrastructure endowments have played a critical role in improving the performance of the Indian industrial sector.

Against this background, the present paper revisits the issue of the impact of the reforms on the manufacturing performance. We test the effect of several factors: import (total, intermediate and capital inputs), export, in-house R&D, technology transfer and physical infrastructure, which we link to the productivity and efficiency of the industries. While doing so, we introduce several novelties from the empirical standpoint. *First*, in the standard literature, the factors mentioned above are most of the time tested separately. We move a step ahead and test them in a single framework in order to compare the drivers of the industrial performance. *Second,* in most of the previous studies on India, data was mainly taken from the Annual Survey of Industry (ASI). We utilize a new manufacturing database, Prowess, which includes eight important industries and allows us to extend the time horizon of the analysis up to 2008. *Third*, while the previous studies in India sometimes focused on total factor productivity (*TFP*), we analyse the impact on another crucial indicator of industrial performance, namely the technical efficiency (*TE*). *Fourth*, the inclusion of too many infrastructure variables separately in a regression analysis may lead to multicollinearity problem. In order to avoid this, we construct two composite indices of infrastructure (*G*) for total infrastructure and (*ICT*) for information & communication technology, by using principal component analysis (*PCA*). *Fifth*, some recent researches (see Kasahara and Rodrigue, 2008; Goldberg et al. 2008) have shown that intermediate imported inputs are crucial sources of industrial productivity gain, while some others (see Ziesemer, 1995, Dovis and Milgram-Baleix, 2009) highlight that it is imported capital goods which are important for technology adoption and implementation. In the paper, we consider both the variables separately in the model.

The rest of paper is organized as follows. The second section introduces the data used in the analysis. The third section discusses some methodological aspects linked to the computation of total factor productivity (*TFP*) and technical efficiency (*TE*). The forth section estimates our empirical models and illustrates the impact of our variables of interest. The last section concludes with policy recommendations.

2   DATA ON INFRASTRUCTURE AND THE MANUFACTURING SECTOR

In this study, we have utilized data for two-digit industry groups taken from the Prowess database[2] provided by the Center for Monitoring Indian Economy (CMIE). The data set is rich and provides heterogeneity across firms and time. Annual financial statements of firms belonging to eight manufacturing industries --namely *Food & Beverages*, *Textiles*, *Chemicals*, *Non-metallic Minerals*, *Metal & Metal Products*, *Machinery*, *Transport Equipment,* and *Miscellaneous Manufacturing* -- have been used. Firm-level data have been transformed into industry-level data by aggregation. This is done for each year over the sample period, 1994-2008. We use the gross value added of the industries as the measures of nominal output, which is deflated by industry specific wholesale price indices (WPI) to obtain output in real terms[3]. The deflator is from the Office of the Economic Adviser (OEA), Ministry of Commerce & Industry, Government of India (http://eaindustry.nic.in/). The series on real capital stock is constructed using the perpetual inventory capital adjustment method as in Levinson and Petrin (2003). We take the initial capital stock equal to its net book value for the year 1994 and the rate of depreciation at 7%, consistent with similar studies for India (Unel, 2003; Ghosh, 2009).

As for labour, Prowess does not provide information on the workforce, but only on wages and salaries. To obtain this information, we used the wage rate (obtained by dividing the total emoluments by the total man days) from the Annual Survey (ASI) database. The number of workers is then approximated by dividing the Prowess information on wages and salaries by the average wage rate obtained previously. Data on other control variables such as trade (export and import) and R&D have also been extracted from the same database. All data series used in the analysis have been deflated with appropriate deflator with base 1994.

For infrastructure, this analysis considers physical infrastructure for the period 1994-2008. It covers transportation (road, rail and air), information & communication technology (*ICT*) and energy sectors. The data sources for these variables are World Development Indicators (WDI) online (2011), and Infrastructure (2009) publications of CMIE (see Table A.1 in *Appendix* 1). Instead of using all infrastructure variables separately, which is likely to lead to multicollinearity, we construct a total and an *ICT* infrastructure index for India by using Principal Component Analysis (*PCA*). For the methodology of construction of both these indices see *Appendix* 2.

3   MEASURING TOTAL FACTOR PRODUCTIVITY (*TFP*) AND TECHNICAL EFFICIENCY (*TE*)

We start our empirical analysis by computing the total factor productivity *(TFP)* of the Indian industries. For this purpose, we follow a two-stage procedure. In the first stage, we construct

---

[2] Prowess Database is online database provided by the Centre for Monitoring Indian Economy (CMIE). The database covers financial data for over 23000 companies operating in India. Most of the companies covered in the database are listed on stock exchanges, and the financial data includes all those information that operating companies are required to disclose in their annual reports. The accepted disclosure norms under the Indian Companies Act, 1956, makes compulsory for companies to report all heads of income and expenditure, which account for more than 1% of their turnover.

[3] We prefer gross value added as a measure of output in computing *TFP*, as it is widely used in the Indian manufacturing sector literature (see Kumar, 2006; Goldar, 2004; Unel, 2003; Ahluwalia 1991; Balakrishnan and Pushpangadan, 1994). There are many advantages of using gross value added over output. *Firstly*, it allows us a comparison between the firms that use different raw materials. *Secondly*, if gross output is used as a measure of output, it adds the necessity of including raw materials, which may obscure the role of labor and capital in the productivity growth (Hossain and Karunaratne, 2004; Kumar, 2006).

Challenges of the Modern World - Contemporary Economy and Globalization

a panel of the eight industries and estimate a basic production function in Cobb-Douglas form:

$$Ln(Q_{it}) = \alpha_1 \ln(K_{it}) + \alpha_2 \ln(N_{it}) + \alpha_3 (T_{it}) + \eta_{it} + u_{it} \qquad (1)$$

where Q, K, and N are the value added, the capital and the labour defined previously (see section 2), for industry i and period t. T_i is the time trend specified for each industry i and α_1, α_2 and α_3 are the parameters to be estimated. The term η_t represents fixed time effects, while ln represents log of the variables. Year dummies are also included in the model.

Equation (1) is estimated using the fixed effect method[4]. Results of estimation are shown in *Appendix 3* (column 1 of the Table A.3). These results are used, in a second step, to calculate the *TFP* of the industries as follows:

$$\ln(TFP_{it}) = \ln(Q_{it}) - \widehat{\alpha_1} \ln(K_{it}) - \widehat{\alpha_2} \ln(N_{it}) \qquad (2)$$

where $\hat{\alpha}_1$ and $\hat{\alpha}_2$ are the estimated parameters of capital and labour, respectively.

To measure the technical efficiency (*TE*) of the Indian manufacturing sector, we estimated the stochastic frontier production function by maximum likelihood (*ML*) method, developed by Battese and Coelli (1992) for panel data. In this model, industry effects are assumed to be distributed as a truncated normal variable, which allows it to vary systemically with time.[5] Specifically, we employ time-varying efficiency model of the stochastic frontier as suggested by Battese and Coelli (1992). The model may be specified as:

$$Q_{it} = \alpha X_{it} + (V_{it} - \mu_{it}) \dots \dots \dots \dots \dots \dots \qquad (3)$$

where Q_{it} and X_{it} are output and inputs in log-form of i-th industry at time t.

Disturbance term is composed of two independent elements, V_{it} and μ_{it}. The former is assumed to be independently and identically distributed as $N(0, \sigma^2_v)$. The element μ_{it} is a nonnegative random variable, associated with technical inefficiency in production, assumed to be independent and identically distributed with truncation (at zero) of the distribution $N(\mu_{it}, \sigma^2_\mu)$. The parameters α s can be obtained by estimating the stochastic production function (3) using a ML technique.

Coelli (1996) utilizes the parameterization of Battese and Corra (1977) to replace σ^2_v and σ^2_μ with $\sigma^2 = \sigma^2_v + \sigma^2_\mu$ and $\gamma = \dfrac{\sigma^2_\mu}{\sigma^2_v + \sigma^2_\mu}$ in the context of ML estimation. The term γ lies between 0 and 1 and this range provides a good initial value for use in an iterative

---

[4] The advantage of the *FE* estimator is that it can handle the issue of omitted variables that may be correlated with the explanatory variables. Also *FE,* to some extent, tackles the endogeneity bias, as well as the problem of non-stationarity because in the estimation for the within form, deviations from the mean are used.

[5] The original model of Battese and Coelli (1992) is for firm level data, whereas we employ the model on industry data. Our working hypothesis is that some industries operate more efficiently than others.

maximization process. Subsequently, the relative technical efficiencies (*TEs*) of each industry can be predicated from the production frontier as follows:

$$TE = \frac{Q_{it}}{\exp(f(X_{it};\alpha))} = \exp(-\mu_{it}) \dots\dots\dots\dots \quad (4)$$

Since μ_{it} is, by definition, a nonnegative random variable, *TE* is bounded between zero and unity, where unity indicates that the industry is technically the most efficient. Our model measuring the efficiency is:

$$\ln Q_{i,t} = \alpha_0 + \alpha_1 LnK_{i,t} + \alpha_2 LnN_{i,t} + \sum_t \lambda_t D_t + (v_{it} - u_{it}) \dots\dots\dots\dots\dots (5)$$

Here D_t is a dummy variable having a value of one for t^{th} time period and zero otherwise and λ_t s are parameters to be estimated. The dummy variable is introduced in the model for the technical change; this is in line with the general index approach of Baltagi and Griffin (1988). The change in λ_t between successive periods becomes a measure of rate of technical change.

$$TC_{t,t+1} = \lambda_{t+1} - \lambda_t \dots\dots \quad (6)$$

This implies that the hypothesis of no technical change is: $\lambda_t = k \,\forall t$.

Using the above model (see equation 5), we estimate the *TE* of the Indian manufacturing. Our dataset for the panel of industries is the same as that used for *TFP* calculations. A Cobb-Douglas form is as well postulated for the purpose of the production frontier. Results of estimation are presented in *Appendix* 3 (column 2 of Table A.3). These results have been used to calculate the *TE* of the industries (as in equation 4).

4   EXPLAINING INDIAN MANUFACTURING PRODUCTIVE PERFORMANCES

After having estimated the *TFP* and *TE* for the manufacturing sector, we turn to explaining the sectors' productive performances. Our empirical model is as follows:

$$X_{it} = \beta_0 + \beta_1 Export_{it} + \beta_2 \, Import_{it} + \beta_3 R\&D_{it} + \beta_4 \, tech_{it} + \beta_5 G_{it} + e_{it} \quad (7)$$

where X is the measure of *TFP* or *TE* and βs are the parameters to be estimated.

Export (*export*) and import (*import)* intensities are calculated respectively as the ratio of export and import of goods to total sales. They are expected to influence positively the firm's productivity and efficiency. A variant of this model has consisted in distinguishing the imported intermediate (*importraw*) and capital goods (*importcap*) from the total imported good. These variables are processed as the ratio of imported intermediate and capital goods to total sales and are expected to improve the industries' productive performances as well. R&D intensity (*R&D*), which is taken as a proxy for research and innovation, is calculated as the ratio of in-house R&D expenditure to total sales. It is also expected to improve the firm's performance. We also consider the intensity of technology transfer (*tech*) measured by expenditure on royalty on technology to total sales. As for R&D, this variable is expected to enhance the industries' performances. Finally, we utilize two measures of public infrastructure: a total infrastructure index (G), and an information & communication technology index (*ICT*) (see Appendix *1* and *2* for details on the infrastructure indicators and

the aggregation method). Both variables are expected to have a positive impact on industries' productivity and efficiency.

We apply the fixed effect (*FE*) model to our panel of eight manufacturing industries. Results are presented in Table 1 for the explanation of *TFP* and in Table 2 for *TE*. Column 1 of Table 1 reports the results pertaining to the impact of import (*import*), export (*export*), and R&D (*R&D*) intensity, as well as total infrastructure availability (*G*) on *TFP*. Findings suggest that infrastructure is the most important determinant of productivity, with an elasticity of 0.109 at the conventional significance level. This can be interpreted as a 1% increase in infrastructure endowments leads to 0.109% growth in *TFP*, which is substantially large. Export intensity (*export*) is also estimated to be statistically significant with a substantial impact on productivity as well (elasticity of 0.099). As for import (*import*) and R&D (*R&D*) intensity, they are not found to be statistically significant.

Column 2 of Table 1 presents the results when total imports are replaced by imports of intermediate (*importraw*) and capital (*importcap*) goods, along with expenditure on royalty for technology transfer (*tech*). Similar as before, results regarding export-intensity (*export*) and infrastructure availability (*G*) are found to be crucial determinants of *TFP* of the industries. As for royalties (*tech*), the impact, though significant, is not sizable. Results fail, as well, to recognize any effect of import intensity (*import*) on productivity, as both imported intermediate (*importraw*) and capital (*importcap*) good variables are estimated to be statistically insignificant.

Columns 3 and 4 display the results when the *ICT* index replaces the total infrastructure index. Findings regarding exports (*export*), imports (*import*), imported intermediate (*importraw*) and capital (*importcap*) goods, R&D intensity (*R&D*) and royalty for technology transfer (*tech*), are very similar to the ones estimated with the total infrastructure index. As for *ICT*, elasticity is found to be statistically significant and varying between 3 to 4 per cent, which is quite sizable.

Table 1: TFP determinants of the Indian manufacturing, 1994−2008 (Authors' estimations)

Variable	Coefficient (1)	Coefficient (2)	Coefficient (3)	Coefficient (4)
C	1.673679** (32.01509)	1.752190** (32.70074)	1.811760** (81.30494)	1.889999** (66.11011)

ICT-index (ICT)			0.041783**	0.029637**
			(4.446658)	(3.384770)
R²	0.623296	0.663626	0.629479	0.669675

Notes: t-values in parentheses. ** indicates statistical significance at 5% level.

In the next stage, the same models are tested for technical efficiency (*TE*). Findings are reported in Table 2. Results of column 1 are very similar to that on *TFP*, as for the total infrastructure index. The impact of export intensity (*export*) is however found to be much lower in that case. The analysis also suggests that import intensity (*import*) has a significant effect on the efficiency of the industries, though not very sizable (elasticity of 0.02). On the contrary, R&D intensity (*R&D*) is not found to having any role in determining *TE*.

In the next estimation, results of column 2 indicate that imported intermediate goods (*importraw)* and direct technology transfer (*tech*) variables display a significant impact on firms' efficiency, although not very sizable either (elasticity of 0.02). Estimations however fail to show a significant role of imported capital goods (*importcap*) on the efficiency. Findings regarding other variables, i.e. infrastructure availability (*G*), R&D (*R&D*) and export (*export*) intensity are very similar to the ones in column 1.

Considering the role of *ICT* in the efficiency movements, it is again found similar to that of *TFP* and it varies from 0.03 to 0.04 (see columns 3 and 4 of Table 2). As for the other variables, conclusions are the same as in column 1 and 2, when estimating the impact of total infrastructure on efficiency.

Overall, our findings validate some of the conclusions of the earlier literature. Regarding infrastructure, in particular, it corroborates the outcomes of Mitra et al. (2002, 2012), Hulten et al. (2006), Sehgal and Sharma (2010). It suggests that, despite a major shift in infrastructure availability and manufacturing performance in India in the recent years, the linkage remains intact and infrastructure is still a major determinant of the manufacturing performance. On the other hand, the results regarding export are important because most of the previous analysis in India failed to find a significant role of this variable (Singh, 2003; Mishra and Sharma, 2011). Our findings thus recognize the hypothesis of *learning-by-exporting* in the case of Indian manufacturing. As for imports (total, intermediate and capital goods), the effects appear uncertain. Our results may suggest that knowledge transfers through exports are more important than through imports. This outcome is similar to that of Sjoholm (1999) for Indonesia. Sjoholm also concluded that imported capital and intermediate goods should be tested separately. Our efforts in that direction, however, failed to bring out any conclusive effect. One explanation can be that the share of imported intermediary and capital goods has not reached a sufficient level to materialize a higher productivity. Not surprisingly, our findings regarding R&D do not validate the impact noted in other studies for India (Raut, 1995; Sharma, 2012). This is understandable, as the Indian firms are known for low R&D intensity. The variable *tech* (technology transfer) being significant, it seems that firms are relying more on this channel than pursuing in-house research and innovation activities.

5   CONCLUSIONS AND POLICY RECOMMENDATIONS

India's economic liberalization in the 1990s provides a rich opportunity to assess the effect of policy reforms on economic performance. Given that one of the main objectives of these reforms was to improve the productivity of the manufacturing sector, the question that we have addressed in this paper is if some of these policy changes have had the expected impact on the Indian firms 'productive performance. In order to do so, we have tested the role of export and import (total, intermediary and capital goods), R&D, technology transfer and infrastructure endowment -- some of the important areas in which the government has shown keen interest during the reform period.

Actually, despite a substantial increase in trade and production following the economic reforms, the manufacturing industry has experienced quite a disappointing productive performance. This situation constitutes a puzzle that the literature has not very well explained until now. One factor suggested in some of the studies relates to the infrastructure deficiency being a serious impediment to the manufacturing performance. Our analysis confirms this view by establishing infrastructure as an important determinant of the manufacturing productivity and efficiency. This is true for a wide range of physical infrastructure, in the field of transport, energy and telecommunication. Our findings confirm as well the results of Mitra et al. (2011) on the productive role of the information & communication technology (*ICT*), which experienced an extensive development over the same period. Actually, despite the recent efforts to modernize the infrastructure sector, bottlenecks still persist as a serious problem in India.

Our empirical work suggests another explanation of the poor manufacturing performances. Trade liberalization is motivated by expected productivity gains coming from an increased competition for domestic firms, as well as knowledge spillover and technology transfer from more developed countries. These gains seem to have imperfectly materialized in the case of

India, since our empirical analysis failed to validate a significant role of total imports, as well as intermediate and capital goods imports, as factors of productivity and efficiency. One explanation of this result can be that the share of import -- intermediate and capital goods specifically -- has not reached a threshold level to materialize into productivity-gains. However, as regards exports, our empirical analysis is more conclusive. Exports exhibit a sizeable impact on firms' productive performances. It appears that the Indian manufacturing sector has benefited more from knowledge transfer through exports than through imports. Our findings thus validate not only the hypothesis of learning-by-exporting, extensively debated in the literature, but also the incitation to be more productive due to competition in the foreign market.

Another result of our empirical work concerns R&D which does not appear to be a significant determinant of productivity. This outcome, consistent with other studies, does not look surprising as Indian firms are known for low R&D activities, despite the recent efforts of the government to stimulate in-house R&D. This conclusion is supplemented by our results on technology transfer, which turns out to be significant in explaining firms 'productive performances. This finding tends to show that firms in India rely more on this channel than on pursuing in-house research and innovation, limiting their ability to be competitive in the medium-long run.

Like most other developing countries, India is increasingly concerned about improving productivity and competitiveness as the country faces the intensified pressure of globalization. As per our results, enhancing total and ICT infrastructure could help the manufacturing sector to resist international competition and reinforce the industrial export capacity of the country. Reducing infrastructure bottlenecks, by leading to a rise in productivity, would also help the manufacturing sector to diversify an grow. Low in-house R&D represents lack of innovation necessary to grow and become competitive. Our results also suggest that export liberalization constitutes another means of boosting the productivity and efficiency of the industries. This policy needs to be continued since Indian manufacturing is still not well integrated with the world economy. As for import liberalization, although our empirical work did not validate its impact on firms' productive performance, our findings call for more investigation on the subject since import intensity, of intermediate and capital good in particular, may have not reach a level at which competition, knowledge spillover and technology transfer can play a crucial role in augmenting productivity growth .

APPENDICES

APPENDIX 1: Infrastructure Variables (Sources Of Data)

Variable	Sector	Indicator	Data sources
Air	Transportation	Air transport, passengers carried	WDI
Electricity	Electricity	Electricity production (kWh/per-capita)	WDI
Internet	Information and Communication	Internet users (per 100 people)	WDI
Mobile	Information and Communication	Mobile cellular subscriptions (per 100 people)	WDI
Tel.	Information and Communication	Telephone lines (per 100 people)	WDI
Mobile-tel.	Information and Communication	Mobile and fixed-line telephone subscribers (per 100 people)	WDI
Port	Transportation	Port (commodity wise traffic , 000 tones)	CMIE
Rail-goods	Transportation	Railways, goods transported (million ton-km)	WDI
Rail-pass	Transportation	Railways, passengers carried (million passenger-km)	WDI
Roads	Transportation	Roads, total network (km/1000people)	WDI

APPENDIX 2: Total And Ict Composite Infrastructure Indicators

The Principal Component Analysis (*PCA*) methodology is a widely used aggregation technique, designed to linearly transform a set of initial variables into a new set of uncorrelated components, which account for all of the variance in the original variables. Each component corresponds to a virtual axe on which the data are projected. The earlier component explains more of the variance of the series than do the later component. The number of components is proportional to the number of initial variables that are used in the *PCA*. Usually, only the first components are retained, because they explain most of the variance in the dataset. The cumulative R^2 gives the explanatory power of the cumulative components.

In order to construct a composite total infrastructure index for India, we apply the Principal Component Analysis (*PCA*) to our nine infrastructure indicators. The results bring out one significant component and this component explains 90 % of the variance in the underlying individual indicators (see Table A.2.1.). In the next stage, on the basis of the results of the *PCA*, the factor loadings of the initial variables are used as weights of the respective variables in constructing the composite infrastructure index (see Table A.2.2.). For more details on the aggregation method using Principal Component Analysis (*PCA*), see Nagaraj *et al.* (2000) and Mitra *et al.* (2002).

Table A.2.1: Principle component analysis: Total infrastructure indicator (G) (1994 to 2008) (Authors' calculation)

	Eigenvalue	Proportion
P1	**7.25486****	**0.9069**
P2	0.561524	0.0702
P3	0.128091	0.0160
P4	0.03333	0.0042
P5	0.009241	0.0012
P6	0.007714	0.0010
P7	0.004457	0.0006

Table A.2.2: Factor loadings: Total infrastructure indicator (G) (Eigenvectors) (Authors' calculation)

	P1
Air	0.3391
Internet	0.3454
Rail-goods	0.3587
Rail-pass	0.3688
Roads	0.3063
Electricity	0.3694
Mobile-Tele	0.3679
Port	0.3681

Using the same methodology as for the composite total infrastructure index, an *ICT* index (*ICT*) is also constructed in this study. The result of the *PCA* for this sector suggests as well the presence of one significant component, which explains 94 % of the variance in the individual *ICT* indicators (see Table A.2.3). On the basis of the factor loadings, the weights are assigned to the respective variables for constructing the *ICT* index (see Table A.2.4).

Table A.2.3: Principle component analysis: ICT infrastructure indicator (ICT) (1994 to 2008) (Authors' calculation)

	Eigenvalue	Proportion
P1	2.8351**	0.9451
P2	0.15522	0.0517
P3	0.00959	0.0032

Table A.2.4: Factor loadings: ICT infrastructure indicator (ICT) (Eigenvectors) (Authors' calculation)

	P1
Internet	0.5908
Mobile	0.5762
Tele	0.5647

Challenges of the Modern World - Contemporary Economy and Globalization

CITIZENS AS CONSUMERS: PROFILING E-GOVERNMENT SERVICES' USERS IN EGYPT VIA DATA MINING TECHNIQUES

Mohamed M. Mostafa

Gulf University for Science and Technology, West Mishref, Kuwait
moustafa.m@gust.edu.kw

ABSTRACT

This study uses data mining techniques to examine the effect of various demographic, cognitive and psychographic factors on Egyptian citizens' use of e-government services. Multi-layer perceptron neural network (MLP), probabilistic neural network (PNN), classification and regression trees (CART), and multivariate adaptive regression splines (MARS) are compared to a standard statistical method (linear discriminant analysis (LDA). The variable sets considered are sex, age, educational level, e-government services perceived usefulness, ease of use, compatibility, subjective norms, trust, civic mindedness, and attitudes. The study shows how it is possible to identify various dimensions of e-government services usage behavior by uncovering complex patterns in the dataset, and also shows the classification abilities of data mining techniques.

1   INTRODUCTION

One of the most intractable problems for anyone dealing with government is the sheer complexity of its organizational structure. For example, it has been estimated that the average government has between 50 and 70 different departments, agencies and regulatory bodies (Silcock, 2001). A number of government's different agencies may be involved in simple matters such as registering the birth of a child. In several countries there has been a growing pressure for governments to move online. In the Arab world, Dubai pioneered e-voting in elections for half the members of the United Arab Emirates' consultative assembly (The Economist, 2008). In Bahrain the e-government authority of Bahrain (E-GA) has recently launched the Enterprise Architecture Project initiative (EAP), which is considered to be the first of its kind in the Arab world. The initiative aims at streamlining government procedures by unifying the standards and procedures among all government entities in all matters related to information communication technology (Bahrain Tribune, 2009). Finally, in Egypt e-government currently provides 85 services to citizens including government forms, public policy information and tax filing (Hamed, 2008). Two main reasons are behind governments' decision to move online. First, a more enlightened view has begun in the ranks of government to treat the citizen like a consumer where transaction satisfaction is important. Second, pressures for governments to do more with less will force governments to provide services in a more efficient way. In fact, e-government offers substantial performance gains over the traditional model of government. For example, based on the analysis of 49 empirical studies, Danziger and Andersen (2002) concluded that there were positive e-government impacts on data access and efficiency and productivity of government performance in both internal operations and external service functions. In fact it has been argued that a significant portion of the benefits created by e-government services are obtained by the government itself in terms of efficiency gains (Tung and Rieck, 2005). For example, the U.S. government generates around US\$ 3 billion on its Web site (Clark, 2003).

Profiling e-government services users is very important because the first step in planning the target marketing strategy is to segment the market and develop profiles of the resulting market segments. In fact, the usefulness of market segmentation hinges upon accurate profiling.

2 LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

2.1 Perceived usefulness
The perceived benefit factor is closely related to perceived usefulness in the TAM theoretical model. Raman and Leckenby (1998) used the concept of utilitarianism to explain online behavior. They found a positive link between utilitarianism and duration of visit of web ads. This construct, too, seems to be closely related to perceived usefulness identified in TAM. Rogers (1995), in his diffusion of innovation paradigm, also posits that the perceived benefit or relative advantage of innovation positively influences adoption rate. In a meta-analysis in the innovation research literature, Tornatzky and Klein (1982) concluded that relative advantage was positively related to adoption. In a similar vein, King and He (2006), in a meta-analysis of the TAM, found a strong positive link between perceived usefulness and behavioral intention ($\beta = 0.505$). It follows that

H1: perceived usefulness of e-government services positively influences users' intention to use these services.

2.2 Perceived ease of use
Perceived ease of adoption can affect adoption behavior since an innovation that is easy to use can considerably reduce the time and effort required by the user and, thus, increase the likelihood of adopting the technology. Most studies on technology acceptance showed that perceived ease of use directly influenced attitude towards use (e.g., Ahn et al., 2004; Bruner and Kumar, 2005; Chen et al., 2002). King and He (2006), in a meta-analysis of the TAM, found a strong positive link between perceived ease of use and behavioral intention ($\beta = 0.186$). In a study of technology adoption in government agencies, Gilbert, Balestrini and Littleboy (2004) found a statistically significant association between perceived ease of use and attitude, indicating the important role of the ease of use in the formation of users' attitudes. It follows that

H2: perceived ease of use of e-government services positively influences users' intention to use these services.

2.3 Compatibility
Prior studies indicated that compatibility had strong direct impact on behavioral intention in areas such as using group support systems (Van Slyke et al., 2002), adopting new methodology for software development (Hardgrave et al., 2003) and using university smart card systems (Lee and Cheng, 2003). In a recent study of e-payment adoption in China, He et al. (2006) found that only compatibility has a significant effect on respondents' intention to adopt the system. Compatibility may also influence behavioral intention through performance expectancy and effort expectancy (Schaper and Pervan, 2007). For example, Lee and Cheng (2003) showed that compatibility of telemedicine technology exerted a significant effect on perceived usefulness. It follows that

H3: perceived compatibility of e-government services positively influences users' intention to use these services.

2.4   Subjective norms

Subjective norm (also called social norm) refers to users' perception of whether other important people perceive they should engage in the behavior (Schepers and Wetzels, 2007). While TAM does not include subjective norm, the theory of reasoned action (TRA) identifies attitudes and subjective norms as the sole determinants of behavioral intention (Fishbein and Ajzen, 1975). The theory of planned behavior (TPB), an update of TRA, also included subjective norms. Venkatesh and Davis (2000) acknowledged this and updated the TAM (TAM2) by integrating subjective norms. Several studies found a positive relationship between subjective norms and behavioral intention (e.g. Yi et al., 2006; Lu et al., 2009). In a study examining culture-specific enablers and impediments to the adoption and use of the Internet in the Arab world, Loch et al. (2003) found that both social norms and the degree of technological culturation can impact the individual and organizational acceptance and use of the Internet. It follows that

H4: subjective norms positively influence users' intention to use e-government services.

2.5   Trust

Prior empirical research incorporated trust into TAM in several ways. For example Shih (2003) extended TAM by adding the perceived Web security construct and found that high perceived Web security directly increases consumer attitudes towards e-shopping. Results also support trust as an antecedent of usefulness (Pavlou, 2003), ease of use (Pavlou, 2003), attitude (Chen and Tan, 2004), and behavioral intention (Pavlou, 2003). Few studies explored the role of trust in e-government adoption. For example, Kim et al. (2008), found that trust in the organization using the technology and trust in government as responsible for the introduction of electronic services are important determinants of e-government services adoption. It follows that

H5: trust in e-government systems positively influence users' intention to use e-government services.

2.6   Civic mindedness

The concept of civic mindedness is central to any analysis of e-government services adoption (Dermody and Hanmer-Lloyd, 2004). Civic mindedness encompasses three aspects: social contact, prior interest in government, and media use for public affairs (Dimitrova and Chen, 2006). As cyberdemocracy represents an extension of democracy into the realm of information technology and electronic communication, it is expected that the use of electronic means by citizens to interact with government to be an extension of their civic and political involvement via traditional channels (Katchanovski and La Porte, 2005). Prior research on e-government suggests that e-government users are similar to those who use government traditional services and are more engaged in civic affairs (Dimitrova and Chen, 2006). It follows that

H6: civic mindedness positively influences users' intention to use e-government services.

2.7   Attitudes

The social psychology literature on behavioral research has established attitudes as important predictors of behavior, behavioral intention, and explanatory factors of variants in individual behavior (Kotchen and Reiling, 2000). Attitude is defined as an individual's overall

evaluation of performing a behavior (Lu et al., 2009). Prior e-services research has established a positive link between attitudes and behavioral intention (e.g., Aggelidis and Chatzoglou, 2009; Agarwal et al., 2000). It follows that

H7: attitude towards e-government services positively influences users' intention to use e-government services.

3 METHOD

3.1 Sample
The empirical study involved the administration of self-completion questionnaire to citizens in three Egyptian cities. Data were collected using the drop-off, pick-up method (Craig and Douglas, 1999). The effective sample size, thus, was 776 with a response rate of 52%.

3.2 Measures
All questionnaire items, originally published in English, were translated into Arabic using the back translation technique (Brislin, 1986).

4 RESULTS
To compare e-government services users and non-users the traditional LDA was used using the SPSS 16.0 package. In order to assess the overall fit of the discriminant function classification results were examined. In combination, the discriminant function achieved 94.3% classification accuracy.

Given its usefulness in data mining (Smith and Gupta, 2000), MLP is a logical choice for the problem studied here. Following Lim and Kirikoshi (2005), a quasi-Newton algorithm with weight updates occurring after each epoch was used for MLP training. The learning rate was set at 0.1. After 100 iterations the correct classification rate (CCR) reached 99.8% as seen in Figure 1. As can be observed, the MLP classifier predicted training sample with 99.8% accuracy and validation sample with 98.3% accuracy.
Figure 1: Correct classification rate (CCR) for the MLP neural network

The PNN classifier predicted both training and testing samples with 100% accuracy.

CART is a nonparametric technique developed by Breiman et al. (1984) to classify group observations based on a set of characteristics into distinct groups, using the decision tree methodology. The technique was introduced to overcome the inherent limitations in the automatic interaction detector (AID) and the chi-square automatic interaction detector (CHAID) techniques. Unlike AID or CHAID, CART can work in classification tree mode withy categorical predictor variables, or in regression tree mode with interval or ratio scaled predictors. CART recursively splits a dataset into non-overlapping subgroups based on the independent variables until splitting is no longer possible (Baker and Song, 2008).

Following D'Alisa et al. (2006), the 10-fold validation approach with re-substitution was adopted. This consists of simulating 10 different samples by subtracting randomly each time 10% of the subjects and duplicating randomly another 10%. After each run, the original sample is restored. The final tree represents the best trade-off between variance explanation and variance stability across 10 "different" samples. Overall correct classification rate obtained from CART was 99.48%. Figure 2 depicts the final obtained pruned CART tree. From this figure we see that trust in e-government systems plays the most important role in rule induction.

MARS is a relatively novel data mining technique developed by Friedman (1991). This technique combines classical linear regression, mathematical construction of splines and binary recursive partitioning to produce a local model where the relationship between response and predictors are either linear or nonlinear through approximating the underlying function through a set of adaptive piecewise linear regression termed basis functions (BF) (Jesus and Angel, 2004). The power of MARS for building prediction and classification models has been demonstrated in many applications such as information technology productivity studies (Ko and Osei-Bryson, 2006), and genetics (York and Eaves, 2001). In this study we used MARS 2.0 package (Steinberg et al., 1999) to conduct the analysis. Overall correct classification rate obtained from MARS was 99.10% (sensitivity = 0.931 and specificity = 0.997).

5 HYPOTHESES TESTING

Group means for user and non-user groups on each of the independent variables used in the LDA were first calculated. Given the unequal group sizes of user versus non-user groups, group specific covariance matrices were used. Review of the significance levels of the individual attributes revealed that all the attributes except demographic variables displayed significant differences between the group means. Our results confirm previous studies which found e-government usage behavior to be correlated with perceived usefulness, ease of use, compatibility, trust, subjective norms and favorable attitudes to use the system (e.g. Helbig et al., 2009). For example Gilbert et al. (2004) found that trust is one of the strongest predictors of willingness to use e-government services.

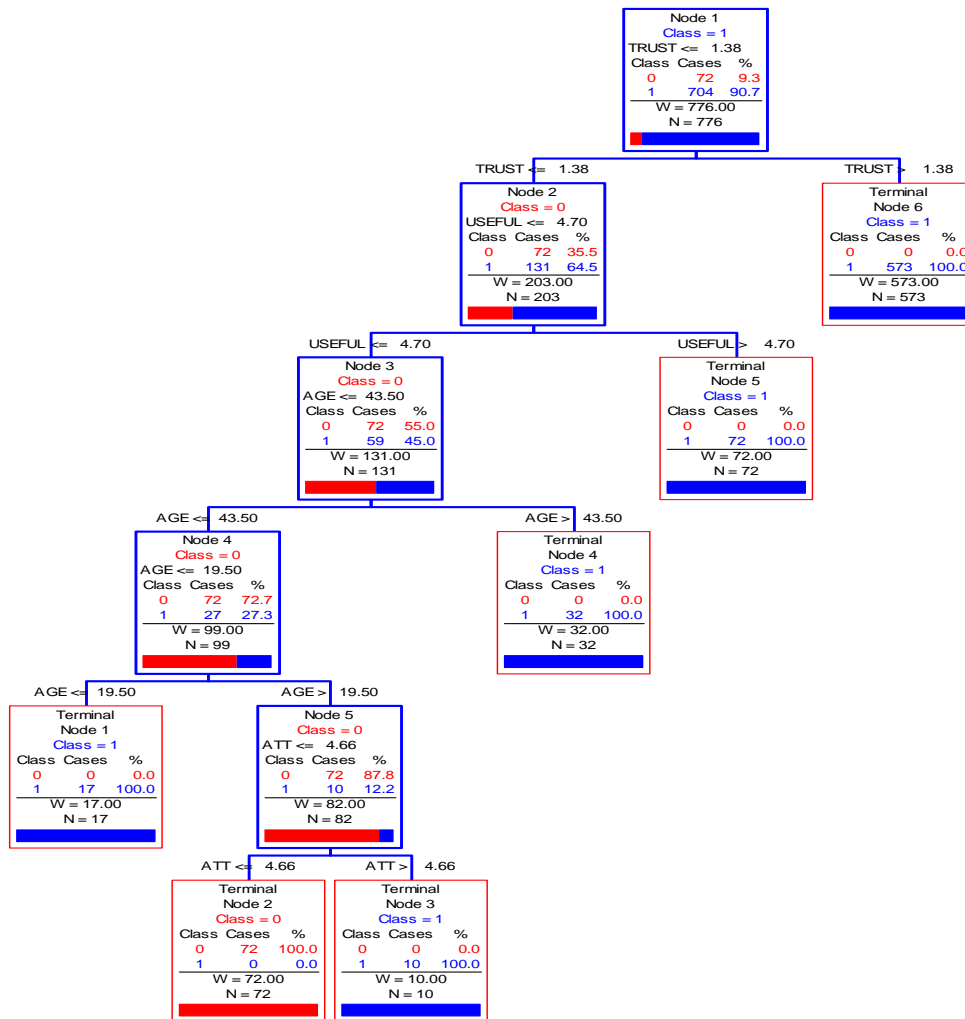
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 2: CART decision tree of e-government services' users

The finding that subjective norm is significant in predicting e-government services usage is consistent with Hofstede's (1991) cultural dimensions. In a high power distance collectivist culture such as Egypt one would expect significant others' opinions to have more impact on the individual because of face saving and group conformity, also a higher power distance would invoke a more influential role of peers.

It should be noted that we tested the research hypotheses using LDA as data mining techniques are of limited ability to statistically test and interpret hypotheses concerning the roles of specific variables that are included in the models as predictors. However, this limitation "should not be a serious drawback if one simply desires classification from the model" (Swicegood and Clark, 2001, p. 176).

6 IMPLICATIONS

The results of this study have several important implications for both theory and practice. From a theoretical perspective, the superior performance of data mining techniques found in this study confirms the theoretical work by Hecht-Nielson (1989) who has shown that machine learning techniques, such as neural network models, can learn input-output relationships to the point of making perfect forecasts with the data on which the model is

trained. However, perfect forecasts with the training data do not guarantee optimal forecasts with the testing data due to differences in the two data sets. Our results also corroborate the findings of other researchers who have investigated the performance of machine learning techniques compared to other traditional statistical techniques, such as regression analysis, discriminant analysis, and logistic regression. For example, in a study of clinical diagnosis of cancers, Shan et al. (2002) found a hit ratio of 85% for the PNN model compared to 80% for the LDA model. In a study of credit-scoring models used in commercial and consumer lending decisions. Trust was found to be one of the most important factors in determining e-government services usage. Because governmental agencies may be required by law to share information with other agencies, the need for trust in the maintenance of accurate citizen information will increase. Thus, a strategic aim could be to develop a trustworthy relationship with the public, giving assurances that their data will be secure, and that the information contained on the Web would be both current and accurate. This can be done through tools and techniques that Web developers can use to increase and promote the security of e-government Web sites, such as firewalls and encryption technology. Therefore, e-government services need to be user-friendly, and citizens need to have confidence in the system. In this process, the government need to be careful to protect its brand and credibility.

URBAN FORM AND SUSTAINABLE DEVELOPMENT: THE CASE STUDY OF TEHRAN CITY

Seyyed Mohammad Mousavi
Islamic Azad University, Faculty of Humanities and Social Sciences, Science and Research branch, Department of Geography and Urban Planning, Iran
mousavi.seyyed.mohamad@gmail.com

Asghar Nazarian
Islamic Azad University, Faculty of Humanities and Social Sciences, Science and Research branch, Department of Geography and Urban Planning, Iran

ABSTRACT
The sprawl phenomenon has caused unsustainable urban development and economical, social and environmental problems. The purpose of this research is to analyze the urban model of Tehran city to achieve a sustainable form. Region 21 of Tehran city is considered for the analysis as one of the most critical regions subject to urban sprawl. A new approach is proposed to achieve urban sustainability and to prevent the urban sprawl phenomenon. The study is applied and the survey method is descriptive– analytic. Shanon entropy, Holdren, Moran and Geary's coefficients were used to analyze the urban growth pattern. Based on the results of the Holdren model, the portions of the population growth and the horizontal and urban sprawl in urban growth were 59% and 41%, respectively. The Shanon entropy value was 1.3738 in 1989 and the maximum value was 1.3862. This was 1.3231 in 2007 that indicates the physical development was sprawl and uncondensed during the past 20 years. The results indicate that decentralized compactness with emphasis on urban smart growth strategies is the best pattern for spatial-anatomical development of Tehran in future.

Keywords: Case study, Holdren model, Planning, Sprawl, Sustainable development, Tehran

1 INTRODUCTION

After the industrial revolution, cities have been attracted large percentage of the population of the world. For the first time in history, the urban population has been equaled the rural population. During the period of 1990 to 2030, the population of urban areas will equal to 3.3 billion of which 90% will be resided in urban areas of developing countries (Flood, 1997). Actually the average urban population growth will be faster in developing countries. During the past 50 years from 1975 to 2025, this ratio will be 3.21 for developing countries and 0.71 for developed countries. The increasing development of urban society, affected by population growth and migration, eventuates the construction without planning and non-harness expansion of cities (Barton et al., 2003). In Iran, many activities took place for physical changes in cities after the reign of Reza Shah Pahlavi (Mashhadi Zadeh, 1999). As the first action, Pahlavi's government decided to change the city structure with the belief that the anatomical changes will cause fundamental and content changes and will provide the required pattern from spatial- anatomical changes of 19th century (industrial city). Therefore, in this period, for the first time in urbanism and urbanization of the country, the government decided to change the face and organization of the city not on the basis of inner evolution and thought but on the basis of external thoughts and changes (Zebardast and Habibi, 2009). After 1960, the population of the cities grew very rapidly due to high natural growth and migration of villagers to the cities. Growth of the cities anatomy and construction was not based on the need, but on the speculation and land trade. It caused chaos of the urban land market and

negative demand of urban sprawl and made a wide range of the urban areas unusable (Athari, 2000). In recent years, similar to other major cities of the country, Tehran has grown rapidly and unbridledly due to natural population growth, immigrations, and expansion of services. Having a political identity as the capital, giving land by various government agencies, construction programs in country, social-economical and political changes and conducive environmental conditions have resulted in notable population and anatomical changes of Tehran. Consequently, its population grew from 2 million to 8 million between years of 1952 to 2011.

The area of Tehran has been a nearly five-fold increase during twenty years and now it is over 700 km^2. Rapid urbanization development and existence of enough lands and lack of directional strategy caused urban sprawl. Nowadays, the consequences of this development are lack of lands, chaos of city appearance, traffic congestion, conversion of agricultural lands to residential and industrial spaces, imponderable construction, and destruction of urban facilities and natural features in Tehran and its countryside. The main purpose of this study is to analyze the urban sprawl in region 21 of Tehran, as major sample for the sprawl phenomenon. In order to analyze the urban growth pattern, Shanon entropy, Holdren, Moran and Geary models were considered. Finally, a new approach is presented to achieve urban sustainability and to prevent the urban sprawl phenomenon.

2 LITERATURE REVIEW

The word sprawl has been used to explain the urban environment since the mid 20th century when expansion of urban areas flourished in USA due to uncontrolled use of personal automobile and expansion of highway system (Hess, 2001). The word sprawl refers to the insatiable use of land, continuous monotonous development, leapfrog discontinuous development and inefficient use of land (Peiser, 2001). This phenomenon is caused by population growth, abundance of land, decentralization of occupation, priorities of housing, destruction of the city center, development of transportation, and public policies of governments (Saeedi Rezvani and Khastoo, 2007). Urban horizontal development causes: excessive consumption of energy, reduction of regional open space, much spread of city toward out of the city, node development of city, increasing of intra-urban trips, overusing of private vehicles, high tax differences between different places, destruction of agricultural lands, ecological pollution of lakes and gulfs (Miller and Hoel, 2002). Some major studies in the field of urban sprawl are as follows:
Ewing (1997) extensively reviewed the literature on characteristics, causes and costs of alternative development pattern. Ewing et al. (2002) presented sprawl measures for 83 of the largest metropolitan areas in the United States. They examined the relationships between urban sprawl and transportation-related measures, including vehicle miles traveled, traffic fatalities, the extent of walking and public transit use, roadway congestion and air quality. Bruckner and Kim (2003) investigated possible source of urban sprawl arising from the institutions of local public finance. In particular, Bruckner and Kim (2003) explored the connection between urban spatial expansion and the property tax. Galester et al. (2004) studied sprawl in eight aspects: density, continuity, concentration, clustering, centrality, dependence on the center, combination of using and adjacency.

In survey of horizontal urban development in Iran, Taghvayee and Sarayee (2004) concluded that excessive supply and incorrect beneficiary of land caused a large area with the most appropriate facilities to be unused and inactive in Yazd city. While urban area is increasing permanently, ancient and historical buildings are evacuated. Taghvayee and Sarayee (2004)

showed that half of the area of Yazd city is useless and the city has no need for increasing in extent for the next 25 years. In analysis of sprawl of city of Zanjan, Zebardast and Habibi (2009) concluded that this city has been rapidly developed in recent years. They identified four factors of density, combination of using, centralism and access as expressive factors of sprawl. The central areas of city have the lowest rate of sprawl and the more distance from city center causes more sprawl. Recently, Mobaraki et al. (2012) identified the urban model of Urmia City to achieve a sustainable form. It was found that the model of urban growth of Urmia City is sprawl.

3   RESEARCH METHODOLOGY

The research is applied and the survey method is descriptive–analytic. Quantitative models of urban planning have been used in recognition of urban growth pattern. Needed data and information have been collected by library studies, field research, comprehensive plans, and different organizations. The data was analyzed by MATLAB and Excel.

4   CASE STUDY: REGION 21 OF TEHRAN

The region 21 of Tehran with a population greater than 200000 is spread in top end of western Tehran along Tehran-Karaj communication road. It is limited to Tehran-Karaj highway from north, old road of Tehran-Karaj from south, Kan stream and north- south along the highway and Karaj old road from east and west, respectively. Region 21 is adjacent to region 22 from north, regions 5 and 9 and 18 from east, Karaj City from west and south of Tehran green belt and Shahriar city from south. It covers a triangular measuring 51.56 km^2 in area that is 8.7% of the total area of Tehran and it is one of the largest regions of Tehran. Region 21 was a part of region 9 that was isolated from it in 2004 and now it consists of three districts. Border of district 1 and 2 is Azadegan highway and the border of district 2 and 3 is Iran Khodro Street. Northern and southern borders of all three districts are Karaj highway and old road. The areas of district 1, 2 and 3 are15.749 km^2, 17.458 km^2 and 18.61 km^2, respectively. These are divided into three equal parts roughly. Figure 1 shows the map of region 21 in Tehran with separated districts.
Figure 1: Map of region 21 in Tehran with separated districts

In the present situation, residential zone, commercial-service zone, production- workshop zone, protected zone, military zone and barren zone within the area are identified. The ratios of production- workshop zone area, military zone area, residential zone area, protected zone

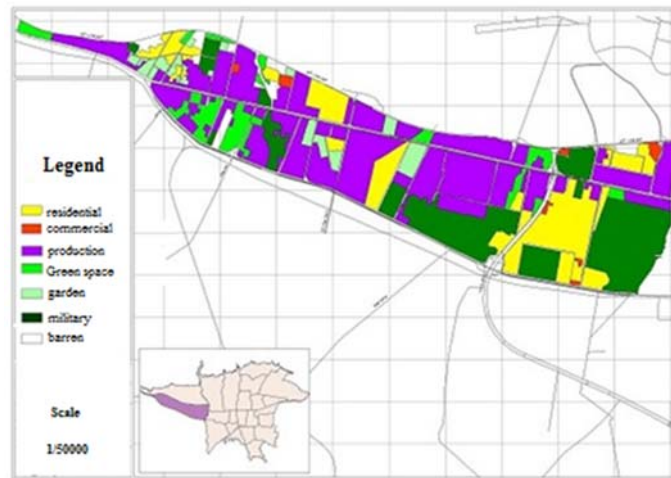
area, commercial-service zone area, barren zone area and the other cases are 39.4%, 22%, 16.5%, 9.6%, 0.9%, 2.2% and 9.3%, respectively (See Figure 2).


Figure 2: Zoning map of land using in region 21

5   RESULTS AND DISCUSSION

5.1   Identification of urban growth pattern of region 21 of Tehran with quantitative models

Recently, quantitative methods have been considered essential tools for systematic classification and analysis of patterns of urban growth. Therefore, different methods and models have been proposed by researchers in this field. In this study quantitative models have been used to determine the pattern of urban growth in Tehran and its region 21.

5.1.1   Shanons Entropy Model

This model is used to analyze and identify the amount of urban sprawl. The structure of the model is as below:

$$H= -\sum_{i=1}^{n} Pi \times Ln(Pi) \tag{1}$$

where H is the amount of Shanons Entropy, pi is the ratio of built-up area of zone i to sum of built-up areas for all zones and n is total number of zones. The value of Shanons Entropy is between 0 and Ln(n.) If the distribution is very compact then the entropy value would be closer to 0 and when the distribution is very dispersed the value will be closer to Ln(n). Large value of entropy indicates the occurrence of urban sprawl (Hekmatnia and Moosavi, 2006). Table 1 presents the calculation of Shanons Entropy for region 21 of Tehran.

Table 1: Calculation of Shanons Entropy in region 21

Zone	Built-up area(Hectare)	Pi	Ln(Pi)	Pi×Ln(Pi)
1	1504.04	0.3067	-1.1818	-0.36248
2	1694.87	0.3457	-1.0621	-0.3672
3	1703.46	0.3474	-1.0572	-0.3673
Total	4902.37	1	-3.3013	-1.0969

Challenges of the Modern World - Contemporary Economy and Globalization

As shown in Table 1, the value of entropy is 1.0969 and Ln(3)=1.09861. The value close to Ln(3) indicates the occurrence of urban sprawl in region 21.

5.1.2 Gini coefficient

The Gini coefficient measures the inequality among values of a frequency distribution and occupation in different areas of a metropole. This coefficient can theoretically range from 0 to 1. Low Gini coefficient indicates a more equal distribution, with 0 corresponding to complete equality, while higher Gini coefficients indicate more unequal distribution, with 1 corresponding to complete inequality. The Gini coefficient is calculated as below:

$$Gini = 0.5 \sum_{i=1}^{N} |x_i - y_i| \tag{2}$$

where N is the number of regions, xi is the ratio of area of zone i to sum of areas for all zones and yi is the ratio of population or occupation of zone i to sum of areas for all zones. Table 2 shows that population, occupation and areas of zones of region 21 of Tehran.

Table 2: Population, occupation and areas of zones of 21 region

Zones	Area	Occupation	Population
1	15749	22493	105875
2	17458	3828	18995
3	18610	6283	26995

For population:
Gini = 0.5∑(0.3-0.7)+(0.34-0.13)+(0.36-0.18)=(0.4)+(0.21)+(0.18)=0.5×0.79=40
For occupation:
Gini = 0.5∑(0.3-0.69)+(0.34-0.12)+(0.36-0.19)=(0.39)+(0.22)+(0.17)=0.5×0.78=39
According to the results, the population and occupation distribution is unequal.

5.1.3 Holdren Model

It is one of the main methods for identifying unequal urban development. John Holdern in 1991 used a method for identifying the ratio of sprawl urban growth and population growth. This model shows that how much of the urban growth is caused by population growth and how much is caused by unequal urban development. It is formulized as below:

$$a = \frac{A}{P} \tag{3}$$

where a is per capita gross, A is area and P is population. And

$$A = P \times a \tag{4}$$

If in Δt time period the population increasing is ΔP, total urban lands increasing is ΔA:

$$A + \Delta A = (P + \Delta P) \times (a \times \Delta a) \tag{5}$$

The area's change of lands ($\Delta A / A$) that has been converted to city in Δt time period is calculated as below:

$$\frac{\Delta A}{A} = \left(\frac{\Delta P}{P} + \frac{\Delta a}{a}\right) + \left(\frac{\Delta P}{P} \times \frac{\Delta a}{a}\right) \tag{6}$$

Hence, the percentage of city area growth is equal to sum of population growth and GDP per capita growth percentage. Therefore, the land growth share is obtained as below:

$$Land\ Growth\ Share = \frac{Total\ percentage\ of\ population\ growth}{Total\ percentage\ of\ land\ area\ growt} \tag{7}$$

$$Land\ Growth\ Share = \frac{Total\ percentage\ of\ land\ using\ per\ capita\ growth}{Total\ percentage\ of\ land\ area\ growt} \tag{8}$$

Holdren presented a general model of growth for completion of his model based on the population growth model:

$$P_{(T)} = P_0 \left(1 + g_p\right)^t \tag{9}$$

where $P_{(t)}$ is population in time t, P_0 is initial population and g_p is amount of population growth in specified time period. g_p is obtained from the following formula:

$$Ln\left(1 + g_p\right) = \frac{1}{t} Ln\left(\frac{P_{(T)}}{P_0}\right) \tag{10}$$

Since Ln(1+x)= x for little values of x:

$$g_p = \frac{1}{t} Ln\left(\frac{P_{(T)}}{P_0}\right) \tag{11}$$

Also, the amount of land area growth (A) and land using per capita growth (a) are obtained as below:

$$g_A = \frac{1}{t} Ln\left(\frac{A_{(T)}}{AP_0}\right) \tag{12}$$

$$g_a = \frac{1}{t} Ln\left(\frac{a_{(T)}}{a_0}\right) \tag{13}$$

Consequently, based on the population growth rate, the Holdren model is:

$$g_p = g_a = g_A \tag{14}$$

with combination of the above three equations, we have:

$$Ln\left(\frac{End\ period\ population}{Beginnig\ period\ population}\right) + Ln\left(\frac{End\ period\ capital\ gross}{Beginnig\ period\ capital\ gross}\right) = Ln\left(\frac{End\ period\ urban\ area}{Beginnig\ period\ urban\ area}\right) \tag{15}$$

Therefore,

$$Ln\left(\frac{157939}{188890}\right) + Ln\left(\frac{362.51}{278.14}\right) = Ln(\frac{7992}{3128})$$
(-0.178) + (0.2649) = 0.9380
-0.178 + 0.2649 = 0.0869
$$Ln\left(\frac{(-0.178)}{0.0869}\right) + Ln\left(\frac{0.2649}{0.0869}\right) = Ln(\frac{7992}{0.0869})$$
-2.0483 + 3.048 = 1

Thus, -2.0483% of physical growth of region 21 between 1988 and 2008 was caused by population and 3.048% of urban development was portion of urban sprawl. Actually the growth of region 21 was urban sprawl completely.

5.1.4 Degree of aggregation model

This model determines concentration degree of population and occupation or compression ratio and distribution based on spatial structure. Moran and Geary coefficients are used to measure the degree of aggregation. The Moran coefficient is defined as below:

$$Moran = \frac{N \sum_{i=1}^{N} \sum_{i=1}^{N} w_{ij}(x_i - x)(x_i - x)}{\sum_{i=1}^{N}\left[\sum_{j=1}^{N} w_{ij}(x_i - x)^2\right]} \qquad (16)$$

where N is number of zoness, x_i and x_j are population or occupation in zones i and j, x is mean of population or occupation and w_{ij} is weight between i and j. Moran coefficient is between -1 and 1. In the calculation of weighted value between two zones that have a direct relationship or common weight, weight coefficient is considered 0 (zero). The Moran coefficient has a range between -1 and +1. A value of +1 indicates totally monopole model, 0 shows random or multi polar aggregation model and -1 shows the checker model of development. The higher the value of this coefficient, the higher the aggregation while the lower the value of this coefficient the lower the aggregation (higher sprawl) (Cliff and Ord, 1981).

The Geary Coefficient is like the Moran coefficient. However, instead of giving emphasis to the mean deviation, it evaluates the difference of each zone in the relationship with another zone. The coefficient is as follows:

$$Geary \frac{(N-1)\left[\sum_{i=1}^{N} \sum_{j=1}^{N} wij(xi-x)2\right]}{2(\sum_{i=1}^{N} \sum_{j=1}^{N} wij) \sum_{i=1}^{N}(xi-x)2} \qquad (17)$$

Where N is the number of zones, Xi zone j's population or occupation, X average population or occupation and Wij the weight between zones i and j. Geary coefficient is between 0 and 2. The lower value indicates more concentration and higher value indicates more urban sprawl.

There are two techniques to calculate Moran coefficient. In first technique the weighting is based on common borders so that the weight of two zones with common border is 1 and the weight of two borders without common border is 0. Second technique is based on measurement of common border. The measured value is compared with total common border to calculate the weights of different zones. Gray coefficient is another method for measuring the concentration and distribution amount. In the Geary Coefficient calculation procedure,

both weighting techniques are used and also an adjacent coefficient is used for scale equality with Moran coefficient. Table 2 presents the Moran and Gray coefficients of the population and occupation of Tehran region 21. The calculated Moran and Gray coefficients indicate the urban sprawl in region 21 of Tehran.

Table 3: The Moran and Gray coefficients for the population and occupation of Tehran region 21

Coefficients	Occupation	Population
Moran	-0.18	-0.47
Gray	1.32	1.53

5.2   The proposed optimal pattern of urban sustainability

The following patterns have been used for urban sustainable development. The first pattern is formed under the influence of modernism in Eastern Asia. This method takes into consideration tall buildings, using of high compactness, short paths to work, easy access to services and extensive use of public transportation in the city. Despite the economical-social sustainability due to air pollution growth and cultural differences between adjacent residents, this method has been limitedly used in the world. The second pattern is decentralized compactness in urban construction that achieved public acceptance in the world. In this pattern, a single center city turns into a multi centers city based on compactness and increase in selected sub centers activities. The third pattern, the most important method of compression in the recent eras, is Transit-oriented development (TOD); a mixed-use residential or commercial area designed to maximize access to public transport, and often integrates features to encourage transit ridership. A TOD neighborhood typically has a center with a transit station or stop, surrounded by relatively high-density development with progressively lower-density development spreading outward from the center. Forth pattern is the reconstruction of city for compactness of empty spaces. Compactness process is performed for revival of historical centers and unused lands. Fifth pattern is land sharing approach that is used for organizing of marginalized area and decayed urban fabrics. In this method, the occupied housing and lands assigned to government or private companies to perform high density residential plans and after reconstruction some parts of areas allocated to communication and services networks and the rest areas allocated to previous resident as compact residential and finally costs and benefits of the investment will be financed. For region 21 of Tehran, the decentralized compactness pattern whit emphasis on smart urban growth strategies is the best pattern for anatomical- spatial development of city in future.

6   SUMMARY AND CONCLUSIONS

In the present study, a comprehensive investigation is conducted on urban sprawl phenomenon and its reasons. For the analysis, region 21 of Tehran city is considered, as one of the most critical regions subject to urban sprawl. The calculated Gini and entropy coefficients indicate that there are inequality and imbalance in distribution of population in the investigated region. The Moran and Gray coefficients indicate that physical development urban pattern has low aggregation and concentration and it is sprawl and somewhat random. Although compactness is increased in recent years but still there is sprawl in region 21 of Tehran. The result of different models of development pattern of region 21 is as follow: the entropy value is equal to 1.0969 that is close to $Ln(3) = 1.09861$ and indicates the existence of urban sprawl in region 21 of Tehran. The Gini coefficients for population and occupation are 40% and 30%, respectively. These amounts indicate the unbalanced distribution of population

and occupation in region 21. Moran coefficient is -0.47 for population and -0.18 for occupation and Geary coefficient for population and occupation is 1.53 and 1.32, respectively. These coefficients indicate dispersion in population and occupation. The Holdren model value indicates the occurrence of urban sprawl in 20 years period between 1986 and 2006. Survey of the explained models shows that urban development pattern of region 21 of Tehran is dispersed. Important reasons of sprawl occurrence are as follows: allocation of a large area of region to non-residential zones, low compactness of residential zones (less than one-third of this region is residential). Due to negative consequences of urban sprawl such as destruction of farmlands around the city, contamination of soil and water resources, air pollution, increase of the costs of urban services, length and time of traffic increasing, growth of fossil fuels consumption, social separation, and unsustainable land use, urban sustainable development and compactness of region 21 is more needed.

ABSTRACT
The article examines the risks and threats in the system of higher education, alsofactors contributing to risk reduction are presented.

Keywords: Higher education, Innovation, Motivation, Risk

1 INTRODUCTION

In a market economy, every organization, from its activities, must constantly study and predict a change in the internal and external environment. And to evaluate the opportunities and threats coming from the outside, to identify strengths and weaknesses, refine core competencies and capabilities of the organization. Thus, the most important factor for economic growth and competitiveness is the development and implementation of effective innovation process of organizational and commercial character. It is necessary to consider the risks that are inherent part of market activity. Consequently, risk analysis and identification of methods to minimize them is one of the pressing problems of today.

Analysis of the current literature on the theory and practice of management, shows the relationship between different types of risk, which refers to "situational characteristics of the activity meaning uncertainty of its outcome, its possible adverse consequences, alternative options for error or success" (Praisner, 2009, p. 303). Note that changing one type of risk may change the others.

Following types of risks are known that are different to each other: political, economic, external, internal, operational, etc. It should be noted that the "most dangerous and unpredictable force on the effects" are operational risks, which "result from inadequate or failed internal processes, people's actions and systems or from external events" (Volkogonova and Zoob, 2007, p. 254).

Operational risk include: personnel risk, process risk, systems risk, the risks of the external environment.

Risk that can be eliminated by diversification is called diversified risk. Non-diversifiable risk arises from external events that affect the overall market. For example, during inflation or

recession the interests of all organizations are affected, so that risk cannot be eliminated by diversification.

Diversification is the penetration of organizations into other industries (Praisner, 2009, p. 303). Diversification strategy is used to ensure that the organization does not become dependent on one activity. At present, many organizations are considering diversification as the most appropriate way to reduce the risk.

2 CHAPTER

2.1 Operational risk in the education system

Today the education system operates on market principles, and the transition to a market economy has fundamentally changed the principles of organization and management in higher education. Higher Education in the Republic of Kazakhstan (RK) is characterized by diversification; higher education institutions have become full actors of the market economy and independently determine the main directions of development. Such trends as globalization, modernization of the education system, high competitiveness in the education market to develop and encourage universities to innovate or to retain their position in the market, or to develop a new segment and additional competitive advantage. The ability of universities to respond and cope with the changes external environment has become one of the most important components of successful functioning of the educational market.

According to the definition a system of measurements for the development, implementation, deployment, diffusion and commercialization of innovations, is called innovative activity (Volkov, 2012, p. 156). That is, innovation is the creation and use of new knowledge, allowing universities to identify and remove barriers that have developed between Kazakhstani higher education and international education area.

However, in practice the biggest challenge of transformation of the university is not the creation of the correct concept, not the development of core innovation processes, and not even as senior management. A key goal is readiness of teachers to innovate. Since it is the instructor, whose motivation, ability to solve problems depends on how easily he can adapt to the changing business environment. Therefore, the willingness of instructors to implement innovation is the risk of staff and now becomes an important issue.

2.2 Motivation of teachers to innovate higher education institution

In higher education institutions an effective system of motivation of teachers to innovate must be developed and implemented. As well as create the conditions that:
- promote the involvement of instructors in the creative process of university innovation;
- increase the personal interest of instructors in self-realization and responsibility for the quality of training;
- estimate contribution to the strategic goals and objectives of the university.

Despite the high degree of elaboration of motivation problems, heads of universities are experiencing some difficulties in using the results of research in the problem-solving process to develop a system of motivation of instructors to innovate. These difficulties are connected with the lack of research focused on the development of motivational issues of teachers to innovate. Hence, having a diversified strategy, university leaders will be able to encourage the instructors to operate effectively in accordance with development issues. And to ensure the

competitiveness of the university in the education market. Typically, the main reason of diversification is the desire to reduce the risk.

Indicators of readiness to implement innovations are as following:
  – the interest in innovation and its dynamics;
  – desire to evaluate their personal and professional experience with the products of innovation;
  – a positive attitude towards the prospects of innovation;
  – awareness of their capacity, the need to self-realization;
  – awareness of instructor's insufficiency in progress and the desire to improve it.

Based on analysis of specificity of instructors' activity we can identify the following key points that affect their motivation.
  – The instructors must be clear about the nature of the job that they have to do, not only results that need to be obtained.
  – The responsibility for performance rests largely on the instructors themselves. Each of them should control themselves in obtaining new results.
  – Continuous innovation must become an integral part of the task of the instructor. He must be responsible for creating inventions, and for participation in their use.
  – Activities of such instructors necessarily involves, on the one hand, the constant self-education and self-improvement, and on the other - teaching others.

However, analysis of current educational research, scientific and methodological literature shows that changes in the external and internal environment of the university require an adequate response, namely, the introduction of innovative management techniques. These include: strategic planning, balanced scorecard, risk management, etc.

Nowadays strategic planning process becomes more and more important for Kazakh universities which provide the basis for managing a team of high school. Strategic planning is one of the basic functions of management, and the function of leadership, organization, control and motivation are aimed at implementation of the strategic plans.

The strategy formulates the basic goals and ways to achieve them so as to provide a single course of action to the whole staff of the university. Development and implementation of strategy is the most important function of top managers. Thus, the senior management level is the rector and vice-rector. Line managers are department chairs and the dean of the faculty, who work directly with students and faculty experts. The effectiveness of the educational activities of the university depends on the quality of management and professionalism of the teaching staff. Therefore, it is important to represent the role and contribution of each instructor to the common business.

Balanced Scorecard (BSC) is a tool for strategic and operational management, which allows linking the strategic goals of the business processes and daily activities of employees at every level of government, as well as to ongoing monitoring of the implementation of the strategy (Zhussupova and Murzagaliyeva, 2010). Today need innovative tools and methods of higher education, focused on the development of university teachers motivation to innovate. Building on the experience of business, we can develop and implement a university balanced scorecard, based on key performance indicators (Key Performance Indicators, KPI) (Zinov, Lebedeva and Tsiganov, 2009, p. 248), which are based on self-esteem and self-efficiency

potential within the organization. Note that the KPI can be applied in the implementation of differentiated pay, bonuses for performance evaluation for professional competitions, that is, those elements of innovation that can positively affect change in the traditionally existing management structure of teaching staff.

Balanced Scorecard (BSC) is a tool for strategic and operational management, which allows linking the strategic goals of the business processes and daily activities of employees at every level of management, as well as to ongoing monitoring of the implementation of the strategy (Volkov, 2012, p. 156). Today we need innovative tools and methods of higher education, focused on the development of motivational tools of university instructors to innovate. Relying on the experience of business, we can develop and implement a university balanced scorecard, based on key performance indicators (Key Performance Indicators, KPI) (Zinov, Lebedeva and Tsiganov, 2009, p. 248), which are based on self-esteem and self-efficiency potential within the organization (Zinov, Lebedeva and Tsiganov, 2009, p. 248). Note that the KPI can be applied in the implementation of differentiated pay, bonuses for performance evaluation for professional competitions, that is, those elements of innovation that can positively affect change in the traditionally existing management structure of teaching staff.

3   CONSLUSION

Risk management is one of the new methods to ensure sustainable and effective development of organizations, and involves the active use of the potential opportunities. Science-based and efficient operation allows knowingly take risks and to adequately respond to them. Organizations conducting targeted risk management, not only ensure the successful implementation of projects, but also become a reliable partner, and therefore long-term relations with investors (Praisner, 2009). Today, risk management is applied in Kazakhstan in large banks, insurance agencies and oil companies.

It should be noted that the methodological approaches to risk management in the field of education are actively being developed by Russian and foreign scientists. However, in the Republic of Kazakhstan such methods did not receive a significant development and practical application. In Kazakhstan there is insufficient scientific research practice of risk management in education, methods of construction of the internal control systems in higher education have not been actively used, experience of businesses has not sufficiently studied in which the system of internal control is based on the internal audit - an independent division on activities of which the executive bodies of companies can not affect.

Therefore, by solving the problem of modernization of higher education in order to improve the quality and effectiveness of activity, higher education institutions have to implement innovative management techniques.

THE CULTURAL FOOD DYNAMIC IN IRELAND

Roy Nelson

CAFRE, Loughry Campus, Cookstown, County Tyrone, Northern Ireland
roy.nelson@dardni.gov.uk

ABSTRACT
Decision making with regards to food choice can be traditionally viewed as an economic transaction, whereby consumers make a choice of which foods they would like to purchase and consume within the framework of how much disposable income they have at any particular time. However, within this framework, research has shown that there is a balance that consumers aim to achieve between the hedonistic qualities of the food and the perceived effects it may have on their health. Consequently, one area that is of significant importance is the concept of how food risks are perceived and how this perception affects the decision-making process. Research has indicated that Irish food consumers use a set of heuristic decision-making tools in order to assist them in making food choices for themselves and their families. These decision-making tools are evoked irrespective of age, gender or social class. This has led to concern (despite numerous health promotion and media campaigns) regarding the national food diet, with imperfections in consumption observed in an increase in obesity, nutritional imbalances and chronic ill health which expose individuals to medical conditions such as cancer and heart disease. The increase risks associated with these are prevalent in Ireland and for many measures Irish consumers rank poorly with other countries in Europe. Although the food choices are predicated by these decision-making tools there are reflections of previous historical dietary choices that persist within the diets pursued today by the majority of Irish consumers. This in addition to the effects of acculturation following recent changes in the demographic structure and the growth global networks for information flow and exchange has resulted in a dynamic food environment with "nutrition echoes" observed in the choices people make.

Keywords: Diet, Food Culture, Risk Perception

1   INTRODUCTION

Food consumption patterns are affected by a host of social, psychological, sensory, and economic factors, and a number of theoretical models have been proposed to classify and understand these processes. Such models tend to relate dietary behaviour to environmental and economic factors and in many instances such models relate dietary behaviour to nutrient intake. However, with the impact of issues related to health and wellbeing, food is no longer seen as a means to satisfy a particular nutrient requirement (e.g., energy intake or protein requirement) but may be viewed as a contributor to overall health by some. The concept of risk associated with foods have also become commonplace with some foods described as "*unhealthy*" and may be detrimental to health whereas others are seen to promote well being and even connote a health outcome, and have been described as healthy or even "*super foods*". In addition, other issues regarding how the food is produced (e.g., GM foods), processed (e.g., use of additives) and pathogenic potential (e.g., bacteria such as *e-coli* or *campylobacter*) have also entered the mindset of the general public and impinge upon the issue. Although the latter do affect behaviour especially when highlighted by the media, it is the long term effect of poor diet that is of primary concern currently.

2   DIETARY ADVICE

The outcomes associated with poor diet generally fall into two categories – those that may lead to overweight and obese conditions, and those, which are more chronic in nature and are related to nutritional disorders (Eurodiet Project Steering Committee, 2001). The former has received the most attention as the incidence of obesity levels in the population as a whole has risen significantly in the past two decades (Childhood obesity, 2003; Campbell, 2004; Lowell, 2004), and is projected to rise to 50% of the population by 2030 with 25% of under 16 year olds also affected.

Currently it is estimated that in the UK 16% of 10 year olds are overweight and/or obese (Lowell, 2004). On the island of Ireland, these figures are thought to be higher with current reports indicating that a third of boys and a quarter of girls are carrying excess weight (Childhood obesity – a weighty issue for Northern Ireland, 2003b). For example, school-aged children in Northern Ireland have been shown to have one of the highest consumption rates of chips, crisps, sweets, and chocolate in Europe, particularly among 11 to 13 year olds (Vereecken and Maes, 2000). It has been observed that dietary behaviours developed during childhood are proven to be replicated later in life (Birch, Savage and Ventura, 2007), which has implications for health and wellbeing of the future adult population.

The risks associated with obesity have been related to a number of health problems. These include type 2 diabetes, heart disease, joint problems, and cancer (Dietz, 1998; McPherson, Montgomery and Nichamen, 1995; Warwick, McIlveen and Strugnell, 1999). Although energy balance is central to weight loss or gain, the consumption of energy dense foods (those high in fat and sugar) are seen as a major contributing factor. This is especially so in situations where there is a reduction of energy expenditure as a result of changes in leisure activities (Anderson et al., 1999; Department of Health and Human Services, 1996; Prentice and Jebb, 1995). Excess energy consumed, which leads to accumulation of fat, is a major worry especially if it is deposited around the waistline (Chan, Rimm and Colditz, 1994; Colditz, Willeff, Rotnitzky and Mamson, 1995). This situation may be compounded when decisions regarding food selection are made by parents which is an example of a form of surrogate decision making. Nutritional disorders that are also prevalent relate to levels of, for example iron, fibre, low or high density lipoproteins in the diet, that may not be visible as an immediate concern but are ongoing worries for health promotion agencies.

To assist the consumer there have been a number of health interventions aimed at promoting good dietary health from improved curricula in schools, wider media coverage of the main issues to labelling of foods giving broad level warnings to the consumer in the form of traffic warning lights. However, many health professionals are critical of that approach and would wish consumers to think of the diet holistically as either contributing to health and wellbeing or not. From this perspective a number of models have been designed to represent the features of a balanced diet all of which have the following common features, i.e., the best diet is one that is based on carbohydrates (breads, potatoes and other cereals) and is rich in fruit and vegetables. It should also include moderate amounts of milk and dairy products, meat, fish or meat/milk alternatives, and limited amounts of food containing fat and sugar (Beauchamp and Moran, 1984; Hunt, Strong and Poulter, 2004; Teobald, 2004).

3   THE FOOD CONSUMER ENVIRONMENT

Consumer behaviour relates to a process where individuals are involved in the complete act of purchasing and consumption of products (Summers, Gardiner, Lamb and McDaniel, 2003).

With respect to food, this includes their selection, purchase, preparation, consumption, and disposal. Traditionally the main criteria considered during this act have been a combination of prices, incomes, taste, and social attitudes, with price recognised as a key determinant (Ellis and Uncles, 1991; Gafton and Ness, 1991; Slattery, 1986; Wheelock, 1986; Woodward, 1988). Although the purchase of food is seen by many as an economic transaction, and income may be important as a final determinant (lower income families will spend less on food but with a greater percentage of their income (Shepherd et al., 1996)), there are a number of non economic factors that affect consumer choice. These range from issues associated with the wholesomeness of the food, where it may have been sourced, time available to prepare and eat, the family setting, and how safe it is to eat (Elaine, 1999; Kohls and Uhl, 2002; Koster, 2009).

The interrelationships between these factors and their effect on behaviour are regularly described in the form of consumer models (Solomon, Bamossy, Ashegaard and Hogg, 2010). These models can be simple input/output models reflective of the market place where the demand for products is seen as a relationship between the demand for food as a means to satisfy a need in the consumer (hunger, desire, social status, etc.) and how this is subsequently reflected in the final purchase. However, some researchers have developed more elaborate models that take into account all the variables related to the act of purchase and consumption including characteristics of the individuals and the social setting.

Various models that have been used to describe the behaviour of consumers the most complete of which are the comprehensive models, as described by Spooncer (1989) and Bareham (1995), and the descriptive models of Kotler (1988). These are multi-attribute models and they acknowledge that there are many types of factors which come together to influence the consumers' decision to perform a particular behaviour, or not to perform it, as the case may be. Examples of other comprehensive or descriptive models include those devised by Howard and Sheth (1969), Wierenga (1980), Hanneman (1984), Engel, Blackwell, and Miniard (1990), Worsfold and Griffith (1995) and Steenkamp (1997). These models tend to highlight the conflicting situation that many consumers find themselves in when making decisions regarding the selection and ultimate use of the food products.

However, for many food items the decisions regarding selection and use are generally made very rapidly and with little thought as they are perceived to be low involvement items (Beharrell and Denison, 1995). Under these conditions the consumer is said to be completing a routine purchase (Meyer, 1988). For other items there may be more involvement and the consumer may then weigh up a small number of attributes in order to make the decision (e.g., concerns related to calorie, fat or salt levels). In this case the consumer is said to be involved in limited problem solving (Sheth, 2011). However, when the consumer takes on board all the available attributes including marketing cues and other people's requirements (e.g., the family or children) then the consumer is involved in extended problem solving. This is rare in the case of food items unless there is a critical incident that is uppermost in the persons mind. This can occur during incidents such as "*food scares*", or with demands for a change in diet, or through personal experience, where the '*incident*' is now a major determinant and "*drives*" the consumer from making either routine or limited purchase decisions to the more complex extended problem solving scenario (Sheth, 2011).

In addition to this people get "*bored*" with the everyday decisions of selecting and consuming the same range of products and will at times enter a situation of seeking out new information

in order to change the product range and introduce variety into the diet (Venkatsan, 1973). Other drivers in this increased desire for variety may be changes in family circumstances, children requests, influences from TV and holiday experiences (Dammann and Smith, 2009; Lawrence and Barker, 2009; Thomson, Spence, Raine and Laing, 2008). When consumers enter a routine problem solving mode they are said to be involved in the psychology of simplification, whereas when they are engaged in limited or extended problem solving they are said to be involved in the psychology of complication (Howard and Sheth, 1969). This creates a natural rhythm to food purchasing with periods when the consumer is either consuming a restricted range of foods or expanding their choices and trying out new foods. However, in order to achieve the optimum solution the consumer will use a specific decision making strategy which may be applied at various stages of the consumer process - from initial purchase through to final consumption but is primarily associated with either limited or extended problem solving.

4 DECISION MAKING

All goods have intrinsic properties and it is these properties or attributes from which utility is derived, and this is the same concept for any food that may be purchased (Lancaster, 1991). Each food can be viewed as having a bundle of different attributes that are bound together and must therefore be considered simultaneously when a choice decision is being made. For the consumer it is difficult to consider all of attributes at the one time and generally only some play a significant role in practical decision-making. In addition the attributes associated with a specific food may often represent conflicting values, and in order to deal with these conflicts, people simplify the process through the use of different strategies. These strategies are the rules that people develop over a period of time for how and what they choose in recurring situations. They simplify food choice by eliminating the cognitive effort and time required for deliberation about every choice situation and a number of distinct strategies can be observed in individuals. These are summarised in Table 1.

The decision-making strategy that is chosen is dependent upon context and emerges from initial conscious food choice decisions for a specific situation and eventually become less mindful when that situation occurs repeatedly (Sobal, Bisogni, Devine and Jastran, 2006). However, one factor that has emerged in recent years as a major contributor affecting the consumer's decision making is the concept of the risks associated with the production, processing, preparation, and ultimate consumption of food (Nelson, 2004).

Table 1: Summary of the decision making strategies when making food choice decision

Linear strategy	Product attributes are estimated according their relative importance and alternatives are then compared. The decision rule is compensatory because the weak or negative characteristics can be compensated by strong or positive characteristics.
Additive difference strategy	The decision rule of additive differences is a sequence of paired comparisons of choice alternatives. The 'winner' of a paired comparison is then compared with another alternative and the loser is rejected.
Conjunctive rule	Conjunctive decision rules that there are minimum or maximum values that are required for one or more characteristics. The alternatives have to meet the requirements in order to be chosen
Disjunctive rule	This rule is based on an outstanding value of one attribute. An alternative is selected because of at least one superior attribute value, irrespective of the other attribute values
Lexicographic strategy	This strategy ranks the attributes in terms of perceived relevance or importance and alternatives are then compared on the most important attribute and the most desirable alternative(s) chosen. If more than one option is chosen then they are compared on the second most important attribute. This process continues until only one alternative remains.
Elimination by aspects rule	This strategy, similar to the lexicographic strategy, sets a cut-off point for the most important attribute, and allows all alternatives that meet or exceed that cut-off point to be evaluated on the second most important attribute's cut-off point. This process continues until only one alternative remains.

5   RISK

It seems that the behaviour of consumers seem to violate the rules of commonsense rationality. To try and understand this phenomena research has been carried out regarding how food risks may be perceived by the consumer and how these may affect the decisions made. When investigating perception two broad approaches can be followed. In most cases, perception is thought of as a physiological process whereby the brain interprets mainly visual stimuli into recognisable forms or shapes. However, when applied to the area of decision making perception is better viewed as the complete act of seeing and is not just concerned with the biochemical interpretations in the brain but how the stimuli are integrated into the complete act of perception, and integrate previous experiences and attitudes and knowledge the individual may have. Classically the perception of risk is based upon a set of general rules known as the risk heuristics. These are evoked when one does not have the full statistical evidence on hand to evaluate risks, which is generally the case with respect to food. Consequently people rely on what they remember hearing or observing about the risk in question and the heuristics help to reduce difficult mental tasks to simpler ones. These heuristics may be valid in some circumstances, but in others may lead to large biases, which subsequently affect risk assessment (Lichenstein, Slovic, Fischhoff, Layman and Combes, 1978). The heuristics are:

(1)   Availability

People use this to judge an event as likely or frequent if instances of it are easy to imagine or recall. Frequently occurring events are generally easier to imagine and recall than rare events. However, availability may be affected by numerous factors unrelated to frequency of occurrence, such as the coverage given to recent disasters or details provided in television

documentaries. Media coverage tends to concentrate on the spectacular at the expense of the common with the result that events which have a low frequency of occurrence may receive more "*air*" time than common occurrences. Applied to food risks, this would suggest people would underestimate, for example, the risk of certain dietary cancers, but overestimate the risk of botulism and this can seriously distort risk judgement (Furby, 1973).

The role of availability therefore indicates how people estimate how "*representative*" information to be. This then leads to errors in the use of the evidence, in that people:

a) ignore evidence about base rates in favour of secondary evidence (Smithson, 1989; Tversky and Kaheneman, 1974) and consequently anticipate signals in randomly generated data (O'Leary, Coplin, Shapiro and Dean, 1974);

b) become overconfident in the evidence presented due to the illusion of validity (Tversky and Kanheneman, 1974);

c) are insufficiently sensitive to the fragility of assumptions or the problems of small sample sizes (Fischhoff, Lichenstein, Slovic, Derby and Keeney, 1981; Tversky and Kahneman, 1971);

d) view chance events as self-corrective (Mathews and Hunt, 1985);

e) make conscious decisions to simplify analysis by excluding low-probability events from consideration (Fredenburg, 1988).

Most people as a result, find it difficult to understand "*low*" risks. They tend to ignore some risks entirely (e.g., cholesterol in the diet) or are very apprehensive even when scientific estimates show a low risk (e.g., pesticides, BSE) (Fisher, McClelland and Schulze, 1989), and are very likely to overestimate the risks of dramatic causes of death (Lichenstein et al., 1978).

(2)   Overconfidence
People are typically very confident in the judgements made by themselves to the extent that people believe that they can exert control over events (Ross and Fletcher, 1985; Strickland, Lewicki and Katz, 1966). This overconfidence is a trait or tendency in people when judging events that have uncertain outcomes (Fishhoff and Slovic, 1980). The psychological basis for this unwarranted certainty seems to be peoples insensitivity to the tenuousness of the assumptions upon which their judgements are based and the tendency to be optimistic about judgements of their own behaviour (Douglas, 1985). Although such perceptions as regards safety are obviously unrealistic, the risk looks very small from the perspective of the individual. Both the public and the experts are prone to overconfidence.

(3)   Desire for Certainty
Peoples desire to reduce anxiety caused by potential risks is commonly illustrated by denial. Denial is exhibited by people when faced with hazards but who view their world as either safe or predictable enough to preclude worry. This is analogous to the concept of "*selective attention to evidence*" and the resulting bias has been noted in having an effect in making judgements under conditions of uncertainty. These include a tendency to ignore or discount negative and disconfirming evidence (Lord, Lepper and Ross, 1979; Nisbett and Ross, 1980). This confirmation bias extends not only to selective attention, but also to selective information seeking, discounting, interpretation and testing.

(4)   It Won't Happen To Me
Overconfidence can also be observed in that people tend to consider themselves personally immune to many hazards whose societal risks they would readily acknowledge. This can be

expressed in the theory of "*optimistic bias*" (Weinstein, 1989), where individuals appear to have a decreased subjective probability of the occurrence of negative events, but an increased subjective probability for positive events. McKenna (1993) explains this bias as a need to control situations, such that the perceived control reduces the subjective probability of personal risk associated with the hazard in question.

Consumers therefore have to process a lot of information, and compare it with many cues and biases they may or may not have. Information related to this risk is treated with scepticism if it does not tally with the persons own perception of risk. This means that people are very selective in what they believe in, and will take on board only, in most situations, what suits their biases (Fischhoff, Bostrom and Quadrel, 2002).

The concept of risk is important for understanding how consumers make choices (Grewal, Gotlieb and Marmorstien, 1994; Mitchell, 1999) and food products have been a consistent feature of perceived risk studies over the years and a study into the risk management behaviour of the Northern Ireland food consumer (Nelson, 2004) revealed how the risks were considered. This study identified that the consumer allocates all the risks associated with food (from production, processing through to consumption) into two identifiable groups in order to simplify the decision making processing. Group 1 relates to the risks associated with the processing of the food. These were thought of as "*extrinsic*" risks i.e., the risk had been added to the food in some way or other by a third party and related to processing and production and related referred mainly to food pathogens and contaminants. Group 2 risks where those risks associated with the product itself. These were thought of as "*intrinsic*" risks and related to the nutritional content of the food, mainly salt, sugar, and fat. However, the perception of the risk (whether in group 1 or 2) was based upon three characteristics of the risk itself – the fear the risk evoked in the individual, how involved the person was in the risk "*decision*" and finally how new the risk was. Although the fear component was instrumental in terms of reacting to new information, involvement was seen as key to managing the risk. As the fear component rose (in any risk scenario), but if the consumer was involved more in the decision making process and was provided with timely and relevant information, the risk could be controlled. Crucially this related to information regarding coping mechanisms related to how to deal with the risk in question.

One other factor also played a role in the effect the perceived risk had on the decision making process – that of prior experience. The effect of this was observed to be akin to the process of inoculation (Nelson, 2002), in that the initial encounter sensitised the individual to future risks, and if the risk was encountered again then a severe change in behaviour was observed. Crucially this was observed across all food categories and was not confined to the food product to which the risk was initially related. For example, a risk observed with beef would also affect how the consumer searched for information and made decisions related to the purchase of other red meats such as lamb or pork. Again active communication regarding the management of the risk was seen as an important tool to help reduce this "*reaction*".

It is, however, recognised that consumers consider not only the risks associated with a particular product when making a judgement but that perception of benefits also plays a part (Conner, Povey, Sparks, James and Shepherd, 1998). Based on this, a number of studies have been conducted, which examine consumer perceptions of both risks and benefits associated with various foods or food hazards. Studies that have examined both risk and benefit perception suggest that risk and benefit perceptions are considered as separate entities, when

it comes to making judgments. This is consistent with analytical approaches to decision-making, which often treat the perception of risks and benefits as two distinct concepts, which are then considered separately and weighed against each other when making a choice.

Alternatively, the perceived risks and benefits can be viewed as inversely related, resulting in the two concepts being considered together when making a product choice. In essence, when consumers are selecting foods to prepare and consume they are weighing up the benefits of the food – taste, nutritional value (positive), convenience against the risks associated with the food and or preparation – nutritional value (negative), possible additives and contaminants etc. In a study on the risk benefit analysis of three commonly consumed products (beef burgers, bread, and milk) carried out in 2007 identified that once the level of risk had been identified then different decision making strategies were employed. If the overall view of a product was that it was of high risk then the consumer was more like to employ a face trade-off strategy when making a judgment. Conversely if the overall view of the product was that it was less risky, then a more relaxed decision-making strategy was used (Windrum, 2007).

One further effect that has been observed that affects food choice behaviour is the changing cultural landscape in which the choice decisions are made.

6 THE CHANGING CULTURAL LANDSCAPE

Society can be identified and characterised by many factors such as language, religion, customs, values and beliefs, and these all form part of our culture. An outcome of this is that our behaviour may be seen as a way of distinguishing an individual of one group from individuals of another group (Hofstede, 1984). Ones food culture is more specific, and may be described as a combination of tastes, cuisines, and practices which are reflected as dietary habits and as such make an important contribution to our food decisions. It is now recognised that our food habits change as we adapt to travel, immigration/migration, and the socio-economic environment. The food culture in Ireland has changed dramatically in recent years following the growth of the large multinational supermarkets after their entrance to the country in the 1990's. This has led to an increasing availability of food, both raw and processed, to the consumer. It was widely recognised that the dietary habits in the country were changing, but with a reliance on more traditional foods and means of preparation and eating centred on the potato.

Specific potato dishes include potato-based dishes such as "*champ*", "*pasties*", "*boxty*", and the ultimate collaboration between potato and bread – "*potato bread farl*". Further traditional Irish recipes promoted featuring potatoes include Irish stew and "*colcannon*". It is not only the presence of potatoes that are thought of as a feature of the diet but how they are eaten - either fried, roast, baked and simply boiled in their "*jackets*" to be peeled ceremoniously at the table. However, this scene, idyllic though it may be, has changed.

Culture can be viewed as a dynamic process liable to change where people learn to make adjustments to their norms and values as a result of contact with other groups of people exhibiting a different culture, through a sharing and transfer of common experiences and knowledge, a process known as acculturation (Lee, Sobal and Frongillo, 1999; Wenkan and Wolff, 1970). The acculturation process can occur at both an individual or group level and may continue for years and will in all likelihood vary in pace and levels. The acculturation process is highly influenced by the individual as some may choose to lose their original

cultural identity while others may choose to integrate elements of the new culture into their original culture.

A multidimensional model developed by Keele and Padilla (1987) holds that an individual's level and speed of acculturation will depend on the individual's level of cultural loyalty and knowledge. The individual who shows more loyalty and more knowledge of their heritage culture, than they do of the incoming culture, will be less acculturated than the individual who possesses more knowledge of the host culture. Some may require little change, for others change may be fundamental and if motivation is low or nonexistent, acculturation will be minimal.

Food habits and traditions are the foundations of our food culture and there is no cultural group for whom traditional foods are not an important symbol of their culture inheritance and their ethnic identity. While we cannot choose our ethnic identity, we can change it. As we encounter and observe new cultures we may imitate and adapt their trends, behaviours and customs that in turn will result in changes in our food choice and our food habits.

With growing interdependence between countries, and cheaper more accessible means of transportation over the past ten years the United Kingdom, including Ireland, has witnessed a dramatic change in the movement of its population. This has included the growth of people holidaying in other countries on more than one occasion in the year to the recent movement of people from other countries (mainly EU citizens) in search of employment. For decades emigration exceeded immigration in Ireland, but this position slowly started to change in the late 1990's and early 2000's when Northern Ireland and the United Kingdom started to become major recipients of international labour migrants.

The Ireland economy as a whole has benefited from the inward migration of labour from countries such as Portugal and Poland, and migrants into Ireland have made a significant contribution to filling the labour forces gaps in food processing, agriculture, healthcare, hospitality, and catering sectors. As people constantly move to other countries, cultures become more integrated and as a result consumer needs become more sophisticated (Sharma, Cade and Cruickshank, 1999).

However, it is not just the inward migration of people that may affect the food eating behaviours but also the media coverage of diverse food health issues and the regular advertising of foods. Food producers and processors (representing global concerns) invest considerable amounts on advertising and packaging to capture the interests of the consumer. The growth of the larger food retailers along with the food service sector, with their extended supply chains have delivered a vast array and choice of foods to be considered by the consumer on a daily basis. Food advertising is also a noted source regarding information associated with aspects of convenience and availability and in one particular example advertising directed at adolescents is seen to focus on fast foods which are generally high in calories.

This was reinforced by the British Medical Association, which has made several recommendations including a ban on the advertising of unhealthy foods for children, the encouragement of price promotions on healthy foods instead of sweets/chocolates etc, and clear nutritional labelling and healthy advertising in schools. The influence of the TV chef preparing and cooking specific menu choices can also be seen to effect demand for a

particular food. This television format is a popular programme that can be viewed most evenings and is usually followed with the publication of the relevant book that again is bought widely by the general public.

Up until the mid 1990's there was relatively little change in the food culture. What was consumed was primarily based on ingredients and foods from the home market and the UK, with a tendency towards plain, well cooked, meat, potato and vegetable meals, with few frills and sauces. However this has now changed and the Northern Ireland consumer is more likely to sample new foods, which have resulted in changes to the traditional meat and potatoes diet and a much more varied diet.

7   A MODEL OF FOOD CONSUMPTION

The Northern Ireland consumer, when making a choice of what to eat at any particular time is dealing with a large number of competing issues in order to make the final decision. Two main themes have emerged in recent years that have affected this process. The first is the ongoing concern regarding the risk associated with eating food. Although in the past this has highlighted issues associated with how the food is produced or processed in the form of contaminants, the concerns now are more related to the nutritional risks of the food. These are constantly being weighed against issues associated with the obvious benefits of the food in terms of its taste and the feeling of being satiated after consumption.

The second theme is the continued change in the culture of eating brought about by ever closer contacts with practices from outside of the island. These pressures for change could be in the form of new food products being considered e.g., dishes from other countries but also includes influences related to how convenient the food may be e.g., fast food outlets with the availability of burgers etc as well as the influence of recently migrated people to the area.

These changes are widespread and are especially visible in adolescents and young adults, but have also been observed at other levels within society including the elderly. The changes also reflect upon the dynamic nature of the food culture in Ireland and the rapid movement of tastes and desires more indicative of a modern consumer. However, echoes from the past reflecting a more traditional Northern Irish food culture can still be seen today (Walsh and Nelson, 2012). Traditional bread products are widely consumed, potatoes are a regular feature on most people's weekly fare, and the practice of eating together at set times still occurs.

Figure 1 summarises the main factors affecting food choice emerging from this review. It envisages a consumer balancing the competing demands of the benefits associated with the food and the risks that may be inherent in the consumption of the food in question. In order to arrive at a satisfactory conclusion the consumer uses an appropriate decision making strategy that weighs these twin issues. The perception of the risks and benefits are affected by their perceptual framework employed at that moment in time. For example, if a food risk issue has been highlighted in the media and is brought to the attention of the consumer then the perceived benefits of choosing that food would have to be considerably enhanced for the choice to be made. The reverse would happen if the food product was perceived as beneficial to the consumer a decision could be made whereby the risk is deemed acceptable.

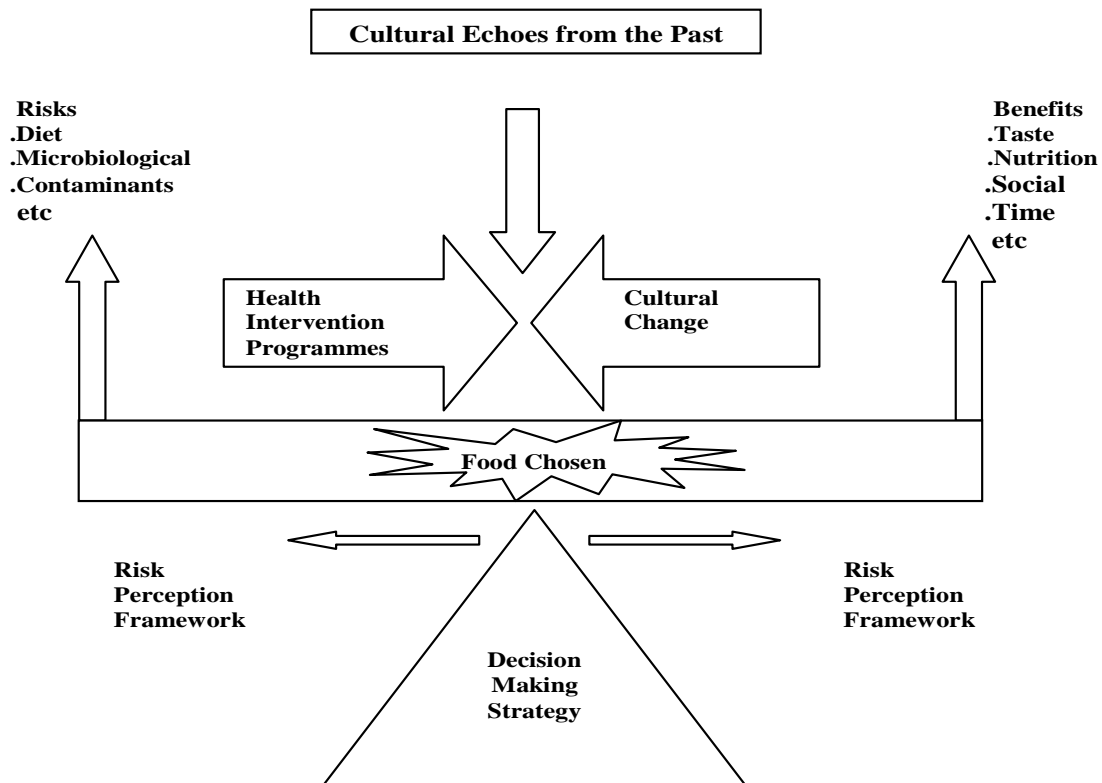
Decision Making Strategy


Figure 1: Summary of the influencing factors affecting food choice in Ireland

However, there is an overarching framework in which the decisions are made and that is the interchange between the driving forces of the cultural change process against the advice provided from the health promotion agencies. On the one hand there is the move towards the consumption of more convenient foods that are in many instances high in fat and/or sugar against the pressure exerted by the ongoing message of healthy and safe eating. The achievement of a healthy and balanced diet relies on the compromise between these two competing forces. One moderating aspect of this interplay has been the influence from the food cultural heritage. There still remain vestiges of the past emerging in dietary behaviours. These can be described as cultural echoes in the sense that their origins may not be known but can still be "*heard*" and observed by others.

These echoes not only influence the foods chosen but how they may be purchased, prepared in the home and with whom they are eaten. For example in a recent study of the nutritional eating habits of pregnant mothers in Northern Ireland, it was identified that those mothers who relied on a more traditional eating pattern did have a healthier food intake with a better balance diet (Coyle and Nelson, 2011). This was a strategy employed specifically by those with lower levels of nutritional knowledge than their peers. It is perhaps these echoes that need to be investigated further as they may be the key to reversing the trend of obesity and related health issues in Ireland.

ABSTRACT
Developing countries like China, India, Bangladesh, and Vietnam are now the largest exporters in global apparel markets mainly due to their participation in the international production networks that are leaded by global buyers. Most of the garment export manufacturers in these countries are found at the low value-added production part of global apparel value chains. There is still a debate on the functional upgrading prospects of these countries although the East Asia newly industrializing countries (NIEs) are generally considered as success stories of moving up from mere assembly to selling their own branded products globally. There is still lack of empirical studies on the current position of developing countries in global apparel value chains. The purpose of this study is to fulfill the gap by examining the case of Vietnamese garment manufacturers. This study is based on secondary sources as well as primary data collected from field study. The field study involved mass survey using questionnaire and in-depth interviews with enterprises, the textile and garment associations and government agencies. The findings show that Vietnamese garment manufacturers, especially SMEs, usually rely too much on powerful foreign buyers in GVC who do not want to share their core competencies in supply chain management, design, marketing and branding. In combination with other external and internal factors, this discourages these firms from functional upgrading. Most of them can not move up to original design manufacturing (ODM) form of exporting and often compete in production sphere in positive way through product and process upgrading or in negative way through squeezing wages and profit margins. The manufacturers who are serving GVC-buyers and non-GVC buyers at the same time are likely to be more successful in functional upgrading than those who are serving only GVC-buyers.

Keywords: Developing countries, Functional upgrading, Global value chain, SMEs, Vietnam

1   INTRODUCTION

Garment is a fast-growing industry in Vietnam with the annual export growth rate from 2001 to 2011 was about 20 percent (GSO Vietnam). After the changes in international trade arrangements in 2005 (the end of MFA/ATC), Vietnamese garment industry has sustained this high level of average export growth regardless of only one year decrease by 2 percent in 2009 as an impact of decrease of demand in major markets due to economic recession and financial crisis. In 2010, Vietnam was the second largest exporter of garment and textile to the US, the third largest to Japan and the EU and the fifth largest globally (VITAS). In 2011, the garment industry gained US$13,15bn (WTO statistics) which contributed around 13,5% of Vietnam's total export and has surpassed crude oil to become Vietnam's largest foreign exchange earner (GSO Vietnam). However, more than fifty percent (50%) of garment export dollars is spent on importing input materials because more than sixty percent (60%) of total

export turnover is carried out under Cut-Make-Trim (CMT) form of exporting in which Vietnamese exporters are responsible for only assembly of imported input materials.

In global apparel industry, although developing countries account for more than seventy percent (70%) of the total global garment export, their share of the global garment value-added is less than thirty percent (30%). In contrast, industrialized countries (mainly the US, the EU and Japan) are major garment importers but account for more than 70 percent of the global value-added in garment (Tewari, 2005; Fernandez-Stark, Frederick and Gereffi, 2011). This phenomenon was explained by the theory of global value chain (GVC) which is rooted in World Systems theory by Hopkins and Wallerstein and developed later by Gereffi and other scholars. A commodity chain is defined as *"the whole range of activities involved in the design, production, and marketing of a product"* (Gereffi, 1999). A particular firm may participate in the value chain of a given commodity (product and service) by choosing one or several actitivies to focus on. Value chains become global when activities in the chains are performed in different parts of the world. In global apparel value chains (GAVCs), low labor-cost developing countries such as China, India, Bangladesh and Vietnam are key players in the low-value assembly segments of the value chain, while developed countries focus on high-value segments such as design, marketing and branding (Fernandez-Stark, Frederick, and Gereffi, 2011). These developing countries, however, can gradually move up to higher value-added segments of value chains (Gereffi and Memedovic, 2003). Gereffi (1999) considers East Asia NIEs (Hong Kong, Taiwan, Singapore and South Korea) as successful stories in moving up from CMT form of exporting to original equipment manufacturing (OEM) and then, to original design manufacturing (ODM). However, Schmitz (2004) claims that the upgrading prospects of firms in developing countries depend on the type of value chains they are participating in and although GVCs can foster product and process upgrading, they hinder functional upgrading. There is still lack of empirical research to conclude this debate. The purpose of this study is to fill this gap by answering two main questions: what is the current position of Vietnamese firms in global apparel value chains? What are the obstacles to functional upgrading of Vietnamese firms in global apparel value chains?

By giving evidence that garment export firms in Vietnam are found mostly at the low-end part of GAVCs, this study supports the argument that the barriers to functional upgrading of developing countries to high-end part of GAVCs are high (Humphrey and Schmitz, 2002) as well as increasing (Palpacuer, Gibbon and Thomsen, 2005). This is our first contribution.

The second contribution of this study is to examine the different types of relationships between the Vietnamese garment export manufacturers and their buyers. This study supports the argument that the captive relationships between Vietnamese manufacturers and their GVC-buyers hinder functional upgrading to ODM and OBM models meanwhile their relationships with non-GVC buyers are market-based or balanced-network so ODM or ODM forms of exporting are much more popular.

Our final contribution is the focus on SMEs and the finding that SMEs are facing more challenges than large enterprises in functional upgrading in GVCs although they can reach to ODM and OBM forms of exporting to non-GVC buyers.

The remainder of this paper is organized as follows. Firstly, we provide a theoretical framework. This is followed by a discussion regarding the methodological aspects of the

study. We, then, discuss the results and explore the implications. Finally, we conclude the paper by identifying the limitations of the study and the directions for further research.

2   THEORETICAL FRAMEWORK

The world economy has been characterized by the globalization of production and trade for decades (Gereffi, Humphrey and Sturgeon, 2005). In many industries, participating in GVCs has been increasingly a common way to integrate into the global economy. In apparel industry, the starting point of firms in developing countries is entering into the lowest value-added assembly segment of GVCs mainly due to their low labor-cost advantage. They can, later, enhance its position in value chains through: (i) process upgrading which refers to increasing the efficiency of internal processes; (ii) product upgrading which refers to introducing new products or improving old products faster than rivals; or (iii) functional upgrading which refers to increasing value-added by changing the mix of activities undertaken by the firm (Kaplinsky and Morris, 2000). The up-movement from low value-added part to higher value-added part of the chains is called as functional upgrading. According to Gereffi (1999), the main stages of functional upgrading are:

- Stage 1: Assembly/Cut, Make, and Trim (CMT): the suppliers are responsible for cutting, sewing and trimming;
- Stage 2: Original Equipment Manufacturing (OEM)/Full Package/Free on Board (FOB): the suppliers are responsible for the CMT activities, financing and sourcing material inputs;
- Stage 3: Original Design Manufacturing (ODM)/Full Package with Design: the suppliers focus on adding design capabilities to the production of garments;
- Stage 4: Original Brand Manufacturing (OBM): the suppliers focus on branding and the sale of own-brand products.

As global apparel value chains are buyer-driven chains, the global buyers play a leading role in the chains and occupy the highest value-added activities in the chains, namely design, marketing and branding. They decide not only what are produced but also how to organize the production process although they do not directly involve in it. Through defining the structure of production chains, they also decide who participate in the value chain and the roles of each participants (Caspari, 2003; Gereffi, 1999). East Asia NIEs (Hong Kong, South Korea, Taiwan and Singapore) have been successful in moving from CMT suppliers to OEM and then to ODM suppliers for global buyers. Some firms in these countries such as Li & Fung Limited are now OBM exporters in regional markets. However, latecomers in global apparel value chains like developing countries in Asia are facing more challenges to functional upgrading objective than the East Asia NIEs twenty years ago.

With respect to developing countries, the barriers of entry into high value-added activities in GVCs such as design, marketing and branding are much higher than the barriers of entry into the production sphere. The first barrier is the enormous amount of investment capital required for carrying out marketing and branding activities in global scale (Thoburn, 2009). The other important barrier is the nature of governance of the global value chains. Governance of the value chains refers to who coordinates the various value-added activities and how value is distributed within the chains. In global apparel value chains, global buyers decide how functional upgrading may occur (Gereffi, Humphrey and Sturgeon, 2005). The relationships between lead firms and their suppliers are described by Humphrey and Schmitz (1999) and Schmitz (2004) as "quasi-hierarchical" or "captive" network in which the lead firms exercise control over other firms by setting "the rules of the game" for operating in the value chains.

Challenges of the Modern World - Contemporary Economy and Globalization

The core competencies of the global buyers are design, marketing and branding so they try to block the development of these capabilities of their suppliers.

Global buyers are setting increasingly stringent "international" and "private" standards such as environmental, social and labor standards as the conditions for the garment export manufacturers to become their suppliers. Besides, their requirements regarding quality, price, delivery time, flexibility and responsiveness for their production supplier are also increasingly high (Abonyi, 2005). As the result, even maintaining the production position in GVCs is not an easy task for firms in developing countries. Schmitz (2004) also mentions the other types of relationships between the buyers and the suppliers such as market-based (suppliers and buyers are independent and deal with each other in arm's length transaction), balanced network (suppliers and buyers co-operate and have complementary competences but no control over each other) and hierarchy (firms are vertically integrated, the parent company controls its subsidiaries). Besides these barriers, there are also many location-related obstacles to the functional upgrading of firms in developing countries. Firstly, while garment production technology is quite basic and popular, the design, marketing and branding activities involve deep knowledge about customers' preferences. End-users in global apparel value chains are mainly in developed countries in the US, the EU and Japan. Therefore, due to the cultural distance it is difficult for firms in developing countries like Vietnam to gain this knowledge. Secondly, in comparison with developed countries, developing countries have low-cost labour advantage for assembly activities but the shortage of high-skilled labour for management, design, marketing and branding is their disadvantage.

Regarding the firm size, Lall (1991) realized that in developing countries the prospects of functional upgrading in GAVCs to large firms are clearer than to SMEs. This is reasonable because SMEs are in disadvantage of financial, human resources and production scale.

3   RESEARCH METHODOLOGY, RESULTS AND DISCUSSION

3.1   Research methodology

Primary data was collected from garment export firms in Vietnam. Data from the Vietnam Textile and Apparel Association (VITAS) showed that in 2009 there are around 2,300 garment and textile enterprises in Vietnam including 370 trading and service enterprises and nearly 1,200 garment export manufacturers. Of these 1,200, 150 are state-owned enterprises (SOEs); 350 are foreign-invested enterprises (FIEs) and 700 are domestic-owned private enterprises. From the lists of garment export firms provided by VITAS and the Vietnam Chamber of Commerce and Industry (VCCI), 560 firms with contact information were drawn. Cross-sectional surveys were conducted using many modes of data collection, including face-to-face interviews, telephone interviews and mailed questionnaires.

We employed a high level of personal involvement in order to acquire data. We contacted chief executive officers (CEOs)/managing directors (MDs) by telephone to explain the purpose of the study, to ask for cooperation and to identify the firm's appropriateness for the research. 495 firms met the criteria of having garment export turnover in the past three years. Of the 65 firms excluded, 16 could not be contacted due to incorrect contact details, 35 have no garment export activities in the past three years or domestically focused, 14 refused to answer. The questionnaires were sent by post and by email to the CEOs/MDs, then, were followed up by telephone again.

Secondary data was collected by online desk research, government published date and in-depth interviews with senior experts in the industry such as Vice Director of VITAS, Director of Post-clearance Customs Audit Office.

3.2 Results

The survey took place from April to June 2011. We received 254 complete and usable responses from the population of 495 enterprises, giving us a response rate of 51.3%. The respondents include 38 state-owned enterprises, 161 domestic-owned private enterprises, 55 foreign-invested enterprises.

Main markets for Vietnam's garment exports before 2002 were the EU and Japan, which accounted for 30.3 percent and 29.8 percent of the total garment export of the year 2001, respectively. Right after the Bilateral trade agreement (BTA) between the US and Vietnam coming into force in 2001, the Vietnam's garment export jumped from 1,975 million US$ to 2,755 million US$ with the export volume to the US market alone is 951 million US$ accounting for 34.5 percent of the total export volume. From 2003 to 2011, the US market always account for around 50-55 percent of the total export turnover. This percentage in case of the EU is about 20 percent, Japan is about 10-15 percent, and in case of the other remaining markets is about 15 percent (GSO Vietnam).

Regarding the firm's buyers, this study differentiates them as GVC-buyers and non-GVC buyers. GVC-buyers refer to the buyers who are taking part in global apparel value chains such as global buyers in developed countries, first-tier suppliers in East Asia NIEs and second-tier suppliers in other developing countries. Non-GVC buyers refer to the buyers who are not members of GVCs even though they are located in the US, the EU, and Japan. The respondents accept this differentiation. For garment export manufacturers, the sign to realize the types of buyers is their role in controlling production process. Different from GVC-buyers, non-GVC buyers do not involve in organizing production process.

Of total 254 firms, 125 are participating in GVC only (exporting to GVC-buyers only), 64 are not participating in GVC (serving only non-GVC buyers) and the remaining 65 are serving GVC as well as non-GVC buyers. Regarding to the forms of exporting to GVC-buyers in the past three years, the percentages of the firms that have CMT, OEM and ODM as the highest value-added form of exporting are 63,7%, 30,6% and 5,7%, respectively. This reflects the fact that most of the Vietnamese firms are locked in the low-end production part of global value chains.

With respect to firm size, according to VITAS, most of SOEs and FIEs garment manufacturers are large enterprises with more than 300 employees (as defined by Vietnamese government under Decree 56/2009/ND-CP). Most of garment manufacturers that have less than 300 employees (SMEs) in Vietnam's garment industry are domestic-owned private enterprises. This is also reflected in our finding.

90,7% of SMEs in our sample are CMT suppliers and 9,3% are OEM suppliers for GVC-buyers. Meanwhile, the percentages of CMT, OEM, and ODM suppliers for GVC-buyers among large firms are 56,0%, 36,7% and 7,3%, respectively. This result is in line with the findings of Abonyi (2005) and Caspari (2003) that most of SMEs are participating in the labor-intensive and low value-added assembly part of the global production process. SMEs that are OEM suppliers in GVCs are, at the same time, the OEM or ODM suppliers for non-

GVC buyers while SMEs that participate in GVCs alone are performing only CMT functions. There are no SMEs with ODM form of exporting to GVC-buyers.

Concerning the firm ownership and export experience, it is found that they are both related to the forms of exporting. The ownership structure of Vietnam's textile and garment industry is a mix of large state-owned enterprises (SOEs), domestic-owned private enterprises and foreign-invested enterprises (FIEs) which consists of joint venture enterprises (with SOEs or private enterprises) and 100 percent foreign-owned enterprises. FIEs' export turnover accounts for about 50 percent of the total exports of the garment industry (VITAS). Of 55 foreign-invested enterprises participating in our survey, 47 are 100-percent foreign-owned enterprises and 8 are joint ventures with a Vietnamese state-owned or private enterprises. All 100-percent foreign-owned enterprises are subsidiaries of garment manufacturers based in Hong Kong, South Korea, Singapore, Taiwan, and China. All of them situate in the lowest note in the apparel value chains, namely CMT while their parent companies in home countries concentrate on higher value-added functions such as supply chain management and design. Most of SOEs are large enterprises and have more than ten-year export experience. Of which, some firms have even more than thirty-year export experience and many firms have both foreign and domestic markets. They are, at the same time, ODM or OBM suppliers in domestic markets, OEM or ODM suppliers for non-GVC buyers and ODM or OEM suppliers for GVC buyers.

Firm's export experience does not play a significant role in determining functional upgrading from CMT to OEM but it is a related factor for moving from OEM to ODM. This supports the above arguments that the barriers of entry into the labour-intensive production part of GVC are much lower than the barriers of entry into knowledge-intensive and high value-added segment of GVC.

3.3   Discussion

Overall, the findings show that the biggest challenge for garment firms in Vietnam now is not how to get access to global markets but how to do this in a way that allows sustainable growth and high profit margin. The Vietnamese export manufacturers realize that they can achieve this objective through product upgrading, process upgrading, or functional upgrading. They have gained some achievements in product upgrading such as moving from low profit margin to higher profit margin products or in process upgrading which results in improvement in productivity, product quality, time of delivery, and flexibility. However, they are, until now, not very successful in functional upgrading to high value-added part of GVCs. Domestic SMEs are primarily locked in Cut-Make-Trim activities. Better than SMEs, large enterprises are able to engage in logistics and design activities but the percentage of OEM or ODM export volume is much smaller than CMT export turnover.

With respect to external factors, according to the CEO/managers the main obstacle to moving up further is the captive relation with the firms' buyers. Vietnamese garment manufacturers are mainly participating in GVCs in these ways:
  - involving in "*triangular*" manufacturing relationship with first-tier suppliers that are mostly based in South Korea, Hong Kong, Singapore and Taiwan;
  - subcontracting with regional traders, mainly from South Korea, Hong Kong, Taiwan, Singapore or Japan;

Challenges of the Modern World - Contemporary Economy and Globalization

- contracting directly with global retailers who have representative offices in Vietnam or in neighboring Asian countries (like in Hong Kong, the leading hub in the global garment industry).

In these *"triangular"* manufacturing relationships, first-tier suppliers receive orders from global buyers, then, organize their production in their own foreign-invested enterprises in Vietnam, or pass the orders to Vietnamese manufacturers. The core competencies of first-tier suppliers in East Asia NIEs at the moment are design and coordinating production networks. They are, therefore, unlikely to leave the management of the supply chain to their Vietnamese suppliers. Meanwhile, there is no such kind of barrier arising from the relationships between the Vietnamese manufacturers and non-GVC buyers. The CMT suppliers in GAVCs, at the same time, can be ODM or OBM suppliers for non-GVC buyers. This supports for the argument of Schmitz (2004) that the upgrading opportunities are determined by the types of governance in value chains and types of relationships between the suppliers and the buyers.

The result shows that the relationship between firm size and form of exporting is statistically significant in case of exporting to GVC-buyers but is not statistically significant in case of exporting non-GVC buyers. CEOs/MDs mentioned the same reasons that are found in literature review that in comparison with large enterprises, SMEs are in disadvantage of functional upgrading in GVCs due to constraints of resources and production scale. In contrast, non-GVC buyers usually order smaller quantity than GVC-buyers and investment in design, marketing, and branding activities targeted at non-GVC end-users requires smaller amount of money. On the other hand, CEOs/MDs of some SMEs revealed that they are still reluctant to move from CMT to OEM form of exporting in GVCs even if they are able to finance for sourcing input materials. The reason is that the increase in transaction cost per unit price depends on the size of the orders, then, the size of firms and they are in disadvantage in comparison with large enterprises.

CEOs/MDs provided some explanations for the finding that functional upgrading prospects and results are different when considering the firm ownership. FIEs are mainly CMT suppliers for their GVC buyers. Most of FIEs are 100-percent foreign-owned with the investors coming mainly from South Korea, Hong Kong, Taiwan, and Singapore. These investors were attracted to Vietnam for the assembly cost advantage due to Vietnam's low wage rates. The parent companies are responsible for finding the buyers and doing higher value-added activities, namely sourcing input materials and design. The managers of FIEs revealed that it is, now, not the time for the parent companies to move these activities to their subsidiaries in Vietnam because Vietnam is still lacking the necessary conditions for developing these capabilities such as high-skilled labor force and strong textile and accessories industry. However, they are preparing for this movement by recruiting the Vietnamese designers to work in the parent companies and building or investing in textile factories in Vietnam. The in-depth interviews with the CEOs/MDs of domestic-owned firms, both SMEs and large enterprises, revealed that they are facing high competition from FIEs in CMT production because the productivity of FIEs is higher. Moreover, many parent enterprises of these FIEs are at the same time the buyers of domestic-owned firms and they give the first priority to their subsidiaries.

4 CONCLUSION

In summary, there is little evidence that the Vietnamese garment manufacturers are successful in moving up to ODM and OBM form of exporting in GVCs or are concentrating on this

objective. Opportunities for functional upgrading in GAVCs are limited for firms in developing countries not only for SMEs but also for large enterprises. Although the garment export turnover keeps growing with quite high rate of twenty percent, the Vietnamese garment producers are still locked into production part of global apparel value chains. The global lead firms know most about consumer preferences and future market developments but they are not willing to share this knowledge even to their historical first-tier suppliers in East Asia NIEs because this knowledge constitutes their core competencies and their competitive advantage. Even if large Vietnamese manufacturers are able to establish direct relationships with global buyers, they may be locked in a position where functional upgrading is possible only to OEM or ODM. The obstacles to SMEs in developing countries for functional upgrading in GVCs are higher than to large enterprises due to the size factor. Being subcontractors of the first-, second- and even third-tier suppliers, they may end up in manufacturing position without any prospects for functional upgrading to OEM or ODM. The main focus of most Vietnamese firms, especially SMEs, at the moment, is not functional upgrading but product and process upgrading in order to keep up with the global buyers' increasing requirements in terms of quality standards, speed and reliability of delivery, flexibility and responsiveness, and other international and private standards such as labor and environment standards. However, there are still some firms, especially those who already involve in ODM/OBM form of exporting to non-GVC buyers or in domestic market are trying to develop the capabilities of managing production networks, design, and marketing in global market. These firms are usually domestic-owned large firms, with long-time export experience. As the learning opportunities provided by the GVC-buyers for improving the design and marketing capabilities are limited, the manufacturers have to learn by themselves by applying the lessons learned from serving other markets and combine them with their self-accumulated knowledge about consumer's preferences.

The results obtained from our study can be particular helpful for domestic-owned garment manufacturers. Vietnamese firms are latecomers in global apparel value chains. The barriers of entry into high value-added activities are even higher than in case of East Asia NIEs twenty years ago. Moving up to OEM or ODM form of exporting in GVCs means those Vietnamese manufacturers must compete directly with their current GVC-buyers who are first-tier suppliers of global buyers. East Asia NIEs used to rely on support and knowledge transfer from their global buyers to build their logistics and design capabilities but it is less likely that Vietnamese manufacturers will receive such kind of support from global buyers because global buyers are not in urgent need of doing that as twenty years ago. Although the opportunities for functional upgrading in GVCs are limited, many Vietnamese firms are successful in ODM or OBM models for non-GVC buyers or domestic buyers and therefore have their own logistics, design, marketing and branding capabilities. Then, they can strengthen these capabilities to meet the demand of global buyers. In summary, firms should take into account the market selection decision when pursuing the functional upgrading objective. Market selection choices include serving the GVC-buyers alone or serving GVC-buyers and non-GVC buyers or domestic buyers at the same time.

This study is subject to several limitations that suggest some directions for future research. Firstly, cross-sectional surveys rather than longitudinal surveys were employed. This cross-sectional research focused on looking at the firms at a specific point in time. We can not show the dynamic process of the firm's functional upgrading over the period of time. Longitudinal method should be used in the next study. Secondly, another limitation relates to the fact that we did not examine the firm capabilities due to the limitation of time and the difficulty in

getting the answer from CEOs/MDs on this issue. Future research that concentrates on the functional upgrading and export performance of the garment exporters should pay more attention to the firm's capabilities and the relationship between them and functional upgrading and export performance. Finally, our findings were drawn from garment manufacturers in Vietnam. Many developing countries in Asia, Latin America, and Africa have the same position in global apparel value chains like Vietnam. The study is needed to replicate for those countries in order to determine whether these results can be generalized to firms in other developing countries.

ABSTRACT
Most commonly, residents are always arguing about the satisfaction of sustainability and quality of their high rise residential property. Often, all the shortcomings and weaknesses will be blamed on the developers without considering the lack of knowledge management from the residents themselves. It is important, therefore, to show that knowledge management of the residents should be taken into account in relation to the satisfactory and the quality of the high rise residential property. This paper aims to discuss the resident's knowledge management level of the high rise residential property in showing that resident's knowledge management is really important to maintain the property at least. To evaluate this situation, the questionnaire surveys are being conducted. The paper analyses and structures the social science research on the importance of knowledge as a resource. The survey evidence demonstrates that, the resident's knowledge management level was highly related in having high quality and sustainable high rise residential property in Johor Bahru.

Keywords: High rise building, Knowledge and information, Knowledge sharing, Residents

1 INTRODUCTION

Many companies throughout the world base their strategies for growth in the generation, transfer and application of new knowledge. Knowledge has been recognized as a source of competitive advantage (Soosay and Hyland, 2008; Goh, 2002; Cohen and Levinthal, 1990). Knowledge as a resource and asset has been one of the major areas of debate in social science research since the last decade of the twentieth century (Love, 1995; McFetridge, 1995; Kogut and Zander, 1995; Athanassiou, 2000; Spencer, 2000; Buckley, 2003). Although international business researchers have analysed successfully the more tangible aspects of knowledge such as technology transfer, innovation and patents, there still remains a more complex issue of precisely how to analyse the transfer and the importance of the more intangible and tacit aspects of knowledge in the twenty-first century. Moreover, knowledge is widely regarded as an instrumental resource when it comes

---

to company performance and innovation (Nonaka and Takeuchi, 1995; Beckett et al., 2000; Sveiby, 2001; Dyer and Hatch, 2006). This paper aims to discuss the resident's knowledge management level of the high rise residential property in showing that resident's knowledge management is really important to maintain the property at least.

For years, the property management and construction industries have focused on three primary concerns in the creation of buildings. But for this paper is concerned, only the first one from the three primary concerns will be discussed. The first, of utmost significance to property managers, is the design of a building and the management after the development. Is the building enjoyable to view and occupy? Does the organization of spaces enhance the user's program?. The second concern, the primary focus of contractors and developers, is the construction of a building. How will the building be built? How much will the building cost? The client expects a contractor to be able to construct a sound building for the predicted construction cost (Amaratunga et al., 2002). These are typically the primary concerns of a client when the idea of developing a building is addressed, so it is no surprise that property managers, developers and contractors focus their efforts to this end. These are noteworthy concerns; however they are not the only concerns that should be addressed when planning for the future.

A third concern that is receiving more attention, as building owners investigate the economics of property management, is the cost of building operations over the life of a building (Dunk, 2004). The combination of economic theory and computer technology allows for more sophisticated approach to the design and construction of material component than ever before. Instead of merely looking at the material component in terms of cost to design and build, owners can broaden their perspective to include operations costs, maintenance costs, repair costs, replacement costs, and disposal costs (Dunk, 2004).

1.1 High Rise Residential Property Development in Johor Bahru

Malaysia has achieved a measure of success in its efforts to provide shelter for all in a sustainable urban environment. This was made possible by the joint efforts of all concerned – government, local authorities, financial institutions, the private sector and the target group themselves. By referring to the Malaysia Plan (five yearly programmes beginning with the First Malaysia Plan 1966–1970), both the public and private sectors have intensified their efforts in the implementation of residential development to meet increasing demand (Ho, 1994, Tapsir, 2001). In this regard, Malaysia has made a firm and clear commitment to build needed infrastructure, both social and physical infrastructure. The government of Malaysia recognises residential property as a basic human necessity and an important component of the urban economy. This has led to the formulation of policies and programmes aimed at ensuring that all Malaysians have access to adequate shelter and related activities. In Malaysia, residential property development programmes are carried out by both the public and the private sector (Government of Malaysia, 2010).

According to the residential property stock report (NAPIC, 2010), the total of high rise residential property development in Malaysia is lower than the low rise residential property development by 41%. However, the current demand for high rise residential property development shows that over 42% of development directed to the high rise residential property development (HRRPD), particularly in Johor Bahru, Malaysia. Based on the current census and National Physical Plan

(NPP) by Ministry of Housing and Local Government and Town Planning, Johor Bahru is expected to provide for a population of 1.84 million people by 2020. With limited land areas left, many property managers need to think about providing vertical residential buildings rather than horizontal residential buildings. In terms of residential property development, property managers need to consider in developing high rise residential building compared to low-rise residential building in the future to solve the problem of limited land areas.

This issue has been traced via the statistics given by the Department of Statistic, Malaysia as in Table 1. The drastic increase in the population means that the land areas left are also decreasing constantly. This scenario creates the situation where, HRRPD is needed in Johor. Instead, Table 2 shows the statistics for population distribution in Johor between Urban and Rural area. The figure in this table is intended to provide the details population movement of Johor comparable to the information stated in Table 1. This pattern of increasing urbanisation of the population is expected to continue up to 2020 when it is anticipated at least 75.0% of the peninsular population will reside in urban areas.

Table 1: Distribution of Population ('000) and AAGR (%) for Johor compare to Peninsular Malaysia (General Report of the Population Census, 2005)

YEAR	Peninsular Malaysia			Johor		
	Population Size	Distribution (%)	AAGR(%)	Population Size	Distribution (%)	AAGR(%)
1980	11,426.6	100		1,638.2	14.3	
1991	14,797.6	100	2.38	2,162.4	14.6	2.56
2000	18,523.6	100	2.53	2,740.6	14.8	2.67
2020	268,097.0	100	1.87	40,422.0	15.1	1.96

Based on the needs and changes in the sustainable development in Malaysia, significant improvement was detected especially in regards the high rise residential property development. The findings as shown in Figure 1, obtained that 157.7% of existing stock of high rise residential property building has increased in year 2012 compared to the year 2004, meanwhile, only 49.5% existing stock increased in Malaysia in total. However, this situation was slightly different when incoming supply data were analysed. Survey detected that only 25.7% different for incoming supply of high rise residential property development in Johor between year 2004 and 2012, meanwhile, the percentage shown the significant dropped on the incoming supply of high rise residential property development by a total of -25.6%. Even though this situation occurred, the most important of knowledge management for the residents of the HRRPD should be examined. By identifying this, it can help to prevent any uncertainties of the quality of HRRPD.

2 KNOWLEDGE MANAGEMENT AND SUSTAINABLE

Knowledge can often be talked (Polanyi, 1957; Schelling, 1960) and its value and quality difficult to ascertain even after the exchange. Because its value is often difficult to ascertain and hence often knowledge can be measured only over time and over repeated interactions, knowledge may be more effectively exchanged in more socially embedded relationships. Since

the 1960s, governments around the world have been encouraged to develop the knowledge sector in their management is concerned.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: Details Urban- Rural Population ('000), 1991-2020 (General Report of the Population Census, 2005)

District Area	19,210km2	
Density	7,409km2 (18,967 sqm2-1)	
Population Size (Year)	**Urban**	**Rural**
1991	989.91	1,079.83
2000	1,787.5	953.1
2005	2,086.5	933.2
2010	2,320.2	1,008.0
2015	2,579.6	1,088.3
2020	2,868.0	1,175.2

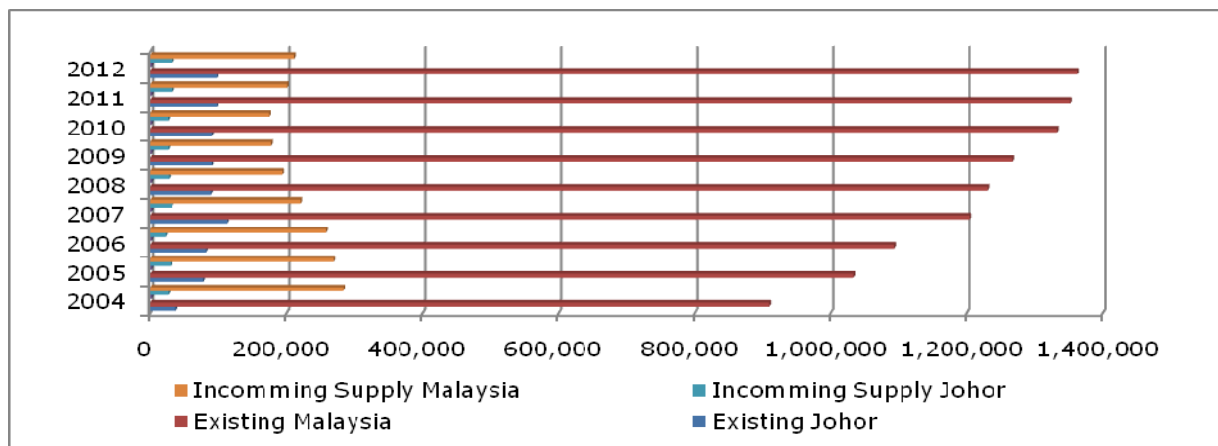
Many reports have been made aggressively which extols the potential of the knowledge management for generating growth (Jarman and Chopra, 2008). Throughout the developed and developing countries, there are being encouraged to pursue similar understanding which embraces a knowledge management and the knowledge economy concept in order to stimulate the best condition of their management process and particularly economic growth.


Chart 1: HRRPD Stock Data in Johor compared to Malaysia
(General Report of the Population Census, 2005)

Knowledge management and sustainability has been focused deeply globally nowadays. Over the last decades the importance of knowledge in social science research has been highlighted in various works and focus especially done by Kogut and Zander (1993, 1995). This works have been supported by Eriksson in year 2000, who helped show that multinational enterprises can be seen from an evolutionary rather than a purely transaction cost perspective – raising the complex need to analyse the crucial importance of knowledge in international business research. Krishan Kumar (1995, p. 23) determined that knowledge according to information society theorists, is progressively supposed to affect work in two ways. One is upgrading of the knowledge content of existing work in the sense that the new technology adds rather than subtracts from the skill of workers. The other determination from Kumar (1995) is the creation and expansion of new work

in the knowledge sector such that information workers come to predominate in the economy. Moreover, it is assumed that it is the more skilled, more knowledgeable information workers who will come to constitute the core of the information economy.

3   OUTLINE OF SURVEY

Both quantitative and qualitative methods have been used as a research method to achieve the objective of this research.

Under qualitative methods is concerned, this research is described to determine a theoretical basis and the factors of knowledge management and sustainable involved in performing the evaluation of resident's knowledge management and sustainable level of the high rise residential residents in Johor Bahru. All of the factors have been determined and the standard provision of the technical performance in delivering all the information of the selected high rise residential property is also analysed.

From this method and analysis, a proposed guideline of resident's knowledge management and sustainable level assessment as an evaluation tool is suggested to be used for high rise residential property residents with regards to the effect of quality and sustainability of the high rise residential property building itself in Johor Bahru. Meanwhile, quantitative methods were used to obtain all the survey results and analyses them in appropriate analyses such regression analysis and correlation analysis.

4   RESIDENT'S KNOWLEDGE MANAGEMENT LEVEL

Twenty high rise residential property development buildings in Johor are chosen randomly for the case studies, whereby the important focus group involved is the resident respectively. 700 sets of questionnaires were distributed to the twenty high rise residential property development buildings and 425 sets were received for analysis. The authors personally distributed to the questionnaires to the respondents' and selected for follow up personally face-to-face survey for the late respondents. Sets of questionnaire with structured questions were distributed to the respective building residents to discover their knowledge on the management of their own high rise residential property development buildings. The analysis of data from the questionnaire responses provide precise data from which tables and graphs are produced.

From the case studies, fourteen (14) elements have been determined and the perspective of the residents was analysed. Table 3 shows the element that has been used in examining the residents' knowledge management level. Basically, residents with age under 25 were excluded in this research because majority of them still under college and university and not having any experiences in managing the high rise residential property building at their place. Table 4 shows that most of the residents that have knowledge on the management of their HRRPD building comes from the age of 31-35 years old with 45.9% while the residents at the age of 26-30 years old only have an average of the knowledge on the management of their HRRPD.

Total		Count	41	197	119	68	425
		Expected Count	41.0	197.0	119.0	68.0	425.0
		% within D1	9.6%	46.4%	28.0%	16.0%	100.0%
		% within D3	100.0%	100.0%	100.0%	100.0%	100.0%
		% of Total	9.6%	46.4%	28.0%	16.0%	100.0%

Each subscript letter denotes a subset of Age categories whose column proportions do not differ significantly from each other at the .05 levels.

Besides that, Table 5 has shown the degree of linear relationship between the elements through Pearson Product-Moment Correlation Coefficient (r). It was found that the level of the knowledge on management of the residents in Johor Bahru HRRPD was above 50% which they were well known of their high rise residential property development especially residents of the age 31-35 years old. In overall, all elements of knowledge management level of the residents in HRRPD in Johor correlate and validated for this study.

5   CONCLUSION

The result presented above among the significant findings analysed but do not represent the entire findings of this study. In general, there is a minor discrepancy in priority order between the residents' age and cultural issues. It is strongly believed that this is due to different dimensions of importance viewed by this age group based on their experience.

While we accept that this is necessarily surface information about what are deeply controversial issues, it is evident from this exploration that there is much work to be done with regard to property business adoption and developer management is concerned in providing high quality and sustainable residential property. It is interesting that usually all the blamed in the case of sustaining the property quality goes to the developers, while at the bottom is essentially a lack of knowledge management of the residents that influence the actual condition of the high rise

residential property quality and sustainability. Creating and sustaining corporate values are a crucial requirement for effective knowledge management for HRRPD residents. In order for an organization to utilize knowledge of their assets and get the maximum value from their assets on HRRPD, knowledge of the residents themselves must move smoothly throughout organizations.

As recommended, it is strongly advised that, all decision making in overcoming the quality satisfaction issues on HRRPD buildings raised by the residents should be taken into account in the future.

ABSTRACT

At present time, we are involved in the knowledge economy era where the knowledge is a fundamental tool in order to obtain competitive advantages. However, although this point has been studied in enterprises since 90 decade, the importance of knowledge management in the case of countries has being discovered the last years. In this sense, researches focus in this topic are essentials in order to promote countries development through a knowledge management strategy. This paper present an interesting analysis about how do OECD countries manage their knowledge using variables related with this process. These variables are linked with knowledge investment, description of countries and knowledge results, all of them extracted in World Bank database and focusing our research in the year 2009. Analyzing the variables with factor analysis technique, we identify four highlight factors in this process: (1) Investment and results, (2) Trade ICT goods, (3) Education and creativity and (4) The power of intangibles. All of them can help to governments interested in the improvement of their situation in the global ranking. We structure the paper like follows: first, a short introduction about the opportunity of this research. Second, we present a bibliographic review about knowledge management in countries analyzing the highlight at present. In the next section we present the methodology used, the data base and the variables of the analysis. Then, we show the results and we present the principal findings of the research derived these results. And finally, we present the conclusion, practical implications, limitations and future researches..

Keywords: *Factor analysis, Knowledge economy, Knowledge management, OECD countries*

1 INTRODUCTION

In the new knowledge economy (Sakaiya, 1991), knowledge is presented like an essential font of competitive advantages in organisations (Nonaka and Takeuchi, 1995; Davenport and Prusak, 2000; Itzkin, 2000; Sharratt and Usoro, 2003; Paswan and Wittmann, 2009; Ajmal, Helo and Kekale, 2010). In this way, countries should manage knowledge present in big and small enteprises and, if it is not captured, it will lose (Fletcher and Polychronakis, 2007).

At present time, society is linked with globalization, and an interesting globalization characteristic is the knowledge highlight. This highlight includes on one hand the backing on technological activities and, on the other hand, essential intangible actives like for example training, software or commercial expenses (Delapierre, 1995). In this way, knowledge

Challenges of the Modern World - Contemporary Economy and Globalization

management is the response to the new society entitled knoledge society where knowledge production (and its using) is the basic pillar (Drucker, 1993; Morrow, 2001; Passerini, 2007; Kebede, 2010). However, alghouth with this discover the publications about knowledge management in enterprises have been increased (Kebede, 2010), there is not many publications about how countries manage their knowledge.

In this scenario, we present an interesting empirical study about knowledge management in OECD (Organisation for Economic Co-operation and Development) countries identifying the most important factors for this process. These factors can help to governments interested in improve their situation in the global ranking focusing their efforts in knowledge value.

OECD countries was founded in 1947 to run the Marshall Plan for reconstruction of a continent ravaged by war. It is composed by 34 member countries span the globe, from North and South America to Europe and the Asia-Pacific region, and it includes also most advanced countries like emerging countries. At present time, the mission of the organisation is to promote policies that will improve the economic and social well-being of people around the world (About the OECD, 2012).

There is not a commonly acepted definition of knowledge management (Hlupic, Pouloudi and Rzevski, 2002). In this sense, authors identify Kebede´s definition like complete and interesting, who defines the concept like a systematic knowledge management and the process and tools associated with it with the aim to exploit its potential and it support decision making process faciliting innovation and creativity, and obtaining a competitive advantage (Kebede, 2010).

From this definition, we expose the relationship between knowledge and other concepts linked with them and exposed by Kebede: Innovation and creativity (research) and process and tools (technological activity). In addition, we analyze an interesting question: education like base of knowledge. In the following subsections, we highlight these relationships from contributions by authors previously.

1.1   Creativity and knowledge: knowledge workers

People are very important in knowledge management, because knowledge is considered like a human capacity (Nonaka and Takeuchi, 1995; Wiig, 1997; Jimes and Lucardie, 2003; Lindner and Wald, 2010). Therefore knowledge is in people´s brain (Sharrat and Usoro, 2003) and knowlege creation is undestood like a process possessed by workers and instrumented in knowledge network in organization. Then Knowledge workers are one of the most important active in enterprises (Drucker, 1991; Zhou, Siu and Wang, 2010). If we move this conclusion to country management, population trained and with habilities is essential in oder to an efficient creation, adquisition and use of knowledge, and it is linked with increase productivity and economy growth (Chen and Dahlman, 2004).

People create, share and use knowledge, and in this sense, there is an essential group: researchers. Studies like published by Adams (1990), who linked the number of scientific articles in a society with productivity growth in American manufacturing sector during the since 1953 until 1980, highlight the importance of researchers and economic development.

Hence creativity is essential to innovation activity and country´s growth (Lee and Choi, 2008), therefore to include researchers and knowledge workers in economic growth models is

essential to research and development (R+D) activity (Raspe and Van Oort, 2006). Moreover in a society like present where creativity and innovation are globalized, a more creative workforce are necessary for the competitiveness (Business Council of Australia, 2006; Oakley, 2007). In this way, stock of ideas is proportional to research effort (Jones, 2002).

Invest in R+D is necessary in order to create new knowledge (Kogut and Zander, 1992; Henderson and Cockburn, 1994; Fleming, 2001; Lindstrom and Heshmati, 2005), and also it is linked with economy growth (Guellec and van Potterlsverghe, 2001; Lederman and Maloney, 2003). In this way, investments associates with new products, new process and knowledge development have a positive impact in GDP (gross domestic product) growth (Davidsson and Segerstrom, 1998; European Comission, 2007).

1.2   Technological activity like knowledge motorway

Some studies show that information and communication technology is an important motor in innovation activity (Polder, Leeuwen, Mohnen and Raymond, 2009). Thus ICT investment is used to process and organize work within organizations (Greenan, Topiol-Bansaid and Mairesse, 2001). In this sense, an intensive use of ICT reduce efforts in research and development (R+D) activity (Cerquera and Klein, 2008), therefore there is a complementarity between both activities (Polder, Leeuwen, Mohnen and Raymond, 2009).

Hendriks (1999) identifies ICT to reduce barriers in knowledge sharing process, facilitate the acces to information bases storing data, improve the processes involved in this process, and may help locate the various elements relevant to knowledge sharing. As consequently, the relationship between ICT and productivity of the organizations is positive (Bresnahan, 2002; Castiglioni, 2009).

1.3   The base of knowledge: Education

Education is the base of knowledge, therefore it is linked with knowledge management. First, primmary education is necessary in order to increase people capacity to learn and use information. Second, secundary and university levels provides the base in order to create innovation and new knowledge (Chen and Dahlman, 2004). In this sense, Universities has a fundamental function in knowledge workers connectivity (Martinez-Fernandez, Rerceretnam and Sharpe, 2007) and present studies show that high education levels are related to increase innovation activity and industrial activities in regions (Goddard, 2007).

In addition, there is a relationship between a population with high education level and technology used in a country. In general, these people will be more sensible to avanzed products quality and they estimulate to local enterprises to innovate and design technological products (Chen and Dahlman, 2004).

2   METHODOLOGY

2.1   Data source

Data for this study were drawn from World Bank database and access was realized in September and October 2012 on the website http://data.worldbank.org/. In this sense, our work includess all the OECD countries and the year of analysis is 2009 thus is the year wchich there are fewer missing data, so we have selected it for our study in order to obtain more conclusions about the countries.

2.2 Description of variables

The variables (see Appendix 1 for more information) have beem classified into the following categories: (1) country description, (2) investment and (3) performance (see Table 1). All of them are related directly or indirectly with knowledge within the countries and its importance has been expose in previous section (1 Introduction).

Table 1: Variables classification

Country Description	Investment Variable	Performance Variable
Researchers	R+D expenditure	Patents
Technicians	Education expenditure	GDP per capita
High tech exports		New businesses
ICT goods exports		Articles
ICT goods imports		
ICT services exports		
Royalties, payments		
Royalties, receipts		

2.3 Research method

In this paper, we use an exploratory factor analysis technique whose aim is to represent a group of variables in terms of a smaller number of underlying factors (Kim and Mueller, 1994), thus this statistical technique identify factors reflecting what variables share in common (Hair, Anderson, Tatham and Black, 1995). Specifically we use principal component analysis (PCA) with Varimax rotation. In this way, Hair, Anderson, Tatham and Black (1995, p. 380) recommend rotation because it *"simplifies the factor structure and usually results in more meaningful factors"*.

3 RESULTS AND DISCUSSION

Using factor analysis technique and rotated component matrix, we identify four highlight factors in knowledge management process linked with OECD countries (see Table 2). These factors explain around 75 per cent of data variability (see Table 3) and following Hair, Anderson, Tatham and Black (1995) a solution that explains more than 60 per cent of the variance is considered satisfactory, thus our study is considered satisfactory. The highlight factors are: (1) Investment and results, (2) Trade ICT goods, (3) Education and creativity and (4) The power of intangibles.

3.1 Investment and results

First factor, called *Investment and results*, explains around 25 per cent of data variability and includes the following variables: research and development (R+D) expenditure, researchers, patents, high technology exports, technicians and GDP per capita. In this sense, this factor highlight the importance about the relationship between invest and results variables and it is in accordance with studies like for example Sarabia, Obeso and Sarabia (2012). R+D expenditure is related to some some description variables as the number of researchers and technicians, and high technology exports. In addition, there is a relationship between R+D investment, patents (the result of investigation) and GDP per capita, following studies like Solow (1957) or Romer (1990), who explains that technical progress is a major source of productivity.

3.2 Trade ICT goods

Second factor, entitled *Trade ICT goods,* explains around 20 per cent of the variance and it is composed by ICT goods imports and ICT goods exports and it is the second most important

factor. This result highlight the importance of ICT technologies in knowledge management in countries, and it is in line with studies like Hendriks (1999) or Bresnahan (2002).

3.3 Education and creativity

Third factor is called *Education and creativity,* and it explains around 16 per cent of data variability. This factor is very interesting because it identies the relationship between education and two important result variables: new businesses and articles. These result variables are linked with prople creativity and following Kerr and Lloyd (2008, p. 488): *"Oakly (2007) (...) emphasises the need to develop communication, leadership, entrepreneurship, team work, creative skills, cross-cultural understanding, problem solving, emotional intelligence and right-brain stuff. Further, a focus by economic policy makers across the world on things `creative´is driven by factors such as crative inputs in innovation policy."*

Table 2: Rotated component matrix

Variables	Component			
	1	2	3	4
R+D expenditure	**,862**	-	,192	-
Researchers	**,763**	-,162	,443	-
Patents	**,668**	,353	-,355	-,321
High tech exports	**,611**	,453	,268	,146
Technicians	**,579**	-,520	,234	,204
GDP per capita	**,570**	-,549	-	,445
ICT goods exports	-	**,903**	-,198	,122
ICT goods imports	-	**,865**	-	,177
Education expenditure	,288	-	**,814**	-
New businesses	-	-,120	**,691**	-
Articles	,571	-,232	**,619**	,195
Royalties, payments	-	,128	-	**,800**
ICT services exports	-	,243	,276	**,788**
Royalties, receipts	,466	-,268	-,231	**,647**

The coefficients less than 0.1 have been removed.

Table 3: Total variance explained

Component		Rotation Sums of Squared Loadings		
		Total	% of Variance	Cumulative %
Factor	1	3,442	24,586	24,586
	2	2,711	19,362	43,948
	3	2,187	15,622	59,570
	4	2,146	15,329	74,899

Extraction Method: Principal Component Analysis

3.4 The power of intangibles

And finally, fourth factor is called *The power of intangibles.* It explains around 15 per cent of the variance and it includes the following variables: royalties (payments and receipts) and ICT services exports. This factor explains the highlight of payments and receipts between residents and nonresidents for the authorized use of intangible, nonproduced, nonfinancial assets and propietary rights such as patents, copyrights, trademarks, industrial processes and franchises.

3.5 Discussion

We identify four interesting factors in knowledge management in OECD countries. The most important factor is *Investment and result*, where includes the relationship between investment and results variables. Then, the second is ICT technologies, thus we exposes the highlight of this tools in the process. Factors 3 and 4 are also interesting but less than factors 1 and 2, so education and intangibles like royalties are less important than others. Therefore, from this information, countries should focus their efforts in investment variables and ICT questions prioritizing these aspects on education and intangibles trademark.

4 CONSLUSION

Following studies like for example Sarabia, Obeso and Sarabia (2012), we identify the highlight factors in knowledge management in an interesting group of countries like OECD. In this sense, there are four factors that governments in OECD countries focus their knowledge management: *Investment and results*, *Trade ICT goods*, *Education and creativity* and *The power of intangibles*, being the first factor *Investment and result* the most important.

This study is very interesting for OECD countries, because it analyzes how these governments manage their knowledge identifying where they focus their efforts in this process. Thus, this research is the first step (what they do) in knowledge management strategy. In this way, we propose new lines of researches, where the analysis about what OECD countries manage their knowledge better than others would be very interesting.

This study also can help other countries that do not belong to OECD organizationand they could use this analysis as a reference for their knowledge management strategy.

Finally, this analysis is also interesting to academicians focused on knowledge management, because it supposes a different point of view in the area (analyzing countries rather than enterprises).

In the end, we identify some limitations in the study. First, how World Bank extracted data, because we have not information about the process as a consequence we do not know if it has been realized it correctly. And second, the analysis is only about the year 2009, thus we obtain a static vision; in this sense, in future researches it could be interesting replicate the analysis in more years and compare the evolution.

Appendix 1: Variables and definitions (extracted by World Bank Database)

GDP growth (annual %): Annual percentage growth rate of GDP at market prices based on constant local currency. Aggregates are based on constant 2000 U.S. dollars. GDP is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources.

GDP per capita (current US$): gross domestic product divided by midyear population. GDP is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources. Data are in current U.S. dollars.

High-technology exports (% of manufactured exports): products with high R&D intensity, such as in aerospace, computers, pharmaceuticals, scientific instruments, and electrical machinery.

ICT goods exports and imports (% of total goods exports and imports): they include telecommunications, audio and video, computer and related equipment; electronic components; and other information and communication technology goods. Software is excluded.

ICT service exports (% of service exports, BoP): include computer and communications services (telecommunications and postal and courier services) and information services (computer data and news-related service transactions).

New businesses registered (per million people): New businesses registered are the number of new limited liability corporations registered in the calendar year.

Patent applications, residents (per million people): Patent applications are worldwide patent applications filed through the Patent Cooperation Treaty procedure or with a national patent office for exclusive rights for an invention--a product or process that provides a new way of doing something or offers a new technical solution to a problem. A patent provides protection for the invention to the owner of the patent for a limited period, generally 20 years.

Public spending on education, total (% of GDP): Public expenditure on education as % of GDP is the total public expenditure (current and capital) on education expressed as a percentage of the Gross Domestic Product (GDP) in a given year. Public expenditure on education includes government spending on educational institutions (both public and private), education administration, and transfers/subsidies for private entities (students/households and other privates entities).

Challenges of the Modern World - Contemporary Economy and Globalization

Research and development expenditure (% of GDP): Expenditures for research and development are current and capital expenditures (both public and private) on creative work undertaken systematically to increase knowledge, including knowledge of humanity, culture, and society, and the use of knowledge for new applications. R&D covers basic research, applied research, and experimental development.

Researchers in R&D (per million people): Researchers in R&D are professionals engaged in the conception or creation of new knowledge, products, processes, methods, or systems and in the management of the projects concerned. Postgraduate PhD students (ISCED97 level 6) engaged in R&D are included.

Royalty and license fees, payments and receipts (BoP, current US$): they are payments and receipts between residents and nonresidents for the authorized use of intangible, nonproduced, nonfinancial assets and proprietary rights (such as patents, copyrights, trademarks, industrial processes, and franchises) and for the use, through licensing agreements, of produced originals of prototypes (such as films and manuscripts). Data are in current U.S. dollars.

Scientific and technical journal articles (per million people): Scientific and technical journal articles refer to the number of scientific and engineering articles published in the following fields: physics, biology, chemistry, mathematics, clinical medicine, biomedical research, engineering and technology, and earth and space sciences.

Technicians in R&D (per million people): they are people whose main tasks require technical knowledge and experience in engineering, physical and life sciences (technicians), or social sciences and humanities (equivalent staff). They participate in R&D by performing scientific and technical tasks involving the application of concepts and operational methods, normally under the supervision of researchers.

ABSTRACT
In this study, convergence between Turkey and the EU has been examined by using time series econometrics in the context of per capita incomes. Firstly stochastic convergence has been summarized. Then, it has been investigated whether Turkey is catching up the EU or not. Both average incomes of the EU13 and individual income of each country in the EU13 have been considered in order to analysis Turkey's convergence process to the EU for the period 1950-2010. According to results, there have no strong convergence tendency in the income differences of Turkey EU13. Turkey is catching up only a country while falling behind of EU13 average and other twelve countries. These results indicate that Turkey must have better economic performance in the process of economic integration in order to catch up living standards of the EU.

Keywords: Catching up, Convergence Hypothesis, Turkey and European Union

1 INTRODUCTION

Turkey has been trying to join the European Union (EU) since the first full membership application in 1959. After more complicated circumstances, Customs Union actualized in 1996 can be seen an important step in this process. In 2004, Turkey was recognized as a nominee state and open-ended negotiations for full membership started on October 13, 2005. Although Turkey has fulfilled Copenhagen Criteria in many aspects, it has confronted many difficulties in fulfilling Maastricht Criteria that will be necessary for monetary union. In other words, apart from socio-cultural differences, integration of Turkey into economy of the EU includes various difficulties. In this sense, in the study it has been investigated whether Turkey, as a nominee state, has convergence towards the EU in the context of per capita incomes. In other words, Turkey's catching up or falling behind the EU and specific countries in the Union was examined by using time series method with special reference to convergence hypothesis.

2 STOCHASTIC CONVERGENCE: A BRIEFLY REVIEW

Neo-Classical Solow (1956) model suggests that growth rate would decrease as long as capital increases because of the law of diminishing returns. When this hypothesis is considered among countries, it is expected that developing countries would present high growth rates than developed economies and catch up in the context of per capita incomes. Catching up (a country is getting close to a leading country, which mentioned by

Gerschenkron in 1958 and discussed by Abramowitz in 1986) and convergence (income differences between countries will decrease in long run, which introduced by Baumol in 1986 and formulized by Barro and Sala-i Martin in 1992) have been popular issues in the growth literature in recent years because these discussions are also about of the validity of traditional neo-classical growth models (Solow, 1956; Swan, 1956) and New Endogenous Growth Models (Romer, 1986; Lucas, 1988).

Convergence and catch-up hypothesis are generally tested with cross section studies (Baumol, 1986; Barro and Sala-i-Martin, 1992), time series methods (Carlino and Mills, 1996; Bernard and Durlauf, 1995), distribution dynamics (Quah, 1993) and panel data analyses (Islam, 1995; Bond et al., 2012). However due to criticism towards cross-section analyses, panel data and time series methods have been usually preferred for testing convergence hypothesis by researchers in recent years (Islam, 2003).

ADF: Augmented Dickey-Fuller; LM: Lagrange Multipler, KPSS: Kwiatkowski, Phillips, Schmidt, and Shin; PP: Phillips-Perron; LS, Lee-Strazicich, KSS: Kapetanios, Shin, Snell.

Testing convergence hypothesis by using time series econometrics started with classical unit root tests and then it has been developed other approaches such as considering possible breaks in trend (Oxley and Greasley, 1995; Carlino and Mills, 1996) and non-linear unit root tests (Chong et al., 2008). Similarly, while Lee et al. (1997) developing definition of stochastic convergence, Bernard and Durlauf (1995) discussed the convergence in the frame of co-integration relationships. On the other words, there are several methods for testing convergence hypothesis in the literature, i.e. structural time series model (Harvey and Carvalho, 2005), Kalman Filter Method (Datta, 2003) and average trend approach (Nahar and Inder, 2002) and so on. A literature survey for these studies was presented in Table 1.

Challenges of the Modern World - Contemporary Economy and Globalization

It can be seen that studies in Table 1 started with ADF unit root test and shifted towards non-linear unit root tests and different test that consider structural breaks in series. It is quite difficult to deduce from study results that there is a clear convergence or divergence between countries. Anyway, common finding of studies upon developed countries such as OECD countries favors convergence. However many studies about developing countries rather point out divergence issues.

3 METHODOLOGY

There are various definitions of convergence and catching up process in the sense of time series in economic growth literature as mentioned above. In this study Carlino and Mills (1996) approach was used. Let show per capita incomes of first country and second country in t period y_{1t} and y_{2t} respectively and say $x_t = \log y_{1t} - \log y_{2t}$. According to Carlino and Mills (1996, p. 573), there should be satisfied two conditions in order to convergence: (a) x_t must be have a mean reverting process, i.e. d<1. (b) x_t must decrease over time, i.e. $\lim_{k \to \infty} E(x_{t+k} / I_t) = 0$. Where I_t is the information set in period t.

If the unit root hypothesis is rejected for the first condition, the following regression is employed to test for β-convergence or catch up (Ayala, Cunado and Gil-Alana, 2013, p. 3222):

$$x_t = \mu + \beta t + u_t \tag{1}$$

Where x_t is the income differences in logarithmic form ($x_t = \log y_{1t} - \log y_{2t}$), μ is the constant, t is the trend, and u_t is the error term. Following conclusions can be derived depending on signs of the estimated parameters (Ayala, Cunado and Gil-Alana, 2013, p. 3222):

1) *β-convergence*: μ and β have opposite signs and statistically significant ($\mu \neq 0, \beta \neq 0$).
2) *Divergence from different levels*: μ and β have the same sign and statistically significant ($\mu \neq 0, \beta \neq 0$).
3) *Constant at different levels*: μ is statistically significant but β is not ($\mu \neq 0, \beta = 0$).
4) *Divergence from the same level*: μ is statistically insignificant but β is not ($\mu = 0, \beta \neq 0$).
5) Constant at the same level: μ and β are both statistically insignificant ($\mu = 0, \beta = 0$).

In other words, that the income differences do not include unit root only points out that shocks are temporary. Augmented Dickey-Fuller test can be employed in order to determine this condition. However; in order to determine whether difference between countries have closed or widened, signs of constant and trend and their statistical meaning should be considered.

4 DATA

Data required for analysis was obtained from Penn World Tables for the 1950–2010 periods (Heston et al., 2012). PWT was preferred since data was corrected according to purchasing power parity and widely used in international studies. On the other hand, there is no past information about countries that have been member of the EU recently. Similarly, there is no reliable information for Germany as well. In order to prevent excessive values, small countries such as Luxemburg and Malta were not included within analysis. For these reasons,

Challenges of the Modern World - Contemporary Economy and Globalization

only 13 states out of 27 stated which are EU members were considered. These countries stated as EU13 are Belgium, The Netherlands, France, Italy, Denmark, United Kingdom, Ireland, Greece, Portugal, Spain, Austria, Finland, and Sweden.

5   EMPIRICAL RESULTS

In order to observe process of income differences among Turkey and EU, income differences in in logarithmic form were shown in Graphic 1. Apart from the income difference among Turkey and other 13 EU member states, income differences among related countries were considered as well. As it can be seen from the graphic, income difference among Turkey and EU13 (and related countries) constantly increased until the middle of 1970's. However this trend paused in 1970's and income difference per capita began closure trend. It can be said that performance of Turkey in recent years is as effective as financial crisis of the EU in these results.
Figure 1: Income Differences in Logarithmic form among Turkey and EU13, 1950–2010

In order to determine whether there is a convergence among Turkey and EU13, income differences per capita in logarithmic form were applied constant and trend ADF unit root test and results were shown in Table 2. First of all, income average per capita of Turkey and 13 EU member countries were considered, and then income difference among related countries were discussed one by one.

Table 2: ADF Results (Constant and Trend Model)

Countries	k*	τ_τ	*Prob.*	Conclusion
TR-EU13	0	-2.48	0.33	Divergence
TR-Belgium	0	-2.88	0.17	Divergence
TR-Netherlands	**0**	**-3.15**	**0.10**	**...**
TR-France	0	-1.52	0.81	Divergence
TR-Italy	0	-0.76	0.96	Divergence
TR-Denmark	0	-2.71	0.23	Divergence
TR-UK	**0**	**-3.93**	**0.01**	**...**
TR-Ireland	1	-2.28	0.43	Divergence
TR-Greece	0	-1.21	0.89	Divergence
TR-Portugal	0	-1.38	0.85	Divergence
TR-Spain	0	-1.39	0.85	Divergence
TR-Avustria	0	-1.48	0.82	Divergence
TR-Finland	**1**	**-3.18**	**0.09**	**...**
TR-Sweden	**1**	**-3.51**	**0.04**	**...**

* Lags have been chosen by considering Schwarz Information Criteria (SIC).

As it can be seen in Table 2, there is no convergence or catching up among Turkey and EU13. According to results, there is no unit root in income differences of only four countries (Netherlands, UK, Finland and Sweden) out of 13. In other words, shocks left no permanent affects in income differences among Turkey and these countries. On the other hand, unit root hypothesis failed to rejected for EU13 and the other nine countries. It can be said that Turkey is falling behind EU and other nine countries. However these results are not sufficient to determine whether there is catching up among Turkey and four countries that have no unit root in income differences. As it is mentioned in method section; checking unit root is not sufficient to determine whether the difference among countries has decreased or not. For this reason, equation no (1) was estimated for all country couples and results were presented in Table 3.

Table 3: Estimation Results

Income Differences	μ	*Prob.*	β	*Prob.*	States	Conclusions
TR-Netherlands	-0.6201 (0.0082)*	0.00	(-0.00007) (0.00023)	0.75	$\mu \neq 0, \beta = 0$	Constant at different levels
TR-UK	-0.5069 (0.0083)	0.00	-0.0006 (0.0002)	0.01	$\mu \neq 0, \beta \neq 0$	Divergence from different levels
TR-Finland	-0.4385 (0.0110))	0.00	-0.0023 (0.0003)	0.00	$\mu \neq 0, \beta \neq 0$	Divergence from different levels
TR-Sweden	-0.6872 (0.0079)	0.00	0.0021 (0.0002)	0.00	$\mu \neq 0, \beta \neq 0$	Catch up

* Standard errors are in the parenthesis.

Results in Table 3 can be interpreted as such: (a) There is a constant per capita income difference between Turkey and Netherlands and this difference does not change in time proportionately. (b)There is a specific income difference per capita among UK and Finland and Turkey and this difference increases in time proportionately. In other words, Turkey is falling behind of the both countries, UK and Finland. (c) On the other hand, income

difference between Turkey and Sweden is decreasing and Turkey is catching up this country in the terms of per capita income.

6   CONCLUSION

According to the results, there is no convergence tendency between Turkey and EU. Only a catch up process (between Turkey and Sweden) has been determined among 13 countries representing EU. Furthermore, it was observed that income differences gradually have increased from 1950's to the middle of the 1970's, but gone straight in the 1980's and then had a tendency to diminish in the 2000's. These cyclical changes indicate that structural breaks or nonlinear cases in series must be considered for next studies. Nevertheless, these results point out the fact that Turkey should have higher growth rates and better economic performance as a nominee state. Similarly, this study draws attention to the necessity that Turkey has to meet its economical span with the EU in addition to political and legal requirements.

ABSTRACT
The phenomenon of poverty is responsible for the insertion of many children in the labor market as a way to ensure the sustenance and survival of the family. Brazilian government created the Bolsa Familia Program to combat this kind of problem. This Program is a transfer income program subject to certain conditionalities as minimum school attendance of children under 17 years old. In 2006, almost half of people with income per capita R$ 300.00 per month declared receive the benefit of the program. Accordingly, the objective of this study was to analyze the impact of Bolsa Familia on child labor in Brazil in 2006. To achieve this goal, we used a Propensity Score Model, with data from the National Household Sample Survey (PNAD), for 2006. Contrary to what was expected, the results indicate that the program increased the number of hours of child labor in the country. However, this can be explained by the fact that families that receive Bolsa Familia are also those with higher socioeconomic vulnerability. So, they need to guarantee the survival with the income generated on child labor. Thus, to achieve good results in the fight against child labor, the government needs to invest not only in income transfer policies, but also in improving the labor market of adults and creating opportunities for social development for children.

Keywords: Bolsa Familia Program, Brazil, Child labor

1 INTRODUCTION

Child labor is a recurrent theme in the economic literature, where are approached its causes, consequences and the policies for its fight. According to Diallo et al. (2010), it is estimated that about 215 million of children aged between 5 and 17 years exercised some sort of child labor in 2008, seeing that 60% of those children had been involved in the farm sector, 7% in the industry and 26% in the service sector. In relation to the spatial distribution of child labor, one has that 53.28% of the child workforce aged between 5 an 14 years is situated in Asia and Pacific, 34.17% in Sub-Saharan Africa, 6.36% in Latin America and the Caribbean and 6.19% in other regions (Diallo et al., 2010).

Among the causes of insertion of the children into labor, one of the most cited is poverty. In this sense, Ferro and Kassouf (2005) observed that the contribution of the earnings of the children for the family income is important, because the per capita income is very low in the families in which the children work. Cacciamali et al. (2010) also stated that the low income population feel obliged to go precociously into job market, in pursuit of warranting his own

survival or complement the family income, allocating time in these activities at the expense of the studies. But, the precocious insertion of children in the job market causes the perpetuation of poverty and low schooling.

With regard to the consequences of child labor, Anker (2000) divided those effects into two levels: those which took place at the micro level, in the home environment and those which occurred at the macro level, upon the job market and economics. The micro level is related with family income and survival. The macro level involves matters relative to the wages and adult unemployment, economic growth and development.

In addition to studying the causes and consequences of that sort of labor, some authors sought to identify proposals for the fight or reduction of the problem. Tanaka (2003) suggests that an increase of school frequency enabled by the availability of schools of better quality and low cost, is a strategy to reduce child labor. Basu (1999) also highlights the creation of laws which make the school frequency compulsory as a strategy to fight the problem, because he believes it is easier to control the presence at school than the absence in job. The government still can intervene in the market creating other incentives which result into the reduction of child labor such as the provision of more and better schools and the improvement of the conditions in job market of the adults (Basu, 1999).

With the purpose of breaking the perpetuation of poverty and creating conditions for the children not to be obliged to go precociously into the job market, the income transfer programs appeared. In the case of Brazil, the Bolsa Familia Program was created by Law number 10.836, of January of 2004. The Bolsa Familia is an income transfer program subject to certain conditions such as compulsory school attendance for children between 6 and 17 years old and social care of children and teenagers of up to 15 years who have been removed from child labor by the Child Labor Eradication Program (Peti). The children who exercised child labor should take part in the Service of Convivence and Strengthening of Links (SCFV) of Peti and obtain minimal attendance of 85% of the monthly number of hours.

According to Cacciamali et al. (2010), programs as Bolsa Familia fight two aspects which characterize the reproduction of the poverty between generations: warrant a minimum level of subsistence income for the poor families and guard the obtaining of human capital of its beneficiaries. For the authors, that is justified by the fact that as the gain of the families rise, their members will be able to allocate more time to leisure or study, without loss to the minimum necessary to their survival, which could reduce the child labor of the poor families.

From the remarks presented and before the importance and the amount of resources intended to programs which seek to reduce the social inequalities, the objective of this work will be to examine the impact of the Family Allowance Program upon child labor in Brazil in 2006. Such a study allows us to verify if the program has effectiveness in reducing the child labor among the children of poor families or if it needs of bettering to fight such a reality.

2 THEORETHICAL REFERENTIAL

The theoretical model on which this work is based is the theory about the time allocation proposed by Becker (1965) with adaptations of Ersado (2002). According to that theory, the family's time is distributed among job, leisure and school. The family decision about the allocation of the time of the children takes into account the private returns of each of them. In

this work, we adopted the neoclassical model of unit home labor supply in which the family takes joint decisions on domestic consumption and labor supply of its members.

Ersado (2002) supposed that the decision about the participation of the children in workforce, leisure or school is determined by an adult person. In addition, the same author considers that a family composed by an adult and a child maximizes its function of utility into two periods (t and $t+1$), according to the equation (1).

$$V_t = U(C_t, L_{p,t}, L_{c,t}, S_{c,t}, X_t)$$ (1)

In which U is a concave utility function based on the consumption set (C), of the child's schooling (S_c), of the leisure time of the adult and child (L_p, L_c) and of a vector of individual and family characteristics (X).

In that model, the decision about the allocation of the child's time is done by the adult. So, if the decision is to insert the child into labor, he will earn a wage W_c in the first period and a salary W_u (wage of an unqualified adult) in the second period. Nevertheless, if the adult decides to send the child to school, she will not earn any salary in the first period and salary W_s (salary of a qualified adult) in the second period. One can suppose that $W_c \leq W_u \leq W_s$. Thus, the head of the family should maximize the utility function presented in equation (1) subject to the availability of time and to the restrictions of resources in each period:

$$C_t + W_t(L_{p,t} + L_{c,t} + S_{c,t}) = \Omega_t + W_t T$$ (2)

In which W_t is a vector of salary rates for the adult and child, T is the total time available for the family (that is, $T = T_p + T_c$), C_t is the value of the total consumption and Ω_t is the non-salary income. The non-salary income Ω_t includes the profits of the self-employment in farming and non-farming activities (Π), incomes coming from asset interests of the family (A_t), government transfers and other sources of revenues which are not derived from labor (Y_t), as presented in equation (3).

$$\Omega_t = \Pi_t + \delta A_t + Y_t$$ (3)

where δ is interest rate. The family head still should consider, in equation (2), the child's restriction time, since this time must be divided between the school, the job and leisure, in addition to the unpaid domestic work.

$$T_c = L_{c,t} + S_{c,t} + E_{c,t}$$ (4)

In which $E_{c,t}$ is the time spent in paid or unpaid labors.

The temporal trajectory of the family assets can be defined by equation (5).

$$A_{t+1} = (1+\delta)A_t + \{\Pi_t + Y_t + W_t E_{c,t} + W_t(T_p - L_{p,t}) - C_t\}$$ (5)

where A_t is the total of assets in the previous period and $\{\Pi_t + Y_t + W_t E_{c,t} + W_t (T_p - L_{p,t}) - C_t\}$ is the saving (or dissaving) in the period t after the spending on consumption. Using equations (3) and (5) and solving for Ω_t, one has:

$$\Omega_t = (A_{t+1} - A_t) + \{C_t - [W_t E_{c,t} + W_t (T_p - L_{p,t})]\} \equiv \Delta A_t \qquad (6)$$

where equation (6) consists in an inter-temporal measure of the non-salary income which allows the agents either to save or not.

From the equations above, it follows that the family head maximizes the domestic well-fare, equation (1), subject to the restrictions of the child's time, equation (4), and non-salary incomes, equation (6). The solution to these maximization problems is the indirect utility function which depends of the prices, salaries, family characteristics (included in the vector X_t), credit constraints and other factors as presented in equation (7).

$$V = U(\Gamma^*(W_t, \Pi_t, A_t, Y_t, X_t, \Psi)) \qquad (7)$$

where Ψ denotes all the observed and unobserved characteristics which affect the parents' decisions. Given that schooling is form of valuing of the human capital, a utility function under the decision of schooling is defined by:

$$V_s = U(\Gamma^*(W_s, \Pi_t, A_t, Y_t, X_t, \Psi)) \qquad (8)$$

So, the parents decide to send their children to school instead of sending to labor in the period t if they understand that the future profits will be higher with the valuing of human capital, that is,

$$V_s - V_u \geq 0 \qquad (9)$$

where V_u is the indirect utility function on the decision of not-sending the child to school.

$$V_u = U(\Gamma^*(W_u, \Pi_t, A_t, Y_t, X_t, \Psi)) \qquad (10)$$

3   METHODOLOGY
The present work used a propensity score model to determine the impact of the Bolsa Familia Program upon child labor in Brazil. The propensity score corresponds to the probability for the families to receive the Program benefit given its characteristics.

To measure the effect of the program on the child labor, may be used the Average Treatment Effect upon the Treaty (ATT), defined by Rosenbaum and Rubin (1983) as:

$$ATT = E(y_1 \mid d = 1) - E(y_0 \mid d = 1) \qquad (11)$$

where $E(.)$ denotes the expectative of the effect of the treatment, y_1 is the result of the treated variable (people given the benefit) and y_0 is the result of the control group (people who received no benefit).

As stood out previously, a problem to estimate equation (11) is that one individual who belongs, at the same time, to the treatment and control groups is not found. So, Araújo et al. (2010) suggested that the replacement of $E(y_0|d=1)$ by the group of persons who effectively do not take part in the program $E(y_0|d=0)$. In that way, equation (11) turns into:

$$ETM_1 = E(y_1|d=1) - E(y_0|d=0) \tag{12}$$

Nevertheless, to estimate the effect of the treatment according to equation (12) can generate biased results, since the adhesion to the treatment no always is random, depending on a set of characteristics of the participants (Araújo, 2009). Furthermore, persons with similar characteristics may or not be beneficiary of the program. So, the results do not depend on the characteristics of the persons, though the selection is done on the basis of observable characteristics (Araújo, 2010).

To solve the bias problem of self-selection of the sample, it is necessary to impose some conditions. At first, one should consider the Conditional Independence Hypothesis (Rosenbaum and Rubin, 1983), which suggests that the results is independent of the treatment so as to the average effect of the treatment is obtained on the basis of the differences among the results of the treated and non-treated ones.

The Propensity Score Model consists in finding the counterfactuals, which is what would have happened if it had not been implemented. Nevertheless, to estimate the propensity score, it is necessary to adopt a statistical model with limited dependent variable, and in this work was employed the Logit Model. So, from the estimate of the propensity score, one has that the Average Treatment Effect (ATT) can be estimated according to equation (13):

$$ATT = E\{E[y_1|d=1, p(X_i)] - E[y_0|d=0, p(X_i)] | d=1\} \tag{13}$$

In which the expectation is about the distribution of the probability of X_i given the treatment, and y_1 and y_0 are the potential results for the two counterfactual situations, with or without the treatment (Becker and Ichino, 2002).

However, Becker and Ichino (2002) highlighted that to estimate the Treatment Effect is still necessary to adopt a matching algorithm and in this work was adopted the Nearest Neighbor Matching, in the same way as in Araújo (2009) and Araújo (2010), in which all the units of the treatment find a match in the control group (Becker and Ichino, 2002).

To test the matching quality, it was compared the situations before and after the use of the propensity score. So, it was compared the standardized bias and pseudo R^2, and both must be reduced after pairing, so that there are no systematic differences between the two groups. In addition, it was verified the existence of bias of the omission of relevant variable from the limits of Rosenbaum, which surveys how the omission of a variable can influence the selection process in order to invalidate the implications of corresponding analysis.

3.1   Source of data
The data utilized in this work were obtained in the National Household Sample Survey of the Brazilian Geography and Statistics Institute (IBGE, 2006), seeing that those data were re-weighted for Brazil in 2009 to consider the new population projections designed by the IBGE

in 2008. It was decided for the data of 2006 because the IBGE designed in this year supplementary works about the access to income transfers and social programs.

For obtaining the results, the sample was limited to the families consisting of individuals aged between 0 and 17 years and who had a per capita income liquid of the government transfers of up to R$ 300.00, amounting to 21,886 individuals. This delimitation of the sample was also adopted by Araújo (2009), Araújo (2010) and Araújo et al. (2010) and corresponds to the families suitable to receive the Bolsa Familia Benefit, in addition to the families who could finding themselves in situation of economic vulnerability.

The variables determining the participation in the Family Allowance in the Logit model were those related with the characteristics of the children and their families. Those variables characterize some social and economic conditions which could contribute towards the increase or reduction of the selection probability for the program.

Among those variables were considered as characteristics of the children the age (in years) and a dummy for the color (1 if the child is black and 0 for the others). A positive relationship between the age and the probability of participating in the program and a negative relationship between the color and the participation in the Bolsa Familia Program is expected.

Other variables relevant to the survey of probability of participation in the Bolsa Familia Program were the parents' characteristics and the family characteristics, being that the former ones were divided into schooling of the father and of the mother (in years) so that a negative relationship between those variables and the participation in the program is expected.

As to the family characteristics, the variables regarded are the per capita income liquid of the government transfers, a dummy for families headed by females (1 if yes and 0 if not), a dummy for families dwelling in rural areas (1 for rural and 0 for urban), a dummy for families dwelling in metropolitan regions (1 if yes and 0 otherwise), number of children of 0 to 5 years in the family and number of children of 6 to 17 years. The dependent variable of the labor is the number of hours of child labor (*hours_inf*). It is expected to obtain a positive relationship between the probability of participating of the program and the dummy of families headed by females, a dummy of families dwelling in rural areas and the number of children of 0 to 5 years or of 6 to 17 years and a negative relationship between the probability of participating in the Bolsa Familia Program and the per capita income liquid of the government transfers and the dummy of families dwelling in metropolitan regions.

4   RESULTS
To evaluate the impact of the Family Allowance Program upon child and teenager labor, a non-experimental method (matching) was utilized to find a control group the characteristics of which were as close as possible to the treated ones. The comparison among the groups, at first, is done by means of the Logit model, given that one does not previously the propensity scores (Araújo, 2010). That model estimated the probability of taking part or not in the program, the results of which are presented in table 1.

Table 1: Estimate of the Logit model for the group of families of Brazil with per capita net income of the transfers up to R$ 300.00, in 2006 (Results of the work)

	Coefficient	Standard Error	Z	p-value
School Attendance	0.419767	0.037709	11.13	0.000000
Mother's schooling	-0.051696	0.003991	-12.95	0.000000
Father's schooling	-0.003636	0.004091	-0.89	0.374000
Age of child	-0.004092	0.004002	-1.02	0.307000
Number of children 1	0.067546	0.018778	3.60	0.000000
Number of children 2	0.308758	0.012028	25.67	0.000000
Head_female	-0.200266	0.195703	-1.02	0.306000
Rural	0.483943	0.034456	14.05	0.000000
Metropolis	-0.605106	0.036018	-16.80	0.000000
Family income	-0.002654	0.000185	-14.31	0.000000
Black	0.037256	0.059414	0.63	0.531000
_cons	0.150244	0.062205	2.42	0.016000

The analysis of table 1 allows us to identify that some variables were not statistically significant. That means that the father' schooling, the age of the child, the families headed by female (*head_female*) and the dummy of race (*black*) are not relevant variables in determining the probability of the families to be beneficiaries of the Bolsa Familia Program. Nevertheless, even not being significant, those variables should not be excluded from the system, for they constitute important sources in the diagnosis of child labor (Araújo, 2009).

To the other variables, it was found that school attendance increased the probability of participating in the program and the per capita income liquid of the government transfers (*family income*) reduced this probability. These results are consistent with the expected, because the conditionalities for the family to be beneficiary from the Bolsa Familia Program is the school attendance of the children of 6 to 17 years and the low per capita income.

Other variables which reduce the probability of participation in the program were the mother's schooling and the fact that the individual living in a metropolitan region. Some of those results were also obtained by Araújo (2009), Araújo et al. (2010) and Araújo (2010), but such works considered the family head's schooling while the present study opted for the distinction between the male's and female's schooling level, observing that only the female's schooling had a significant impact upon the probability of participation in the program.

On the other hand, the number of children of 0 to 5 years, of 6 to 17 years and the fact of living in a rural area increased the chances that the individual was a family Allowance Program beneficiary. Similar results were obtained by Araújo (2009) and Araújo et al. (2010).

The next procedure was to analyze the quality of the pairing. The validity of the conditional independence hypothesis was tested on the basis of the standardized bias reduction analysis and in the Pseudo R^2 test, the results of which are presented in table 2.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 2: Standardized bias analysis for the sample of matched and unmatched individuals
(Results of the work)

Variable	Sample	Mean		Reduction of the bias
		Treated	Untreated	
School attendance	Unmatched	0.72306	0.58451	
	Matched	0.68853	0.58451	24.9
Mother's schooling	Unmatched	5.01470	6.61740	
	Matched	5.45480	6.61740	27.5
Father's schooling	Unmatched	2.73150	3.23230	
	Matched	2.86100	3.23230	25.9
Age	Unmatched	8.28990	7.10490	
	Matched	7.95580	7.10490	28.2
Number of children1	Unmatched	0.88980	0.91385	
	Matched	0.88070	0.91385	-37.8
Number of children2	Unmatched	2.04320	1.20430	
	Matched	1.64540	1.20430	47.4
Head_female	Unmatched	0.00371	0.00888	
	Matched	0.00439	0.00888	13.2
Rural	Unmatched	0.42447	0.22901	
	Matched	0.34172	0.22901	42.3
Metropole	Unmatched	0.16632	0.33243	
	Matched	0.19667	0.33243	18.3
Family income	Unmatched	169.87000	185.10000	
	Matched	175.84000	185.10000	39.2
Black	Unmatched	0.06378	0.06599	
	Matched	0.06509	0.06599	59.3
		Pseudo R^2	LR	P-value
Summary	Unmatched	0.104	3145.660	0.000000
	Matched	0.054	1507.940	0.000000

The results of table 2 allow us to identify that, with the exception of the variable concerning the number of children of 0 to 5 years in the family (*number of children1*), the other variables presented reduction of the bias. In way complementary, the comparison among the results of the Pseudo R^2 test before and after the matching indicated that the same obtained a significant reduction when matched, which corroborates the fact that there are no systematic differences in the distributions of the variables between the two groups.

Other procedure used to test the quality of matching was the verification of the existence of bias of omitted bias variable. The method of analysis of that bias is based upon the Rosebaum limits, the results indicated that there is no bias resulting from variable omitted from the model. In that manner, the model was quite adjusted with a balanced distribution of the independent variables in the two groups and validation of the bias absence hypothesis of omitted relevant variable.

After the previous procedures, it was sought to evaluate the impact of the Bolsa Familia Program upon the child labor in Brazil. That procedure was carried out from the effect of the treatment on the treated one, adopting the nearest neighbor matching method in the same form as in Araújo (2009) and Araújo (2010). The results of this algorithm are reported in table 3.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 3: Effect of the average treatment upon the treated one for the variable hours of child labor (horas_inf) for Brazil, in 2006 (Results of the work)

Response variable	Treatment	Control	Estimator of the ATT (nearest nieghbor)
Hours_inf	11869	5250	0.525[***]

Note: [***]Significant at 1%.

The results of table 3 allows us to verify that the Bolsa Familia Program increased the number of hours of child labor in Brazil by 52.5%, contrary to the expected. This result stands for a perverse effect of the program and was also observed by Cacciamali et al. (2010), Araújo (2009) and Araújo et al. (2010). Cacciamali et al. (2010) found that the Bolsa Familia Program increased the incidence of child labor in rural and urban areas. Araújo (2009) noted that the program increased the proportion of children and teenagers who study and work, while Araújo et al. (2010) observed that the Bolsa Familia is an important instrument to raise the children's school attendance, but does not show enough to restrict work activities.

A possible explanation for that result is concerned with the fact that, given the characteristics of the sample as well as the objectives of the program, it is possible to suppose that the families more liable to receive the benefits are those who are more likely to insert their children into labor market (Ferro and Kassouf, 2005). The same authors still stated that, since the public managers are concerned with meeting mainly the most needy, those persons who were more prone to work because of poverty will also be those will form the target public of those programs.

Therefore, although that result is the opposite to the expected and to highlighted in some national and international works (Araújo, 2010; Ravallion and Wodon, 2000), the structure of the program may not be enough to fight all the determinants of child labor. For the Bolsa Familia Program to be more effective in combating child labor, would require actions that attack the causes of that labor, among which one has the shortage of cultural, social and economic resources (Araújo et al., 2010).

In this sense, to reduce effectively child labor in Brazil, it is necessary to modify the program or create strategies to fight other determinants of that labor, not only poverty. So, the families will have better conditions, which may favor the development of children and youth and contribute to the eradication of this sort of work.

5 CONCLUSION

The present work sought to analyze the impacts of the Bolsa Familia Program on child labor in Brazil. So, the propensity score model was utilized and the results were estimated from the data of PNAD 2006. The sample limited itself to the families holding a per capita income liquid of the government transfers of up to R$300.00 and which had children and teenagers under 18 years old.

From the application of the above cited methodology, it was observed that the variables which contributed to raise the probability for a family to be beneficiary of the program are the school attendance of children and teenagers, the number of children and the living in rural areas. On the other hand, the variables concerning the mother's schooling, living in metropolitan region and per capita family income liquid of the government transfers decrease that probability.

It was still found by means of the matching quality tests and Rosembaum limits, which the model was well adjusted, seeing that no bias caused by omission of relevant variables was identified. So, the analysis of the impact of the program on child labor in the country was conducted. The results of that work indicated that the Bolsa Familia Program increased the number of hours of child labor, which reveals itself as a perverse effect of the program, since that aims to reduce the families' poverty. However, as the income transfer policies are turned to the families which present greatest economic and social vulnerability, one has that they seek other means of complementing the family income and warrant survival, even for that it is necessary to insert their children precociously in job market.

Given this scenario, to reduce the incidence of child labor in the country, it is necessary to invest into policies not only based upon income transfer, but in the increase of employment for the adult persons and creation of opportunities of social development of children. The fight against other determinants of child labor, in addition to poverty, will also be fundamental to achieving the desired goals of reduction and even the eradication of child and teenage labor in Brazil.

ABSTRACT
In this study there are considered mechanisms of a currency turnover control and legal regulation of foreign economic activity from the standpoint of the legislation of the Russian Federation, and also taking into account the accession of the Russian Federation to the WTO and according to the provision on the Customs union in frames of Eurasian economic community (Belarus, Kazakhstan, Russia). It is also shown a historical review of formation of foreign economic activity in the Russian Federation. Technologies and possible mechanisms of interaction of subjects of the Russian Federation with foreign arbitrators with a view of attraction of direct investments and obtaining the income out of commercial activity are offered. In particular, the necessity of improvement of mechanisms of currency turnover control and monitoring of the foreign economic activity, interfering mass outflow of the capital abroad is indicated.

Keywords: *Currency turnover control, Direct investments, Foreign economic activity, Legal regulation*

1 INTRODUCTION
In the current research it's shown the need of improvement of currency turnover control system at this temporary stage and at the same time of preparation of its reforming in the long term developments of a domestic financial system. Today it is obvious the necessity of available problems solution through improvement of mechanisms of implementation of currency turnover control by change standard legal base of currency regulation and currency turnover control. Relevance in the long term improvement of system of currency control is caused by need of institutional reforming, change of forms and methods of implementation of currency turnover control, possible creation of other institutes of its implementation, or change of powers of existing institutes of the currency turnover control faced on efficiency of all system of currency turnover control. For the effective organization of currency turnover control the clear, sustainable system of currency turnover control, effective mechanisms of

implementation, the accurate, consolidated and efficient legislation which reflects economic interests of the state is necessary, following a course on diversification and economy liberalization, including conditions of accession of Russia to the WTO. The system of currency turnover control has to be focused on protection of interests of participants of foreign economic activity, interests of the state in the course of formation foreign trade and the balance of payments of the country and implementation of the state function of the currency regulator, with the general orientation on prevention of commission of offenses in the sphere of economy and creation of effective barriers on a way of capital flight from the country.

Cross-border movement of the capital, that is its export and import – one of aspects of internationalization of the economic life which considerably amplified in the last third of the last century and has generated processes, called by globalization. In the course of the international exchange of the country carry out both export, and capital import. Therefore in cross-border movement of the capital it is possible to judge their original position, only correlating balance of export and import. At such approach it becomes clear how sufficient the volume of own financial resources (savings) for satisfaction of requirements of accumulation. In case of excess of assets over obligations the pure export (outflow) of the capital testifying to its "redundancy" in the country takes place, in the return case there is a pure import (inflow) of the capital to the country which testifies to its shortcoming.

In the last decade in world practice special importance is gained by legitimacy of receiving money therefore money at the disposal of legal entities and the citizens, used in the international and internal payments, have to have proofs of a legal origin.

In Russia a currency turnover control carries out function of protection of national economy from a surplus of foreign currency and therefore calculations between residents in foreign currency, except for the cases established by Bank of Russia aren't allowed. At the same time there are no restrictions in carrying out currency transactions by nonresidents in Russia.

The policy of the Central Bank of Russian Federation (CB RF) in the field of currency turnover control is under construction on two fundamental principles: first, observance of interests of society and the state, ensuring economic safety of the country, secondly, the accounting of a real situation and tendencies in domestic economy and in the world markets of goods, services and the capitals.

In frames of such approach of the CB RF concentrates efforts on the following main directions of the considered sphere of the relations. The first consists in application in full systems of the prevention of illegal currency transfer in foreign trade of goods based on customs – bank control technology. Today customs - bank control is capturing about 80% of the Russian commodity export and 90% of commodity import (except for barter, processing under customs control and some other customs regimes). The result of specified mechanisms application was expressed that not return of currency revenue from export came nearer to minimum for the last fifteen years level – about 3% from the volume of the export, covered by customs - bank control whereas in 1992-1993 a half revenue from export of goods didn't come back to the country.

In 1996 in connection with acceptance by the Russian Federation of obligations under article VIII of Articles of the Agreement of the International Monetary Fund the CB RF lifted limits

on the current operations, having provided possibility of nonresidents to convert the rubles received from carrying out the current operations, in foreign currency.

As for negative impact of capital flight on economy, in the market liberalized economy cross-border movement of the capital is defined by efficiency of its application in the different countries. The countries, being characterized the greatest return on the capital; attract it from the countries, differing with smaller efficiency. It is known that in the nineties Russia differed rather low average return on the capital invested in production. At the same time the income from financial and trade operations until the end of the 90th last century was significantly higher, and in the middle of the considered period operations in the financial market were the main source of the income both banks and many enterprises of real sector of economy that had a pernicious effect on a condition of the Russian industry – available funds were always more favorable to invest, for example, in the state papers, than in the productive capital. When the country possesses sufficient stocks of foreign currency and its trade balance is steady and isn't negative, it can allow invest the domestic capitals to other countries. However, if the trade balance is steadily negative, or (as in a case with Russia) there are considerable restrictions on uses of the currency income, in particular, high level of external debt, free streams of the capital will quickly destroy a basis of currency and monetary system of the country and will lead at least to devaluation of national currency. It was recognized already also by the international financial organizations, in particular, IMF.

In Russia throughout the entire period of market transformations the state carried out work on improvement of the mechanism of currency turnover control. In process of emergence of necessary economic preconditions for liberalization of the currency legislation were taken steps on revision of the principles of currency regulation and the currency turnover control, directed on their reduction in compliance with the standard norms in world practice.

2 CURRENCY CONTROL IN THE RUSSIAN FEDERATION: STANDARD REGULATION, PRINCIPLES, DIRECTIONS, FORMS AND METHODS

Currency control is one of types of the state control exercised in the financial and legal sphere. Without this control it is impossible to imagine stable functioning of a financial system, and also to ensure economic safety of the state. The attention was paid to this circumstance practically at all stages of formation and development of currency system in Russian Federation. Questions of currency turnover control became especially important in the nineties. Capital flight abroad, terrorism financing, legalization of the money received by an illegal way, caused emergence: Instructions of Bank of Russia, and the State Customs Committee of Russia from October 12, 1993 №19/01-20/10283 "About a procedure of currency turnover control of income in the Russian Federation of currency revenue from export of goods", Resolutions of the Government of the Russian Federation from March 6, 1993 №205 "About strengthening of currency turnover and export control", the Decree of the President of the Russian Federation from November 21, 1995. №1163 "About prime measures for strengthening of system of currency turnover control in the Russian Federation", etc. The resolution of the Government of the Russian Federation from November 15, 1993 № 1157approved the Provision concerned Federal service of Russian Federation on currency turnover and export control which existed up to – 2000. According to the Resolution of the Government of the Russian Federation from December 21, 2000 No. 990 functions of this Service were transferred to the Federal Ministry of economic development and trade.

Adoption of the above-named acts, and also transformation of appropriate authorities of executive power didn't help creation of the effective mechanism of currency turnover control in the nineties. For its improvement a number of Federal laws were accepted: "About export control", "About counteraction of legalization (laundering) of income gained by a criminal way, and terrorism financing", new editions of Federal laws: "About the Central bank of Russian Federation", "Currency regulation and currency turnover control", "About the foreign trade activity", "The Customs Code of the Russian Federation", etc. Instructions of the above-mentioned acts are urged to strengthen the mechanism of currency turnover control, to create obstacles in a way of capital flight abroad, to stop channels of financing of terrorism, and also legalization of income gained by an illegal way. Currency turnover control is a component of the mechanism of regulation of the public relations connected with implementation of currency transactions. Currency turnover control is understood as a complex of the administrative and organizational measures which are carried out by representatives on the basis of the law by government bodies or other special organizations (agents of currency turnover control) and directed on realization of an order of commission of currency transactions and transactions regarding currency restrictions; and also measures for identification, prevention and suppression of violations of this order. For today there is no legal definition of currency turnover control. It will be reasonable legally formalize it. The public relations developing in form of implementation of currency turnover control, are regulated by Federal laws: "On currency regulation, and currency turnover control", "About the Central bank of the Russian Federation (Bank of Russia)", The Customs code of the Russian Federation", etc. Requirements of currency turnover control are established concerning the Russian and foreign physical and legal entities in connection with their currency possession and using, implementation of currency transactions, use of bank accounts and represent a number of the restrictions which list is defined by the currency legislation of the Russian Federation and is established by the Government of the Russian Federation and Bank of Russia.

The main normative legal act of the currency legislation regulating currency legal relations, the rights and duties of the Russian and foreign physical and legal bodies, powers of bodies of currency regulation, and also the procedure, subject structure of currency turnover control is the Federal law from 10.12.2003 № 173 "On Currency Regulation and Currency Turnover Control".

The currency legislation covers laws, and acts of bodies of currency regulation (CB RF and the Government of the Russian Federation), the normative legal acts of federal executive authorities adopted in frames of their competence. Acts of the currency legislation are subject to official publication, unpublished acts aren't applied. Bodies of currency turnover control can issue acts of currency turnover control on items carried in accordance of their competence, strictly in cases of currency legislation. Such acts shouldn't contain points concerning currency operations. All ineradicable doubts, contradictions and ambiguities of acts of the currency legislation and acts of bodies of currency control are interpreted in favor of residents and nonresidents (pct 3 - 6 of the Art. 4 of Federal Law №. 173). In the most general view currency control can be characterized as state activity represented by bodies and agents of the currency turnover control, directed on ensuring observance of the currency legislation at implementation of certain currency transactions. More developed definition of currency turnover control can be formulated as a special kind of activity of the state structures authorized and obliged to carry out in the territory of the Russian Federation control functions at implementation of the operations connected with transition of the property right and other

rights on currency, movement of currency through customs border of the Russian Federation and also operations of nonresidents in currency of the Russian Federation.

3 POSSIBLE MECHANISMS OF IMPROVEMENT OF CURRENCY TURNOVER CONTROL SYSTEM

The main directions of improvement of currency turnover control system have to be aimed at institutional changes and the corresponding change of forms and methods of implementation of currency turnover control. The analysis of the current legislation shows a predominating role of the Government of the Russian Federation in system of currency turnover control, not as controler, but like an administrator. The government of the Russian Federation doesn't implement direct currency turnover control, but simply defines the direction vector of currency turnover control. Structures subordinated to the Government of the Russian Federation in system of currency turnover control include the following: the Ministry of Finance of the Russian Federation (MF RF), the Federal Customs Service (FCS), the Federal Tax Service (FTS). Their role and power in the system of currency turnover control resonable expedient to be reconsidered. It is necessary to give accurate definition of functions, powers and regulations of activity of above-named subordinated structures. Position of the Central Bank of the Russian Federation as body of currency turnover control is ambiguous. CB RF, in particular, is organizing and carrying out currency turnover control according to item 12 of Art. 4 of the Federal Law from 10.07.2002 №86 "About the CB RF". At the same time, according to existing Federal Law "On currency regulation and currency turnover control", the CB RF implements control over certain subjects of currency turnover control and interacts with other bodies that it is difficult to call "organization" of currency turnover control. In this case the CB RF has to carry out and coordinate activity of FTS, FCS, Federal Service for Financial and Budgetary Supervision (Rosfinnadzor) that isn't provided by the current legislation. The observed dissonance could be resolved by means of redistribution of functions, as follows: to fix function of currency movement control for the CB RF, and turnover of goods, transport means and services for FCS, estimation of income and taxation for FTS. Out of results of research becomes obvious that the CB RF is actually unnecessary segment in system of bodies of currency turnover control. If required, its functions in currency turnover control can be transferred to other institutes without violation of structure, directions and forms of currency turnover control. So, it is possible to refuse the mechanism of customs bank control simultaneously investing the power of currency turnover control over circulating goods services and transport means through customs border of the Russian Federation. For effective implementation of function of currency turnover control will be reasonable to associate FCS and FTS with ensuring rotation of employee for an exception of corruption component in their activity.

At research of a legal status of Rosfinnadzor numerous contradictions in regulations of its activity are revealed. Among them: problems in application of instructions, as main instrument of execution by Rosfinnadzor of function of currency turnover control body; low efficiency of reaction, by means of instructions and representations which are submitted for violation of the currency legislation by results of hearing of cases about administrative offenses in this connection, between commission of an offense and issue of the instruction can pass years; and others. As increase of overall performance of Rosfinnadzor, it is advisable, for elimination of the specified problems, to clean control functions, having left supervising in system of currency turnover control, by means of modification of Administrative regulations of Rosfinnadzor.

Creation of the mechanism of distribution of functions between subjects of currency turnover control is advisable, namely: (1) function of control of circulation of currency means needs to be assigned to the Central Bank of the Russian Federation legislatively; (2) function of control of turnover of goods, vehicles and services through border of the Russian Federation needs to be referred to competence of the Federal Customs Service; (3) estimates of the income and the taxation at implementation of currency turnover control need to be carried to Federal Tax Service functions. Considering the importance of FCS and FTS, volume of currency turnover control implemented by them, a role in all system of currency turnover control, it is necessary to associate the Federal Customs Service and Federal Tax Service for increase of efficiency of implementation of functions of currency turnover control by them. Taking into account the above mentioned and for the purpose of increase of overall performance it is necessary to clean control function of Rosfinnadzor, having kept realization of its supervising function.

4 STANDARD AND LEGAL IMPROVEMENT OF SYSTEM AND MECHANISMS OF CURRENCY TURNOVER CONTROL

The most vital and conceptual point of improvement of currency turnover control system in the Russian Federation is change the mechanism of implementation of currency turnover control by bodies and agents. By upgrade of the status of agents of currency turnover control such as: FTS and FCS from level of agents to level of bodies of currency turnover control, and also creation of the mechanism of the associated bodies of FCS, FTS, CB RF, interacting in a uniform chain, for ensuring expeditious interaction at direct implementation of currency turnover control in the Russian Federation.

The government of the Russian Federation plays an essential role not only in regulation of currency legal relations; control function is inherent to it. The government possesses the right of differentiation of functions between bodies of currency turnover control and ensuring their interaction among themselves, and also the right of delegation of the powers to the body of currency turnover control. At the same time, the Federal Constitutional Law "About the Government of the Russian Federation" doesn't carry out differentiation between regulating and control function of the Government of the Russian Federation in the sphere of currency legal relationship.

Among ways of strengthening of efficiency of customs currency control of export-import and barter operations it seems to be very important to legislatively upgrade the status of the Federal Customs Service of Russia. Happened in 2004 legislative fall of the status of customs authorities in the sphere of currency control from level of body of currency turnover control to the agent of currency turnover control doesn't promote improvement of quality and productivity of its activity on a number of positions. Preservation for FCS of the status of currency turnover control body would grant it the right to issue the acts of currency turnover control according to its competence including ones combined with other concerned bodies of currency turnover control. Subordination of FCS during the period from 2004 to 2006 to the Ministry of economic development and trade of the Russian Federation shouldn't have minimized a role of FCS in the sphere of currency transactions control of residents and nonresidents, connected with circulation of goods and vehicles through customs border of the Russian Federation, having left behind it functions of special structure on control and supervision in the field of customs affairs, on fight against contraband and counterfeit production. FCS can't effectively carry out currency turnover control functions without closely interacting with bank structures, including the Central Bank of Russia. This interaction is necessary for FCS as for adoption of normative documents (the status of the

agent of currency control doesn't grant it such right), and for expeditious interaction of customs authorities and authorized banks on implementation of currency control of actions of participants of foreign trade activities when moving goods and vehicles circulating through customs border of the Russian Federation as well as timely and in a full amount repatriate of financial funds back to the country.

Along with a problem of upgrading the status of FCS to the level of body of currency turnover control it is important to create rational for modern conditions the mechanism of customs authorities interaction and bank structures in frames of implementation of currency turnover control of the foreign trade operations. Currency turnover control in our country is generally automated, but each department which is carrying it out, uses the information systems not connected with each other. Instead of accurate exchange of information on a telecommunication network customs authorities and authorized banks interaction is realized today most often by means of inquiry letters that doesn't allow them quickly implement currency control and completely solve the problems concerned. Inquiries now became to change to a systematic exchange of electronic information between these subjects of currency turnover control on separate, doubtful currency transactions. Lack of a certain system of interaction and exchange of information between authorized banks and customs authorities is essential omission of policy of currency regulation realized today and demands the fastest legal completion.

In many respects large volumes of illegal outflow of the capital from the country in recent years can be explained with separate actions of subjects of the currency turnover control, created by existing currency legislation, for participants of foreign trade activities by currency transactions. Originally in the adopted Federal Law from 10.12.2003 № 173   only authorized banks were defined as agents of currency turnover control. Then during 2004 - 2005 tax and customs authorities were in addition included in this law as agents of currency turnover control. As agents of currency turnover control, authorized commercial banks and customs authorities are obliged to interact closely not only among themselves, but also with bodies and agents of currency turnover control representing other state departments.

It is possible to take the scheme of customs bank control for a basis of new system of interaction of customs and bank structures. It is advisable to include in the new scheme of CBCC and tax authorities, having called it system of passive monitoring: customs bank tax currency turnover control (CBTCTC) considering that circumstance that now in the Federal Law № 173 authorized banks, customs and tax authorities are defined as agents of currency turnover control. Thus, the full chain of currency turnover control will be closed. Authorized banks will be able to supervise timeliness and completeness the receipt in the Russian Federation currency transactions funds carried out by residents and nonresidents. Customs authorities implement currency turnover control over actions of participants of foreign trade activities at circulation of goods and vehicles through customs border of the Russian Federation as well as Russian currency, internal securities and currency funds. Tax authorities provide currency turnover control over the foreign trade transactions which subjects don't contain a material form, completeness of receipt in the Russian Federation proceeds from export of works, services, intellectual property; state registration of physical and legal bodies and their record; control over opening residents accounts abroad and circulation of funds on them.

Challenges of the Modern World - Contemporary Economy and Globalization

Introduction of new system of customs bank tax currency turnover control will allow agents of to carry out comparison of contract cost of export or import of goods, contract amounts, dates of payments and deliveries, and also to estimate real volumes of non repatriated currency. Introduction of the automated system of an operational exchange and information processing on currency transactions carried out by residents and nonresidents will allow replacing the current mechanism of agents' interaction of by means of inquiry letters on separate doubtful operations with the mechanism of the continuous automated control, to increase its efficiency and efficiency.

Proceeding from said above, it is necessary to reform existing system of currency turnover control taking into account the current problems and the near-term outlook. Here the offered scheme of CBTCTC is actual. Considering requirements of the World Trade Organization for liberalization of the foreign trade and currency legislation, this scheme is conditionally possible to call the customs bank tax currency monitoring (CBTCM), emphasizing not mainly on punitive, but on preventive measures of administrative influence (preventions, penalties, deprivation of licenses, etc.) according to prevention of rules of international trade and implementation of currency transactions violations by participants of foreign trade activities. Developing interaction of customs authorities with authorized banks in the solution of this problem the essential help here could render strengthening of cooperation of customs authorities with other supervising structures on the organization of currency control over implementation of the foreign trade operations.

Developing interaction of customs authorities with authorized banks in the solution of this problem the essential help here could render strengthening of cooperation of customs authorities with other supervising structures on the organization of currency turnover control over implementation of the foreign trade operations.

It looks necessary to activate interdepartmental interaction and "common information space" creation considering that in the current legislation there are gaps and contradictions on the control organization over implementation of export-import transactions and the foreign trade barter transactions as well as specifics of their implementation and complexity of control organization. It is a question of active use by customs authorities of information bases of FTS, Rosfinnadzor, the Ministry of Economic Development of the Russian Federation, the Ministry of Internal Affairs of Russia, the Central Bank of Russia and other structures in identification and suppression of the tax offenses connected with realization of foreign trade operations.

Creation in the country of a uniform information database which would reflect commission of offenses and crimes in the sphere of the currency and tax legislation which law-enforcement and economic departments could use within their competence is obviously important. For this purpose expedient to create uniform information and analysis center for Federal Security Service of Russia, the Ministry of Internal Affairs of Russia, the Prosecutor General's Office of the Russian Federation, the Central Bank of Russia, FTS of Russia, FCS of Russia, Rosfinnadzor, Rosfinmonitoring and other concerned departments. Duplication in their work can be avoided as in the relevant laws and provisions crimes and the offenses carried to competence of each of these structures are defined.

Improvement of information exchange with other competent authorities can be provided by development of combined standards and techniques defining a uniform order and requirements to implementation procedures of information and expeditious interaction with

them. Because economic crimes know no limit, for successful work customs authorities need adjustment of the strongest contacts with financial, customs and law-enforcement structures in foreign countries.

Joining to the WTO demand from the Russian Federation creation of a legal framework for civilized market interstate cooperation and attraction of the foreign enterprise capital. Russia, in connection with accession to WTO, assumed obligations, in particular, to provide necessary level of transparency of the legislation and practice of regulation of foreign economic activity. Work of effective and transparent information and analytical base will promote strengthening of interstate economic interactions, increase in trade balances of the countries - participants of the WTO, income to Russia of direct investments, and to preclude capital flight from the country (Pakhomov and Balasanyan, 2011). In the foreign organizations high standards of disclosure of information are accepted, the national organizations will seek to correspond to them that will promote also increase of transparency of activity in the market of financial services and thus will facilitate regulation implementation, will reduce effect of an administrative resource and excessive bureaucracy (Pakhomov, von Cramon-Taubadel and Balasanyan, 2012). From the expert's standpoints (Stepanova, 2012), having added liberalization of financial sector by effective reform of system of state regulation in this sphere, the country receives double benefit: increase in volume of trade in the conditions of stability increase in financial sector and in economy as a whole. The reforms directed on optimization of system of state regulation of economy are considered as one of the reasons of economic growth and development. Moreover, there are proofs of existence of positive dependence between openness of economy and economic stability, opening of sector of the financial services, accompanied by its effective regulation promoted strengthening of economy and stimulated economic growth in such countries as Indonesia and Singapore. Great value has that fact that GATS doesn't prohibit applying the prudential measures directed on maintenance of stability and integrity of a financial system. Moreover, at emergence of threat of problems with the balance of payments, the country has according to article XII full authority regardless of the accepted obligations to enter temporary restrictions on trade in services, including on implementation of the current operations.

Besides, the mentioned measures of improvement of system of currency turnover control will help Russia, after accession to WTO, to reduce probability of possible complications on the way of integration Russia with the countries of EurAsEC, the CIS and, first of all, the Customs union within the Euroasian economic community as the standard and legal base of the Customs union will be coordinated with WTO membership requirements, and these measures will promote maintenance of level of transparency of the legislation.

5   CONCLUSION

As a result of current legislation research in the sphere of currency regulation and currency turnover control it is possible to state inconsistency in work of subjects of currency turnover control, duplication of functions, lack of efficiency at control over the currency transactions, constantly changing regulatory base. All these factors characterize an inefficiency of operation of the existing mechanism of currency turnover control. The essence of offered changes of currency turnover control mechanisms and the currency legislation is reduced to the following:

  − to creation of the mechanism of the customs bank - tax currency turnover control for a
    direct information exchange between subjects for implementation of the most careful
    and effective control for participants of foreign trade activities,

677

- need of increase of the status of FCS of Russia to level of body of currency turnover control for the purpose of conditions creation for operational work of Service taking into account volume of functions implemented by FTS as the agent of currency turnover control,
- modification of legal status of Federal service of financial and budgetary supervision having left in its competence only supervising functions over observance of the currency legislation.

Taking into account requirements of the WTO for liberalization of the foreign trade and currency legislation, in a type of accession of Russia to it the offered mechanism of customs bank-tax currency turnover control it is possible to call conditionally the customs and bank and tax currency monitoring (CBTCM) which will promote increase of transparency of foreign economic activity. Having placed the main emphasis on preventive measures, instead of criminal prosecution of participants of foreign trade activities for already executed violations of the rules of international trade and currency transactions and having passed to effective measures of administrative influence (preventions, penalties, license deprivations), it will be possible to carry out further monitoring of currency transactions with bigger efficiency and to warn the facts of possible violation of the currency legislation.

In the course of improvement of system of currency turnover control in the Russian Federation there is a need of creation of a uniform information database which, within the competence, law-enforcement structures and financial departments could use. For this purpose it is necessary to establish in the country the uniform information and analysis center available to power structures, the Prosecutor General's Office, the Central Bank of the Russian Federation, FNS, FTS, Rosfinnadzor and other concerned state departments, including foreign organizations (such as FATF). Thus, it is obviously possible transfer of the Russian system of currency turnover control to new qualitative and open level taking into account the entry of our country into the WTO, and also protection of its economic interests by means of the instrument of currency turnover control.

A MODEL FOR HEALTH DEVELOPMENT BASED ON THE SUFFICIENCY ECONOMY PHILOSOPHY IN THAILAND

Rutja Phuphaibul
Mahidol University, Ramathibdi Hospital, Faculty of Medicine, Ramathibodi School of Nursing, Thailand
ruja.phu@mahidol.ac.th

Manee Apanatikul

Kusuma Khuwawatsamrit

ABSTRACT

A model village for sufficient health under the "Sufficiency Economy Philosophy" (SEP) using the Participatory Action Research (PAR) method was developed in a rural community in the middle region of Thailand. The three main concepts of SEP consisted of: moderation, rationality, and self-immunity reflecting the middle-path of living, using participatory action research methodology that included action planning, action taking, and the evaluation process. As a result, six health-related activities were initiated and performed by the villagers in the model village. The results showed that by using the PAR process in the development of a model village the SEP can be integrated into and is inseparable from daily life activities, which can influence the villagers' health beliefs and health-related practice. The lessons learned included community dynamics, reasearcher and villagers relationships, health management, and factors that contributed to successful and unsuccessful outcomes.

Keywords: Development, Economy, Health, PAR, Sufficiency, Thailand

1 INTRODUCTION

The term of "Sufficiency Economy Philosophy" or (SEP) is not new for the Thais. It is also called the King's philosophy of living. The SEP hightlights ways to balance one's life amist the rapid economic changes and social development. Thai people honor with love and respect His Majesty King Bhumibol Adulyadej as the result if more than 6 decades of his hard work in nuturing the country and its people. His Suffiiceincy Economy Philosophy targets not only economic growth, but encouraes a paradigm shift to target growth for balanced and sustainable development.

Historically, the main ideas of the Suffiiceincy Economy were deductively extracted from the King's influencial speeches in 1970 concerning the country's rapid economical transition, reminding Thai people about the impacts of modernization and rapid economic progress. The impacts of economic changes were evident at the macro level regarding national natural resources and the environment, as well as on the micro or community level (Sathirathai and Piboolsravut, 2004; Chaipattanna, 2012). His speeches were notably expanded again almost 30 years later after the economic crisis in 1997. The SEP concept pointed the way for recovering from the ecomonic impacts by living in moderation. The SEP orientation of living brought about more resilient, balanced, and sustainable development (Piboolsravut, 2010).

Information gathered by the Royal Development Study Center (1997) reveals numerus positive outcomes of the SEP through its applications such as in agriculture, business or Corperate Social Responsiblity (CRS), and in the government sector. Even though there is a

belief that the SEP is a guide to a good way of living. the application of this holistic SEP in the health development sector has been limited to a few specific health services. There is no specific health outcome derived from the SEP concepts (Chaiphibalsarisdi, Sopajaree, Nakwaree, Kasemsuk and Chaiyachet , 2006; Suthasingh, 2007; Reuangpradith, 2009).

Thus, this article aims to demonstrate a model for health development in the community by applying participartory research methodology to community health development using the SEP as an underlining framework for development.

2   LITERATURE REVIEW

2.1   Sufficiency Economy Philosophy (SEP)

World socioeconomic development has created severe problems of natural resource deterioration and environmental pollution. According to the Unitied Nations Conference on Environment and Development (UNCED) in 1992, the confernce's goal for "Sustainable Development" was established as agenda 21. Sustainable development was defined as a devlopment approach that can accomodate the physical needs of people in the present generation without compromising avalability of resources for future generations. The compelling concepts of sustainable development were considered to be conflicting between development and environmental protection (Sathirathai and Piboolsravut, 2004, p 2). Economically, development indicators include high income and high productivity in all sectors. This growth-driven development has caused increased utilization of natural resoures and environmental deterioration. However, the SEP offers a new paradigm that can minimize current development challenges and their adverse impacts on the environment. It proposes human well-being as a goal for development by developing from the inside-out by focusing more on social capital in the community.

According to King Bhumibol Adulayadej's speech in 1997, the SEP or " The Middle Path," can be used to guide ways of living at individual, community, and national levels. The following is a synthesis of the SE philosophy (Mongsawad, 2010, pp. 127–128):
> "Sufficiency" means moderation and due consideration in all modes of conduct, as well as the need for sufficient protection form internal and external schock. To achieve this, tha application of knowledge with prudence is essentials. In particular, great care is needed in the utilization and untested theories and methodologies for planning and implementation. At the same time, it is essential to strengthen the moral fibre of the nation, so that everyone, particularly political and public officials, technocrats, businessmen and financiers, adhere first and foremost to the priciple of honesty and integrety. In addition, a balanced approach combining patience preservance, deligence, wisdom and prudence is indispensable to cope appropriately with the critical challenges arising from extensive and rapid, environmental and cultural changes occurring as a result of globalization.

In brief, the essential core concepts in the SEP are:
   1) Moderation
   2) Rationality or reasonableness
   3) Self-immunity

These three interdepenent and interconnected principles can be explained as follows (Mongsawad, 2010; Chaipattana, 2005).

Moderation: Its meaning relates to a way of life in the "Middle Path". Rapid economic development can cause overindulgence on the part of many people. A person should be aware of his or her basic needs and potentiality. The middle path reminds people to live in moderation, not to extremes, and that they should be self-reliant. Living in moderation can reduce the utilization of natural resources and prevent contamination of the environment.

Rationality: The meaning here is related to analytical thinking. A person should comply all his or her knowledge and past experiences, together with his or her analytical capability to make decisions. The consequences of such decisions or actions also should be examined before hand. prior examined.

Self-immunity: This concept can be called risk-mangement and can be defined as the to protect oneself against unpredictable and uncontrollable life events. A person should try to oversee risk factors and guard against them.

Additionally, there are two conditions that add up to the success of the application of the above three principles, which are so-called "knowledge" and "morality." Each careful step of decision making and actions requires accumulated information while understanding the issue and take action for problem solving, then sustainble development will be the expected result (Mongsawad, 2010). These actions should be performed with moral principles. Here, morality refers to integrity, honesty, preserverance, and hard work. The SEP reflects the insights of Buddhist philosophy. Terms such as "The Middle Way" are used, for example, for curving personal greed and increasing good judgment and risk management (Warr, 2007). In brief, economic growths as well as the recurrent economic crisis in Thailand and other countries have caused human suffering. The SEP provides a solution for suffering, not through materialization, but within their ways of living. Its principles are focused on one's intellectual thinking and action.

2.2 Health development in the community

2.2.1 Sufficiency Health Development and SEP

The health agenda in Thailand as can be seen in the 10th National Health Plan of Thailand (2005-2011) revealed the main focus on setting up a health system for sufficiency health (SH). The six strategic plans, including health system management, health culture, healthy health personnel, risk-management, alternative medicine, and a knowledge-based health system, were developed (MOPH, 2010). This 10th National Health Plan offers implementation of the SEP at the macro level. However, its process and outcomes in terms of the application of the SEP into community health has not been systemically or clearly demonstrated. Most of the reports show the application in specific conditions and settings, such as flood relief programs, local wisdom for health, community health volunteer participation in health development, and so on (Chaiphibalsarisdi et al., 2006; Suthasigh, 2007).

Three possible causes of sufficient health (SH) development problems include: 1) lack of indicators to measure the above "Sufficiency Health," 2) more clarification of health behaviors and their outcomes based on the SEP is required, and 3) the variations of community characteristics post difficulties in application across the country. Therefore, there is a need for the development of sufficiency health indicators, behavioral outcome indicators, and a model for SEP application in the community setting.

Challenges of the Modern World - Contemporary Economy and Globalization

The three proposed sufficiency health concepts based on the SEP can be further conceptualized as follows.

- *Moderation(in sufficiency health):* Moderation in one's manner of living acccording to the "Middle Path." The moderation of health can be observed through health behaviors, such as moderation in consumming foods and excersice. For example, over eating as well as under- or problem-eating habits are the significant causes of various health problems. The "Middle Path" reminds people to consume in moderation, not to an extreme. In addition, less consumption of unneccessary foods can reduce utilization of natural resources. Futhermore, less unnesseccary food production leads to less use of chemical substances and minimizes changes of chemical contamination to the environment.

- *Rationality (in sufficiency health):* The meaning of rationality is related to analytical thinking. For health-related decision making, one should apply knowledge and past experiences, together with analytical thinking.

- *Self-immunity (in sufficiency health):* Risk-management at the individual and community level is expected. A person and his community should try to oversee risk factors and safeguard against them. Self-immunity can be defined as the ability to protect oneself against unpredictable and uncontrollable undesirable events. Prevention against accident, drug abuse, and endemic and epidemic diseases is among the common preventable community health problems.

Community partners are essential for community health development using the SEP. Health personnel work with individuals, families, and the community to achive their desired sufficiency health outcomes. Details of the "Health Sufficiency" based on the SEP are illustrated in Figure I.

2.2.2   Participatory Action Research in Health Development

Various approaches to health development in the community have been employed in the social and health sciences. They can be a mutual collaboration approach, a technical collaboration approach, and an enhancement approach, which emphasize practical problem solving and participatory actions at the community level, or using Participatory Action Research (PAR) as a developing process (Creswell, 2005). In community health development, the PAR process empowers people to control their decisions and life styles.

This kind of collective and self reflective inquiry (PAR) is characterized by partnership among researchers and the stakeholders in the community. They work together, with consideration of history, culture, social and local context, to find solutions to improving the current situations (Baum, MacDougall and Smith, 2006).

According to Whyte (1991), PAR is the intellectual development and action that are implemented in business and agriculture in the following 3 areas: social research methodology, participation in decision making by people in organizations and communities, and oraganizational behavior. Its paradigms are based on critical theory and constructivism, whose methodology ranges from qualitative to quantitative and mixed methods (Baum, MacDougall and Smith, 2006). Recently, PAR methods haven been successfully applied in developing health behaviors in psychiatric patient care, with HIV infected persons, and so on. For example, a psychaitric disablty project engaged psychiatric disable persons as key participants or so-called "research associates". This project focuses on collaborative effort among academic researchers and the community, with provision of experience mentorship and vocational support (Delmam, 2012).

Therefore, PAR is recognized as a significant process for health development. The collaborative process using PAR enables all parties to learn from each other and improve community health. In this community health development project based on the SEP for sufficiency health using the PAR process, a collaborative process among stakeholders is essential for devloping community health or specifically, "Sufficiency Health," based on the SEP among the villagers.

3 METHODOLOGY

3.1 Sufficiency Health Model Village

3.1.1 Village background
Since 2008, "Saladin village" has been recognized as a "Sufficiency Economy Community" by the provincial authority according to the people's ways of living, especially regarding the agricultural economy based on the SEP. This agricultural community, located in central Thailand, was selected as a model village for health development since the SEP has been embedded in ways of living already existing. The main source of income of this village is from lotus, mango, coconut, and rice growing. The population was 1,459, with 795 females and 664 males. We implemented PAR activities during the village regular monthly meeting on every 5th day of the month between February 2010 and March 2011. The community leaders participated in the health development process, including the village headman (female), local authority members, local health post personnel, village health volunteers, the housewive group, the youth group, and the elderly group. There were approximately 50 persons attending each meeting. The reseracher team comprised Mahidol University professors from 2 nursing schools, the Resource and Environmental Science School, and local health personnel such as the district hospital administrator, and local health promotion hospital personnel.

3.1.2 Participatory Action Research (PAR)
The research methodology is PAR in its nature using both qualitative and quantitative methods. The methods employed for data collection were a health survey, a focus group interview, and an individual in-depth interview. The three main PAR processes used, according to Bessette (2004), were:
- *Action Planning and Diagnosis.* This consisted of the following activities:
    - Community preparation. The researchers provided information about health development and also extended their invitation to village leaders and interest groups.
    - Situational analysis and problem identification. Problem identification stemmed from the analysis of data from the short health survey collected among 120 families in the village.
    - Team development. In order to empower the community for health, a series of activities were initiated, such as providing information, study visits, and village health volunteer training for SEP based health development.
    - Action planning. After a series of 3 workshops, the villagers developed action plans for the village's sufficiency health. The researchers acted as facilitators throughout the action plan development process.
- *Action Taking.* Six months after the action plans were developed and reported at the community meeting, the villager-own projects initiated at Saladin village were: home-

Challenges of the Modern World - Contemporary Economy and Globalization

grown vegetables, community first aid, breast feeding promotion, anti-smoking/drinking, clean environment, and a community support system.

- *Evaluation*. Through reflection and validation during the project activities in the community, a model for sufficiency health development in the community was conceptualized by the reserachers' team. Later the model was reviewed by 2 experts, a sociologist and an expert from the Bureau of the Royal Household (BRH) who worked with the SEP project and made suggestions and recommendations.

4   RESULTS

4.1   Model for Sufficiency Health based on the SEP

From analysing the community health activities, it was seen that all of the activities focused on at least one of three main SEP concepts, as illustrated in Table 1. Each of the three concepts were interrelated. For example, the home-grown vegetable project reflected the concept of "moderation" as the major concept because of its cost savings, while breast feeding promotion represented the family's cost savings as well as increased the infants' immunity.

Table 1: The SEP concepts in community health projects

Community projects	Moderation	Rationality	Self-immunity
1. Clean environment	□	■	■
2. Community support system	□	□	■
3. Home-grown vegetables	■	□	□
4. Breast feeding promotion	■	□	■
5. Anti-smoking and drinking	■	□	■
6. Community first aid	□	□	■

■ major concept □ minor concept

The final revised model for sufficiency health devlopment in community in Figure 3 below shows more details of related input, process, and output.

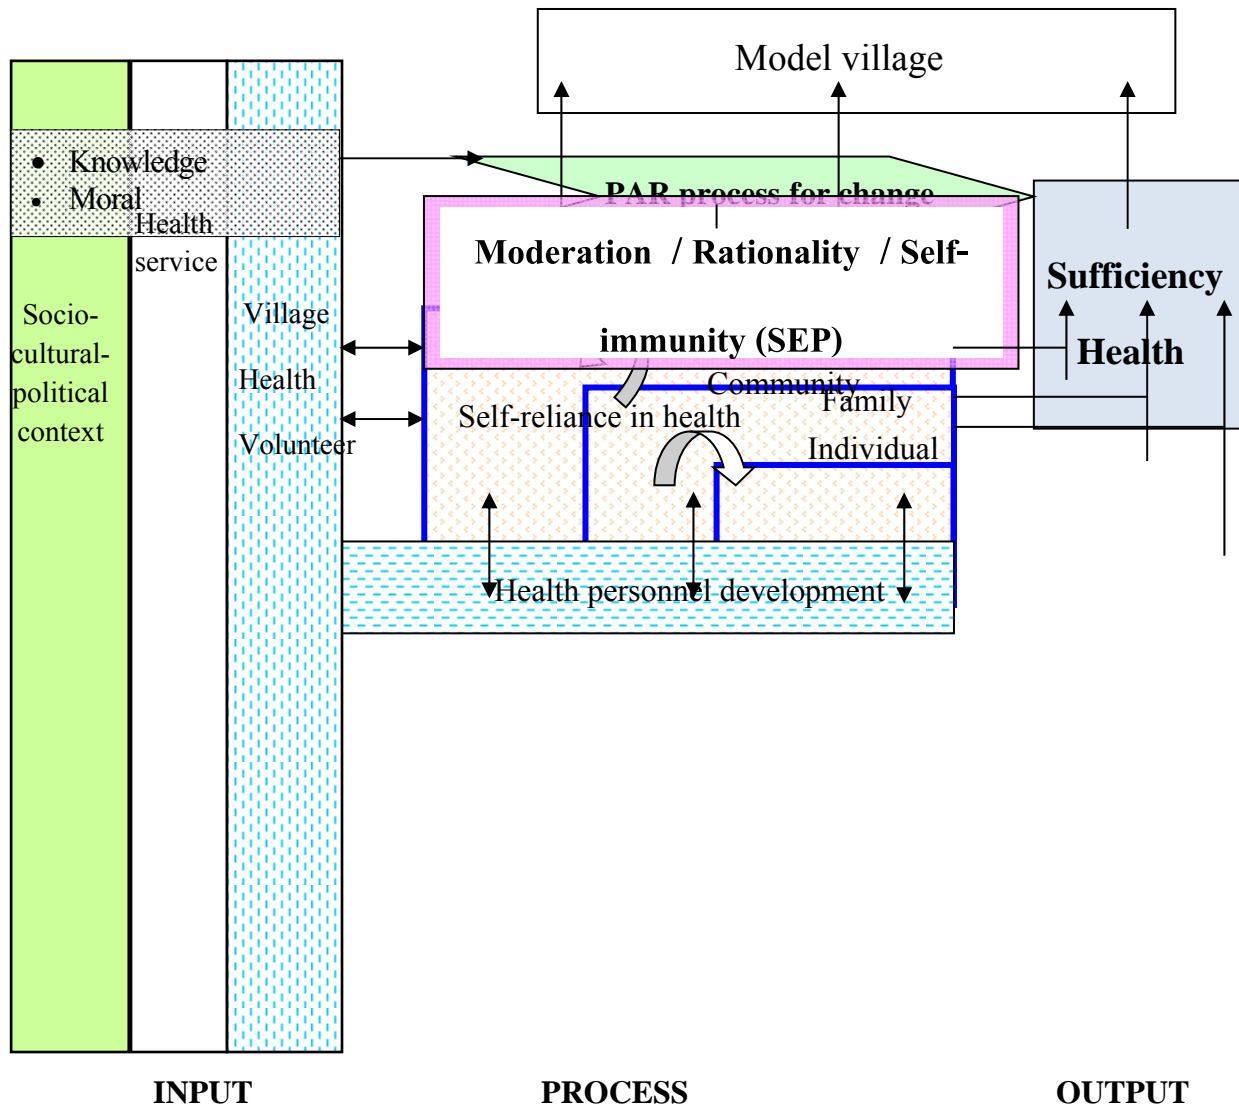
Challenges of the Modern World - Contemporary Economy and Globalization


Figure 2: Model for health development based on sufficiency economy philosophy

According to figure 2, the proposed model depicts the essential process for improving community health based on the SEP. It involves community leaders, community dwellers, and local health personnel, including health volunteers. In consideration of its socio-cultural context and the health service system, the PAR process was introduced to help the community to critically analyze and develop health-related activities based on health information gathered from the village. Community dwellers participated in initiating plans for health development based on the SEP, which later were implemented accordingly. At this point, the outcomes focused on changes occurring during and after the project implementation. The study results from the focus group interview among the group of villagers one year after the project began showed positive change in communication and in the relationships among the villagers (Phuphaibul et al., 2012).

5   CONCLUSION AND DISCUSSION

In brief, the Sufficient Economy Philosophy (SEP) is the conceptual framework of this research.   The sufficient economy is a philosophy bestowed by His Majesty King Bhumibol

Adulyadej and emphasizes the middle path as an overriding principle for appropriate behavior by the population at all levels. Overall, we found that the SEP can be intergated in daily life and affects a person's health behaviors and outcomes.

The model developed from this project demonstrates a body of knowledge in developing a community with sufficient health concepts based on the sufficient economy philosophy. This model can be used as a prototype for applying the SEP in other communities. Furthermore, a follow up study is recommended to identify the changes and its sustainability.

Lessons learned from the model devlopment include:
1. Team devleopment: The most important step we took at the early stage of this project was core team development. All team members went through the process of learning more about the SEP through group discussion and provided reading on the SEP from the project leader.
2. Good community relationship: At the monthly meeting, there was an opportunity for team members to get acquited with the groups and individuals in the village. Community special events also provided informal closer connections.
3. Social capital: This close-nit community is already an SEP village, and they have learned how to work together and have had experience working with Mahidol University projects in the past.
4. Media: The most effective media used for communicating the SEP activities were personal phone calls and monthly newletters from the project team. The newletters offered information on activities, outcomes, and the names of responsible individuals and groups. It reminded the group of what needed to be done according to the plan.
5. Future research: The SEP for the SH projects should be expanded to urban community health development. Most of the SEP projects have been established in rural communities. Thus, it is suggested that the SEP for SH model be tested among the urban population later.

POLITICAL BUSINESS CYCLES IN TRANSITION COUNTRIES, EU MEMBER STATES

Damir Piplica
Ministry of Interior, PNUSKOK Department Split, Croatia
damir.piplica@gmail.com

ABSTRACT

Political and economic reality in transition countries, EU member states is still quite different than in other member states. Electoral cycles in selected countries occurred in terms of EU enlargement and specified economic framework after accession to its membership as defined by mutual agreements. A change of government in the circumstances of the increasing demands for social welfare improvements and personal standards could lead to time inconsistency problem of economic policy. Moreover, after getting the mandate to form the new government such circumstances may be the reason that left-wing or right-wing parties do not implement economic policy that is announced before the election. Considering the fact that the central banker has a legislative duty to coordinate the implementation of monetary policy with the economic policy conducted by the government, he can also be in a position to threaten his primary goal - to maintain monetary stability. The research has shown that there are not political business cycles in the transition countries in the form as they are presented in developed countries. Nevertheless the result does not mean that the left or right wing parties implement a consistent economic policy after receiving the mandate to form a new government in relation to the announced economic policy before elections. One of the major factors that have influenced on this result is still unsatisfactory profile views of political parties in transition countries, because the practice of party activities often differs significantly from established programming framework. Furthermore, the determined economic guidelines of the EU do not allow political parties to conduct other government economic policy, whether they are left or right-wing. Moreover, if the EU creates stronger mechanisms for fiscal responsibility in the future, it will be a real possibility of further narrowing the choice of an alternative framework to conduct economic policy at the national level.

Keywords: *Economic policy, Inflation, Time inconsistency problem, Transition countries, Unemployment*

1 INTRODUCTION

Transition process from former socialist social system to modern entrepreneur society created a unique historical occasion for analysis of certain economic phenomena under completely different circumstances regarding the ones already existing in developed western European countries. Moreover political and economical reality of transition countries, EU members after the change of the executive power is still specific regarding other EU members so these circumstances can be a factor of different implementation of economic politics. Furthermore election cycles in analysed countries happen always under circumstances of continuous enlargement of EU as well as already set guidelines of economic politics before and after the access to membership in compliance with signed reciprocal agreements.

This paper shall first of all examine whether left or right–wing parties after receiving the mandate for composition of new government implemented such economic politics which was implemented before the elections. Changed political environment can influence on

government to adapt its economic politics to choice of different priorities namely to putting stronger impact to lower inflation or diminishment of unemployment which has impact of time inconsistency of economic politics. Election cycles can influence on different behaviour of political parties which than jeopardises their reputation for left-wing parties being more sensitive to prevention of unemployment regarding the right-wing parties namely that right-wing parties are more inflation aversive regarding the left-wing ones. Such behaviour makes the position of central banker more difficult as he is legally obliged to coordinate the implementation of monetary politics with economic politics implemented by the government which can result with the situation that a primary goal – keeping of monetary stability – shall be jeopardised.

2 TRANSITION PROCESS AND TIME INCONSISTENCY PROBLEM OF ECONOMIC POLITICS

The time inconsistency problem of economic politics has been analysed for several decades. Basically the state administration is very often in a situation to solve ex post the ex ante formulated economic politics regardless the circumstances under which it is implemented. Economic politics implemented in the moment t shall have certain limits for future period t+1. Such limits are not the same as the limits of economic politics existing in the period t+1. Due to these reasons economic actors can rationally change their behaviour to prevent the government to cheat them with their discretionary decisions. Economic politics in transition countries faces today numerous challenges in its implementation especially as with its manipulation various opportunistic aims of political parties participating in executive government are tried to be achieved. We can often witness the media performance in which the representatives of political parties in analysed transition countries before the elections announced consistent and very convergent economic politics. But as the aim of all parties is first of all to win at the elections it happened often that parties in power try to change the announced economic politics with the purpose of its adjustment to proper political and world view perspectives. Such changes can create problem also to central banker in his effort to adjust the monetary politics to new circumstances in order to keep the monetary stability.

Ideological framework of the party in power in western democracies was often brought in connection with the choose of priority in economic politics at which for the left wing-parties it was considered as if they were more sensitive for diminishment of unemployment while those right-wing were credible in implementation of economic politics in compliance with world view perspective and would often implement the politics announced before the elections also within the period after they gain the mandate for new government. It happened often though that the economic politics of left and right–wing parties in transition countries before the elections was directed towards the so called "median voter" which resulted with its convergence at ideologically different political parties.

In this paper we shall, among other things, analyse whether there is a convergence in implementation of economic politics of left and right-wing parties and whether it has long term characteristics which would have impact on parties' programmes to loose their significance but also to the possibility to choose among various political options. Though the aiming to "median voter" in multiparty environment of transition countries should not always be a rule as each political party judges its optimal location on "political market".

3 IMPLEMENTATION OF ECONOMIC POLITICS AND POLITICAL BUSINESS CYCLES

One of the important theoretical approaches that perceives the relationship between the inflation and unemployment takes into consideration the political-business cycles in view of the non ideologically loaded politicians and "short-sighted "voters. According to the mentioned theoretical consideration the implementation of economic politics at the beginning of mandate of each government would be restrictive while the expansive economic politics would be implemented before the new elections regardless the political differences of the party in power.

The theory of political business cycles and its author Nordhaus (1975) underlined the election success as the guideline of behaviour of political parties in power. Nordhaus thinks that politicians have personal interest to increase the possibility of their staying in executive power which brings again to the implementation of the same economic politics. His model presumes that the voters have "short memory" and that they reach their decisions based on the events from the direct history. Furthermore great part of public is not familiar with the existing economic legitimacy with the relationship between inflation and unemployment as especially important which is described in the best way with the Philips curve. Due to the previously mentioned politicians are interested in stimulating aggregate request before the elections cheating the voters with the so called conjecture. Manipulating with certain instruments of economic politics in order to make some economic indicators look "nicer" before the elections and the problems solved after the mandate received, politicians try to make the illusion of prosperity before the elections and before the voters realise that they are going to pay the consequences after the elections. Moreover as the consequences of such expansive politics are late in time, the inflation is to be seen after the elections done. The party in power shall try to solve the problem with the restrictive economic politics after the elections. Of course when the time of new election cycle comes the "forgetful" voters shall not remember what happened at that time and manipulation of economic politics means starts again before the new elections for the aim of encouraging of new aggregate request.

The theory of political business cycles has been additionally elaborated by bringing the elements of rational expectations that also presumes not ideological politicians but rational voters. Probably the most important authors that in that sense complemented the theory of political business cycles are Cukierman and Meltzer (1986), Rogoff (1990) and Rogoff and Sibert (1988). They confirmed Nordhaus assumptions even when the voters would not have short survey in the history. Namely the model mentioned would be correct in case the voters would be not perfectly informed about their economic environment, the aims of economic politics creators or their ability to manage economy. Moreover the complicated process of budgeting brings to asymmetric information even with some experts and not surprisingly at common not informed voters. This statement can be described in the best way by the following Alesina's (1989, pp. 55–98) sentence: "The RPBC theory is thus compatible with relatively short-run cycles of budget deficits, transfers, and money supply growth around the election date but it does not have clear implications for a longer cycle of output and unemployment."

Empirical researches of political-business cycles in transition countries were made by more authors like Pacek (1994), Bell (1997), Fidrmuc (2000), Halleberg and de Souza (2002), Akhmedov and Zhuravskaya (2004) as well as some other researches. So Pacek focused the researches to Bulgaria, former Czechoslovakia and Poland (using aggregated interregional

data) for the period of only several years namely from 1990–1992 having established the macroeconomic reasons that influenced on voters to party commitment at the elections. Fidrmuc (2000) analysed the determinants that influenced the behaviour of voters at the elections in Czech Republic, Hungary, Poland and Slovakia. The author proved that the reforms were supported by those that had some benefit from them which mainly referred to right wing parties. Contrary to that such segment of society that lost with the reforms implemented chose left wing parties. Halleberg and de Souza (2000) in their research concluded that transition countries in the process of access to EU had political business cycles having taken into their calculations also the cash flow trends and budget deficit.

Akhmedov and Zhuravskaya (2004) established the existing of political business cycles in Russia having taken into consideration the trends of cash flow before and after the elections. Maurel (2006) proved the magnitude of fiscal manipulation or deficit grow in elections years at many EU member countries but indicated also that it does not appear in middle and central Europe transition countries. She also proved that the fiscal manipulation in east Europe transition countries is not greater that in other European countries. Bell (1997) analysed the economic reasons for political commitment of voters at the elections in Poland underlying the diminishment of unemployment. Treisman and Gimpelson (2001) analysed the political business cycles in Russia. Authors explain that the expectations are closely linked with the actual macroeconomic data. Brender and Drazen (2005) measured the empirical data for the existence of a political budget cycle in new opposed to traditional democracies. They show political deficit cycle as a phenomenon of new democracies. Of course some other authors that effectuated the researches of political business cycles could be quoted.

4   MODEL APPLIED AND ITS PRESUMPTIONS

Countries analysed during the transition process had only several election cycles. Although the transition process had no equal dynamic and success achieved, transition countries that became EU members have doubtlessly a series of reciprocal connections that make them one special group of countries suitable for certain economic researches. In this paper we added to these countries namely Lithuania, Latvia, Estonia, Poland, Czech Republic, Slovakia, Slovenia, Hungary, Bulgaria, Romania and also Croatia as future EU member. In researching paper we start from the presumption that the liberalization of market during the initial few transition years measured by cumulative liberalization index was not at the birth level in the countries analysed it was logical to include in the research the period from 2001–2011 when the transition process left birth pangs. In this way we included the time period in which the inflation and the unemployment rate could have been measured in "market" conditions of business.

We added the data on unemployment and inflation to appertaining years depending on the fact whether left or right-wing parties were on power. We divided the mandates of left and right wing governments at the initial two years period after the forming of a new cabinet and second period of the last two years after the forming of a new cabinet. Of course this division could have been different in time but we started from the presumption that these are new democracies that need more time for profilation as well as stability in economic politics implementation.

Furthermore though the transition countries central banks are independent in implementation of monetary politics, this in reality is not a limiting factor in our researches due to the fact that these are also legally obliged to coordinate the implementation of monetary politics with

economic (fiscal) politics implemented by the government without jeopardizing its primarily goal – stability of prices. In essence our research is based on Phillips curve with the possibility of choice between the inflation and unemployment rate:

$$y_t = \alpha y_{t-1} + \gamma(\pi_t - \pi_t^e) + \varepsilon_t, \qquad 0 < \alpha < 1, \qquad \gamma < 0$$

which would with elements of rational expectations look like this:

$$y_t = \bar{y} + \gamma(\pi_t - \pi_t^e) + \mu_t$$

where y_t is the output growth rate , π_t inflation rate , π_t^e expected inflation rate , μ_t level of politicians ability for keeping of low level of unemployment with relatively low inflation rate and $\bar{y}$ is the balanced (steady-state) output growth rate .

5 INFLATION AND UNEMPLOYMENT IN FIRST MANDATE OF LEFT AND RIGHT WING PARTIES

During the analysed period in the first two years of mandate of EU members transition countries governments (including Croatia) we had total of 37 cases when we added to right wing parties the data for inflation, the thing that we did for left-wing governments in 26 cases. The trend of inflation in left and right political environment during the first two years of mandate of transition countries governments has been clearly shown in Chart 1.

Chart 1: Inflation in first two years of mandate left and right wing partie
(WEO, own calculation)

Inflation at the left-wing governments in the first two years of mandate was average 5,72% while at the same period the right-wing governments had somewhat lower inflation rate that was 4,72%. Furthermore it is also clear that median inflation rate at the left-wing governments was 4,21% while at the right-wing government it was almost identical 4,1%. Range of the inflation rate was significantly higher at the left-wing governments and moved from the

Challenges of the Modern World - Contemporary Economy and Globalization

minimum of 0, 2% to the highest amount of 34,5% while at the right-wing governments it moved from the minimum of 1,0% to the highest rate of 15,3%. Standard deviation at the right wing governments inflation was 3,07 while the standard deviation at the left-wing governments was higher and amounted 7,32 which proves their higher dispersal within the period analysed.

Also during the first two years of mandate of EU members' transition countries (including Croatia) we had total of 37 cases when we added the data for unemployment to right-wing governments which we did with left-wing governments in total of 26 cases. The unemployment trend during the first two years of mandate of transition countries in left and right political environment has been clearly shown in Chart 2.
Chart 2: Unemployment in first two years of mandate left and right wing partie (WEO, own calculation)

Unemployment at left-wing governments during the first two years of mandate amounts average of 9,86% while at the same time period the right-wing governments had somewhat higher unemployment rate of 10,2%. Furthermore it is clear that unemployment rate median at left-wing governments amounted 7,75% while at right-wing governments was again higher namely 9,6%. Unemployment rate range at left and-right wing governments was almost similar. Namely at left-wing governments it moved from the minimum of 5,5% up to the highest of 19,6% while at the right-wing governments it moved from the lowest rate of 4,4% up to the highest of 18,1% . Standard deviation at unemployment at right-wing governments amounts 4,0 while standard deviation at unemployment of left-wing governments was higher namely 4,47.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 1: Multiple Regression Results: Inflation and unemployment during the first two years of left wing governments mandate 2001–2011 (proper calculation)

Dependent: Var2	Multiple R = 0,27699468		F = 1,994452	
R2= 0,07672605			df = 1,24	
No. of cases: 26	adjusted R2= 0,03825630		p = 0,170712	
Standard error of estimate: 4,384536648				
Intercept: 10,829236669	Std.Error: 1,099506	t(24) = 9,8492		p = 0,0000
Var1 beta= - 0,28				

In case we examine interdependence between inflation and unemployment rate during the first two years of mandate of left-wing parties power in transition countries using the previously explained theoretical considerations their slighter negative correlation link shall be evident. It is also clear that the central banker implemented monetary politics that to smaller extent supported priorities of left-wing executive governments putting greater weight on prevention of unemployment regarding the inflation. Such monetary politics, as we have already seen, had as a consequence somewhat higher inflation rate at the left-wing governments related to the executive power by right-wing parties.

Table 2: Multiple Regression Results: Inflation and unemployment during first two years of mandate of right wing parties 2001–2011 (proper calculation)

Dependent: Var2	Multiple R = 0,18960135		F = 1,305121	
R2= 0,03594867			df = 1,35	
No. of cases: 37	adjusted R2= 0,00840435		P = 0,261035	
Standard error of estimate: 3,984604031				
Intercept: 11,371727151	Std.Error: 1,213010	t(35) = 9,3748		p = 0,0000
Var1 beta= - 0,19				

In case we examine interdependence between inflation and unemployment rate during the first two years of mandate of right-wing parties power in transition countries using the previously explained theoretical considerations their slighter negative correlation link shall be evident. It is also clear that the central banker implemented monetary politics that to smaller extent supported priorities of right-wing executive governments putting greater weight on prevention of unemployment regarding the inflation. This is by all means interesting as the primary goal of central bank is keeping the monetary stability so right-wing parties' government with its economic politics that has similar goals should make easier implementation of monetary politics of their countries central banks and such correlation is insignificant.

6   INFLATION AND UNEMPLOYMENT IN SECOND HALF OF MANDATE OF LEFT AND RIGHT WING PARTIES

During the time period observed in the last two years of mandate of EU members' transition countries (including Croatia) we had total of 29 cases when we added the data for inflation to right-wing governments, the thing that we did for left-wing governments in totally 26 cases. Inflation trends in left and right political environment in the last two years of mandate of transition countries has been shown in Chart 3.

Challenges of the Modern World - Contemporary Economy and Globalization
Chart 3: Inflation in last two years of mandate left and right wing partie
(WEO, own calculation)

Inflation at left-wing government in the last two years of mandate was an average of 4,58% while at the same period right wing governments had somewhat lower inflation rate that was 3,86%. Furthermore it is clear that inflation rate median at left-wing government was 3,75% while at the right-wing governments it was somewhat higher namely 4,1%. Inflation rate range was higher at left-wing governments and was from the minimum of 0,8% to the highest of 14,5% while at the right-wing government it moved from the minimum of -1,2% up to the highest of 9,2%. Standard deviation of inflation at right-wing governments amounts 2,29 while standard deviation of inflation of left-wing governments was higher namely 3,83 from which their dispersal within the period observed can be seen.

Also during the last two years of mandate of EU members transition countries governments (including Croatia) we had totally 29 cases when we added to right-wing governments the unemployment data, which we in case of left wing governments we did in 26 times. Unemployment trends during the last two years of mandate of transition countries governments in left and right political environment is clearly shown in Chart 4.

Challenges of the Modern World - Contemporary Economy and Globalization

*Chart 4: Unemployment in last two years of mandate left and right wing parties
(WEO, own calculation)*

Unemployment of left-wing governments in the last two years of mandate is an average of 9,38% while in the same period right-wing governments had somewhat higher average unemployment rate of 10,3%. Furthermore it is clear that the unemployment rate median at left-wing governments was 8,1% while at the right-wing governments it was 9,6%. Unemployment rate range at left and right-wing governments was almost equal. At left-wing governments it was from the minimum of 4,3% up to the highest of 19,0% while at the right wing governments it moved from 4,4% up to the highest measured of 19,0%. Standard deviation of inflation at right-wing governments amounts 4,21 while standard deviation of inflation of left wing governments was lower namely 3,67.

*Table 3: Multiple Regression Results: Inflation and unemployment in the last two years of
mandate of left wing parties 2001–2011 (proper calculation)*

Dependent: Var2	Multiple R = 0,48504897		F = 7,383728	
R2= 0,23527250			df = 1,24	
No. of cases: 26	adjusted R2= 0,20340885		p = 0,012020	
Standard error of estimate: 3,271865911				
Intercept: 11,505475958	Std.Error: 1,012594	t(24) = 11,362		p = 0,0000
Var1 beta= - 0,49				

In case we examine interdependence between inflation and unemployment rate during the last two years of mandate of left-wing parties power in transition countries using the previously explained theoretical considerations their significant negative correlation link shall be evident. It is also clear that the central banker implemented monetary politics that supported priorities of left-wing executive governments putting greater weight on prevention of unemployment regarding the inflation. Such monetary politics had as a consequence as we have previously seen, an average higher inflation rate at left-wing governments regarding the executive power of right-wing governments.

Challenges of the Modern World - Contemporary Economy and Globalization

Table 4: Multiple Regression Results: inflation and unemployment in the last two years of mandate of right wing parties 2001–2011 (proper calculation)

Dependent: Var2	Multiple R = 0,53614992		F = 10,89244

Var1 beta= - 0,54			

In case we examine interdependence between inflation and unemployment rate during the last two years of mandate of right-wing parties power in transition countries using the previously explained theoretical considerations even higher negative correlation as opposed to one at left wing governments shall be evident. It is also clear that the central banker implemented such monetary politics that supported priorities of right-wing executive governments putting greater weight on prevention of unemployment regarding the inflation. As the central bank primarily goal is keeping the monetary stability and the right-wing governments with their economic politics support such priorities, central bank in the second half of right-wing governments mandate had significantly easier task.

7   CONCLUSION

Election cycles in EU members' transition countries happen under circumstances of enlargement of EU as well as already set economic frameworks after the access to membership. The change of executive power in circumstances of greater and greater request for increase of social welfare and personal standard can be the reason for left or right-wing parties after receiving the mandate for new cabinet do not implement such economic politics as announced before the elections. Time inconsistency of economic politics implemented by the government can make the position of central banker that is linked by law to coordinate the implementation of monetary politics with such economic politics even more difficult so that he can be in a position to jeopardize its primarily goal- keeping of monetary stability.

With the research effectuated we have established that in transition countries analysed there are no political business cycles in a way they are present in western countries. Such a result of research does not mean that left and right-wing parties implement consistent economic politics before the elections. One of the main factors that had impact on such a result are still not sufficient distinctiveness of political parties in transition countries as the praxis of party activities very often vary from the set programme framework. Also the economic guidelines set by EU do not allow the parties on power to implement different economic politics regardless they are left or right-wing. Moreover in case EU in future makes stronger mechanics of fiscal liability according to already set criteria there is a real possibility of further narrowing of frameworks for the choice of alternatives in implementation of economic politics at national level.

ABSTRACT
Nowadays, it is essential for a multitude of companies to engage in foreign markets. However, the successful management of internationalization processes constantly poses numerous novel challenges. The attempt of this paper is to provide guidance on the multiple and complex requirements of international business activities. Authors provide empirical assessment and theoretical elaboration on the headquarters-subsidiary relationships phenomena which must be observed in international management practice. Foreign subsidiaries can add considerable complexity to the management of multinational corporations because they are located in different countries which may show varying degrees of psychic, administrative and cultural distance to the home country. But, subsidiaries are also involved in local business networks and therefore may develop different ideas since they have the approach to the diverse sources of knowledge. Multinational corporations have the potential to combine organization-specific advantages with advantages of different geographic locations through the internal transfer of resources. Since the authors' interest lies in the relationship between headquarters and foreign subsidiaries, the focus here will be on the last form of internationalization. In the theoretical part of the paper authors illustrate the relationship between headquarters and foreign subsidiaries, the roles and assignments that headquarters have towards foreign subsidiaries and vice versa. Empirical research focuses on subsidiary roles in headquarters-subsidiary relationships and it is conducted in subsidiaries of French multinational corporations in Croatia. The emphasis is to identify whether the traditional relationship changed - from the control that was the fundamental activity done by headquarters - towards the contemporary relationship where the subsidiary is an important node within the intra-organizational network of multinational corporation.

Keywords: Croatia, French multinational corporations, Headquarters and foreign subsidiaries relationship, Multinational corporations, Subsidiary's role

1 INTRODUCTION

A multinational (respectively transnational) corporations are companies which (a) possess business entities in two or more countries, regardless the legal form and scope of activities of the entity, (b) have a decision-making system that enables coherent policies and a common strategy coordinated from one or multiple centres of decision making, and (c) the entities are linked through ownership and other relationships in such a way that one or more entities may affect the activities of other entities, especially the sharing of knowledge, resources and responsibilities towards others" (UNCTAD, 2002). A parent enterprise (Headquarters) is defined as an enterprise that controls assets of other entities in countries other than its home

country, usually by owning a certain equity capital stake. A foreign affiliate is an incorporated or unincorporated enterprise in which an investor that is a resident in another economy owns a stake that permits a lasting interest in the management of that enterprise (UNCTAD, 2008).

Multinational corporations require a large market which they realise by the internationalization of their (business) activities. Their prime objective is a presence in the global market that is achieved through the network of the subsidiaries. In the headquarters-subsidiary relationship there are many roles and assignments that headquarters have towards foreign subsidiaries and *vice versa*. The most important role of the subsidiaries lies in the fact that the headquarters conquer the market straightforwardly through them. Subsidiary's role in the corporation can be defined by the headquarters or it can be developed by the subsidiary's managers. This paper will present the role of subsidiaries considering different factors that can affect their operations.

In theory, as well as in the practice of multinational corporations, it is known that the developing countries, because of the unsaturated market, cheaper labour and many other favourable conditions, present a very interesting area for the settlement of multinational corporations. That is the reason why, in the last 20 years, many multinational corporations, from Europe and from all over the world, have been investing in Croatia where they established subsidiaries through which its products are successfully placed in the Croatian market. In this paper, a particular attention is paid to the French multinational corporations in Croatia. France is, in fact, after Austria, the Netherlands, Germany, Hungary and Luxembourg, the sixth largest country in foreign direct investments in the Republic of Croatia and its direct investment amounted to 1383.5 million Euros, in the period since 1993. until mid 2012 (www.hnb.hr).

In Croatia there are 70 French subsidiaries (with more than 10% of French participation in the equity) with a total of 7,000 active employees, of which, 3% in the agricultural sector, 32% in industry and 65% in the service sector (http://www.ambafrance-hr.org). This is a good reason to explore the specificities of the French management and to pay more attention to the French subsidiaries management in the Croatia. Therefore, in the empirical part of the paper are presented results of the research conducted in subsidiaries of French multinational corporations in Croatia about the French subsidiaries management and their relationship with the headquarters.

2 THEORETICAL INSIGHT ABOUT THE HEADQUARTERS-SUBSIDIARY RELATIONSHIPS

Chang, Gibbons and Schoch (2000, p. 648) pointed out that during the process of internationalization, headquarters-subsidiary relationship is affected by various factors:
1. subsidiaries' size
2. subsidiaries' location
3. cultural similarities of subsidiaries' and the headquarters' cultural environment
4. communications between the headquarters and subsidiaries.

All these factors, to some extent and in some way, affect the headquarters-subsidiary relationship. Their influence is mostly manifested by a greater or lesser degree of subsidiary's autonomy.

Autonomy is a „critical point" in the subsidiary-headquarters relationship. It is conditioned by numerous factors and it also affects directly to the subsidiaries performance in local conditions. In other words, to adapt to local conditions, the subsidiary requires a certain degree of autonomy. Except the specified, subsidiaries' degree of autonomy is also affected by subsidiaries goals and strategies, tasks and technologies, it's size, the life cycle of a subsidiary, location, human resources and specific environments of certain countries. For an analysis of subsidiary autonomy, it is important to consider its relationship with the headquarters. According to the traditional way of thinking, there are two basic types of relations between headquarters and subsidiaries, which are centralized and decentralized approach (Galbraith, 2000).

For the centralized approach it is characteristic that the most important decisions are made in the headquarters' level. According to that, managers in the subsidiaries don't have a high degree of autonomy. They only implement decisions according to the instructions given by the headquarters. In such corporations hierarchies are elaborated in detail, as well as the lines of authority and types of delegations at various levels of the corporation, which makes it rigid. The opposite of the centralized approach is a decentralized approach which transmits subsidiaries' control and management from headquarters managers to subsidiaries' managers. In that case subsidiaries have a higher degree of autonomy and managers make important decisions related to the subsidiary's operations, which acquires a greater degree of flexibility (Bartlett, Ghoshal and Beamish, 2008).

Although subsidiaries are legally independent units with their own tangible and intangible assets, they still operate as „departments" that are more or less controlled by the headquarters (Chang and Hong, 2000, p. 430). Therefore, one of the key activities of managers in the headquarters is controlling and monitoring subsidiaries' activities, especially those located in foreign countries. Formal verification provides effective control of the subsidiary, and thus obtained information allow the headquarters to evaluate subsidiary's efficiency and effectiveness as well as those of their managers. Another possibility to monitor subsidiary's operations is the implementation of knowledge, goods and capital (Chung, Gibbons and Schoch, 2000, p. 650). This can not be seen as exclusive indicator since subsidiary's ability should also be adding value and adopting knowledge and new concepts from the environment. Coordination mechanisms are systems designed to ensure that the necessary degree of integration is achieved between the activities of all subsidiaries (Johnston, 2005, p. 124). They are concerned with the subsidiary's multilateral relationships with other subsidiaries as well as with the subsidiary's specific relationship with headquarters. They are usually related to the flows of resources, intermediate products, knowledge and information.

Financial management of multinational corporations has very important tasks of financial planning and control, investment decision-making and raising funds to finance the corporation. Multinational corporations have a specific financing system that is different from the financial system of all "national" companies. The advantage of these systems is reflected in the abilities of transferring capital and profits through internal mechanisms of global systems that enable a more favourable financing, a wider range of risk exposure and the use of an internal funding for better liquidity management. It is a complex system which includes an international trade, manufacturing and finance, which requires ingenuity and a variety of knowledge and skills for successful financial management of these complex entities.

3 SUBSIDIARY TYPES CONSIDERING THEIR ROLES TOWARDS HEADQUARTERS

If we observe the development of multinational corporations and their strategies, we will notice that each strategy implies certain roles and assignments of the subsidiaries and an appropriate organizational structure of the corporation. Subsidiary's role in the corporation can be defined by the headquarters or it can be developed by the subsidiary's managers (Hodgetts, Luthans and Doz, 2006). Numerous studies have attempted to give the answer to the question of subsidiary's roles and assignments within the corporation. Most of the studies consist of multiple classifications of subsidiary roles. These studies are based on analyzes in a particular business context or they result from the use of one of several conceptual models such as IR (integration-responsiveness) grid (Rugman and Brewer, 2001).

White and Poynter thus, identified three main scopes as dimensions in their model:
- market scope
- product scope
- value-added scope

By installing product scope and value-added scope on one dimension, and market scope on the second dimension, they were able to generate five basic subsidiary types:
- "The strategically independent" subsidiary operates as an independent company. This kind of subsidiary has the largest degree of autonomy and independence in making decisions. It possesses its own resources and it is not restricted by the headquarters in finding opportunities in existing or new markets.
- "The product specialist" with similar characteristics as the previously mentioned type of subsidiary, except that the relationship with the headquarters is more intense which results by a lesser degree of autonomy. The headquarters provides resources to this subsidiary but it is independent in developing it's own business.
- "The marketing satellite" is most characterized by low degree of autonomy and limited value-adding effect. Usually, it is not involved in production of the final product and its main purpose is to represent and / or sale headquarters' products in a particular market.
- "The rationalized manufacturer" is a subsidiary that produces intermediate products which are built into the final products. It has a very low degree of autonomy (but is highly integrated in the corporate activity.
- "The miniature replica" is producing products /providing services from a headquarters' range of products in the local market. This type of subsidiary is a "miniature headquarters" which aims to operate as a local company in a particular market but the autonomy of its managers is very low.

Jarillo and Martinez (1990) based their model on the dimensions of degree of global integration and the degree of localization (Johnston, 2005, p. 58). Their study set three types of subsidiaries:
- "The receptive subsidiary" corresponds on high integration and low localization degree. These are globally integrated subsidiaries characterized by the lower degree of autonomy and greater connections with the headquarters and other subsidiaries within the corporate network.

- "The autonomous subsidiary" corresponds to a low degree of integration and a high degree of localization. It has a high degree of autonomy and it generates a significant local operations.
- "An active subsidiary" is characterized by a high degree of integration and a high degree of localization, and presents a very important link in the multinational corporation network.

Bartlett and Ghoshal (1995) also mapped subsidiary's role on the basis of competence of the local organization and the strategic importance of the local environment, which produced four subsidiary roles:
- "Strategic leader" has a high degree of local authority and the market in which it operates has significant strategic importance for the corporation. This kind of subsidiary is seen as a partner of the headquarters.
- "The contributor" has considerable capability but it acts in a minor market. It has to be encouraged to contribute its capability for the benefit of the entire corporation instead of remain locally focused
- "The implementer" is a subsidiary that has low values of both dimensions, but also has enough competence to maintain local operations
- The "black hole" has a position in an important market but lacks competence to deliver more value to the corporation. The task of this subsidiary is to manage its transformation to strategic leader status.

Gupta and Govindarajan (1991) introduced a new perspective on subsidiary task based on knowledge flows. They proposed a framework with high and low values of outflows and inflows of knowledge between the subsidiary and the rest of the corporation which resulted by four subsidiary tasks:
- "A local innovator" is characterized by low knowledge in both directions. Innovation autonomy and a specific knowledge resulted in a high degree of independence
- "The global innovator" is charged with innovating on behalf of the rest of the corporation. There are generally a specialized functions or areas or it can comprehend the entire research and development function. Global innovator has a high outflows and to and low inflows from the rest of the corporation network.
- "The integrated player" implies responsibility for creating knowledge but at the same time it doesn't have a self-sufficiency in its own deeds. Consequently, inflows and outflows are both high
- "The implementer" characterised by low outflows of knowledge to the rest of the corporation but high inflows of knowledge from the headquarters and other subsidiaries.

Ability to acquire knowledge from the environment is not only important for the effectiveness of the subsidiaries, it is also important for the entire corporation as it enables the transfer of knowledge in the headquarters and in other subsidiaries. It is easier for the subsidiary to adopt knowledge and concepts if it is in direct relation (if it is close to) with the local environment, its suppliers and customers. Local knowledge-adoption can be useful for subsidiaries operations in the local market thanks to which it can locally improve its effectiveness.

It is evident that in all the above models, the autonomy appears as a „critical" variable. Some important business determinants such as speed, method and scope of the local market depend

of the degree of autonomy. If the degree of autonomy is not appropriate, in certain markets that may pose a major obstacle to the successful operations of the subsidiary.

The role that the subsidiaries have in the corporation network may change over time. Once established, a foreign subsidiary can be developed, raised in the hierarchy of the group to achieve a greater degree of responsibility and autonomy, and, according to the achieved results, it can completely change from the original strategy. However, there are also subsidiaries that don't generate positive results which makes their existence unjustified and according to that, they show need to be lifted.

4   EMPIRICAL RESEARCH

In order to research cultural differences and the degree of autonomy of French subsidiaries in the Republic of Croatia, a primary research was conducted during October and November of 2012. The research was conducted on a target group whose task was to fill out a questionnaire. The target group consisted of managers of French subsidiaries in the Republic of Croatia because they represent the group that makes and implements business decisions and policies, and they are also in a direct contact with the headquarters. The sample was deliberate and appropriate; a sample of acquaintances, and it included 11 managers of French subsidiaries in Croatia. The measuring research instrument was a questionnaire, which investigated the management styles, cultural differences as well as *headquarters-subsidiary relationship which* was determined by the autonomy degree of the subsidiary's business functions.

Most of the surveyed managers (55%) were in the age group of 41 to 50, slightly fewer of them (45%) were younger, 31 – 40 years old. Also, most of them (64%) work on a higher management level whereas a smaller part (36%) works on a middle level, closer to the top management of the subsidiary.

Most managers (73%) stated that the headquarters is setting the goals and business strategy of the subsidiary. Subsidiaries of multinational corporations, therefore, rarely make strategic decisions, but their managers are actively involved in the decision-makings for the subsidiary.

When asked how high, on a scale from 1 to 5 (1 lowest, 5 highest), the subsidiaries degree of autonomy is in terms of business functions, managers gave the following answers:

Table 1: Subsidiaries' business functions' degree of autonomy

Human resources management	1	2	3	4	5
	0%	18%	64%	18%	
Marketing	1	2	3	4	5
	0%	9%	45%	36%	9%
Sales and/or production	1	2	3	4	5
	0%	9%	9%	64%	18%
Finance	1	2	3	4	5
	27%	45%	18%	9%	0%

The results show that the highest degree of autonomy for subsidiaries lies in the field of sales and production, which also includes the level of autonomy in setting goals and sales quota,
